DATE:	July 6, 2017
PROJECT:	Interdisciplinary Science Building 8274 Big Bend Blvd. Webster Groves, MO 63119
OWNER:	Webster University 470 E. Lockwood Ave. Webster Groves, MO 63119
ROOFING CONTRACTOR:	Kirberg Company 1400 South Third Street St. Louis, MO 63104
SPECIFICATION SECTION:	075323 EPDM Membrane Roofing 077100 Roof Specialties 077200 Roof Accessories
SUBMITTAL ITEMS:	Operation and Maintenance Data

Preventative Maintenance Guidelines

Ongoing and proper maintenance of the roofing system is part of a building owner's responsibility under the terms of the guarantee agreement. Only allow approved JM Peak Advantage® Contractors to maintain or perform repairs on a guaranteed roofing system.

Do's and Don't's of Roof Maintenance

Do...

- Perform inspections at least twice a year or as required by the guarantee. The ideal times to perform inspections are at the end of winter and the end of summer, when roofs have gone through the greatest amount of thermal stress (inspecting your roof for any trouble spots and to unclog drains in the spring and fall is also a good idea).
- Conduct additional inspections immediately after unusual occurrences such as heavy rains, high winds, hail, nearby fires, explosions, etc.
- Keep a file of all records and inspection reports relating to your roof.
- Advise equipment service personnel to be careful handling tools and heavy equipment on the roof. Log all such trips to the roof.
- Keep your roof clean and free of debris and contaminants.
- Establish a rooftop control policy. Keep access doors or hatches locked. Advise equipment service personnel to be careful.
- Keep roof drains free of debris.

Don't...

- Allow unqualified personnel to maintain your roof.
- Allow equipment service personnel to make penetrations into your roof; these are to be made only by an approved roofing contractor.
- Power-wash your roof. You may cause unintended damage!
- Puncture the membrane.
- Move heavy equipment across the roof.

Cause and Effect

Split in water line leaking

Evidence of water ponding

Weeds growing in drain due to excess water

Maintenance Checklist

To ensure the integrity of the roofing system, it is important to contact JM before any alterations are made. We encourage all alterations and repairs to be completed by a JM Peak Advantage Contractor to ensure they meet the high standards of JM and the requirements outlined in the guarantee.

Below is a checklist of things to look for while on your roof. Good roofing practice recommends these areas be inspected twice annually to ensure the roofing system integrity.

Building Exterior	
General Condition	Inspect all areas for signs of leaks and/or deterioration.
Walls	Inspect for deterioration, missing mortar and stains in walls indicating possible leaks.
Roof Edge – Coping Caps or Gravel Stop/Gutter	A coping is a covering for the top of a wall that is exposed to weather. It is usually sloped to shed water to the roof. Check for cracking, splits and mortar integrity. Replace any damaged, loose or cracked areas. Caulk joints if necessary.
Fascia	Inspect all surfaces for signs of leaks and/or deterioration.
Building Interior	
General Condition	Inspect all areas for signs of leaks and/or deterioration.
Walls	Inspect all surfaces for signs of leaks and/or deterioration.
Underside of Deck	Inspect for stains, discoloration, spalled or rusted surfaces.
Ceilings	Inspect for evidence of staining.
Field of Roof	
General Condition	Remove any debris such as leaves, small branches, dirt, rocks, etc. that have accumulated.
Surfacing	Minimize the amount of foot traffic on the roof whenever possible. Place walkway pads at roof entry areas and at rooftop equipment access panels.
Laps	Inspect the condition of membrane laps, if applicable.
Drainage System	
General Condition	Water should flow freely, unobstructed from the roof.
Gutters/Scuppers/Down Spouts/Drains	Remove any debris from inside and the surrounding areas. Make sure strainers and clamping rings are secure.
Perimeter/Flashings	
General Condition	Inspect attachment to make sure it remains watertight. All metal work must be caulked and watertight. Only JM metal is covered by the JM Peak Advantage Guarantee.
Base Flashing	Inspect for adequate fastening at top of the flashing. Check attachment to the substrate. Inspect vertical flashing end laps and horizontal laps at membrane.
Counterflashing	Ensure that the counterflashing is well secured. Periodically remove and replace caulking to ensure watertight conditions. Only use commercial grade caulk suitable for rooftop application.
Roof Top Units	
General Condition	All roof penetrations are prone to leaks. All units should be installed using compatible roof materials and should be properly flashed. Be sure to have a JM Peak Advantage contractor assist in the installation and flashing of new rooftop equipment.
HVAC	Check condensation lines for positive drainage. Ensure they are flowing freely to roof drains. Condensation lines should rest on wood blocks or rubber supports and never directly on the roof surface. Ensure equipment is in good condition and working properly. Install protection/walkpads around perimeter of equipment that requires periodic maintenance.
Equipment Supports: Satellite Dishes, Signs, Antennas, etc.	Properly support all heavy equipment on vertical curbs. All vertical curbs should be properly flashed and covered with a metal cap. Use protection/walkpads below all lightweight horizontal wood equipment supports.
Lightning Protection	Should not penetrate the roof surface. Ensure there are no overly loose or dangling cables.
Equipment Flashing	Ensure equipment base flashings are secure, watertight and counterflashed.
Penetrations	
General Condition	Do not allow exhaust fats, petroleum or other chemicals or contaminants directly onto the roof. Contact JM if any chemicals or service fluids come into contact with the roofing system.
Pipes and Vents Penetration Pan/ Pitch Pocket	Inspect the lap at membrane and vertical lap. Ensure that the top to the flashing is secured and caulked properly. An enclosure made of sheet metal, rubber or other material used to flash penetrations through a roof system. Often a source of leaks. Must be topped-off annually with compatible sealer.
Expansion Joints	A structural separation between two building elements that allows free movement between the elements without damage to the building or roofing system. Check for excessive movement or deterioration. Check all end laps and repair or replace lap splice as necessary. JM Expand-O-Flash expansion joints are covered under the terms of the JM Peak Advantage Guarantee.

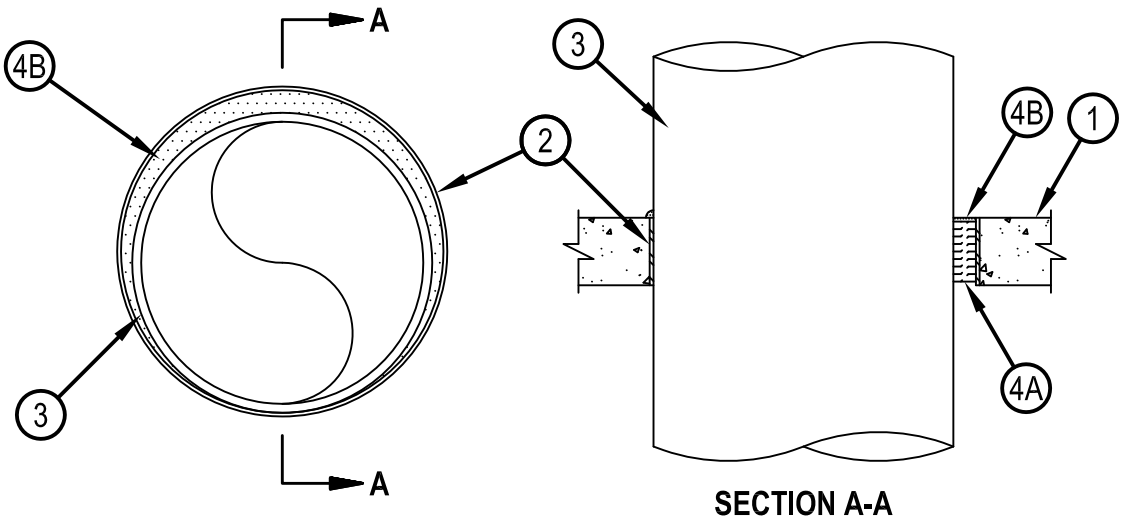
SECTION A-A

1. Floor or Wall Assembly — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diameter of opening is 6 in. (152 mm).
   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.
2. Steel Sleeve — (Optional)-Nom 6 in. (152 mm) diameter (or smaller) Schedule 40 (or heavier) steel pipe cast or grouted into the floor or wall assembly, flush with floor or wall surfaces.
3. Firestop System — The firestop system shall consist of the following:
   A. Packing Material — Min 4 in. (102 mm) thickness of 4 pcf (64 kg/m3) mineral wool batt insulation tightly packed into the opening as a permanent form. Packing material to be recessed from top surface of floor and both surfaces of wall to accommodate the required thickness of fill material.
   B. Fill, Void or Cavity Materials* — Sealant — Min 1/4 in. (6 mm) thickness of fill material applied within the annulus, flush with top surface of floor.
   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant



* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

SECTION A-A

1. Floor or Wall Assembly — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 32 in. (813 mm).
2. Metallic Sleeve — (Optional) Nom 32 in. (813 mm) diam (or smaller) Schedule 40 (or heavier) steel sleeve cast or grouted into floor or wall assembly, flush with floor or wall surfaces or extending a max of 3 in. (76 mm) above floor or beyond both surfaces of wall.

2A. Sheet Metal Sleeve — (Optional) Max 6 in. (152 mm) diam, min 26 ga. galv steel provided with a 26 ga galv steel square flange spot welded to the sleeve at approx mid-height, or flush with bottom of sleeve in floors, and sized to be a min of 2 in. (51 mm) larger than the sleeve diam. The sleeve is to be cast in place and may extend a max of 4 in. (102 mm) below the bottom of the deck and a max of 1 in. (25 mm) above the top surface of the concrete floor.

2B. Sheet Metal Sleeve — (Optional) - Max 12 in. (305 mm) diam, min 24 ga galv steel provided with a 24 ga galv steel square flange spot welded to the sleeve at approx mid-height, or flush with bottom of sleeve in floors, and sized to be a min of 2 in. (51 mm) larger than the sleeve diam. The sleeve is to be cast in place and may extend a max of 4 in. (102 mm) below the bottom of the deck and a max of 1 in. (25 mm) above the top surface of the concrete floor.

3. Through-Penetrant — One metallic pipe, tube or conduit to be installed either concentrically or eccentrically within the firestop system. The annular space between penetrant and periphery of opening shall be min 0 in. (point contact) to max 1-7/8 in. (48 mm). Penetrant may be installed with continuous point contact. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic penetrants may be used:
   A. Steel Pipe — Nom 30 in. (762 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. Iron Pipe — Nom 30 in. (762 mm) diam (or smaller) cast or ductile iron pipe.
   C. Copper Pipe — Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.
   D. Copper Tubing — Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.
   E. Conduit — Nom 6 in. (152 mm) diam (or smaller) steel conduit.
   F. Conduit — Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing (EMT).

4. Firestop System — The firestop system shall consist of the following:

A. Packing Material — Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or sleeve or from both surfaces of wall or sleeve as required to accommodate the required thickness of fill material.

B. Fill, Void or Cavity Material* — Sealant — Min 1/4 in. (6 mm) thickness of fill material applied within the annulus, flush with top surface of floor or sleeve or with both surfaces of wall or sleeve. At the point or continuous contact locations between penetrant and concrete or sleeve, a min 1/4 in. (6 mm) diam bead of fill material shall be applied at the concrete or sleeve/ pipe penetrant interface on the top surface of floor and on both surfaces of wall.

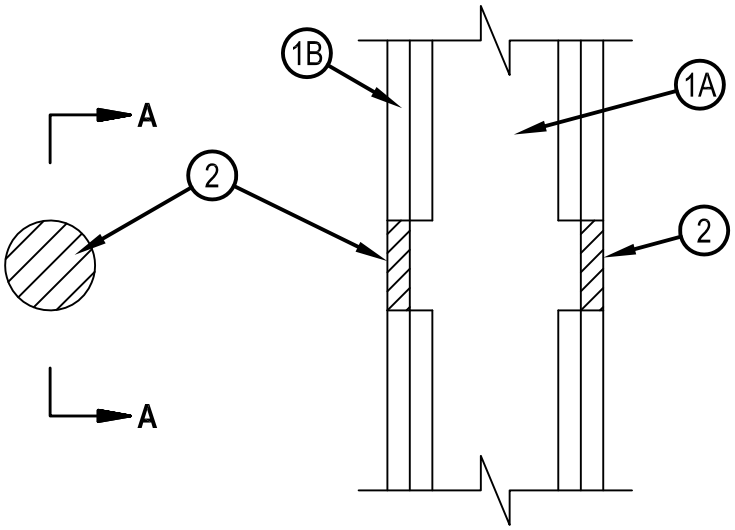
1. Floor or Wall Assembly — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete floor. Min 5 in. (127 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening is 8 in. (203 mm) by 30 in. (763 mm).
   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.
2. Through Penetrants — One or more metallic penetrants to be installed either concentrically or eccentrically within the firestop system. The total number of penetrants is dependent on the size of the opening and sizes of penetrants. The annular space between the penetrants and periphery of opening shall be min 0 in. (point contact). The annular space between nom 2 in. (51 mm) diam (and smaller) penetrants shall be a min 0 in. (point contact). The annular space between penetrants greater than nom 2 in. (51 mm) diam shall be a min. 1/2 in. (13 mm). A max annular space in the system shall be 12 in. (305 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:
   A. Conduit — Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing or rigid steel conduit
   B. Through Penetrating Product* — Flexible Metal Piping — The following types of steel flexible metal gas piping may be used:
      1.) Nom 2 in. (51 mm) diam (or smaller) steel flexible metal gas piping. Plastic covering on piping may or may not be removed on both sides of floor or wall assembly.
      OMEGA FLEX INC
      2.) Nom 1 in. (25 mm) diam (or smaller) steel flexible metal gas piping. Plastic covering on piping may or may not be removed on both sides of floor or wall assembly.
      GASTITE, DIV OF TITEFLEX
      3.) Nom 2 in. (51 mm) diam (or smaller) steel flexible metal gas piping. Plastic covering on piping may or may not be removed on both sides of floor or wall assembly.
      WARD MFG L L C
3. Firestop System — The firestop system shall consist of the following:
   A. Packing Material — Min 4 in. (102 mm) thickness of 4 pcf (64 kg/m3) mineral wool batt insulation tightly packed into the opening as a permanent form. Packing material to be recessed from top surface of floor or both surfaces of wall to accommodate the required thickness of fill material.
   B. Fill, Void or Cavity Material - Sealant* — Min 1/2 in. (13 mm) thickness of fill material applied within the annulus flush with the top surface of the floor or both surfaces of the wall.
   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant.



* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. Wall Assembly — The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.

   B. Gypsum Board* — Thickness, type, number of layers and orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening is 2-1/2 in. (64 mm) or a max area of 4 in. (25.8 cm2) with a max dimension of 2 in. (51 mm).

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T, FT and FTH Ratings of the firestop system are 0 and 1-3/4 hr for 1 and 2 hr rated assemblies, respectively.

2. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of sealant applied within annulus, flush with both surfaces of wall.
HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant

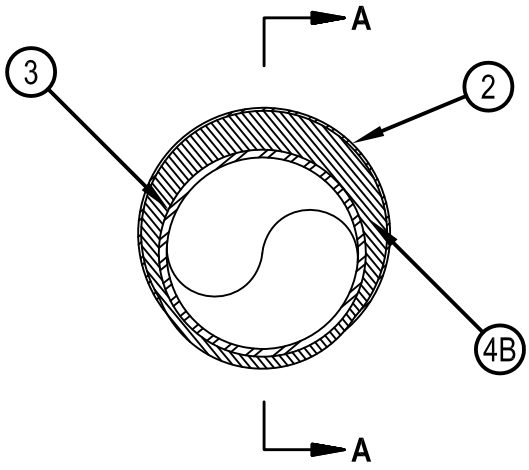
SECTION A-A

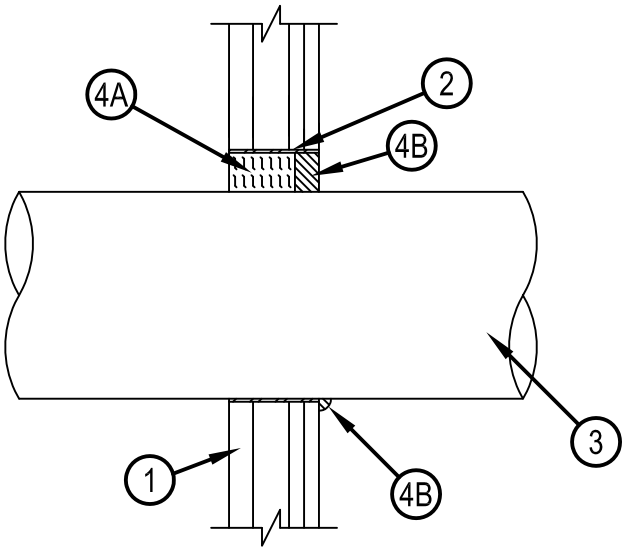
1. Wall Assembly — The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC. When steel studs are used and the diam of opening exceeds the width of stud cavity, the opening shall be framed on all sides using lengths of steel stud installed between the vertical studs and screw-attached to the steel studs at each end. The framed opening in the wall shall be 4 to 6 in. (102 to 152 mm) wider and 4 to 6 in. (102 to 152 mm) higher than the diam of the penetrating item such that, when the penetrating item is installed in the opening, a 2 to 3 in. (51 to 76 mm) clearance is present between the penetrating item and the framing on all four sides.
   B. Gypsum Board* — 5/8 in. (16 mm) thick, 4 ft (122 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 32-1/4 in. (819 mm) for steel stud walls. Max diam of opening is 14-1/2 in. (368 mm) for wood stud walls.

The F and FH Ratings of the firestop system are equal to the fire rating of the wall assembly.

System No. W-L-1054



2. Through-Penetrants — One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the firestop system. The annular space shall be min 0 in. to max 2-1/4 in. (57 mm). Pipe may be installed with continuous point contact. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. Steel Pipe — Nom 30 in. (762 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. Iron Pipe — Nom 30 in. (762 mm) diam (or smaller) cast or ductile iron pipe.
   C. Conduit — Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing or 6 in. (152 mm) . diam steel conduit.
   D. Copper Tubing — Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.
   E. Copper Pipe — Nom 6 in. (152 mm) diam (or smaller) regular (or heavier) copper pipe.
3. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. At the point or continuous contact locations between pipe and wall, a min 1/2 in. (13 mm) diam bead of fill material shall be applied at the pipe wall interface on both surfaces of wall.
   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-One Sealant or FS-ONE MAX Intumescent Sealant



* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

SECTION A-A

1. Wall Assembly — The fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — "C-T" shaped studs 1-5/8 in. (41 mm) wide by 2-1/2 in. (64 mm) deep, fabricated from 25 MSG galv steel, spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — One layer of nom 1 in. (25 mm) thick, 24 in. (610 mm) wide gypsum liner and one or two layers of nom 5/8 in. (16 mm) thick, 4 ft. (1.27 m) wide gypsum board with square or tapered edges. The gypsum board types, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening is 10-1/2 in. (267 mm).

1A. Wall Assembly — As an alternate to the above wall assembly, the 1 or 2 Hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC.
   B. Gypsum Board* — Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max diam of opening is 10-1/2 in. (267 mm).

   The hourly F, FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.

2. Metallic Sleeve — Max 10-1/2 in. (267 mm) diam cylindrical sleeve fabricated from min 0.016 in. (0.41 mm) thick (28 gauge) galv sheet steel and having a min 1 in. (25 mm) lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall. Sleeve installed by coiling the sheet steel to a diam smaller than the through opening, inserting the coil through the opening and releasing the coil to let it uncoil against the circular cutouts in the gypsum board layers. Sleeve may also be formed of No. 8 steel wire mesh having a min 1 in. (25 mm) lap along the longitudinal seam.

Reproduced by HILTI, Inc. Courtesy of Underwriters Laboratories, Inc.
January 22, 2015

System No. W-L-1206

3. Through-Penetrants — One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the firestop system. An annular space of min 0 in. (0 mm, point contact) to max 1-7/8 in. (48 mm) is required within firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. Steel Pipe — Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. Iron Pipe — Nom 8 in. (203 mm) diam (or smaller) cast or ductile iron pipe.
   C. Conduit — Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing or 4 in. (102 mm) diam steel conduit.
   D. Copper Tubing — Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   E. Copper Pipe — Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.
   F. Flexible Steel Conduit+ — Nom 2 in. (51 mm) diam (or smaller) flexible steel conduit.
      See Flexible Metal Conduit (DXUZ) category in the Electrical Construction Equipment Directory for names of manufacturers.
4. Firestop System — The firestop system shall consist of the following:
   A. Packing Material — Min 1-5/8 or 2-1/4 in. (41 or 57 mm) thickness of min 4 pcf (64 kg/m^3) mineral wool batt insulation firmly packed into sleeve on one side of the wall as permanent form for 1 and 2 Hr walls, respectively. Packing material to be recessed from the room side of wall to accommodate the required thickness of fill material. In alternate wall assembly, packing material to be flush with either side of the wall and recessed from the other side of the wall to accommodate the required thickness of fill material.
   B. Fill, Void or Cavity Material — Sealant* — Min 1-1/2 in. (38 mm) thickness applied within sleeve, flush with the surface of wall. At the point contact location between pipe and wall, a min 1/2 in. (13 mm) diam bead of fill material shall be applied at the pipe/wall interface.
      HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Classified by Underwriters Laboratories, Inc. to UL 1479 and CAN/ULC-S115

ANSI/UL1479 (ASTM E814)	CAN/ULC S115
F Ratings — 1 and 2 Hr (See Item 1and 3)	F Ratings — 1 and 2 Hr (See Items 1 and 3)
T Rating — 0 Hr	FT Rating — 0 Hr
	FH Ratings — 1 and 2 Hr (See Items 1 and 3)
	FTH Rating — 0 Hr

SECTION A-A

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing shall consist of min 3-5/8 in. (92 mm) wide steel studs spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — Thickness, type, number of layers and fasteners, as specified in the individual Wall and Partition Design. Max height of opening is 3-1/2 in. (89 mm). Max width of opening is 32 in. (813 mm).

   The hourly F, FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.
2. Through Penetrants — Multiple pipes or conduits installed in single layer array within the firestop system. The annular space between the pipes and conduits and the edges of the opening shall be min 0 in. (0 mm, point contact) to max 1-3/8 in. (35 mm). The separation between pipes and conduits to be a min 0 in. (0 mm, point contact) to a max 1-1/4 in. (32 mm). Pipes and conduits to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or conduits may be used:
   A. Steel Pipe — Nom 2 in. (51 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. Conduit — Nom 2 in. (51 mm) diam (or smaller) rigid steel conduit or steel electrical metallic tubing (EMT).
3. Fill Void or Cavity Materials* - Sealant — Min 5/8 in. (16 mm) thickness of fill material installed to completely fill annular space between pipes, conduits and gypsum flush with each surface of wall. Min 1/2 in. (13 mm) diam bead of fill material applied to the through penetrant/wall interface at the point contact locations on both sides of the wall. The 2 hour F, FH Ratings apply only when FS-ONE Sealant is used.

   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — Hilti CP 606 Flexible Firestop Sealant or FS-ONE Sealant, FS-ONE MAX Intumescent Sealant

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — 5/8 in. (16 mm) thick, 4 ft (1.2 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and PartitionDesign. Diam of opening to be min 1/2 in. (13 mm) larger than outside diam of through penetrant. Max diam of opening is 2-1/4 in. (57 mm).

   The F, FH Ratings of the firestop system are equal to the fire rating of the wall assembly.
2. Pull or Junction Box+ — Min 16 ga steel pull or junction box mounted flush with or max 1/4 in. (6 mm) from surface of wall. See Junction and Pull Boxes (BGUZ) category in the Electrical Construction Material Directory for names of manufacturers.
3. Conduit — One nom 1 in. (25 mm) diam (or smaller) steel conduit or steel electrical metallic tubing to be installed either concentrically or eccentrically within the firestop system. The annular space shall be min 0 in. (point contact) to max 1-1/8 in. (29 mm). Conduit or EMT to be secured to back surface of pull or junction box with steel connector and rigidly supported on both sides of wall assembly.
4. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with surface of wall opposite the pull or junction box. A min 1/2 in. (13 mm) diam bead of fill material shall be applied t the point contact location between the conduit and wall. A min 1/2 in. (13 mm) diam bead of fill material shall be applied around the entire perimeter of the pull or junction box at its interface with the wall surface. The fill material shall lap min 1/2 in. (13 mm) onto both the wall and sides of the pull or junction box.

SECTION A-A

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — 5/8 in. (16 mm) thick, 4 ft (122 cm) wide with square or tapered edges. The gypsum wallboard type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening is 3-1/2 in. (89 mm).
2. Metallic Sleeve Optional — Nom 3-1/2 in. (89 mm) (or smaller) cylindrical sleeve fabricated from min 0.016 in. thick (28 gauge) galv sheet steel and having a min 1-1/4 in. (32 mm) lap salong longitudinal seam. Length of sleeve to be installed flush with wall surfaces.
3. Through Penetrants — One nonmetallic pipe installed within the firestop system.. Pipe may be installed at an angle not greater than 45 degrees from perpendicular. Pipe to be rigidly supported on both sides of wall assembly. The space between pipe and periphery of opening shall be min 1/4 in. (6 mm) to max 11/16 in. (17.5 mm). The following types and sizes of nonmetallic pipes may be used:
   A. Polyvinyl Chloride (PVC) Pipe — Nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. Chlorinated Polyvinyl Chloride (CPVC) Pipe — Nom 2 in. (51 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
4. Fill, Void or Cavity Materials* — Sealant — For 1 hr F Rating, min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. For 2 hr F Rating, min 1-1/4 in. (32 mm) thickness of fill material applied within annulus, flush with both surfaces of wall. SECTION A-A

1. Wall Assembly — The 1 or 2 fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — Nom 5/8 in. (16 mm) thick gypsum board, with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max diam of opening is 5-1/2 in. (138 mm) when sleeve (Item 2) is employed. Max diam of opening is 4 in. (102 mm) when sleeve (Item 2) is not employed.

   The F, FH Ratings of the firestop system are equal to the fire rating of the wall assembly.
2. Metallic Sleeve — (Optional) - Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing (EMT) or Schedule 5 (or heavier) steel pipe or min 0.016 in. thick (0.41 mm, No. 28 ga) galv steel sleeve installed flush with wall surfaces. The annular space between steel sleeve and periphery of opening shall be min 0 in. (0 mm, point contact) to max 1 in. (25mm). When Schedule 5 steel pipe or EMT is used, sleeve may extend up to 18 in. (457 mm) beyond the wall surfaces. As an option when Schedule 5 steel pipe or EMT is used, sleeve may extend continuously beyond one wall surface. When cable bundle penetrates wall assembly at an angle of 45 degrees, no metallic sleeve is used.

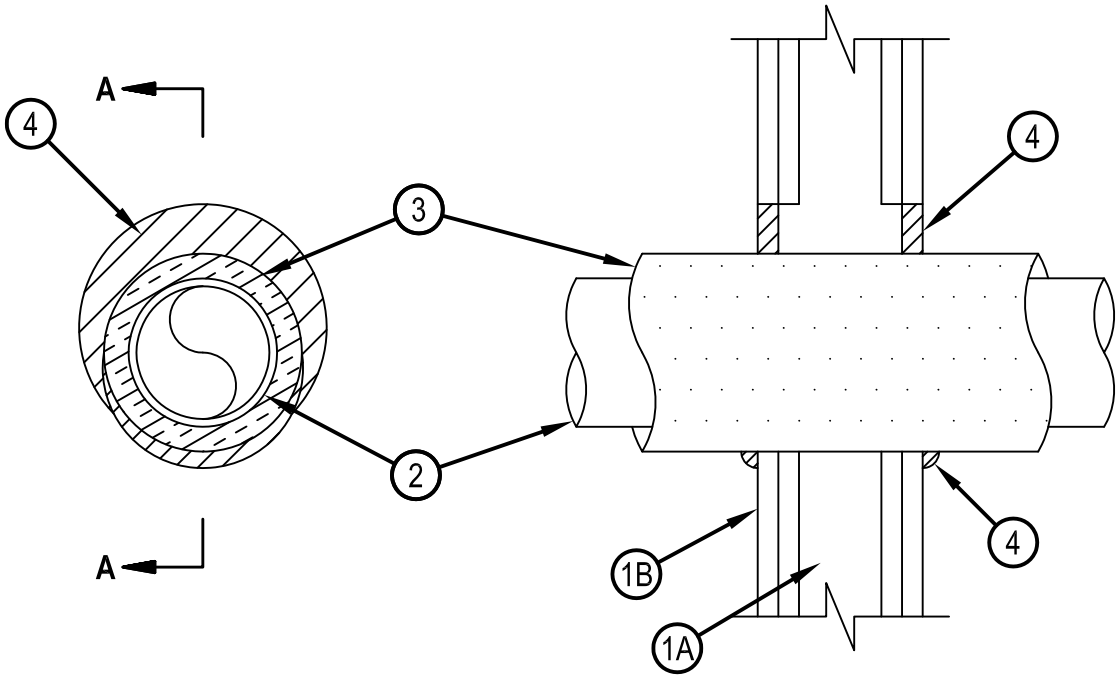
Underwriters Laboratories, Inc.
October 14, 2015

System No. W-L-3065

3. Cables — Aggregate cross-sectional area of cable in opening to be max 45 percent of the cross-sectional area of the opening. The annular space between the cable bundle and the periphery of the opening to be min 0 in. (point contact) to max 1 in. (25 mm). When sleeve is continuous on one side of wall (see Item 2), the cable fill may be 0 to 45% and the max annular space is not limited. Cables to be rigidly supported on both sides of the wall assembly. Any combination of the following types and sizes of copper conductor cables may be used:
   A. Max 7/C No. 12 AWG with polyvinyl chloride (PVC) insulation and jacket.
   B. Max 25 pair No. 24 AWG telephone cable with PVC insulation and jacket.
   B1. Max 4 pr No. 22 AWG Cat 5 or Cat 6 computer cables.
   C. Type RG/U coaxial cable with polyethylene (PE) insulation and PVC jacket having a max outside diameter of ½ in. (13 mm).
   C1. Max RG 6/U coaxial cable with fluorinated ethylene insulation and jacketing.
   D. Multiple fiber optical communication cable jacketed with PVC and having a max OD of 5/8 in. (16 mm).
   E. Through Penetrating Products*— Max three copper conductor No. 8 AWG .Metal-Clad Cable+.
   AFC CABLE SYSTEMS INC
   F. Max 3/C (with ground)(or smaller) No. 8 AWG copper conductor cable with PVC insulation and jacketing.
   G. Max 3/4 in. (19 mm) diam copper ground cable with or without a PVC jacket.
   H. Fire Resistive Cables* - Max 1-1/4 in. (32 mm) diam single conductor or multi conductor Type MI cable. A min 1/8 in. (3 mm) separation shall be maintained between MI cables and any other types of cable.
   I. Max 4/C with ground 300 kcmil (or smaller) aluminum SER cable with PVC insulation and jacket.
   J. Through Penetrating Product* - Any cables, Metal-Clad Cable+ or Armored Cable+ currently Classified under the Through Penetrating Products category.
   K. Maximum 3/C No. 8 AWG metal-clad cable.
   L. Maximum 5/8 diam fiber-optic cable with PVC jacket.
   For cable bundle penetrating the wall assembly at an angle of 45 degrees, the T, FT, FTH Ratings are 0 hr and 3/4 hr for 1 and 2 hr wall assemblies, respectively.
   See Through Penetrating Product (XHLY) category in the Fire Resistance Directory for names of manufacturers.
4. Fill, Void or Cavity Material*— Sealant or Putty — Fill material applied within the annulus, flush with each end of the steel sleeve or wall surface. Fill material installed symmetrically on both sides of the wall. A min 5/8 in. (16 mm) thickness of sealant is required for the 1 or 2 hr F Rating . An additional 1/2 in. (13 mm) diam bead of fill material shall be applied at the interface of sleeve with gypsum board.

HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — CP601S, CP606, FS-One Sealants or FS-ONE MAX Intumescent Sealantor or CP618 Putty

5. Packing Material — (Optional, Not Shown) — Mineral wool forming material may be used as a backer for the fill material (Item 4). When used, it shall be firmly packed into annular space within the sleeve as a permanent form and recessed from end of sleeve to accommodate the required thickness of fill material.



* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

SECTION A-A

1. Wall Assembly — The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — 5/8 in. (16 mm) thick, 4 ft (1.22 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening is 7-1/2 in. (191 mm).

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.
2. Through Penetrants — One metallic pipe or tubing to be centered within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. Steel Pipe — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe.
   B. Copper Tubing — Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   C. Copper Pipe — Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

System No. W-L-5028

3. Tube Insulation — Plastics+ — Min 1/2 in. (13 mm) to max 1 in. (25 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. An annular space of min 0 in. (point contact) to max 1-1/2 in. (38 mm) is required within the firestop system. The T, FT and FTH Ratings are 1 hr when the 1 in. (25 mm) thick tube insulation is used and 3/4 hr when the 3/4 in. (19 mm) thick tube insulation is used. When tube insulation thickness is less than 3/4 in. (19 mm), the T, FT and FTH Ratings are 0 Hr.
   See Plastics+ (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.
4. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. At the point contact location between pipe covering and gypsum board, a min 1/2 in. (13 mm) diam bead of fill material shall be applied at the pipe covering/gypsum board interface on both surfaces of wall.
   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant

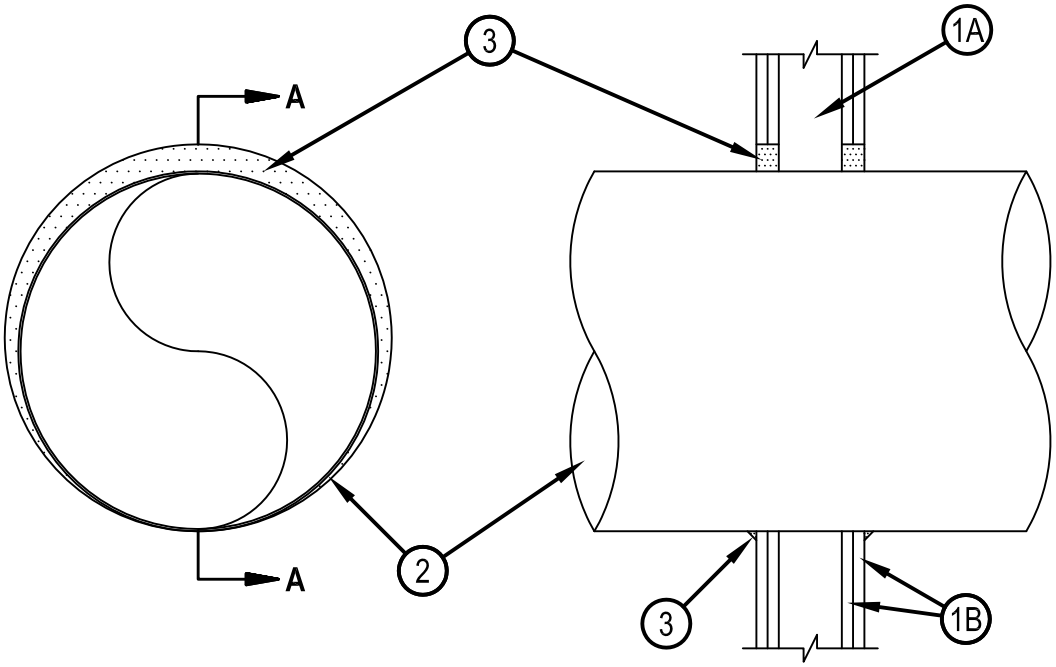
SECTION A-A

1. Wall Assembly — The 1, 2 or 3 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide for 1 and 2 hr F and FH rating and 3-1/2 in. (89 mm) wide for 3 hr F and FH rating and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — Min 5/8 in. (16 mm) thick with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening is 18-5/8 in. (473 mm). The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.
2. Through Penetrants — One metallic pipe or tubing to be installed within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. Steel Pipe — Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. Iron Pipe — Nom 12 in. (305 mm) diam (or smaller) cast or ductile iron pipe.
   C. Copper Tubing — Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing. When the hourly F or FH Rating of the firestop system is 3 hr, the nom diam of copper tube shall not exceed 4 in. (102 mm).
   D. Copper Pipe — Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe. When the hourly F or FH Rating of the firestop system is 3 hr, the nom diam of copper pipe shall not exceed 4 in. (102 mm).

System No. W-L-5029

3. Pipe Covering* — Nom 1, 1-1/2 or 2 in. (25, 38 or 51 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. For 1 and 2 hr F and FH Ratings, the annular space between insulated penetrant and periphery of opening shall be min 0 in. (point contact) to max 1-7/8 in. (48 mm). For 3 hr F and FH Ratings, the annular space shall be min 0 in. (point contact) to max 1-1/4 in. (32 mm).
   See Pipe and Equipment Covering — Materials (BRGU) category in the Building Material Directory for the names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
   The hourly T, FT, FTH Ratings of the firestop system are 1/2 hr for 1 hr rated walls and 1 hr for 2 hr rated walls. For 3 hr rated walls, the hourly T, FT and FTH Ratings when steel and iron pipes are used are 1 hr. For 3 hr rated walls, the hourly T, FT and FTH Ratings when copper penetrants are used are 1-1/4 hr for 2 in. (51 mm) thick pipe covering and 0 hr for pipe covering thickness less than 2 in. (51 mm).

3A. Pipe Covering* — (Not Shown) — As an alternate to Item 3, max 2 in. (51 mm) thick cylindrical calcium silicate (min 14 pcf) units sized to the outside diam of the pipe or tube may be used. Pipe insulation secured with stainless steel bands or min 18 AWG stainless steel wire spaced max 12 in. (305 mm) OC. When the alternate pipe covering is used, the T and FT Rating shall be as specified in item 3 above.
   See Pipe and Equipment Covering — Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.



4. Fill, Void or Cavity Material* — Sealant — For 1 and 2 hr F and FH Rating, min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. For 3 hr F and FH Rating, min 1 in. (25 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. At the point contact location between pipe covering and gypsum board, a min 1/2 in. (13 mm) diam bead of fill material shall be applied at the pipe covering/gypsum board interface on both surfaces of wall.
   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-One Sealant or FS-ONE MAX Intumescent Sealant

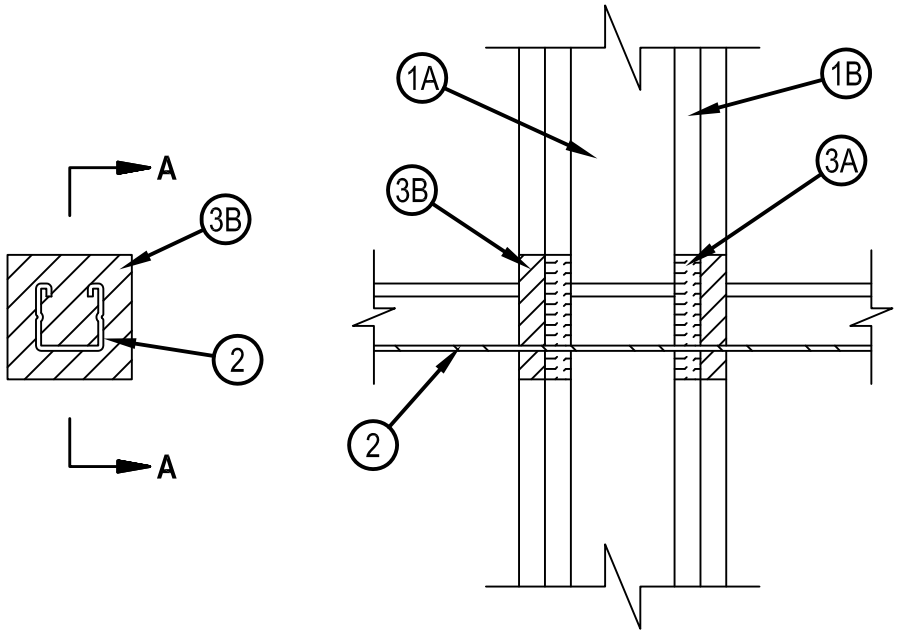
SECTION A-A

1. Wall Assembly — The 1 or 2 hr fire rated wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features.
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced 24 in. (610 mm) OC.
   B. Gypsum Board* — For 1 hr assembly, one layer of min 5/8 in. (16 mm) thick wallboard as required in the individual Wall and Partition Design. For 2 hr assembly, two layers of min 5/8 in. (16 mm) thick wallboard as required in the individual Wall and Partition Design. Max diam of opening is 14-1/2 in. (368 mm) for wood stud walls and 21-3/4 in. (552 mm) for steel stud walls.

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.
2. Through Penetrant — Galv steel duct to be installed concentrically or eccentrically within the firestop system. The annular space between the duct and periphery of opening shall be 0 in. (0 mm, point contact) and max 1-1/2 in. (64 mm) Duct to be rigidly supported on both sides of wall assembly.
   A. Spiral Wound HVAC Duct — Nom 20 in. (502 mm) diam (or smaller) No. 24 MSG (or heavier) galv steel spriral wound duct.
   B. Sheet Metal Duct — Nom 12 in. (305 mm) diam (or smaller) No. 28 MSG (or heavier) galv sheet steel duct.
3. Fill, Void or Cavity Material*—Sealant — Min 5/8 in. (16 mm) and 1-1/4 in. (32 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly for 1 or 2 hr rated walls, respectively. At the point contact location between duct and wallboard, a min 1/2 in. (13 mm) diam bead of sealant shall be applied at the wallboard/duct interface on both surfaces of wall assembly.

   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — CP601S Elastomeric Firestop Sealant, FS-ONE Sealant, FS-ONE MAX Intumescent Sealant or CP606 Flexible Firestop Sealant



* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

SECTION A-A

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — One or two layers of gypsum board, as specified in the individual Wall and Partition Design. Max area of rectangular opening is 15 sq in. (96 cm2) with max dimension of 5 in. (127 mm). In lieu of rectangular opening max diam of circular opening is 3 in. (76 mm).

   The F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly.
2. Through Penetrants — One metallic strut, cable, rod or angle service support to be installed within the firestop system. An annular space of min 1/8 in. (3 mm) to max 7/8 in. (22 mm) is required within the firestop system. Strut, cable, rod or angle service support to be rigidly supported on both sides of floor or wall assembly. The strut, cable, rod or angle service support may be installed at an angle not greater than 45 degrees from the perpendicular. The following types and sizes of metallic strut, cable, rod or angle service support may be used:
   A. Steel Strut — Max 1-5/8 by 1-5/8 in. (41 by 41 mm) channel strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.
   B. Steel Strut — Max 3-1/4 by 1-5/8 in. (83 by 41 mm) H strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.
   C. Cable — Max 3/8 in. (9.5 mm) diam unjacketed galv steel cable.
   D. Threaded Rod — Max 1 in. (25 mm) diam galv steel threaded rod.
   E. Steel Angle — 2 by 2 by 1/8 in. (51 by 51 by 3 mm) thick steel angle.

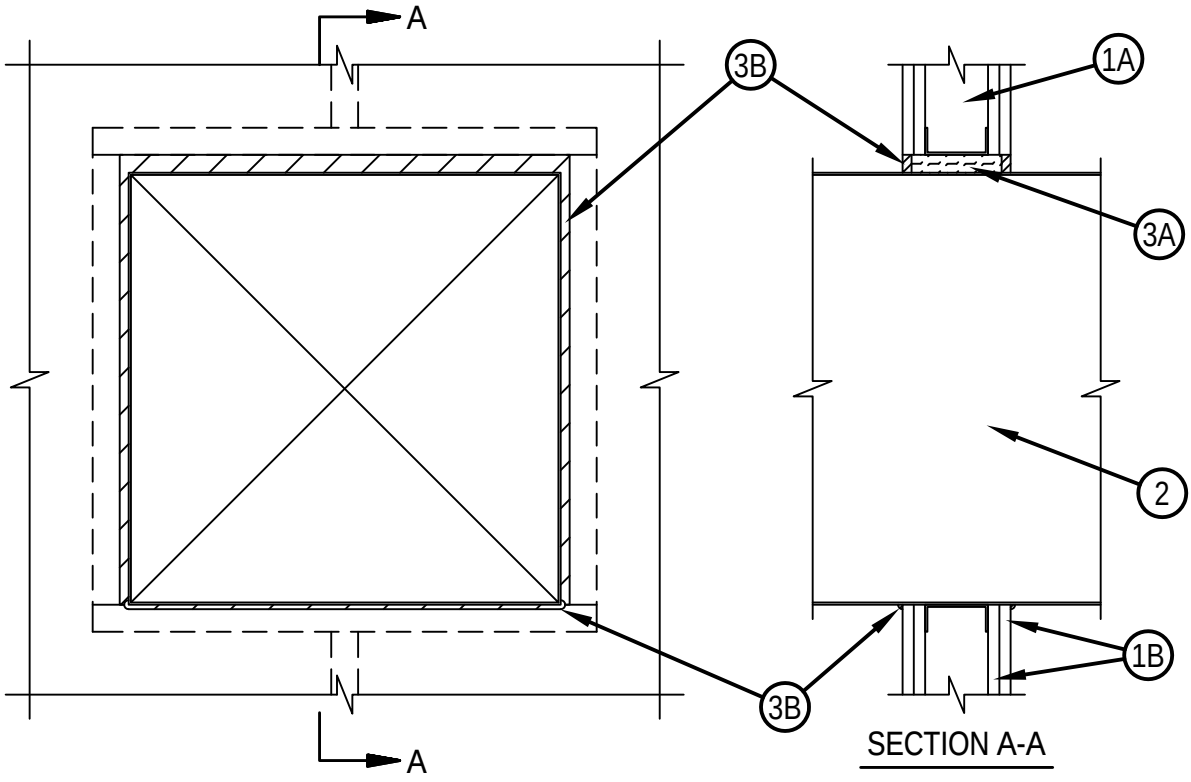
System No. W-L-7130

3. Firestop System — The firestop system shall consist of the following:

A. Packing Material — Min 1/2 in. (13 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be located between penetrant and periphery of opening, and within channels of struts. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material. When through penetrant is oriented perpendicular to wall or when Type FS-ONE Sealant (Item 3B) is used, packing material is optional.

B. Fill, Void or Cavity Material* - Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within the annulus and within the channel struts, flush with both surfaces of wall.



HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant, CP 606 Sealant or FS-ONE MAX Intumescent Sealant

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

F Ratings -- 1 and 2 Hr (See Items 1 and 2)
T Ratings -- 0 and 1/2 Hr (See Item 1)

SECTION A-A

1. Wall Assembly -- The 1 and 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs -- Wall framing shall consist of min. 3-1/2 in. (89 mm) wide steel channel studs and spaced max 24 in. (610 mm) OC. Additional 3-1/2 in. (89 mm) wide steel studs shall be used to completely frame opening.
   B. Gypsum Board -- One or two layers of 5/8 in. (16 mm) thick gypsum board as specified in the individual Wall and Partition Design. Max size of opening is 625 sq in. (4032 cm2) with a max dimension of 25 in. (635 mm).
   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T Rating of the firestop system is 1/2 hr for 2 hr fire rated walls and 0 hr for 1 hr fire rated walls.
2. Steel Duct -- Nom. 24 in. by 24 in. (610 by 610 mm) (or smaller) No. 24 gauge (or heavier) galv. steel duct to be installed within the firestop system. An annular space of min 1/2 in. (13 mm) to max 1 in. (25 mm) is required within the firestop system. As an option, for systems with a 2 hr F Rating only, the min annular space at the bottom of the duct may be 0 in. (point contact) for 2 hr rated assemblies only. Steel duct to be rigidly supported on both sides of wall assembly
3. Firestop System -- The firestop system shall consist of the following:
   A. Packing Material -- Min 3-3/4 in. (95 mm) or 5 in. (127 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed into opening as a permanent form for 1 and 2 hr rated assemblies, respectively. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.
   B. Fill Void or Cavity Materials* - Sealant -- Min 1/2 in. (13 mm) thickness of sealant applied within annulus, flush with both surfaces of wall assembly. Min 1/4 in. (6 mm) diam bead of sealant shall be applied at the duct/gypsum board interface at any point contact location, on both surfaces of wall assembly.

2. Steel Duct — Galv steel duct to be installed concentrically or eccentrically within the firestop system. Duct to be rigidly supported on both sides of wall assembly.
   A. Spiral Wound HVAC Duct — Nom 20 in. (508 mm) diam (or smaller) No. 24 MSG (or heavier) galv steel spriral wound duct.
   B. Sheet Metal Duct — Nom 12 in. (305 mm) diam (or smaller) No. 28 MSG (or heavier) galv sheet steel duct.
3. Duct Insulation* — Nom 1-1/2 in. (38 mm) thick glass fiber batt or blanket (min 3/4 pcf or 56 kg/m3) jacketed on the outside with a foil-scrim-kraft facing. Longitudinal and transverse joints sealed with aluminum foil tape. During the installation of the fill material, the batt or blanket shall be compressed 50% such that the annular space within the firestop system shall be min 1/4 in. (6 mm) to max 1 in. (25 mm). See Batts and Blankets - (BKNV) category in the Building Materials Directory for names of manufacturers. Any batt or blanket meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index 50 or less may be used.
4. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) or 1-1/4 in. (32 mm) thickness of fill material applied within annulus, flush with both surfaces of wall for 1 or 2 hr walls, respectively. If voids develop after the fill materials cures, the voids shall be sealed with additional fill material.

SECTION A-A

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing shall consist of min 3-1/2 in. (89 mm) wide steel channel studs spaced max 24 in. (610 mm) OC. Additional steel studs shall be used to completely frame the opening.
   B. Gypsum Board* — 5/8 in. (16 mm) thick, 4 ft (1.22 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max area of opening is 73.7 sq ft (6.85 m2) with a max dimension of 104 in. (2.64 m).

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.
2. Steel Duct — Max 100 in. by 100 in. (2.5 by 2.5 m) galv steel duct to be installed either concentrically or eccentrically within the firestop system. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. The space between the steel duct and periphery of opening shall be min 0 in. (point contact) to max 2 in. (51 mm). Steel duct to be rigidly supported on both sides of the wall assembly.

2A1. Through-Pentrating Product* — As an alterate to Item 2. Fiber cement with galvanized steel facing, 3/8 in.(10 mm) thick composite metallic duct, with a max cross-sectional area of 43.0 sq ft, (4 m2) and a max individual dimension of 78 3/4 in. (2 m). Duct to be installed either concentrically or eccentrically within the firestop system such that the annular space is min 0 in. (point contact) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of wall assembly. Refer to Ventilation Duct Assemblies in Vol. 2 of the Fire Resistance Directory.
DURASYSTEMS BARRIERS INC — Type DuraDuct HP.

2A2. Through-Pentrating Product* — As an alternate to Item 2. Fiber cement with galvanized steel facing, 1/4 in. (6 mm) thick, with a max cross-sectional area of 1764 sq in. (1.14 m2), and a max individual dimension of 42 in. (1067 mm). Duct to be installed either concentrically or eccentrically within the firestop system such that the annular space is min 0 in. (point contact) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of wall assembly and installed in accordance. Refer to Ventilation Duct Assemblies in Vol. 2 of the Fire Resistance Directory.
DURASYSTEMS BARRIERS INC — Type DuraDuct SD.

2A3. Through-Pentrating Product* — As an alternate to Item 2. Galvanized steel faced duct panel, with a max cross-sectional area of 2450 sq in. (1.58 m2), and a max individual dimension of 49-1/2 in. (1258 mm) Duct to be installed either concentrically or eccentrically within the firestop system such that the annular space is min 0 in. (point contact) to max 2 in. (51 mm). Duct to be rigidly supported on both sides wall assembly. Refer to Ventilation Duct Assemblies in Vol. 2 of the Fire Resistance Directory.
DURASYSTEMS BARRIERS INC — Type DuraDuct GNX.

3 Firestop System — The firestop system shall consist of the following:

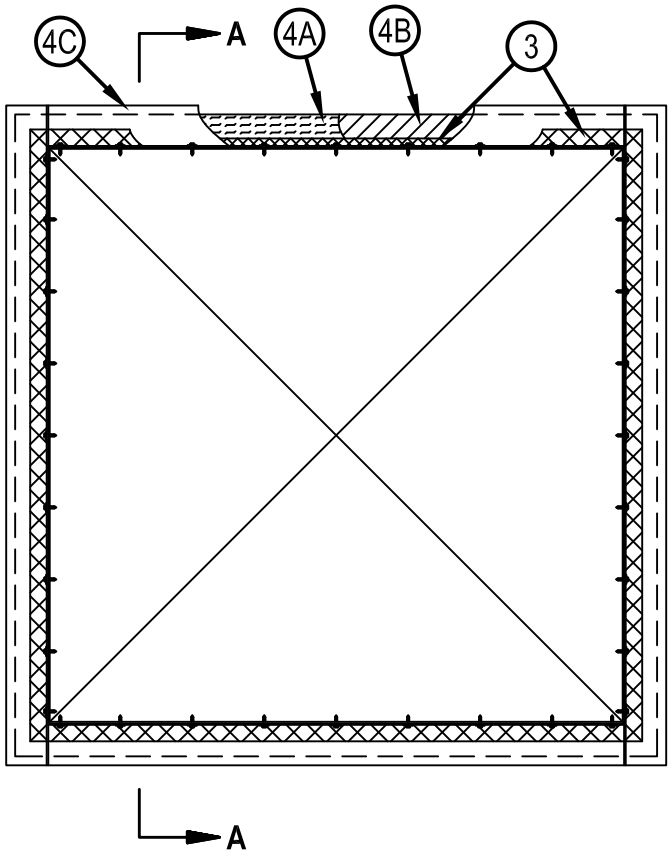
A. Packing Material — (Optional, Not Shown) — Polyethylene backer rod, mineral wool batt insulation or fiberglass batt insulation friction fitted into annular space. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.

A1. Packing Material — Required as specified in Table below. Min 3-3/4 in. (95 mm) or 5 in. (127 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed into opening as a permanent form for 1 and 2 hr rated assemblies, respectively. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.

B. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of fill material shall be applied at the point contact location between the steel duct and the gypsum board.
HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — CFS-S SIL GG Sealant, FS-ONE Sealant, FS-ONE MAX Intumescent Sealant or CP606 Flexible Firestop Sealant

C. Steel Retaining Angles — Min No. 16 gauge galv steel angles sized to lap steel duct a min of 2 in. (51 mm) and to lap wall surfaces a min of 1 in. (25 mm). When max duct dimension does not exceed 48 in. (122 cm) and duct area does not exceed 1300 in2 (8387 cm2), angles may be min No. 18 gauge galv steel. Angles attached to steel duct on both sides of wall with min No. 10 by 1/2 in. (13 mm) long steel sheet metal screws located a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC. Steel angles are optional for those sides of duct that do not exceed the dimension specified in Table below, dependent on packing material, sealant and annular space as specified.

Max Duct Dimension	Duct Thickness	Annular Space	Packing Material	Angle (Item 3C) Required
24 in. (610 mm)	24 ga or heavier	1/2 in. min to 1 in. max (13 to 25 mm)	Item 3A1	No



* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing shall consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.
   B. Gypsum Board* — Min 5/8 in. (16 mm) thick, 4 ft (1.2 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual Wall and Partition Design. Max size of opening is 210 sq in. (1355 cm2) with a max width of 14-1/2 in. (368 mm) for wood studs. Max size of opening is 76.2 sq ft. (7 m2) with a max width of 105-1/2 in. (2.7 m) for steel studs.

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall in which it is installed.
2. Steel Duct — Max 100 by 100 in. (2.5 by 2.5 m) steel duct to be installed within the framed opening. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. Steel duct to be rigidly supported on both sides of wall assembly.

System No. W-L-7156

3. Batts and Blankets* — Nom 1-1/2 or 2 in. (38 or 51 mm) thick glass fiber batt or blanket (min 3/4 pcf or 12 kg/m3) jacketed on the outside with a foil-scrim-kraft facing. Longitudinal and transverse joints sealed with aluminum foil tape. During the installation of the fill material, the batt or blanket shall be compressed minimum 50% such that the annular space within the firestop system shall be min 1/2 in. (13 mm) to max 2 in. (51 mm).

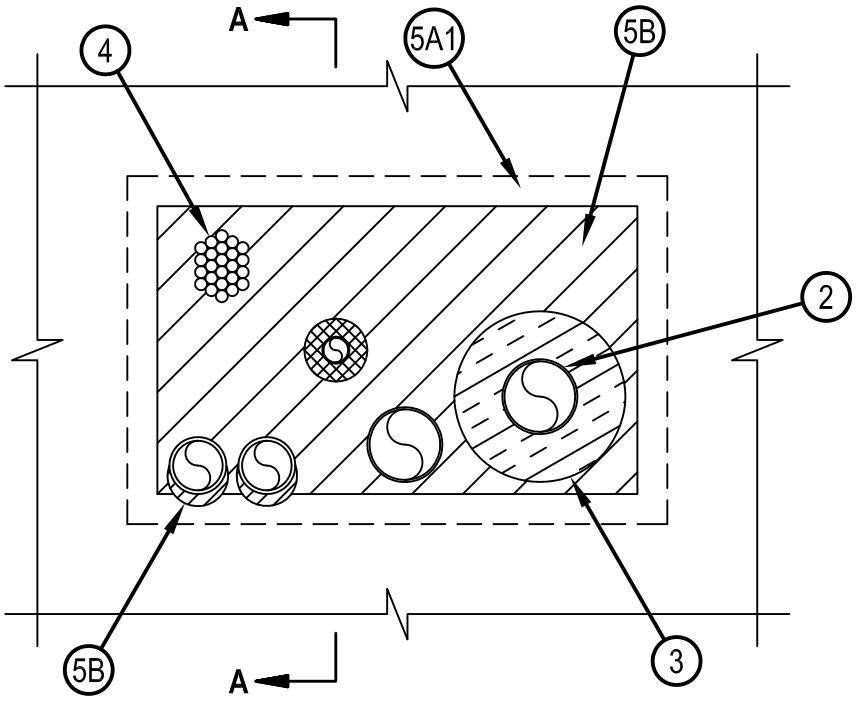
   See Batts and Blankets (BKNV) category in the Building Materials Directory for names of manufacturers. Any batt or blanket meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index 50 or less may be used.

4. Firestop System — The firestop system shall consist of the following:

   A. Packing Material — Min 3-5/8 (92 mm) or 4-7/8 in. (124 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed into opening as a permanent form for 1 or 2 hr fire-rated walls, respectively. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.

   B. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall. HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant

   C. Steel Retaining Angles — Min No. 16 gauge (0.059 in. or 1.5 mm) galv steel angles sized to lap steel duct a min of 2 in. 51 mm) and lap wall surfaces a min of 1 in. (25 mm). Angles attached to steel duct on both sides of wall with min No. 10 steel sheet metal screws spaced a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC. When max duct dimension does not exceed 48 in. (122 cm) and duct area does not exceed 1300 in2 (8387 cm2), angles may be min No. 18 gauge galv steel. Angles attached to steel duct on both sides of wall with min No. 10 by 1/2 in. (13 mm) long steel sheet metal screws located a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC. When max 1-1/2 in. (38 mm) thick insulation is used, steel angles are optional for those sides of duct that do not exceed the dimension specified in Table below, dependent on packing material and annular space as specified.



Max Duct Dimension	Duct Thickness	Annular Space	Packing Material	Angle (Item 3C) Required
24 in. (610 mm)	24 ga or heavier	1/2 in. min to 1 in. max (13 to 25 mm)	Item 3A1	No

A-A

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. Wall Assembly — The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood studs or channel shaped steel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — 5/8 in. (16 mm) thick with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300, U400 or V400 Wall and Partition Design. If the through penetrants are installed in a wood stud/gypsum board assembly, the max area of square, rectangular, or circular opening is 210 sq in. (1355 cm2). with max dimension of 14-1/2 in. (368 mm). If the through penetrants are installed in a steel stud/gypsum board assembly, max area of square, rectangular, or circular opening is 240 sq in. (1548 cm2) with max dimension of 20 in. (508 mm) wide.
   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.

January 28, 2015

System No. W-L-8079

2. Through-Penetrant — One or more pipes, conduit or tubes to be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces and the spacing between the through penetrants are maintained. The separation between the penetrants shall be min 1 in. (25 mm) to max 22 in. (560mm). The annular space between penetrants and the periphery of opening shall be min 0 in. (0 mm, point contact) to max 22 in. (560 mm). Pipes, conduit or tubes to be rigidly supported on both sides of wall assembly. The following types and sizes of pipes, conduit or tubes may be used.
   A. Copper Tubing — Nom 3 in. (76 mm) diam (or smaller) Type L (or heavier) copper tube.
   B. Copper Pipe — Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.
   C. Steel Pipe — Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   D. Iron Pipe — Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   E. Conduit — Nom 3 in. (76 mm) diam (or smaller) electric metallic tubing (EMT) or rigid steel conduit.
   F. Polyvinyl Chloride (PVC) Pipe — Nom 2 in. (51 mm) diam (or smaller) Schedule 40 cellular or solid core PVC pipe for use in closed (process or supply) or vented (drain, waste, or vent) piping systems.
   G. Chlorinated Polyvinyl Chloride (CPVC) Pipe — Nom 2 in. (51 mm) diam (or smaller) SDR 13.5 CPVC pipe for use in closed (process or supply) piping systems.
   The T, FT and FTH Ratings are 0 Hr if bare pipe and tubing is used.
3. Pipe Insulation — One or more metallic penetrants (pipe or tubing) may be insulated with the following types of pipe coverings:
   A. Pipe Covering* — Min 1 in. (25 mm) to max 2 in. (51 mm) thick hollow cylindrical heavy density min 3.5 pcf (56 kg/m3) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.
   See Pipe and Equipment Covering - Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
   B. Tube Insulation-Plastics+ — Min 1/2 in. (13 mm) to max 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.
   See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.
   The annular space between the insulated penetrants and the periphery of the opening shall be min 0 in. (0 mm, point contact) The separation between the insulated penetrants and the other penetrants shall be a min 1 in. (25 mm).
   The T, FT and FTH Ratings are 1-1/2 hour if Item 3B is used. The T, FT and FTH Ratings are 2 hr if Item 3A is used.

System No. W-L-8079

4. Cables — One max 3 in. (76 mm) diam bundle of cables installed within the opening and rigidly supported on both surfaces of wall. The annular space between the tightly-bundled cables and the periphery of the opening shall be min 0 in. (0 mm, point contact) to max 22 in. (560 mm). The separation between the cable bundle and the other penetrants shall be min 1 in. (25 mm) to max 22 in. (560 mm). Any combination of the following types and sizes of cables may be used:

A. Max 25 pair No. 24 AWG telephone cable with polyvinyl chloride (PVC) insulation and jacket.

B. Max 7/C No. 12 AWG copper conductor power and control cable with PVC or cross-linked polyethylene (XLPE) insulation and PVC jacket.

C. Multiple fiber optical communication cable jacketed with PVC and having a max outside diam of 1/2 in. (13 mm).

D. Max 3/C No. 8 AWG with bare aluminum ground, PVC insulated steel Metal-Clad+ Cable currently Classified under the Through Penetrating Product* (XHLY) category.

E. Max 3/C (with ground) No. 8 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.

F RG/U coaxial cable with polyethylene (PE) insulation and polyvinyl chloride (PVC) jacket having a max outside diam of 1/2 in. (13 mm).

G Max 3/4 in. (19 mm) diam copper ground cable with or without PVC jacket.

H Max 1-1/4in. (32 mm) Diam single or multi conductor mineral-insulated copper-clad cable.

The T, FT and FTH Ratings are 1/4 hr if cables D, G and H are used. The T, FT and FTH Ratings are 3/4 Hr for any other combination.

4A. Through Penetrants — (Not shown) - Max six nom 1 in. (25 mm) diam (or smaller) flexible steel conduits to be installed either concentrically or eccentrically within the firestop system. The annular space between the conduits and the periphery of the opening shall be min 0 in. (point contact) to a max 3 in. (76 mm). Conduits to be rigidly supported on both sides of wall.

4B. Through Penetrants — (Not Shown) - Max twelve nom 3/8 in. (10 mm) diam (or smaller) polyvinyl chloride (PVC) pneumatic tubing for use in closed (process or supply) piping systems. Tubing to be installed either concentrically or eccentrically within the firestop system. The annular space between the tubing and the periphery of the opening shall be min 0 in. (point contact) to a max 1 in. (25 mm). Tubing to be rigidly supported on both sides of wall.

5 Firestop System — The firestop system shall consist of the following:

A. Packing Material — In 2 hr fire rated wall assemblies, min 4-3/4 in. (121 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed into opening as a permanent form. In 1 hr fire rated wall assemblies, min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material recessed from both surfaces of the wall to accommodate the required thickness of fill material.

A1. Packing Material — Min 1-1/4 in. (32 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation firmly packed as a backer around the perimeter of opening as a permanent form.

B. Fill, Void or Cavity Material* — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall. At the point contact location between through penetrants and gypsum board, a min 1/2 in. (13 mm) diam bead of fill material shall be applied at the gypsum board/through penetrant interface on both surfaces of wall.

HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — FS-ONE Sealant or FS-ONE MAX Intumescent Sealant

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

+ Bearing the UL Listing Mark

Bearing the UL Recognized Component Mark

1. SCOPE

1.1 This guide outlines methods, equipment and materials applicable for cleaning architecturally finished aluminum after construction and for subsequent periodic maintenance.

1.2 The methods outlined herein are intended for use on anodized or painted architectural products whether rolled or extruded shapes, including window and door frames, store fronts and entrances, curtain walls, mullions, columns, panels, hand rails, flag poles and hardware.

1.3 Types of architectural finishes are: anodic coatings, thermoplastic and thermosetting organic coatings.

2. PURPOSE

This information is intended as a guide for architects, owners, building managers, contractors and others in the building industry who are interested in the proper care and maintenance of finished architectural aluminum. Herein are described safe, practical methods for cleaning, maintenance and protection of finished architectural aluminum.

3. GENERAL

3.1 Anodized Aluminum: As with any finished building material, anodized aluminum requires reasonable care prior to and during installation and periodic cleaning and maintenance after installation. Although anodized aluminum possesses exceptional resistance to corrosion, discoloration and wear, its natural beauty can be marred by harsh chemicals, rough conditions or neglect. Such conditions usually affect only the surface finish and do not reduce the service life of the aluminum. However, the marks resulting from such mistreatment may be permanent. For example, mortar, cement and other alkaline materials will quickly corrode anodic coatings if allowed to dry on the metal surface.

3.2 Painted Aluminum: Organic coatings on aluminum do not normally show an appreciable amount of dirt collection. In many atmospheres dirt or soil would not indicate a detrimental risk to the coating, but cleaning and surface care may be desirable for the sake of appearance. Cleaning may become desirable in areas where heavy industrial deposits have dulled the surface, where materials from construction processes have soiled the surface or where cleaner run-down from other surfaces should be removed.

3.3 Both painted and anodized surfaces, exposed to the atmosphere, collect soil and dirt, the amount of which may vary depending on geographic area, environmental conditions, finish and location on the building. Local atmospheric conditions as well as building location within a geographical area quite naturally have an effect on cleanliness.

More frequent cleaning will be required in heavy industrialized areas compared to rural areas. Seasonal rainfall can affect washing frequency by removing water soluble deposits and less adherent soil. In foggy coastal regions, frequent cycles of condensation and drying can create a heavy build-up of atmospheric salts and dirt which may adhere tenaciously. In climates where rainfall is low, the opportunity for atmospheric washing of the surface is minimal. Los Angeles, for example, has a unique combination of limited rainfall, temperature fluctuation, smog and condensation. This situation requires that cleaning be done more frequently than in other metropolitan areas where rainfall is more frequent.

In both wet and dry climates, recessed and sheltered areas usually become more heavily soiled because of the lack of rain washing. Frequent and longer periods of condensation also occur in protected areas increasing the adhesion of the soil. This is particularly true of soffit areas on some overhangs, bottom areas of fascia panels, sheltered column covers and the like. Periodic maintenance inhibits long-term accumulation of soil which, under certain conditions, can accelerate weathering of the finish. The more frequently aluminum is cleaned, the easier and less costly succeeding maintenance is. It is recommended the finish supplier be consulted for proper cleaning schedule.

3.4 In any case, the aluminum cleaning schedule be integrated with other cleaning schedules for efficiency and economy. For example, both the glass and the aluminum curtain wall on the same building can be cleaned at the same time. If automatic wall cleaning equipment is to be used on a building, a test should be made early in equipment design to insure that the cleaning solutions, brushes, as well as the frequency of cleaning have no detrimental effect on the coating.

4. CLEANING PROCEDURES AND CARE AFTER INSTALLATION

Construction soils, including concrete or mortar, etc., should be removed as soon as possible. The exact procedure for cleaning will vary depending on the nature and degree of soil. When selecting a method of cleaning and type of cleaner, consideration should be given to all other materials that may be adversely affected by the wash of the cleaning process. Try to restrict cleaning to mild weather. Cleaning should be done on the shaded side of the building or ideally on a mild, cloudy day.

4.1 REMOVAL OF LIGHT SURFACE SOIL ON ORGANIC AND ANODIC COATINGS

Removal of light surface soil may be accomplished by alternative methods as described in 4.1.1, 4.1.2, 4.1.3 and 4.1.4. Only trial and error testing employing progressively stronger cleaning procedures can determine which will be most effective. Begin the cleaning process at the top of the building by rinsing an area the width of the stage or scaffolding to the ground level in continuous drop with forceful water spray. This should be done at the beginning and the end of each drop regardless of the final cleaning materials employed.

4.1.1 The simplest procedure is to flush the surface with water using moderate pressure to dislodge the soil. If soil is still adhering after drying, then a mild detergent will be necessary.

4.1.2 When mild detergent or mild soap is necessary for removal of soil, it should be used with brushing or sponging. The washing should be done with uniform pressure, cleaning first with a horizontal motion and then with a vertical motion. Apply cleaners only to an area that can be conveniently cleaned without changing position. The surface must be thoroughly rinsed with clean water. It may be necessary to sponge the surface while rinsing, particularly if cleaner is permitted to dry on the surface. The rinsed surface is permitted to air dry or is wiped dry with a chamois, squeegee or lint-free cloth.

4.1.3 Run-down of cleaner (from any operation) to the lower portions of the building should be minimized and these areas should be rinsed as soon as and as long as necessary to lessen streaking, etc., from unavoidable run-down, lower areas should be kept wet or flooded with water. Do not allow cleaning chemicals to collect on surfaces or to "puddle" on horizontal surfaces, crevices, etc. These should be flushed with water and dried. Always clean coated surfaces down from top to bottom and follow with a thorough rinsing with clean water. (With one-story or low elevation buildings, it is recommended to clean from bottom up and rinse from top down.)

4.1.4 Mild soaps or detergents ruled safe for bare hands should be safe for coated aluminum. Stronger detergents should be carefully spot tested and may necessitate rubber gloves, long handled brushes, etc. With any soap or detergent the finish should be thoroughly rinsed with clean water and dried. Some mild cleaning solutions, comprised of selected wetting agents in water solution, are available for automatic-building-washing machines. These machines would have built-in brush agitation, squeegee, filtration and re-circulation; in some, a fresh water connection may be provided.

4.2 REMOVAL OF MEDIUM TO HEAVY SURFACE SOIL ON ANODIC COATINGS

4.2.1 If surface soil still adheres after using procedures under 4.1, cleaning with the assistance of a cleaning pad can be employed. Hand scrub the metal surface using a palm-sized nylon cleaning pad. Thoroughly wet pad with clean water or a mild detergent cleaner or pumice powder. Start across the top and work down, rubbing the metal surface in the direction of the metal grain with uniform pressure. After scrubbing, the metal surface should be rinsed thoroughly with clean water to remove all residues. It may be necessary to sponge the surface while rinsing, particularly if the cleaner is permitted to dry on the surface. Solvents may be used to remove non-water soluble deposits. Extreme care must be exercised when solvents are used since they may damage organic sealants, gaskets and painted finishes. If solvents are used, rinse the surface completely with clean water and allow the surface to air dry or wipe dry with a chamois, squeegee or lint-free cloth.

CAUTION: These procedures must not be used on surfaces with a factory applied clear organic protective coating unless the clear coating has deteriorated and should be removed. Many organic solvents are flammable and/or toxic refer to MSDS for proper handling.

4.2.2 Use of power cleaning tools may be necessary for removal of unusually heavy soils from large areas including panels and column covers. In such cases an air-driven reciprocating machine fitted with abrasive pads can be employed. During this operation, the surface being cleaned must be continually wetted with clean water or mild detergent cleaning solution to provide lubrication and a medium for carrying away the dirt. The cleaning solution may be applied to the panels by sponging or brushing. Water may be applied in the same manner by spraying from a hose or by utilizing the water connection on the cleaning machine. The machine is moved over the metal by the operator with a sufficient number of overlapped passes to effect maximum cleaning. The direction of travel with the cleaning machine is dependent largely upon the geometric configuration of the surface being cleaned. However, when possible, the machine strokes should be made first in one direction and then in a direction perpendicular to the first; (e.g., horizontal passes followed by vertical passes). Areas which are not accessible with the machine must be manually cleaned as in paragraph 4.2.1.

After an area has been machined scrubbed, it must be rinsed with clean water and thoroughly scrubbed with a fairly stiff bristle brush. While still wet, a final water rinse without brushing completes this cleaning operation. The rinsed surface should be either permitted to air dry or wiped dry with a squeegee, chamois or lint-free cloth. It is important to promptly remove any cleaner rundown

from the uncleaned lower portions of the building to avoid staining.

4.3 REMOVAL OF MEDIUM TO HEAVY SURFACE SOIL ON ORGANIC COATINGS

4.3.1 A mild solvent such as mineral spirits may be used to remove grease, sealant or caulking compounds. Stronger solvent or solvent containing cleaners may have a deleterious or softening effect on paints. To prevent harm to the finish, these types of solvent or emulsion cleaners should be spot tested and preferably the coating manufacturer should be consulted. Care should be taken to assure that no marring of the surface is taking place in this manner since this could give an undesirable appearance at certain viewing angles. Cleaners of this type are usually applied with a clean cloth and removed with a cloth. Remaining residue should be washed with mild soap and rinsed with water. Use solvent cleaners sparingly.

4.3.1.1 It may be possible for solvents to extract materials from sealants which could stain the painted surface or could prove harmful to sealants; therefore, these possible effects must be considered. Test a small area first.

4.3.2 If cleaning of heavy surface soil has been postponed or in the cases of an especially tenacious soil, stubborn stains, etc., a more aggressive cleaner and technique may be required. Cleaner and technique should be matched to the soil and the painted finish. Some local manual cleaning may be needed at this point. Always follow the recommendations of the cleaner manufacturer as to proper cleaner and concentration. Test clean a small area first. Cleaners should not be used indiscriminately. Do not use excessive, abrasive rubbing as such may alter surface texture or may impart a "shine" to the surface.

4.3.2.1 Concrete spillage that has dried on the painted surface may become quite stubborn to remove. Special cleaners and/or vigorous rubbing with non-abrasive brushes or plastic scrapers may be necessary. Diluted solutions of Muriatic Acid (under 10%) may be effective in removing dried concrete stains, however, a test area should be tried first. Proper handling precautions must be exercised for safety reasons. Also, effective proprietary cleaners for concrete and mortar staining are available.

4.3.3 Never mix cleaners together. The mixing of cleaners may not only be ineffective, but also very dangerous. For example, mixing of chlorine containing materials such as bleaches, with other cleaning compounds containing ammonia, can result in poison gas emission.

4.3.4 Always rinse after removal of any surface soil.

4.4 INSPECTION

It is suggested that the building owner provide an engineer or representative to inspect the cleaning work to ensure satisfactory clean appearance of the building.

4.4.1 Metal seams, crevices, sills and any other area that may trap water, cleaner or dirt must be cleaned and thoroughly dried. These "trap" areas must be hand-wiped with absorbent towels or cloths to prevent rundown streaks or "puddling" which will later cause discoloration.

4.4.2 Inspect metal surfaces for any discoloration or stains not removed during cleaning operations. Soil or discoloration's still remaining should be manually cleaned in accordance with sections 4.1, 4.2 and 4.3 until a satisfactory appearance is achieved. Stubborn surface soils should be scrubbed in a uniform direction using a nylon cleaning pad and cleaner solution.

5. CLEANING PRECAUTIONS

Here's a common sense summary of cleaning recommendations for architectural aluminum finishes.

5.1 Correctly identify the aluminum finish to be cleaned when selecting an appropriate cleaning method. Check specifications and/or "as-built" drawings if in doubt as to the finish.

5.2 Never use aggressive alkaline or acid cleaners on aluminum finishes. Do not use cleaners containing trisodium phosphate, phosphoric acid, hydrochloric acid, hydrofluoric acid, fluorides, or similar compounds on anodized aluminum surfaces. Strong solvents or abrasive cleaners can cause damage to painted surfaces. Always follow the cleaner manufacturer's recommendations as to the proper cleaner and concentration. Test-clean a small area first. Different cleaners should not be mixed.

5.3 It is preferable to clean the metal when shaded. Do not attempt to clean hot, sun-heated surfaces since possible chemical reactions on hot metal surfaces will be highly accelerated and non-uniform. Also, avoid cleaning in freezing temperatures or when metal temperatures are sufficiently cold to cause condensation. Surfaces cleaned under these adverse conditions can become so streaked or tainted that they cannot be restored to their original appearance.

5.4 Apply the cleaning solution only to an area that can be conveniently cleaned without changing position. Thoroughly rinse the surface with clean water before applying cleaner. Minimize cleaner rundown over the lower portions of the building and rinse such areas as soon as practical.

5.5 Strong cleaners should not be used on windows and

other building accessories where it is possible for the cleaner to come in contact with the aluminum. Solutions of water and mild detergents should be tried first. If an aggressive cleaner is required for some other component of the building, care must be taken to prevent the cleaner from contacting the aluminum finish.

Note: *Care should be taken to avoid over spray or run off of cleaner onto other buildings components such as glazing materials, weatherstripping sealants, etc.*

5.6 Do not use excessive abrasive rubbing to remove stubborn stains. Such procedures can produce an undesirable appearance or adversely affect the finish.

5.7 The type and frequency of cleaning and coating will vary with the amount of atmospheric soil and dirt accumulated on the surfaces and the owners desires regarding appearance. Periodic re-application and wipe-on surface protectants will assist in maintaining the appearance and reduce the cleaning required.

DOW CORNING

April 23, 2015

ATTN: Dow Corning Customers

RE: **Cleaning and maintenance of Dow Corning® Construction Sealants**

In response to your request regarding sealant maintenance and cleaning procedures for silicones, Dow Corning offers the following comments.

Silicones have been used in your quality building project because of their stable properties regardless of environmental conditions. Therefore, cured silicone sealants in weatherproofing joints or remedial repair joints do not require cleaning in order to functionally perform as a weatherseal. However, the joints may become dirty and it is desired by a building owner to clean them for aesthetic reasons. This can be accomplished during regular building washing that may occur annually; or it could be a scheduled maintenance event specific to cleaning the sealant. How often this is required is a decision for the building owner, and will be influenced by building location and the environment around the building. In general, Dow Corning would recommend an annual cleaning procedure if desired to maintain peak aesthetic appearance.

A mild detergent and water solution will remove any dirt and most rundown materials from the sealant or 123 strip. Examples of detergents could include, but not be limited to: Simple Green and TSP, which are commonly available at hardware stores. A solution using a mild detergent and water could be sprayed on the joint if the building were being pressure washed anyway, and then the dirt from the surface can either be sprayed away or brushed away with a soft bristle brush. Testing or a mock-up would assist in determining if a brush is necessary. Soft bristle brushes with yellow bristles, available at hardware stores, have been found to work well. Sometimes the label on the brush reads "acid brush." You could also choose to clean the joints individually; in which case the excess dirt and debris should be brushed away; then a detergent solution could be rubbed on; and then this solution should be wiped away with a clean rag. Again, the soft bristle brush could be used to loosen dirt which did not easily release.

In order to lessen the amount of materials required, it has also been found that the cleaning sponges that are pre-soaked with a detergent work well in cleaning stains from silicone surfaces. Examples are the "Mr. Clean" pre soaked sponges. It would still be recommended to remove any excess dirt or debris from the sealant surface first; then if there are spots remaining, the pre-soaked sponges can be used at those areas to further clean the surface.

If the sealant is cleaned using pressure washing during a full building cleaning, Dow Corning recommends that a mock – up area be tested in order to determine the psi required that will clean the sealant or Dow Corning® 123 Silicone Seal without damaging it. Dow Corning warranties do not cover damage caused by water spray. Sealant joints and designs are unique to each building project, so the best way to proceed with pressure washing is to test small areas prior to cleaning the entire building. A starting point would be 1500 psi, fan blade, and a distance of 6-8" from the joint. Wheels from swing stages are not recommended to ride on the Dow Corning® 123 Silicone Seal. Please use caution when wheels need to run over a strip of Dow Corning® 123 Silicone Seal, which will occur, but attempts should be made to move the wheels away from the building at those points.

Please feel free to contact us should you have any concerns regarding weatherseal maintenance.

Handling and Care Instruction for your Mirror

Read Carefully
Important

- The best and safest cleaner for a mirror is clean, warm water used with a soft, clean cloth. Be careful not to allow the edges of the mirror to get or remain wet over a period of time.
- Do not use any acid or alkali cleaners for mirror cleanup after installation. They can attack the surface and edges as well as the backing of the mirror. And never use an abrasive cleaner on any mirror surface.
- You may also use a standard brand of glass or mirror cleaner that does not contain ammonia or vinegar.
- Remove surface marks or stubborn dirt with 0000 oil-free steel wool, not solvents. These could attack and damage the edges and backing.
- Never spray any cleaner directly onto a mirror. Instead, apply the cleaner to a soft cloth and then wipe the mirror.
- Always use a soft, clean, grit free cloth when cleaning a mirror to reduce scratching the surface.
- Be sure to dry all joint and edges to be certain no commercial cleaner comes in contact with the edge or backing.

Note: Good ventilation will keep mirror from "sweating" and creating condensing liquids which could be corrosive and damaging to mirrors.

Thank You for Your Business!

Special Conditions
Stains on Pre-Fixx protected vinyl wallcoverings can be cleaned by the following methods (Staining agents have been grouped to allow quick reference for cleaning instructions):

Cleaning Agents to Use:

1. Full Strength household cleaners (non-abrasive type) to be used with water and scrub brush
   409 All Purpose Cleaner
   Fantastic
   Butchers Sun Bath Cleaners
   Service Master's Wallglide Plus
   Other type household cleaners and bleaches
2. Solvent type cleaner to be used with scrub brush and cloth. For most effective cleaning, use 100% full strength with brush. Dry area with cloth.
   Rubbing Alcohol (IPA type)
   Service Master's Disaster Clean
   Mineral Spirits
   Kerosene
   Naptha (lighter fluid)
   Turpentine (paint thinner)
3. Strong active solvent cleaners such as nail polish remover (acetone/water) with scrub brush and cloth.

Co-Polymer
To clean co-polymer, dust it with a soft, damp cloth or chamois and wipe the surface gently. Use soap and lukewarm water to remove light dirt. After washing and rinsing, be sure to dry the surface by blotting with a damp cloth or chamois. If a cleaner must be used to remove heavier dirt, please try one of the following recommended cleaners:

- Top Job with Ammonia
- Fantastik
- Swish Detergent
- Spic & Span
- Mr. Clean
- Clagonite
- Johnson's Pledge
- Janitor in a Drum
- Cascade
- Joy Detergent
- Handy Andy
- All Detergent (Powder)
- Isopropanol (45%) – higher concentrations will dull the firm surface

Be careful to avoid getting cleaning solution on the fiberglass core. It is best to apply all cleaners to the cloth or chamois and not directly on the perforated co-polymer surface.

Painted Panels
G&S Acoustics' Painted Panels should be cleaned using the following methods:

- Use compressed air to lightly blow off any debris
- Use a dry cloth or soft bristle brush, such as a feather duster, to wipe away debris

Small Paint Repair Instructions
For small areas where paint is chipped, use a small brush and lightly touch-up the spot with paint supplied by G&S Acoustics.

Large Paint Repair Instructions
For large areas requiring new paint, spray the face of the panel only with new paint. Do not roll or brush on paint.

type cleaning preparations such as nail polish remover, tar and bug removers, etc., can be used with Pre-Fixx protected wallcoverings to remove residual stains that remain after cleaning with standard cleaning agents.

WARRANTY - HIGH PERFORMANCEPC

PRODUCT WARRANTY FOR CARPET WITH HIGH PERFORMANCEPC

Bentley Mills, Inc. broadloom carpet products with High PerformancePC backing are warranted by the manufacturer in accordance with the following terms and conditions:

10 YEARS – SURFACE WEAR, EDGE RAVEL, DELAMINATION, AND TUFT BIND

The manufacturer warrants for a period of 10 years from the date of invoice that the carpet products will not suffer excessive surface wear, edge ravel, delamination from primary backing, or tuft pull problems under ordinary indoor commercial use in direct-glue applications. Excessive surface wear means loss of more than 10 percent by weight of face fiber as a result of abrasion.

MATERIALS AND WORKMANSHIP

The manufacturer warrants for a period of two years from the date of invoice that the performance of the carpet products will not be adversely affected by defects in the materials or workmanship used in manufacture.

STATIC DISCHARGE

The manufacturer warrants for a period of 10 years from the date of invoice that the carpet products will not generate static discharges exceeding 3.5 kV at 70 degrees Fahrenheit and 20 percent relative humidity, using test method AATCC 134, Electrostatic Propensity of Carpets, step.

RADIANT PANEL

The manufacturer warrants that the carpet products as sold have a Critical Radiant Flux of 0.45 W/cm2 (Class I) or better using test method ASTM E 648, Critical Radiant Flux of Floor Covering.

SMOKE DENSITY

The manufacturer warrants that the carpet products as sold have a measure of 450 or less using test method ASTM E 662, Specific Optical Density of Smoke, flaming.

REMEDY, LIMITATIONS, AND EXCLUSIONS

If a carpet product fails to meet this warranty, the manufacturer will correct the affected areas either by repair or (at its option) replacement with comparable product(s) at no charge. If the manufacturer determines that repair or replacement is not reasonably feasible, the manufacturer will refund that portion of the product purchase price allocable to the affected areas; provided that any refund on a claim made more than two years after the date of invoice will be prorated to reflect beneficial use prior to the claim. This is the exclusive remedy for claims related to the carpet products. The manufacturer's liability is limited to repair, replacement or refund as stated herein and, for example, does not include costs associated with moving furniture, partitions, fixtures, or equipment as necessary to allow repair or replacement.

©2013 Bentley Mills, Inc.

WARRANTY - HIGH PERFORMANCEPC

This warranty does not cover tears, burns, cuts, pulls or other damage, deterioration, problems or loss caused by abuse, misuse, neglect, improper maintenance, improper installation (including without limitation failure to use direct-glue), flood/excessive moisture, stairs and associated landings, or use of footgear with cleats, spikes, skates, blades or similar projections. Failure to comply strictly with Bentley's installation and maintenance instructions and recommendations shall void warranty coverage for all affected carpet products. Pooling, shading, watermarking, pile reversal, pile crush, dye lot differences and soiling are not manufacturing defects and are not covered by this warranty. Problems arising from use of non-approved adhesives will void warranty coverage. Coverage under this warranty is conditioned upon buyer promptly notifying Bentley of the warranty claim in writing within the applicable warranty period at the following address: Bentley Quality Claims Department, 14641 E. Don Julian Road, City of Industry, CA 91746.

THE WARRANTY, REMEDY, AND LIMITS OF LIABILITY CONTAINED HEREIN ARE EXPRESSLY IN LIEU OF AND EXCLUDE ALL OTHER WARRANTIES, REMEDIES, AND LIABILITIES, WHETHER EXPRESS OR IMPLIED. THE MANUFACTURER MAKES NO OTHER REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, AND HEREBY DISCLAIMS ANY AND ALL OTHER WARRANTIES THAT MAY ARISE BY OPERATION OF LAW, INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS OF ITS PRODUCTS FOR ANY PARTICULAR PURPOSES. THE MANUFACTURER WILL NOT BE LIABLE FOR ANY INCIDENTAL, INDIRECT, SPECIAL, OR CONSEQUENTIAL DAMAGES IN ANY CASE.

WARRANTY - AFIRMA™ HARDBACK TILE

PRODUCT WARRANTY FOR CARPET WITH AFIRMA HARDBACK TILE

Bentley Mills, Inc. carpet products made with AFIRMA Hard-Back Tile are warranted by the manufacturer in accordance with the following terms and conditions:

15 YEARS – SURFACE WEAR, EDGE RAVEL, DELAMINATION, TUFT BIND, AND MOISTURE RESISTANCE

The manufacturer warrants for a period of 15 years from the date of invoice that the carpet products will resist moisture penetration through the backing material and will not suffer excessive surface wear, edge ravel, delamination from primary backing, or tuft pull problems under ordinary indoor commercial use. Excessive surface wear means loss of more than 10 percent by weight of face fiber as a result of abrasion.

MATERIALS AND WORKMANSHIP

The manufacturer warrants for a period of two years from the date of invoice that the performance of the carpet products will not be adversely affected by defects in the materials or workmanship used in manufacture.

STATIC DISCHARGE

The manufacturer warrants for a period of 15 years from the date of invoice that the carpet products will not generate static discharges exceeding 3.5 kV at 70 degrees Fahrenheit and 20 percent relative humidity, using test method AATCC 134, Electrostatic Propensity of Carpets, step.

RADIANT PANEL

The manufacturer warrants that the carpet products as sold have a Critical Radiant Flux of 0.45 W/cm2 (Class I) or better using test method ASTM E 648, Critical Radiant Flux of Floor Covering.

SMOKE DENSITY

The manufacturer warrants that the carpet products as sold have a measure of 450 or less using test method ASTM E 662, Specific Optical Density of Smoke, flaming.

REMEDY, LIMITATIONS, AND EXCLUSIONS

If a carpet product fails to meet this warranty, the manufacturer will correct the affected areas either by repair or (at its option) replacement with comparable product(s) at no charge. If the manufacturer determines that repair or replacement is not reasonably feasible, the manufacturer will refund that portion of the product purchase price allocable to the affected areas; provided that any refund on a claim made more than two years after the date of invoice will be prorated to reflect beneficial use prior to the claim. This is the exclusive remedy for claims related to the carpet products. The manufacturer's liability is limited to repair, replacement, or refund as stated herein and, for example, does not include costs associated with moving furniture, partitions, fixtures, or equipment as necessary to allow repair or replacement.

WARRANTY - AFIRMA™ HARDBACK TILE

This warranty does not cover tears, burns, cuts, pulls or other damage, deterioration, problems or loss caused by abuse, misuse, neglect, improper maintenance, improper installation (including without limitation failure to use Bentley-recommended adhesive), flood/excessive moisture, or use of footgear with cleats, spikes, skates, blades or similar projections. Failure to comply strictly with Bentley's installation and maintenance instructions and recommendations shall void warranty coverage for all affected carpet products. Pooling, shading, watermarking, pile reversal, pile crush, dye lot differences, and soiling are not manufacturing defects and are not covered by this warranty. Problems arising from use of non-approved adhesives will void warranty coverage. Coverage under this warranty is conditioned upon buyer promptly notifying Bentley of the warranty claim in writing within the applicable warranty period at the following address: Bentley Quality Claims Department, 14641 E. Don Julian Road, City of Industry, CA 91746.

THE WARRANTY, REMEDY, AND LIMITS OF LIABILITY CONTAINED HEREIN ARE EXPRESSLY IN LIEU OF AND EXCLUDE ALL OTHER WARRANTIES, REMEDIES, AND LIABILITIES, WHETHER EXPRESS OR IMPLIED. THE MANUFACTURER MAKES NO OTHER REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, AND HEREBY DISCLAIMS ANY AND ALL OTHER WARRANTIES THAT MAY ARISE BY OPERATION OF LAW, INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS OF ITS PRODUCTS FOR ANY PARTICULAR PURPOSES. THE MANUFACTURER WILL NOT BE LIABLE FOR ANY INCIDENTAL, INDIRECT, SPECIAL, OR CONSEQUENTIAL DAMAGES IN ANY CASE.

MAINTENANCE **GUIDE**

EXCLUSIVE TO ALL BENTLEY PRODUCTS

Important note: This Maintenance Guide is written to include carpet made from both nylon and wool fiber. However, it is important to note that wool carpet is discussed in a separate section included within this guide. Please understand wool will be specifically included in instructions intended for wool. Otherwise, the instructions are for nylon carpet only. Some of the more aggressive techniques recommended as beneficial and necessary for nylon fiber, such as vacuuming with a beater bar and brush or pile lifting, can be damaging to wool.

THE RAMIFICATION OF SPECIFICATIONS

The best maintenance program cannot overcome inappropriate choices in colors, patterns, carpet density, backing system, yarn style (cut pile or loop), staple, or BCF fibers and yarn type will all have a significant impact on the performance of the carpet.

The carpet choice should not be made purely on aesthetics but rather on a wide range of criteria like foot traffic, wheel traffic, density of occupancy, type of soil exposure, traffic frequency, and the overall intended use of the area. One of the most important considerations is how you intend to maintain the carpet once it is installed.

For instance, light-to-medium blue carpet will show soiling more than other colors. Solid-color carpet will show traffic lanes and spots more than pattern carpets. Cut-pile carpet in traffic lanes will crush and matte faster than loop carpets. Bulk continuous filament yarn will out perform staple yarn.

Planning should include providing appropriate protection of the new carpet immediately following installation, especially when carpet installation is part of a larger construction or renovation project where other construction trades may be working on top of the new carpet.

The most critical decision of the carpet maintenance program will be WHO will maintain the carpet. 99% of the life of the carpet comes after it is installed. Choosing an in-house person or a company with certified commercial carpet cleaning technicians is crucial. The best products and best installation will not perform as intended if maintained inappropriately.

The goals for any good floor-maintenance program should include the following.

1. Keep the floors looking as close to new as possible.
2. Design a cleaning program that is safe and the least disruptive to the occupancy.
3. Increase indoor air quality.
4. Extent the useful life of the carpet.
5. Be as "GREEN" as possible in the overall maintenance program (energy, water, noise and if possible chemical)

WHY IS REGULAR, PLANNED CARPET MAINTENANCE IMPORTANT?

People spend about 90% of their time indoors. According to the EPA, the air inside facilities are two to five times more polluted than the air outside the buildings. Companies want to provide a healthy and pleasant work environment for their employees. Healthful work environments have been shown to improve employee attitudes and a reduction in sick days, which increase productivity by approximately 10%.

Carpet acts like a filter and can actually reduce air born pollutants including volatile organic compounds compared to hard-surface floors, provided that they are maintained properly. On the other hand, poorly maintained carpet can harbor bacteria and mold, which can cause an increase in indoor air pollution, allergies, breathing issues, foul odors, and productivity reduction.

©2013 Bentley Mills, Inc.

A COMPREHENSIVE MAINTENANCE PLAN

A regular routine of carpet maintenance helps prevent soil buildup that can damage carpet fiber, which, in turn, can cause color loss and loss of resiliency. A well-planned maintenance routine can maximize a carpet installation's useful life and forestall the need for replacement because of premature wear or because the carpet "uglies out."

Routine maintenance involves a planned approach of methodical daily care such as vacuuming and spot cleaning, in addition to periodic interim and restorative cleaning performed as soiling becomes apparent.

Excessive soiling, stubborn spots or spills may require different methods or combination of methods. Please keep in mind that when maintenance is neglected or performed at irregular intervals, carpet can deteriorate to a level that will be difficult or impossible to restore to its original luster and beauty—no matter what cleaning methods are used.

Persistent, thorough maintenance and daily-care routines will keep carpet looking its best, as well as enable carpet fiber to perform as intended. This planned approach to maintenance needs to begin immediately following installation.

For instance, when installation is performed in conjunction with other construction projects, the carpet must be protected with a covering such as re-enforced craft paper that allows the carpet to breathe as adhesives continue to cure. Plastic sheeting should be avoided as a means of carpet protection. Trapping adhesive off-gassing underneath plastic sheeting can cause permanent discoloration of new carpeting.

Properly trained technicians armed with the proper tools are essential to correctly performing the five key elements of any successful maintenance program.

Those five elements involve:

OUTSIDE YOUR FACILITY

- **Preventative Maintenance:**

Capturing or containing the soil before it reaches the building by regularly sweeping the parking lot, parking garage, and sidewalks and at the building entryways by using an adequate system of barrier mats at entrances. An adequate barrier system includes mats installed both inside and outside the building, as well as strategically placing mats at funnel areas where traffic loads become more concentrated or at specific highly trafficked interior areas.

A system of appropriate "scrape, scrub, and wipe" mats will remove up to 10 times more soil than carpet mats alone.

With an appropriate walk-off system the first five feet will remove approximately 37% of the soil, 10 feet 52%, 15 feet 71%, 20 feet 86% and 30 feet almost 100% of the exterior soil.

Another consideration:

Areas of the country where ice melts are used. There are different types of ice melts some are more difficult to remove than others, and the volume and frequency of use will have a big impact.

©2013 Bentley Mills, Inc.

Asphalts parking lots and driveways coated with inexpensive sealers may "walk off" and discolor all flooring including the carpet. Once the damage is done, it is permanent.

©2013 Bentley Mills, Inc.

INSIDE YOUR FACILITY

• **Vacuuming/Pile Lifting:**
Regular vacuuming is the single most important part of a maintenance program. It can cost between $500.00 and $700.00 a pound to remove soil from carpet, once inside the facility. If the soil is removed before it becomes attached to the carpet fiber through proper vacuuming, then the cost to remove it per pound is greatly reduced. A proper vacuuming program can remove about 80% of this soil making it the most cost-effective soil removal process.

Vacuuming is designed to remove dry soil before it becomes attached to the fiber. Pile lifting will enhance routine vacuuming as well as cleaning effectiveness. It should be added as part of the overall maintenance program. The more aggressive pile lifter will help remove more stubborn, embedded soil, as well as working more effectively to lift and separate fiber so that routine vacuuming is more effective.

• **Spot and Spill Removal:**
Promptly addressing spills is the key to prevent the spill from getting into the carpet backing and causing stubborn spots that are far more difficult to clean. Quickly addressing spills helps minimize the chance of that spill becoming a stubborn stain.

• **Interim Cleaning:**
Several different methods can be utilized. If used regularly, interim cleaning can prolong the need for restorative cleaning.

• **Restorative Cleaning:**
Deep cleaning is designed to remove trapped soils. Hot water extraction is the most effective method and the only restorative method recommended by Bentley.

IDENTIFYING SPECIFIC MAINTENANCE NEEDS

Just as various areas of an office or building are subject to different uses, each type of area demands a different level of maintenance and care. Heavy-traffic areas and areas where traffic is more concentrated, such as entrances and corridors, require more frequent vacuuming and cleaning. Areas around vending machines or kitchen areas and desks need daily attention to spills and stains. Some areas may require different types of equipment for effective maintenance or cleaning.

A comprehensive maintenance program should have a color-coded diagram of the building's floor space and furniture layout plan indicating appropriate cleaning frequency rates for vacuuming, spot cleaning, pile lifting, and interim and restorative cleaning, based on the nature and concentration of traffic flow.

©2013 Bentley Mills, Inc.

MAINTENANCE TECHNIQUES

The ideal maintenance program is designed to help prevent soil from reaching the carpet and to remove soil before it causes damage. Once soil becomes compacted, vacuuming becomes less effective and more aggressive pile lifting becomes necessary.

When soiling is allowed to build-up and become compacted deep within the fiber, the abrasive combination of heavy foot traffic and compacted soil can scratch and damage the best, most durable fiber, causing color and fiber loss. Deeply compacted soil will affect cut-pile fiber twist levels and cause fiber ends to splay outward, losing resiliency and causing matting.

Once neglect results in color or fiber twist loss, full restoration becomes impossible.

To keep carpet clean and looking as nearly new as possible, this ideal maintenance program should use a combination of methods and frequencies tailored to a facility's specific needs. Those needs should be evaluated by a trained maintenance professional and based on the specific nature of soiling, traffic load, and traffic concentrations.

For instance, the first floor of a building will have maintenance needs that vary significantly from those on the fifth floor. A restaurant or a busy retail outlet will have an even greater variation of maintenance needs.

Remember, poor maintenance can cut short carpet life and adversely affect its long term performance. Failing to adhere to these guidelines in a regular routine that includes interim maintenance as well as restorative cleaning can cause irreparable damage that falls outside warranty coverage.

PREVENTATIVE MAINTENANCE

Maintaining carpet appearance means more than choosing the right cleaning method. Selecting a suitable carpet color, style and construction for the application with careful consideration of traffic load and performance expectations is the best possible start for an effective maintenance program that emphasizes prevention.

Concrete sidewalks, parking lots, and hard-surface floors do very little to remove soil from the bottoms of shoes or from the wheels of rolling traffic.

Barrier mats are essential in keeping as much soil and moisture as possible from ever entering the building.

Outside mats are designed to scrape dirt and debris off shoes while interior mats are designed to remove smaller soil particles as well as help absorb moisture.

Interior barrier mats should extend a minimum of six feet inside the entrance. A planned system of barrier mats, which also requires regular maintenance, is an essential part of any sound maintenance program.

Mats can also be effective in other interior areas including elevators, food station areas, and at stair thresholds. Barrier matting should be maintained the same way as interior carpet with severe traffic as illustrated by the frequency chart in this document. Rubber-backed mats should never be placed on carpet or other rubber floors.

©2013 Bentley Mills, Inc.

VACUUM ESSENTIALS

There is no substitute for slow, methodical vacuuming performed at the appropriate frequency with an approved vacuum cleaner, at the appropriate speed of 1.8 feet per second, four passes total for high traffic areas, two north and south, and two east and west. For moderate traffic, two passes at the same speed. This step is not a race to see how fast the area can be vacuumed. When writing a vacuum spec it's not enough to give frequencies of certain areas you must specify the type of vacuum cleaner to use and the rate of production.

Effective daily vacuuming can help reduce the need for more rigorous methods to keep the carpet's clean appearance. Vacuuming removes soil while lifting carpet fiber. In addition to removing soil, the vacuum's lifting action enhances resiliency and helps the vacuum work more effectively on subsequent vacuuming.

THE RIGHT EQUIPMENT

Vacuums with horizontal cylindrical brushes should be used and set so that brushes are always in full contact with the carpet surface. Twin-motor vacuums with independent motors for dedicated to suction and brushing are preferred.

Vacuums with top-loading soil bags and HEPA filters to further contain dust are highly recommended.

Canister and backpack vacuums without motorized rotating brushes should be avoided, as well as riding sweepers with rotary brushes.

The Carpet and Rug Institute's Seal of Approval program grades a variety of maintenance equipment, including vacuum cleaners.

For a list of certified vacuums units, please visit:

http://www.carpet-rug.org/commercial-customers/cleaning-and-maintenance/seal-of-approval-products/index.cfm

Vacuum frequency should be determined by visual inspection and performed at least once daily.

Heavy-traffic areas such as lobbies, entryways, funnel areas, barrier mats, and areas in the direct path of weather influences may require more frequent vacuuming. Furthermore, such high use areas may require vacuuming more frequently than once a day. Keen attention to weather vulnerable areas will help prevent wet soil from being tracked throughout the building.

The proper technique for thorough vacuuming depends upon using slow, overlapping strokes and making sure that the entire carpet surface is covered. Strokes should be no longer than two to three feet in length to avoid unnecessary back strain for the operator.

PILE LIFTING

Pile lifting is an effective method for lifting crushed pile and loosening dry soil. Heavily trafficked cut-pile products need more frequent pile lifting than looped products. Pile lifting should always be used to precondition carpets for general cleaning. Pile lifting improves cleaning effectiveness. For best results, apply the pile-lifter machine against the lay of the pile.

©2013 Bentley Mills, Inc.

SPOT CLEANING

Daily removal of spots and spills helps maintain the carpet's appearance between scheduled cleaning. Immediate action against spots and spills also reduce the probability of a permanent stain. Spotting solutions should be selected as appropriate for the specific type of spot or spill.

Different chemistry should be selected for water-based and oil-based spills or spots. A different chemical will be necessary for solids, including gum. Always use spotting solutions sparingly. If the spill is wet, remove as much moisture as possible with dry, white towel or a hand-held extractor before applying any spotter. Try to remove the spot with water on a white towel or by using a hand-held extractor before using a spotting agent.

TREATING WATER-BASED SPOTS

Liquid spills should be blotted with a clean, white cloth to remove as much of the liquid as possible. If the spill is semi-solid or has hardened, gently scrape away with a spoon or spatula and then blot the spot with a damp white cloth. Always work from the edge of the spot towards the center. Never rub across a wet spill in a manner that causes the stain or contamination to be spread outward from the original area. If the spot remains, try **Grab Carpet Spotter** or go to the Carpet and Rug Institutes "Spot Solver" (http://www.carpet-rug.org/commercial-customers/cleaning-and-maintenance/spot-solver.cfm) for an excellent reference that should have an approach to help safely remove the spot.

Apply a minimal amount of the recommended solution. Use a soft-bristle brush and gently agitate the solution by hand. Rinse the affected area with water and allow the area to dry for about one hour and then vacuum. Prevent traffic on the freshly cleaned area until the carpet is completely dry.

Please remember to blot the spot. Do not brush the spot aggressively.

TREATING OIL-BASED SPOTS

When removing oily stains such as grease, tar, or asphalt, try **Grab Grease and Oil Remover**, always check for color fastness by testing in an inconspicuous area of the carpet. Apply **Grab Grease and Oil Remover** directly onto the spot. Again, do not rub across the spill, but wipe gently from the outer edge toward the center of the spot. Repeat the procedure until the spot has been removed. Rinse with water and allow the area to dry about one hour and then vacuum. Protect the freshly cleaned area until the carpet is completely dry.

Please note: A small, portable hand-held extractor can simplify the task of flushing residual solution from spots and spills.

SPOT REMOVAL GUIDE

Please refer to the Carpet and Rug Institutes "Spot Solver" to remedy a wide range of the most typical causes of carpet spotting. The Spot Solver can be found at http://www.carpet-rug.org/residential-customers/cleaning-and-maintenance/spot-solver.cfm.

If you have further questions, please call Bentley at 800.423.4709.

©2013 Bentley Mills, Inc.

INTERIM CLEANING

DRY EXTRACTION

Dry compound extraction, such as **Grab Dry** from **XL North**, is a safe, easy, and effective method for performing maintenance on a regular basis. The procedure uses a moist, powder-like compound that does not leave the carpet excessively wet, thus allowing immediate access and traffic once the procedure is complete. This cleaning method typically has the lowest production rate and is the most expensive method of carpet cleaning. Dry compound cleaning eliminates wicking and does well with oily spots and soils. It is considered the safest cleaning method.

The technique for dry compound extraction is as follows:

1. Thoroughly vacuum the carpet two passes at 1.8 feet per second at 2 to 3 feet in length.
2. If carpet is not heavily soiled proceed to step 4.
3. If needed, use a pre-spray like **Grab Carpet Spotter** and allow 10 minutes dwell time, spray evenly and heavy enough to stay damp for 20 minutes using a pump-up or electric sprayer. Do not over spray onto other surfaces, walls, or furniture.
4. Agitate carpet with counter rotating brush machine with the appropriate brush stiffness at 1.5 feet per-second in a V or W pattern. The soil load will determine the number of passes. Continue this step until you can visually see the soil separation from the fiber.
5. Spread the dry compound evenly on carpet making sure not to clump the product use one pound of product for every 150 square feet. Apply in a small area not to exceed 30' x 30' the dry compound must stay moist until it can be agitated into the carpet
6. Agitate the compound into the carpet at 1.5 feet per-second at 2 to 3 feet in length in a V or W pattern.
7. Allow compound to completely dry approximately 30 minutes to one hour.
8. Vacuum up the dry compound with two to three very slow passes, 1 foot per second make sure all visible compound is removed

Please note: This process can be even more effective when the carpet is first pile lifted and vacuumed prior to spreading low-moisture cleaning compound.

©2013 Bentley Mills, Inc.

LOW-MOISTURE CLEANING

ENCAPSULATION APPLICATION

The Encapsulation (or crystallizing) method of maintenance uses a liquid (like **Liquid Grab Green**) that breaks down and encapsulates sticky soils, then then dries to a crystal-like powder that is easily vacuumed away. Encapsulation cleaners should be applied and used as follows:

1. Thoroughly vacuum the carpet two passes at 1.8 feet per-second at 2 to 3 feet in length.
2. Spray evenly and heavy enough to stay wet for roughly 20 minutes using a pump-up or electric sprayer. Carpet must stay wet until the agitation process can be completed. Do not over-spray onto other surfaces, walls or furniture.
3. Agitate carpet with counter rotating brush machine with the appropriate brush stiffness at 1.5 feet per-second in a V or W pattern. The soil load will determine the number of passes. Continue this step until you can visually see the soil separation from the fiber.
4. Thoroughly vacuum the carpet two passes at 1.8 feet per-second at 2 to 3 feet in length.

FILMER APPLICATION

Filming encapsulates, like **ResisTech 5,** are technically cleaners but should be viewed also as a fiber treatment. Filmers do encapsulate soils but are not designed to completely release during the vacuuming process. Filmers release or "shed" over time from foot traffic and multiple vacuuming. The soils attach to the treatment on the fiber not the fiber itself, so when the coating separates through vacuuming or foot traffic it only removes a small amount of the treatment, leaving behind more material to which soil can cling, thus repeating the process. For the best results, this method should only be applied to clean carpet preferably after a hot water extraction method was used.

This method will keep the carpet the cleaner than any other cleaning method over a set period of time. And when used in conjunction with Hot water extraction and low moisture encapsulation cleaning, this method will be the most cost effective of all maintenance cleaning programs.

The application process is the same as encapsulation application.

Please note: Both applications can be performed using sprayers or can be applied as a foam.

BONNET CLEANING

Avoid bonnet cleaning. Using a bonnet or any other type machine that rotates in a motion parallel to the flooring surface to clean or dry carpet is not recommended and may void warranty coverage. Low-speed rotary cleaning methods must be approved by Bentley.

©2013 Bentley Mills, Inc.

HOT WATER EXTRACTION TRUCK-MOUNT/BOX EXTRACTORS

This method of cleaning has the ability to remove the most amount of soil (up to 95%), depending on the type of equipment and process used. This method can be slow and labor intensive, with more challenges compared to other methods.

1. Before starting this method of cleaning make sure the HVAC system stays on until the carpet is totally dry.
2. Check for any occupancies that may have a chemical sensitivity before using any carpet pre-spray.
3. Always vacuum and pile lift thoroughly before beginning any carpet cleaning method. This is especially important with hot water extraction in order to remove as much dry, loose soil as possible prior to adding water to the carpet.
4. Place wet floor signs at all transition points, from carpet to hard surface.
5. Pre-spray with a traffic lane cleaner such as **Grab Nylon Pre-Spray** or **ResisTech HWE** (a pH between 9.9 and 4.5). Spray heavy enough to keep carpet wet until the carpet can be extracted. Use a pump-up type or electric sprayer with no more than 60 psi (so pre-spray will not aerosolize). Do not over spray on any furniture, walls, or other floor surfaces.
6. Allow to penetrate for 10 minutes.
7. Agitate using a counter-rotating brush machine with the appropriate brushes at a 1.5 feet per second rate, use 2 to 3 foot long strokes in a V or W pattern continue this process until you can visually see the soil separate from the fiber.

All portable extractors should be plugged into a ground fault circuit interrupter. Extract using a carpet wand with straight forward and backward passes (NO V or W pattern) at a rate of 1.8 feet per second, overlap each stroke by 1 inch (use **Grab Crystallizing Acid Rinse** in fresh water tank when using high (9.0-9.9) pH cleaners). On restorative cleaning use multiple passes and finish with 1 dry pass. Continue to pull the wand toward you another 3 inches after releasing the spray trigger to insure all water removal.

Use air movers to help dry the carpet especially at transition points.

Self-contained water extraction equipment (walk behind, pull back, ride on)

This water extraction cleaning method has average-to-good soil removal somewhere between low moisture and hot water truck mount/box extractors. However, it has a much higher production rate compared to truck-mount or box extractors and about the same as low moisture encapsulate cleaning.

Steps for self-contained extraction equipment:

1. Before starting this method of cleaning, make sure the HVAC system stays on until the carpet is totally dry.
2. Check for any occupancies that may have a chemical sensitivity before using any carpet pre-spray

©2013 Bentley Mills, Inc.

3. Always vacuum and pile lift thoroughly before beginning any carpet-cleaning method. This is especially important with water extraction in order to remove as much dry, loose soil as possible prior to adding water to the carpet.

4. Place wet floor signs at all transition points from carpet to hard surface.

5. Pre-spray with a traffic lane cleaner Such as **Grab Nylon Pre-Spray** or **ResisTech HWE** with a pH between 9.9 and 4.5 (Spray heavy enough to keep carpet wet until the carpet can be extracted). Do not over spray on any furniture, walls or other floor surfaces.

6. Allow to penetrate for 10 minutes.

Extract
All portable extractors should be plugged into a ground fault circuit interrupter. Overlap each pass at least 3 to ½ inches depending on how soiled the carpet is.

Use a **Grab Crystallizing Acid Rinse** in fresh water tank when using high (9.0-9.9) pH pre-sprays. For best results do not add cleaning solution to fresh water tank.

Use air movers to help dry carpets especially at transition points from carpet to hard surfaces.

THE RIGHT CLEANING SOLUTIONS

Bentley recommends the **Grab** carpet-care system by **XL North** and also the **Resistech** Carpet Maintenance Treatment by **Antron**.

However, if you choose to use others here are some things to consider:

Some commercial carpet cleaning solutions are very harsh and can damage carpet fiber. Only use cleaning chemicals that meet the basic standards outlined here.

It's also important to evaluate each product prior to widespread use by applying in a small inconspicuous area prior to widespread to prevent the possibility of damage. Bentley carpet can be maintained using a number of widely recognized carpet cleaning agents that are readily available. However, cleaning solutions that have earned the Carpet & Rug Institute's Seal of Approval are preferred.

The Carpet and Rug Institute uses an independent testing laboratory to evaluate cleaning chemistry based on the following criteria:

- Overall cleaning effectiveness; this ensures that the product removes soil and spots better than plain water.
- Rate of re-soiling; this ensures that the product does not attract dirt to the cleaned areas faster than the rest of the carpet.
- Chemical pH; a more neutral pH ensures that carpet dyes and fibers are not adversely affected.
- Surface texture change; the product must leave the carpet pile minimally changed after repeated cleanings.
- Optical brighteners; none are allowed, as they can leave some patches of carpet lighter than the rest.
- Colorfastness; products must not be so aggressive that they cause a color change in the carpet.

©2013 Bentley Mills, Inc.

For a list of these certified cleaning solutions see the Carpet & Rug Institute's website at: http://www.carpet-rug.org/commercial-customers/cleaning-and-maintenance/seal-of-approval-products/cleaning-solutions-list.cfm?product_type=0&manuf_id=0

Avoid products with pH levels over 9.9 for nylon and a maximum of 8.5 for wool. Also, make sure that cleaning solutions for either nylon or wool are free of toxic or flammable solvents. Detergents designed for use in hot water extraction equipment should not contain an oil-based de-foamer and caution should be used with the amount of detergent added. Oil-based de-foamers have the potential to leave oily residues and adding too much detergent could leave excess detergent on the carpet. Both scenarios will lead to rapid re-soiling and create a need for more frequent cleanings. In addition, cleaning solutions containing optical brighteners should not be used. Optical brighteners can adversely affect the coloration of carpet and lead to premature aging or yellowing of the carpet. Cleaning solutions used for interim and/or restorative cleaning should be tested for sticky residues that may cause re-soiling. To test a solution, pour a small amount in a clean glass dish. Allow the solution to air dry completely (24 hours minimum). Break up any hard residue on the surface of the glass dish and examine it. If the residue can be characterized as dry powder, dry flakes, or dry crystals, the solution is acceptable. If the residue appears oily, greasy, sticky, or in waxy flakes, the solution is not acceptable since it would likely contribute to rapid re-soiling. Spotting solutions should be used as needed and should be flushed out with clean water once the spot has been treated.

MAINTENANCE EQUIPMENT

Using the right equipment is as important as using the right cleaning solution and the best techniques. These guidelines are intended to provide a proper framework for minimum basic maintenance designed to maximize a carpet investment. Equipment should be selected from those units tested and certified by the Carpet and Rug Institute's Seal of Approval program.

- Vacuums: Select a dual-motor, commercial-grade vacuum cleaner bearing the Carpet and Rug Institute's Seal of Approval/Green Label Certification program. Top-loading dust bag machines with HEPA filters are strongly recommended. Battery-powered vacuum cleaners are not recommended.

- Low-moisture applicator: Use only those units with counter-rotating brushes bearing the Carpet and Rug Institute's Seal of Approval.

- Hot water extractor: Truck-mounted extraction units generally provide optimal performance, but self-contained units are more mobile and can be highly effective in most commercial applications. Use only those units bearing the Carpet and Rug Institute's Seal of Approval.

©2013 Bentley Mills, Inc.

CARING FOR WOOL CARPET

Wool is a natural protein fiber obtained from sheep. It is sensitive to color change, yellowing, and degradation when exposed to direct sunlight and it has a narrow pH range for cleaning. Wool cleans best between a pH of 5 and 8.5. The cleaning chemistry must not contain bleaching agents or optical brighteners. Temperature in cleaning wool should never exceed 140 to 150 degrees and excessive agitation when used with high temperatures should be avoided. Wool can absorb up to 33% of its weight in moisture, so it is important not to over wet the carpet and to allow ample time for drying. Below are some guidelines that should be followed.

1. Use a cleaning solution with low alkalinity (pH of 8.5 or less). Alkaline cleaning solutions pH above 8.5 may contribute to browning of fibers.

2. Select a solution that leaves no sticky residue following drying.

3. Do not use cleaning products with added bleaches or dyes. Full-strength application of bleach or cleaners containing bleach will dissolve wool fibers. Weakened solution of bleach or cleaners containing bleach can release fiber dyes and discolor the wool carpet completely.

4. Regular vacuuming is crucial to prevent soil from penetrating to the base of the fibers. Wool has an inherent property that suspends soil near the top of the pile on the surface of the carpet face. Regular vacuuming will remove this surface soil and dirt, preventing it from working into the face and abrading/wearing the fibers.

5. Care should be used when vacuuming shag carpeting. A vacuum without a beater bar or rotary brush should be used for this style of carpet. This will prevent damage to carpet or vacuum. High-end vacuums have separately controlled brushes or beater bars. These should be off when vacuuming. Check vacuum bag frequently as loose fibers are long and tend to clog the vacuum when approaching full.

6. For spot cleaning, act quickly and blot it up with a clean cloth or paper towels. Then use a towel dampened with lukewarm water to remove the substance completely. You can replace water with a solution of three parts of water and one part white vinegar. This solution will not cause any damage to your carpet, but helps to dilute the stain. Blot the area continuously with a dry cloth and never leave any wet spots. Avoid rubbing or scrapping the carpet for stain removal. This can cause breaking down of the fibers.

7. Wool offers excellent encapsulation release properties, which makes it an ideal fiber for dry and low moisture cleaning. These encapsulation products, like **Grab Crystallizing Encap, (ADD) Grab Carpet Spotter, and Liquid Grab Green** from **XL North** can be used (see "Interim Cleaning, Encapsulation Method for details on process)sprayed onto the carpet surface, agitated, and then vacuumed to remove the cleaning product and the attached soil. Use caution with overly aggressive agitation. Damage to wool carpet is generally attributed to over wetting, too much agitation, and improper chemical selection.

MAINTENANCE **GUIDE**

Traffic, Soil Rating	Carpet Owner Site Maintenance		Professional Cleaning Restoration Service	
	Vacuuming	Spot Cleaning	Interim Maintenance	Restoration Maintenance
Light ▪ Private offices ▪ Cubicles ▪ 500 traffics or less daily	Twice or more each week	Perform when vacuuming as spots, spills occur	Once per year	Once per year; should include pile lifting
Moderate ▪ Secondary hallways ▪ Share offices ▪ Conference rooms ▪ Classrooms ▪ 500-1000 traffics daily	Once daily	Perform when vacuuming as spots, spills occur	Twice per year; should include pile lifting at least twice or more	Twice per year; should include pile lifting at least twice or more
Heavy ▪ Common entrances ▪ Elevators ▪ Elevators lobbies ▪ Main hallways ▪ Break rooms ▪ Mail rooms ▪ Patient rooms ▪ Waiting areas ▪ 100-2,500 traffics daily	At least once daily; some areas will require more.	Perform when vacuuming as spots, spills occur	Monthly; should include pile lifting	Four times annually; should include pile lifting
Severe ▪ Common entrances when snow and rain are factors ▪ Cafeterias and any food-service areas ▪ Heavy-traffic load funneled into concentrated areas ▪ 2,500 or more traffics daily	At least once daily; some areas will require more.	Perform when vacuuming as spots, spills occur	Weekly Should include weekly pile lifting. More frequent pile lifting may be needed to contain tracked soiling	Monthly Should include pile lifting
This grid is intended as a guideline that should apply as a general minimum in most commercial applications. There will be exceptions where frequencies will need to be adjusted by site needs.

BŌLYÜ

TOTAL **level** FLOORING

CARE GUIDE

PROACTIVE CLEANING FOR THE HEALTH OF THE **level** FLOORING AND END USER

Without regular removal, dirt and soil accumulates to grind and permanently damage fibers, so **level** flooring can "ugly out" before it's time. **level** by its very nature, will mask soil, stains and abrasion to a certain degree, unlike hard flooring surfaces that readily reveal these symptoms indicating the need for immediate maintenance. It is for this reason **level** must be proactively maintained before soiling becomes noticeable to prolong the appearance and life of your **level** flooring.

> Proactive cleaning is preventive maintenance before the carpet looks dirty, instead of reactive cleaning after the carpet is visibly soiled.

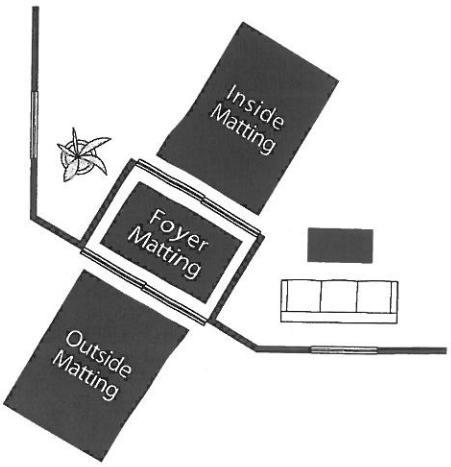
Proactive cleaning is preventive maintenance before **level** looks dirty, instead of reactive cleaning after **level** is visibly soiled. It is the foundation of Beaulieu Commercial Total Solution **level Flooring** Care Guide that proactive daily, interim and scheduled maintenance can reduce or eliminate the cost and time of reactive restoration required for extreme cases of badly soiled or damaged **level** while extending the life and appearance of **level** itself.

Reactive restoration involves water extraction with aggressive agitation followed by thorough rinsing and pile grooming. This procedure may need to be performed several times before any improvement is noticeable. Proactive cleaning provides the best possible **level** appearance day after day, extending replacement due to appearance.

Not only is the proactive nature of cleaning important, so is the overall environmental friendliness of the process. Beaulieu Commercial is committed to the environment. We only recommend cleaning systems that are environmentally friendly which is described as containing minimal to no VOC's, biodegradable, non-toxic, non-flammable, non-hazardous and safe for the environment.

level can act as a filter that traps and keeps dust and dirt out of the air. This can be a significant health benefit since most people spend a great deal of their time indoors. When removing contaminants from **level**, it's important to use equipment that will prevent re-circulation of dust back into the air.

This guide is organized by cleaning frequency (daily, interim, and scheduled). Depending on frequency and traffic, there are different techniques and tools recommended for best results in your particular facility. All chemicals used must have a pH level of less than nine. Do not use chemicals containing optical brighteners or deliminene (orange terpenes).



DAILY CLEANING

Daily cleaning is necessary for heavy, medium, and light traffic areas, and includes the following:

- Daily vacuuming of walk-off mats.
- Daily vacuuming of track-off, funnel, and main traffic lanes. In some instances, frequency may be greater.
- Immediate spot removal with emulsification and agitation, extraction, or blotting to guard against permanent staining.
- Recommended Spotters: R.E. Whittaker Co.(Crystal® Spotting Kit & Crystal® Spot Tool) or Windsor Ind. (Pro Spotting Kit)

Cleaning Walk-off Mats As Front Line level Flooring Protection

The first step toward clean **level** is preventing dirt from getting to the **level**. Since 80% of all soil is brought from outside on the bottom of shoes, Beaulieu Commercial strongly recommends walk-off mats at all entry ways and transition areas where soiling is likely. Mats trap or localize dirt, and the longer the mat, the more dirt trapped. Daily vacuuming and frequent cleaning of mats will optimize mat efficiency and provide front line protection to keep **level** flooring cleaner longer.

Recommended Vacuum: ProTeam (ProForce 1500XP) or Windsor Industries (Versamatic Plus)

Vacuuming Efficiently And Effectively

Vacuuming - removes 90% of dry soils that accelerate wear and fiber abrasion.

Vacuuming is a powerful method for preserving **level** life and appearance. The first step in vacuuming is selecting the equipment best suited to your requirements and preferences.

Two-motor Vacuum

In a two-motor vacuum, there is a separate motor for vacuuming and beater brush drive. Each motor is sized and configured to optimize the specific function. Operation is generally quieter and dirt pick-up more effective than single-motor vacuums. We recommend a two-motor vacuum for all traffic levels.

INTERIM CLEANING

Interim cleaning bridges the gap between routine vacuuming and restorative wet extraction. It is the most important component of the total maintenance program relating to **level's** appearance. This is due to two factors - 1) it reduces the oily soils that accumulate on **level** fibers and 2) it lifts and opens the **level** pile, which improves routine vacuuming's ability to remove dry soils. If oily soils are not minimized, then fibers become matted down and stuck together. If this is allowed to occur repeatedly, then even restorative wet extraction becomes incapable of recovering an acceptable appearance, which leads to early **level** replacement. See Fig. 1 below.

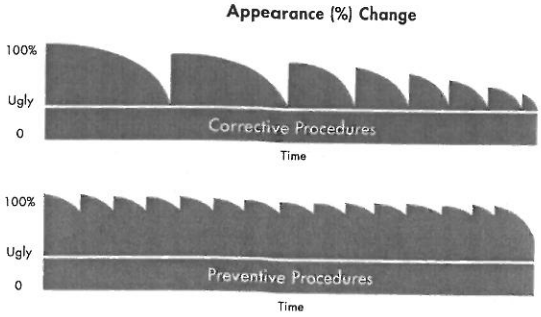


FIG 1

The recommended process for interim cleaning is low moisture encapsulation. It incorporates a cylindrical brush machine (Fig. 2) to agitate an encapsulating pre-spray chemical solution. The chemical solution dries (Fig. 3) and encapsulates the oily soils allowing a dry vacuum to recover these soils that had been stuck to the **level** fibers.

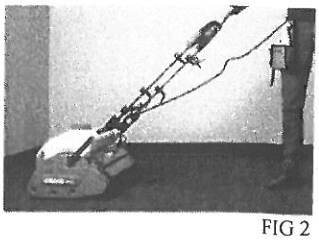

FIG 2

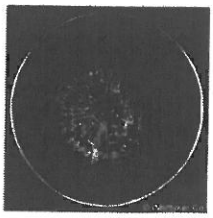

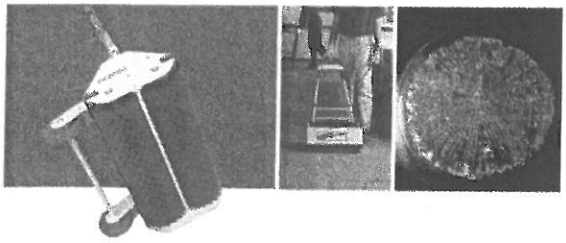

FIG 3

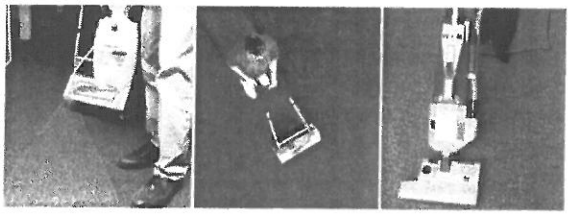
Recommended Low Moisture Encapsulation Method



Step 1: Spray a diluted chemical solution onto **level** fibers.

Step 2: Agitate immediately or at same time as spraying, using the soft or medium stiffness brushes. Please avoid using the stiffest brushes.

Step 3: Vacuum, when **level** is completely dry or, at the next scheduled time. **level** is dry in as little as 30 minutes, allowing less disruption in areas during operating hours. Productivity rates for low moisture encapsulation range between 3,000-15,000 square feet per hour depending on equipment being used.

The Crystal Dry chemical action breaks down the sticky and oily residue that attracts soil on contact. The GLS machine works the Crystal Dry deep into the pile and loosens foreign solid materials, lifting the carpet pile at the same time. As the Crystal Dry chemicals dries, it encapsulates the soil in crystals that are then dry extracted by vacuum. The entire interim cleaning process is pictured below

Spraying Scrubbing Vacuuming

Other comments

Beaulieu Commercial recommends chemical pre-sprays, which have received The Seal of Approval of the Carpet & Rug Institute. Additionally, while not required we recommend that the pre-spray be Green Seal certified for reduced environmental impact. By using a cylindrical brush machine during regular interim cleaning there is no need to perform pile lifting as a separate operation with a separate piece of equipment.

Recommended Interim Equipment and Chemistry: R. E. Whittaker Co. (Smart Care® machines and Crystal® brand chemistry).

Recommended Equipment & Chemicals: R.E. Whittaker Company (GLS Crystal Dry, pictured on the left)

Recommended Vacuum: ProTeam (Proforce 1500XP) Windsor Industries (Versamatic Plus) or comparable two-motor vacuum

Beaulieu Commercial does not recommend the use any type of 'bonnet' or rotary shampoo cleaning method for Bolyu or Aqua **level** brands. **Use of the 'bonnet' method may void all warranties.**

SCHEDULED CLEANING

Scheduled periodic overall deep cleaning with hot water extraction cleans to the base of the fiber. It is our recommendation that on new **level** installations hot water extraction be performed only with clean, clear water and when necessary, a pH adjusted rinse (depending on pH of carpet fibers) for best long-term results.

DEEP RESTORATIVE CLEANING

The restorative cleaning process is capable of removing the highest amount of accumulated soil. Beaulieu Commercial and other major fiber producers recommend hot water extraction for the periodic deep cleaning maintenance process. Equipment is used to spray water under high pressure and usually at high temperature to loosen embedded soils and flush them out of **level** fibers with suction. The variety of equipment ranges from truck-mounted high-powered machines to portable machines that use a hose and wand or self-contained extractors.

The restorative cleaning process is performed by spraying a chemical solution onto **level** fibers and immediately removing with suction. Hot water extraction equipment is then used to rinse

level fibers of the soils and chemical solution. **level** fibers should dry in 2-12 hours depending on indoor environment and outdoor climate. It is recommended to operate HVAC system and utilize air movers when possible to speed drying process. Productivity rates range from 500 (hose & wand)-10,000 (large ride-on) square feet per hour depending on equipment used. Beaulieu Commercial recommends hot water extraction equipment, which has received The Seal of Approval of the Carpet & Rug Institute.

Recommended Extraction Equipment & Pre-Sprays: U.S. Products (Cobra Plus Series); Windsor Ind. (Commodore or Dominator series); and R. E. Whittaker Co. (Smart Care® machines for agitation & Crystal® Extract pre-spray).

level Tile Extraction Requirements

level flooring must only be extracted using 100 psi. max and not to exceed 100° at wand. Exceeding these limits may disrupt adhesive bond on perimeter of tiles.

Recommended Hot Water Extraction Methods

Hot water extraction is disruptive and should only be performed after every 3-6 interim cleaning cycles.

Step 1: Spray a diluted chemical solution onto **level** fibers.

Step 2 (optional): Agitate with a cylindrical brush machine to carry chemical solution into the fibers. This step pre-loosens the soils and permits maximum contact between chemical and soils. It also opens and lifts **level** fibers to promote better extraction function.

Step 3: Allow a dwell time of at least 10 minutes to provide time for emulsification of oily soils prior to extraction.

Step 4: Operate hot water extractor to loosen embedded soils and flush them out of **level** fibers. It is our recommendation that on new **level** installations hot water extraction be performed only with clean, clear water and when necessary, a pH adjusted rinse (depending on pH of **level** fibers) for best long-term results. You can cut dry time in half by making extra dry passes with the extractor and directing an air mover onto wet carpet.

Do not over wet **level.** Over wetting **level** causes wick back, which will allow spots to reappear. **level** must also be 100% dry before foot traffic commences to prevent rapid re-soiling.

When To Use Defoamers

If foaming occurs, put a small amount of defoamer into the recovery tank of the extractor. Spraying defoamer onto the inner wall of the recovery tank can give faster contact with foam as it enters the tank.

Warning: Never put defoamer into the solution tank. This can clog the spray jets. Also, defoamer residue on the carpet will cause rapid resoiling.

Recommended Extraction Equipment & Pre-Sprays: U.S. Products (Cobra Plus Series); Windsor Ind. (Commodore or Dominator series); and R. E. Whittaker Co. (Smart Care® machines for agitation & Crystal® Extract pre-spray).

SPOT REMOVAL – 7 RULES FOR BEST RESULTS

Spot removal can be one of the most confusing and frustrating aspects of **level** care. Improperly treated or ignored spots can destroy expensive **level**, The following seven rules can help simplify the challenge.

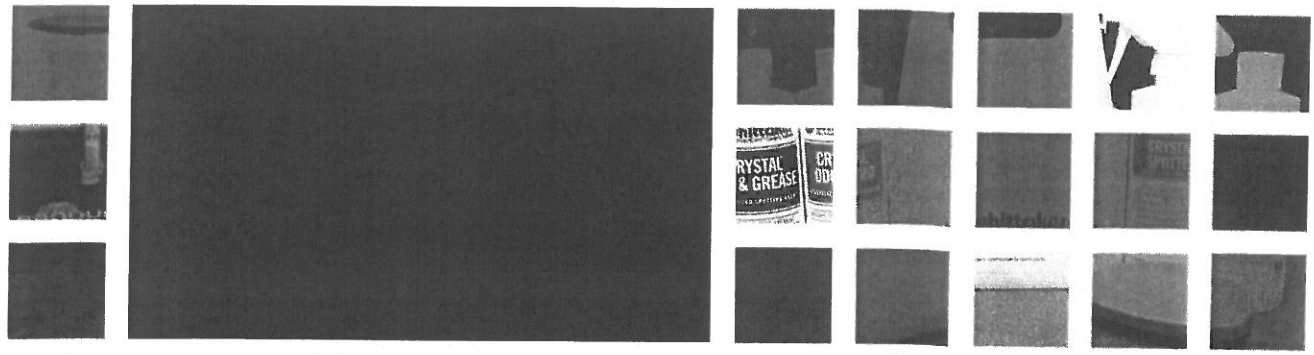
Recommended Spotting Kits: R.E. Whittaker Co. (Crystal Dry Spotter & Carpet Roamer)

Recommended Spotting Kits: Windsor Industries (Pro Spotting Kit & Presto spotting extractor)

Seven Rules of Spot Removal:

1. The faster you get to a spot the better for removal. At the minimum, spot removal must be a daily routine.
2. Know the fiber make-up of your **level**. Most commercial **level** uses solution-dyed polyester fibers. IICRC certified professional cleaners have simple tests that can determine fiber type for you.
3. Know and recognize the common spots in your facility. Keep a spotting kit on hand with a general purpose spotter and specialty spotters for spots specific to your area of responsibility. Offices, for example, often have coffee or copier toner spots. Hospitals commonly have blood or betadine spots. You can expect coffee, tea, and red food dye spots in retail or hospitality facilities. Nursing homes commonly have urine stains. Gum stains are common in public facilities.
4. Many spots are concentrated areas of general soil tracked into an area. A general purpose water-based spotter will remove these.
5. Greasy spots and tar are best removed by an oil or solvent-based spotter.
6. Protein or fatty soils such as vomit, feces, or blood can be effectively removed with an enzyme-based spotter.
7. When applying a spotter, never rub the spotted area. Always carefully blot the spot with a cloth. To help prevent resoiling, use a spotting water extractor to thoroughly clean the spotted area after blotting.

YOUR MAP TO TOTAL SOLUTION CARPET CARE



There are many ways to clean commercial **level**. To determine the best for your requirements, you should map out the types of traffic in your facility's areas. Using a copy of your building's floor plan, categorize and label traffic areas as heavy, medium, or light.

AMOUNT OF TRAFFIC	TRAFFIC	VACUUM FREQUENCIES	INTERIM CLEANING FREQUENCIES	DEEP CLEANING FREQUENCIES
Light	Office area with 1 worker	2-3 Times per week	Two to Four times a Year	Every 12-18 months
Moderate	Up to 500	Daily	Quarterly	1-2 times per year
Heavy	500-1000	Daily	Every Other Month	2-4 times per year
Extra Heavy	1000-2000	Daily	Monthly	4-6 times per year
Extremely Heavy	Over 2000	Twice Daily	Weekly to Monthly	6-12 times per year

*The term "traffics" means each time one person walks in the area. The same person walking in the same area 20 times a day equals 20 traffics.

Note: Spotting maintenance should be performed on a daily basis.

You are now on your way to total solution **level** care provided by your partner in business, Beaulieu Commercial, in an effort to increase your return on investment of your floor coverings. For additional technical information pertaining to installation, adhesives, maintenance, specifications and warranties please see our website at bolyu.com or feel free to contact technical services at 800 451 1250.

P.O. Box 1447 • 1996 Highway 225 South • Chatsworth, GA 30705 • 800 451 1250

5/13/2013

Lifetime Commercial Limited Warranty

Modular Carpet

This warranty begins when the carpet product is installed by Masland authorized installation professionals in accordance with Masland Contract's current installation specifications, including the use of Masland Contract adhesives and sealers, if applicable. Providing care recommendations are followed, the warranty continues for the useful life from the date of the original installation. The warranty is further defined as the period the carpet is owned and maintained by the original end-use purchaser. The basis of any warranty related claim is the original Masland Contract invoice or the original Masland Contract dealer invoice. If these specifications and procedures are not followed, a standard two-year warranty against manufacturing defects will be in effect as well as any further protection offered by the fiber producer. *Installation specifications and carpet care recommendations can be obtained from your dealer or Masland Contract Information Center at 1.888.633.4770, or on the Masland Contract web site at www.maslandcontract.com.*

TUFT BIND

Masland Contract warrants that its high performance modular carpet will provide tuft bind strengths consistent with accepted industry standards for these products. Any failure to perform with respect to acceptable tuft bind will be independently evaluated and the product replaced by Masland Contract if a product defect is responsible for substandard performance. Specific product and performance criteria may be noted and registered as part of this specific warranty.

EDGE RAVEL

Masland Contract warrants that under normal use, Masland Contract high performance modular carpets will not edge ravel.

BACKING INTEGRITY DELAMINATION

Masland Contract warrants that, under normal use, the backing will not delaminate. Masland Modular Carpet will not shrink or stretch under normal conditions during the lifetime of the product. This also warrants against cupping, doming, curling or dishing of the Modular Carpet.

SMOKE DENSITY

Masland Contract warrants that its high performance Modular Carpet will generate less than the generally accepted maximum rating of 450 specific optical density for smoke in the flaming mode, when tested in accordance with ASTM Test Method E-662 (NFPA 258). See the specific test report for each high performance product.

STATIC PROPENSITY

Masland Contract warrants that its high performance Modular Carpet prevent static buildup in excess of 3.5 KV when tested using AATCC Test Method 134 at 70 degrees F at 20% R.H.

CARPET CLASS

Masland Contract warrants that its high performance Modular Carpet is appropriately classified under all applicable fire codes for the specified endues as tested under Test Method ASTM E-648. See the specific test report for each high performance product.

NOTICE AND DEFECT CLAIMS AGAINST WARRANTY

All claims under this warranty must be submitted, in writing, to Masland Contract, P. O. Box 11467, Mobile, AL 36671.

OBLIGATIONS OF WARRANTOR

Masland Contract will, within ten working days of receipt of claim, designate a representative to inspect the standard performance and evaluate the warranty claim.

LIMITATIONS

Any portion of the Masland Contract high performance Modular Carpet not performing as stated will be repaired to conform to the warranty. If repair is not commercially practical, Masland Contract may, at its option, replace the affected carpet or refund the proportional purchase price for the affected area. Masland Contract will pay the costs of the carpet, reasonable freight, and labor. Thereafter, Masland Contract will pay only the costs of the carpet and reasonable freight. Costs incurred for the moving of equipment, furnishings, partitions, and the like, that were installed over the Masland Contract standard performance product will be at the consumer's expense. Carpet installed on stairs or in areas subject to abnormal foot-traffic use (i.e., golf spikes, other spiked footwear, ski boots, and the like) is excluded. This warranty does not cover burns, cuts, fading, matting, pills, pulls, odor, soiling, staining, tears or damage due to improper installation or due to improper cleaning agents or methods. Incidental and consequential damages are not the responsibility of Masland Contract, and, to the extent permitted by law, are hereby excluded as to both property damage and personal injury. Replacement carpet will come only from current running line standard performance products comparable to the warranted product.

IMPLIED WARRANTY RIGHTS

This lifetime warranty gives you specific legal rights and is in lieu of all other express or implied warranties. In certain states, you may also have implied warranty rights, including an implied warranty of merchantability or fitness for a particular purpose. In any event of a problem with warranty, service or performance, your rights under both the express and implied warranties may be enforceable in an appropriate court of law. These warranties apply only in the United States and Canada.

Protect and Preserve

Thank you for choosing a Masland Carpet for your fine interior space. Carpet is a textile material and it will receive more abuse and use than any other finish in a building. In order to keep Masland Carpet products performing to their potential, you must design and implement a comprehensive maintenance plan.

Developing A Plan

To develop a proper plan, you should define the type of traffic patterns the carpet will receive.

WALK OFF AREAS- This area is normally at the entrance of the building or at a hard-surface transition where walk-off mats are found. Masland does recommend the use of walk off mats and suggests that they are regularly maintained and changed as needed. You must pay close attention to these areas as soil and other contaminants are easily transferred from the mats onto the carpet. This is likely to be the area that cleaning is required most often.

FUNNEL AREAS- These areas will receive a higher concentration of traffic and soil. Funnel areas occur where two or more traffic lanes merge together to form one concentrated lane. These areas occur in corridor intersections, doorways, and around elevators. These areas, like the WALK-OFF AREAS require more stringent maintenance procedures. Funnel areas can be subjected to significant pivoting traffic that will grind soil deep into the carpet fibers.

MAIN TRAFFIC AREAS- Large spaces that receive heavy foot traffic that is more dispersed than funnel areas.

HIGH SPILL/STAIN AREAS- Immediate attention must be given to spills as they occur. Many spills can result in permanent damage if they are not addressed immediately. These include but are not limited to: Coffee, soft drinks, red wine, mustard, oil, and fruit drinks. These areas require daily maintenance.

LOW TRAFFIC AREAS- These areas are the lowest volume of traffic and soil load such as upper floors and individual offices. These areas would have only 500 traffics per day or less and will not require as much maintenance as the four other areas.

WALK OFF MATS

- The 1st line of defense for your carpet is a walk off mat. Masland suggests a minimum of 5 feet of walk off mats be placed at every building entrance. Studies have shown that 12 feet of mat is optimal if the area will bear it. These mats need to be vacuumed at the very least, once a day. Mats should also be placed at any kitchen area transition. Regularly vacuum and clean the walk off mats as they will receive a high soil load very quickly.

VACUUMING

- The most important maintenance procedure is the removal of dry soil by vacuuming. Appropriate vacuuming is 4 slow passes back and forth in the same area. Use a dual motor upright vacuum where the brushes and suction are driven by separate motors. For best results, change vacuum bags before they become two-thirds full. Masland does not recommend vacuums with beater bars.

- **All vacuums** must be approved under the Carpet and Rug Institute's Indoor Air Quality Vacuum Cleaner Program. A comprehensive list of approved products can be found at www.carpet-rug.org. These vacuums have been performance tested and have met indoor air quality standards to help ensure that your carpet is clean and your indoor environment remains healthy.

SPOT CLEANING

- Spills and spots must be attended to with immediacy. Spills that are allowed to dry are much more difficult to remove. All spot cleaners used on Masland products must be approved by the CRI Seal of Approval Program. These products are listed at www.carpet-rug.org .
- For Synthetic fibers, cleaners should have a pH range of 5.5 to 10.0. Do not use cleaning chemicals outside of this range as damage to the fiber could result. This requirement is for all chemicals (spot cleaners, pre-sprays, and in-tank) used on Masland products. Never rub spots or spills, use a blotting action only.
- For specific Spot cleaning instructions, please refer to the Masland Spot and Spill Removal Guideline at the end of this document.

INTERIM CLEANING

- This type of cleaning is a fast high volume process that is used in between restorative cleanings. Masland suggests methods such as **Low Moisture Extraction**, a cleaning system that uses encapsulants that dry to a crystalline state and can be removed by vacuuming. **Low Moisture Compound Cleaning** is a cleaning technique that applies highly absorbent material onto the carpet face and is then agitated into the carpet and allowed to dry. The cleaning compound and soiling debris are then removed by thorough vacuuming. **Dry Foam** cleaning is conducted by a machine applying a foaming chemical onto the upper surface of the carpet and then removing the chemical and soil contaminants that were captured by the foam. All of these systems dry very quickly and cause less intrusion in an interior space than Restorative cleaning.

RESTORATIVE CLEANING

- Hot Water Extraction is the preferred method of cleaning by Masland. This method is proven to be the most effective means of removing entrapped soil and other residues. This method does require effort and will take some time to dry. Use air movement systems and the HVAC system to aid in drying time. Masland does require that all systems used on Masland Carpet be approved under the Carpet and Rug Institutes Seal of Approval Program. Masland also prefers that all equipment be at least a Silver Level cleaning system. Carpet should only be cleaned by trained technicians. IICRC Certified technicians are preferred.
- Never mix "In-Tank" solutions at greater the recommended concentrations. The most effective cleaning method by hot water extraction employs a pre-spray chemistry coupled with agitation. Always thoroughly rinse any detergents from the carpet with water only as to impede accelerated soiling. If detergent residue or build up exists, clean the carpet with hot water only.
- The use of a pile lifter will help to remove embedded soil and sandy particulate. It will also help to erect the pile fiber and renew the appearance of the carpet. Use of a pile lifter in funnel areas, walk off areas, and around elevators will enhance the appearance of the carpet.

DO NOT USE BONNET/ROTARY SYSTEMS ON MASLAND CARPET. USE OF THIS TYPE SYSTEM WILL VOID ALL MASLAND WARRANTIES.

Follow all guidelines set forth by the Institute of Inspection Cleaning and Restoration (IICRC) S100 *Standard and Reference Guide for Professional Carpet Cleaning*. This is available at www.iicrc.org

FREQUENCY OF MAINTENANCE

The table below is a guideline for the frequency of cleaning established by the IICRC. This is a very good guide for a maintenance schedule. However, each building and traffic patterns are different and modifications to the table may need to be implemented.

	Carpet owner/Maintainer		Professional Carpet Cleaner/Restorer	
Traffic Soil Rating	**Vacuuming**	**Spot Cleaning**	**Interim Maintenance (between restorative cleanings)**	**Restorative Cleanings**
Light <500 Foot Traffics per day	1 to 2 per week	Daily or as soon as noticed	1 to 3 times annually	1 to 2 times annually
Medium 500-1000 foot traffics per day	Daily in traffic areas, overall 3 to 4 X per week	Daily or as soon as noticed	3 to 6 tomes annually	2 to 4 times annually
Heavy 1000-2500 foot traffics per day	Daily in traffic areas, overall 4 to 7 X per week	Daily in traffic areas, overall 4 to 7 X per week	6 to 12 times annually	3 to 6 times annually
Very Heavy >2500 foot traffics per day	1 to 2 X daily in traffic areas. Overall 7 X per week	1 to 2 X daily in traffic areas. Overall 7 X per week	12 to 52 times annually	6 to 12 times annually

HARD SURFACE TRANSITIONS

Areas where carpet meets a hard surface are sometimes more susceptible to accelerated soiling and can become difficult to clean. This area would be similar to a walk off area and will normally require weekly attention. This is even more important in areas of transitions to kitchens or bathrooms. Well placed walk off mats will help to minimize the affect of soiling that comes in these transitional areas.

Maintenance personnel should never use hard surface cleaners on carpet. It should also be noted that buffers or rotary cleaners should never be allowed to spin on or even come in contact with the carpet. High pH cleaners used for hard surface are very likely to harm the carpet.

SPOT CLEANING GUIDE

A. **WATER SOLUBLE STAINS**:
First, blot thoroughly with a white cotton cloth or paper towels. Next, apply a solution of ½ teaspoon (no more) of liquid dishwasher detergent to one quart of water. A spray bottle works well. Repeat until stain is removed.

B. **WATER SOLUBLE STAINS WITH ODOR:**
Same as A, but treat with white vinegar before using detergent.

C. **WATER SOLUBLE STAINS WITH HEAVY COLOR:**
Same as A, but treat with household ammonia before using detergent.

D. **GREASE:** Blot as much as possible with white cloth or paper towels. Apply a volatile solvent such as Perchloroethane (dry cleaning fluid), or lighter fluid (naptha) to a white cotton cloth. CAUTION: Do not apply the solvent directly to the carpet pile as permanent damage WILL result. Use rubber gloves and provide adequate ventilation.

E. **WAXES and GUMS**: Freeze the stain with ice or a commercially available product in an aerosol can. Shatter with a blunt object and vacuum immediately. Repeat until spot is removed.

F. **MEDICAL STAINS:** Commercial preparations are available. A 5% Sodium Thiosulphate solution (from a photography store) may also be used. For stains more than a few hours old, this solution should be heated.

G. **RUST**: Most can be removed with a 10% solution of oxalic acid. More stubborn stains will require professional cleaning as restricted chemicals may be needed. Use of oxalic acid is not recommended for solution dyed products as damage may

result. Certain household cleaners contain oxalic acid and should be used with caution.

Tandus Centiva
A Tarkett Company

MODULAR
LIFETIME LIMITED WARRANTY

Modular styles with nylon face fiber are covered by a non-prorated Lifetime Limited Warranty issued by Tandus Centiva against excessive surface wear, edge ravel, zippering, resiliency loss of backing, and delamination of the secondary backing from the primary backing containing the face fiber. Lifetime is defined as the period of time during which the product is owned and maintained by the original end-use purchaser in the original indoor installation location. Tandus Centiva Modular products must be installed in accordance with the appropriate Modular Installation & Floor Preparation Instructions and must be maintained in accordance with Tandus Centiva care and maintenance guidelines. The use of Tandus Centiva primers and adhesives or approved alternatives is required. Failure to conform to these requirements will result in loss of limited warranty coverage.

Moisture and pH testing requirements and limitations are defined in the Tandus Centiva Modular Installation & Floor Preparation Instructions for each Modular product. Product or installation failure due to moisture or pH levels in excess of the limits set forth in these instructions is specifically excluded from limited warranty coverage.

Chair pads are not required, but are recommended for optimum textural performance. Absent the use of chair pads, more intensive maintenance will be required for areas in direct contact with chair caster traffic, and some degree of appearance change is to be expected.

Soiling visibility is affected by colors and patterns. Information on optimizing your selection can be found at www.tandus-centiva.com. **Appearance retention is not covered by this limited warranty.**

Excessive surface wear means more than fifteen percent (15%) loss of pile fiber weight measured before and after use.

Resiliency loss means more than ten percent (10%) loss of backing resiliency calculated using average thickness measurements of the backing of the carpet before and after use. Since resiliency recovery is not immediate and may be influenced by temperature and other conditions, thickness must be measured only after a 72-hour conditioning period.

Modular products also carry a Lifetime Limited Warranty against excessive static electricity only when installed and maintained in accordance with Tandus Centiva approved procedures. Excessive static electricity means more than 3.0 kilovolts at a relative humidity of 20% and a room temperature of 70 degrees Fahrenheit.

If these products fail to perform as described in this limited warranty, the affected area will be repaired to meet the applicable Tandus Centiva limited warranty provisions. If repair is not commercially practical or possible, Tandus Centiva may, at its sole discretion, replace the affected area or refund the original Tandus Centiva invoice cost for the affected area. If repair or replacement is required, Tandus Centiva reserves the right to utilize an independent qualified labor provider or Tandus Centiva Field Technical personnel. Replacement will be made with a product of comparable cost from the current Tandus Centiva running line of products.

This limited warranty does not cover pile shading, pile crushing, tears, burns, cuts, pilling, matting, damage due to improper installation, improper use, improper maintenance, installation over irregular surfaces, point loads in excess of 150 pounds per square inch or any other damage not expressly covered above and is subject to the applicable Tandus Centiva product tolerances, which are available upon request. **This limited warranty does not cover damage resulting from improper installation or maintenance.** Liability of Tandus Centiva is limited to the actual repair or replacement of the affected area and does not cover incidental or consequential damages. Tandus Centiva is not responsible for any expenses incurred for removal of furniture, partitioning, temporary walls or other fixtures on or around the affected area of the carpet.

All Tandus Centiva Limited Warranty and Maintenance Information can be accessed at www.tandus-centiva.com or by dialing 800-248-2878.

THE BUYER AND/OR END USER IS SOLELY RESPONSIBLE FOR THE SUITABILITY OF THE MERCHANDISE SELECTED FOR A PARTICULAR APPLICATION. TANDUS CENTIVA SHALL NOT BE RESPONSIBLE FOR THE REPAIR OR REPLACEMENT OF ANY PRODUCTS DAMAGED AS A RESULT OF FORCE MAJEURE, INCLUDING BUT NOT LIMITED TO FIRE, FLOOD, OR OTHER CATASTROPHE, ACTS OF GOD, OR ANY CAUSE BEYOND THE CONTROL OF TANDUS CENTIVA.

ALL IMPLIED WARRANTIES WHICH MAY ARISE BY LAW, IMPLICATION OF LAW OR APPLICATION OF COURSE OF DEALING OR USAGE OF TRADE INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE ARE EXPRESSLY DISCLAIMED AND EXCLUDED. ANY ORAL STATEMENTS ABOUT THE MERCHANDISE DESCRIBED HEREIN ARE NOT WARRANTIES, SHOULD NOT BE RELIED UPON BY THE BUYER, DO NOT FORM ANY PART OF THE BASIS OF THE BARGAIN, AND ARE NOT PART OF THIS OR ANY OTHER LIMITED WARRANTY. NO AGENT, DISTRIBUTOR OR REPRESENTATIVE OF TANDUS CENTIVA, EXCEPT AN OFFICER OF TANDUS CENTIVA, SHALL HAVE AUTHORITY TO AGREE TO ANY TERM, CONDITION OR PROVISION INCONSISTENT HEREWITH OR NOT CONTAINED HEREIN.

MODULAR MAINTENANCE CARE PROCEDURES

The following CARE recommendations should be implemented prior to, or immediately after the installation of Tandus Modular products.

Use and traffic patterns in a facility can vary greatly; therefore, a planned maintenance program must be designed in each facility. In addition to this initial planning, the maintenance program must be reviewed on a regular basis to adjust for changing traffic and use patterns. All modular installations require a properly designed and implemented maintenance system to maximize appearance retention.

Some areas may require a yearly cleaning, while other areas may require cleaning on a weekly basis. The ultimate goal is to maintain a high appearance level in all areas at all times and thus extend the life cycle of the modular carpet. This objective is obtained by eliminating the soiled/cleaned, soiled/cleaned cycle as expressed in the illustration below.

A total maintenance package must be initiated to supplement cleaning in order to assure customer satisfaction of the product. Deep or Restorative Cleaning typically occurs as a result of the failure to maintain any Textile floor covering selection. In essence, the better the maintenance plan, the reduced need for deep cleaning and the longer the lifecycle for modular installations. Following are recommendations for a complete maintenance package. Keep in mind, that frequencies may vary depending upon the diligence of the maintenance program and the inclusion of these essential support tools.

Developing the Plan:

This CARE maintenance program is based on both Low Moisture Primary Maintenance and Hot Water Extraction methods using minimal cleaning agents. Product construction, color selection,

entry mats, daily vacuuming, spot removal, regular cleaning, and product repair are all integral considerations of this CARE program.

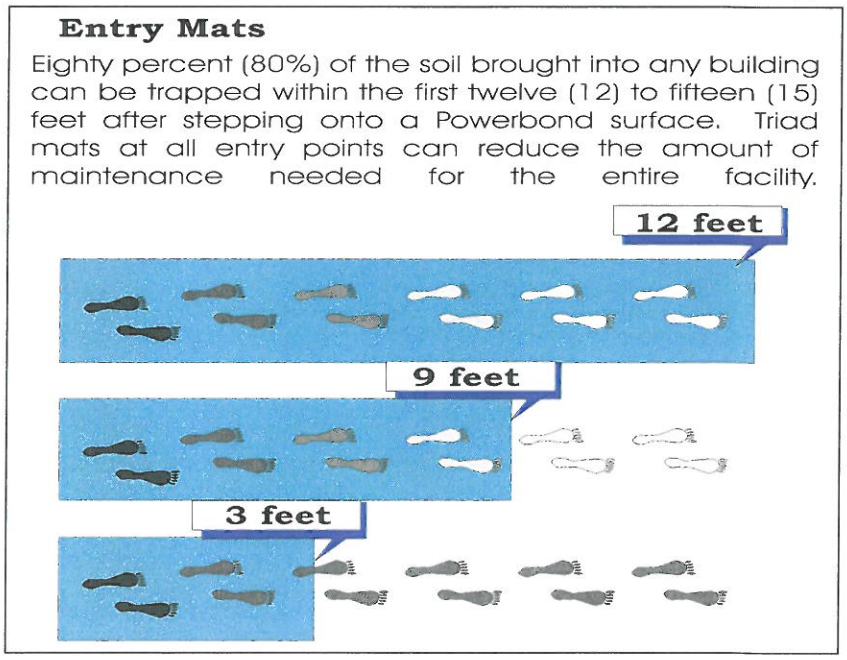
Implementing a strategic plan is an essential step in developing and maintaining a successful CARE program. Maintenance is a process of soil removal designed to retain carpet appearance. Soiling is a cumulative process that can easily be controlled by vacuuming and soil localization. A facility diagram assists the plan by identifying areas of soiling before they become excessively soiled.

An effective plan includes color-coding a floor plan identifying areas of extreme, heavy, medium and light traffic areas; spot prone areas, and other areas that may require additional maintenance and cleaning attention. The color-coded diagram of the facility will assist in scheduling where to clean and how often.

The facility diagram also can be useful in selecting the cleaning method and proper equipment to perform the required tasks in each area. For example, entry areas may require daily vacuuming, weekly pile lifting, and monthly cleaning; whereas, break areas may require a hand-held, spot removal extractor for frequent spot removal. Additionally, the plan can be useful in identifying where to place entry mats.

Each maintenance staff member should be provided with a copy of the plan. The floor plan also may be used to identify newly developed tasks that occur during the course of the business day.

Preventive Maintenance:



Preventive maintenance is the most cost-effective maintenance activity that takes place. These activities include any active or passive activity designed to eliminate soil before it reaches the modular carpet. It may include careful selection of drinks in soda machines that do not contain dyes, which can permanently stain the nylon face yarns and it may include the strategic placement of additional trash receptacles.

One of the most important, yet most often overlooked, preventive maintenance method is the use of transition/entrance matting systems. Up to 90% of the soil load is caused by soil tracked in from outside areas. Entrance matting is an essential part of the CARE maintenance program. The proper use of matting systems can reduce a significant amount of tracked-in soil. Matting systems should be used at all facility entrances and transition points adjoining hard surface flooring.

All matting must be kept clean to make sure they do not become a source of soil. Ideally, a duplicate set of free lay mats should be provided for all areas. Matting systems should be thoroughly vacuumed or changed weekly to ensure a clean mat is in use at all times. Entrance mats should provide at least eight to twelve footfalls of coverage.
Tandus has developed and recommends the Triad® matting system which utilizes a three-tier soil removal process to reduce soil tracked into a facility.

- Tier ONE Exterior Triad® mats- Placed at outside entrances as the initial protection from tracked-in soil. The scraping action of this mat removes excess soil and moisture from foot traffic
- Tier TWO Foyer Triad® Mats- Placed in the vestibule of an entryway. This mat features a brushing action to remove soil and moisture. Foyer mats also may be used as exterior mats.
- Tier THREE Interior Triad® mats- Placed in interior areas adjacent to entryways and other areas exposed to heavy walk-in traffic. This mat offers unique aesthetic appeal, while completing the three-tier soil removal process.

Cleaning: Triad mats are cleaned using the maintenance procedures detailed in this publication includes daily vacuuming and weekly cleaning. Once these mats become filled with soil they then become an additional source for soil. Make sure the mat is dry prior to use.

Daily Maintenance:

Daily maintenance activities include vacuuming and spot removal. These activities are critical for the success of the maintenance plan. Without an adequate plan for these activities, facility appearance will quickly deteriorate to an unacceptable level and the aesthetic value of the modular carpet will be substantially shortened.

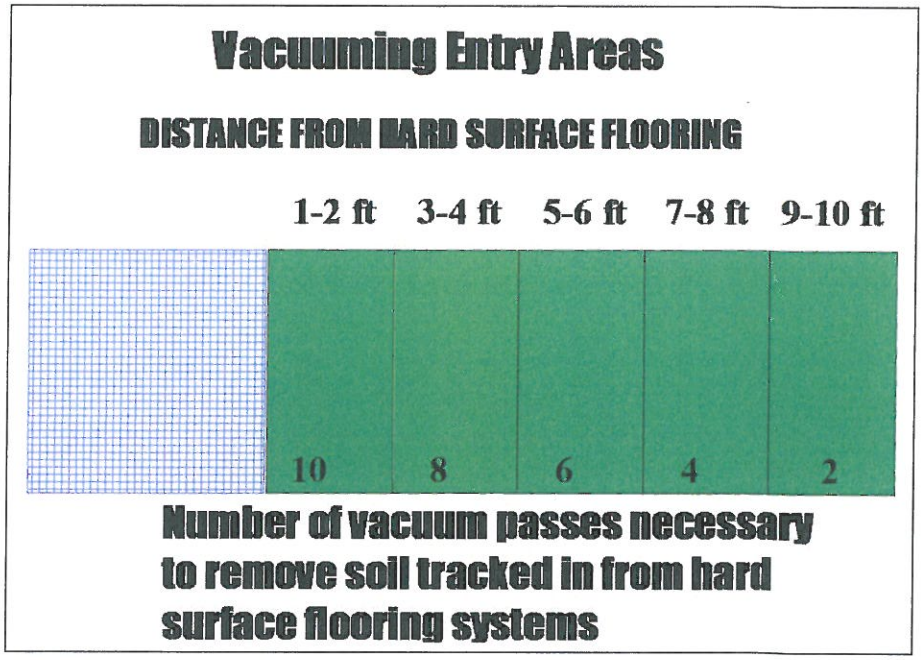
Effective, well-functioning equipment is required for successful daily maintenance. The size and type of equipment will be determined by the requirements of the job. As an example, a wide area vacuum cleaner may be necessary for facilities with large, open areas that must be cleaned on a daily basis. A modular office may require smaller vacuum cleaners in order to clean in tight spaces.

A note on equipment care: Like any tool, keeping cleaning equipment in top working order enhances cleaning results, lowers carpet maintenance costs by extending equipment life and limits staff downtime due to equipment failure. Follow equipment manufacturer recommendations for equipment care. For vacuum cleaners, replace nylon brushes at the first sign of wear. Empty vacuum bags when they become one third to one half full to improve soil removal results. Use only original equipment manufacturer parts for consistent performance results.

Vacuum cleaners should remove adequate soil without introducing substantial particles into the air and without damaging pile yarn. It is impossible to evaluate vacuum cleaner performance based on equipment specifications alone.

Vacuuming :

Vacuuming is the single, most important maintenance activity for modular carpet, so proper vacuuming and vacuum cleaner selection is given a high priority in the CARE maintenance program. Approximately 74%-86% of the soil deposited into carpet is dry particulate soil and may be easily removed with proper vacuuming. Dry soil can abrade and permanently damage pile yarn. Effective dry soil removal can be managed through a continuing planned maintenance program. While vacuuming alone WILL NOT keep textile floor coverings completely clean, vacuuming will remove dry (insoluble) soil that cannot be removed through regular wet extraction cleaning.



Vacuuming must play a significant part in a planned maintenance program. Cubicle spaces, Track-off areas, heavy traffic areas and entry mats should be maintained at least once ***daily*** using an approved vacuum. For improved indoor air quality, the vacuum should offer high efficiency filtration and should be Carpet & Rug Institute Vacuum – Green Label, Seal Of Approval Certified (www.carpet-rug.org).

A note on backpack vacuums: Backpack vacuums may be used in conjunction with an upright vacuum. These units may be used for daily vacuuming, as they have shown to provide even greater dry soil removal than upright units when used on structured backed product, such as modular tiles.

- Entry areas and areas adjoining hard surface flooring materials should receive a larger share of maintenance emphasis than other heavily trafficked areas within the facility. If an adequate job of entry maintenance is performed, dry soil can be limited to the first 12-15 feet after stepping onto the modular tiles. If dry soil can be restricted to these areas, interior maintenance can be redirected to remove surface litter only, rather than spending an inordinate amount of time in trying to remove embedded dry soil. This translates to vacuuming less square footage on a daily basis, thus reducing labor costs. It will not be necessary to vacuum every square foot each day, if entries can be maintained properly.

Tandus
TECHNOLOGIES

Technical Services Bulletin

Spot Removal:

Spot Removal should take place on a daily basis. Each facility should plan to purchase a spot removal extractor. One of the most effective maintenance tools to be introduced in the past few years is the spot removal extractor. These 1-2 gallon portable extractors are lightweight and are available for quick removal of spot and spills. Spot removal, if performed on a daily basis, can be performed with minimal effort.

As an all-purpose spotter, Tandus recommends SYON-5 for the majority of the spills encountered on a daily basis. SYON-5 should be applied directly to the spill and agitated slightly. Extract the solution after 5-6 minutes of dwell time using fresh hot water only. Spills should be addressed as soon as they occur. The sooner removal can be attempted, the higher the probability of complete spill removal. SYON-5 can be purchased from your local Tandus Account Executive.

The following products will be helpful in removing many spots and spills:

SYON-5	Product patented and distributed by Tandus. May be used as the first solution for all spills. Especially effective on Water Soluble food and beverage spills. Dilution ratio is: Undiluted; up to 1 part: 10 parts of hot tap water.

Hot Water Rinse	Used to rinse detergent residues to limit re-soil potential. Use only cold water on blood spills to prevent setting the stain. Hot water should be utilized in every other situation.
Crystal Clear or iCapsol Encapsulator	Good for water-based spills. May be used instead of SYON-5 is no fragrance is desired and no deodorization is needed.
SAF T SOLV	Bane-Clene product (800.428.9512) Non-Flammable, volatile, dry solvent. Can be used on many oil-based spills, as well as ink, gum and other solvent soluble contaminants.
Acetone	Breaks down adhesives, seam sealer etc. Use 'Caution' and follow label directions for proper use.
Spray n' Go	Chemspec product (800.428.9512) An oxidizing bleach. Works on many permanent stains by removing color from the staining agent. Never use Clorox or any chlorinated bleach that will remove color from the nylon face yarn. Simply dilute Spray n' Go; apply to the area and leave. Solution weakens after a few hours so do not premix more than is needed for immediate use.
Acid Rinse	Use white vinegar or a commercially available extraction rinse solution. This removes some yellowing and neutralizes many high pH detergent residues to limit re-soil propensity.

Common Cleaning Suggestions:

There are no standard frequencies that can be suggested for all facilities. Periodic cleaning is dependent upon soiling levels, traffic levels, and the quality of daily maintenance. Due to this fact, some areas may require cleaning on a weekly basis, while other areas only may require cleaning on a yearly basis.

Proper planning will help identify those areas that require more frequent cleaning. The objective should be to limit soiling to smaller areas, before they spread, rather than cleaning the entire facility. It is less costly to clean a 90 square foot entry area on a weekly basis, rather than clean a 2000 square foot outer office quarterly. This should be accomplished by trial and error, with continuous monitoring. The following are areas that are the first to become heavily soiled. These areas are where the bulk of interior soil originates.

- Entry areas – any outside entry. Asphalt sealer, dry from sidewalks, grass clippings, oily soil. These soils accumulate in entries and slowly spread deeper with the building.
- Areas adjoining hard floors- also called transition areas, these areas occur as a result of the failure to properly maintain hard floors. Even hard floors that are superbly maintained allow

finishes to be tracked to the modular tiles. Restrooms, kitchen and break areas, and tile common areas all contribute to soiling. Cleaning these areas before the traffic pattern begins to spread will lighten the maintenance load.

- Break areas- the majority of spills can be found in these areas. Spills transfer to the soles of shoes and spread throughout the facility. Shoes require about 8 steps to be adequately cleaned. This translates to about 18 linear feet.
- Soda Machines and coffee makers- areas next to refreshment areas should be monitored frequently for spills and should be cleaned semi-monthly (every other week), and before spots/ spills becomes apparent.
- Around the desks of the "neatness challenged"- Cleaning staff usually can identify the offices of those employees who seem to have difficulty in reducing spills in their areas. These areas may require more frequent inspection and more frequent spot cleaning.
- Areas of concentrated traffic- these are areas where traffic funnels to a concentrated area.
- Elevators- modular tile allows for easy removal, cleaning and replacement, as needed, if elevators cannot be maintained frequently
- Stairs- because of increased force exertion, soil from shoes is deposited more quickly and more deeply than in other areas.

Color Fading/Yellowing:

Some cleaning agents may affect dyes causing a gradual loss of color over an extended period. Optical brighteners should NEVER be used on any Tandus product. Optical brighteners can cause permanent yellowing or discoloration, and the use of any cleaning solution containing optical brighteners will adversely affect warranty coverage.

Loss of Color in small areas:

Color loss in limited areas typically may be attributed to bleaching or oxidizing agents used in facility. Some bleaching agents may be latent intruders, such as acne medications, that require several months, with heat and moisture to be activated. Others may affect dyes immediately. Typically, these color changes are permanent and cannot be reversed.

Rotary Shampooing/Bonnet Cleaning:

Is never to be used on Tandus products. As an alternative, PLEASE implement a dual cylindrical brush agitation machine. There are a few Tandus Approved machines: Windsor Industries " iCapsol Mini"; XL North/ Grab Carpet Cleaning System's "XLerator", Carpet Cleaner America's "Dri-Star & Renovator" and North American Cleaning Equipment "Duplex Hydrowasher".

The rotary action does not allow for sufficient cooling from the friction and potential yarn abrasion and permanent pile fiber distortion typically results.

Periodic Cleaning:

Tandus products provide end- users with a high performance, easily maintainable flooring options. An organized, fully implemented maintenance plan will ensure many years of

performance from Tandus products and will reduce product lifecycle costs to make them one of the most affordable flooring options available.
For enhanced performance of your new installation, Tandus has evaluated most methods of periodic cleaning, and has selected the optimum cleaning systems. Based on numerous scientific evaluations involving field and laboratory investigations, Tandus suggests the use of both Low Moisture and Hot Water Extraction systems for the maintenance of all of our products.

While there is no standardized cleaning frequency for all facilities, Tandus recommends regularly scheduled primary maintenance cleaning, before the flooring appears soiled. Some areas will require daily attention, while limited-use areas only may require a yearly extraction. Ultimately, localized use, soiling conditions, the quality of daily maintenance and appearance retention inspections will determine the frequency of primary maintenance cleaning.

The following should be considered when cleaning any Tandus products:

1. Operate heating, ventilation, and air-conditioning (HVAC) system during, and for at least 24 hours following, periodic cleaning with Hot Water Extraction.
2. Utilize air movers, in conjunction with HVAC operation, to expedite drying.
3. Limit traffic on damp modular tiles to limit soil tracking and soil wicking.
4. NEVER use any cleaning product that contains optical brighteners or bleaching agents.
5. Select cleaning products with a pH range of 4 - 9.
6. Select cleaning products that do not leave oily or sticky residues. Evaluate residue by diluting and pouring the solution into a pie plate. Place the pie plate in direct sunlight and allow evaporation. Evaluate residue for oily or sticky consistency.
7. Always keep Material Safety Data Sheets (MSDS) available during cleaning.
8. Always read and comply with label instructions of the detergent formulator.

Following is the recommended periodic cleaning procedure for the maintenance for our products:

- Vacuum the area to be cleaned, taking the required time and effort to remove as much dry particulate (insoluble soil) as possible. Hot Water Extraction (HWE) is performed to remove water-soluble soil, which cannot easily be removed with daily vacuuming. Surfactants, used in the cleaning process, attempt to emulsify these non-water soluble particulates, thus increasing cleaning efficacy.
- Following thorough vacuuming, apply a slightly alkaline prespray surfactant or SYON-5 directly to the pile fiber. Most surfactants require 8-10 minutes of dwell time to enable emulsification and saponification of the contaminants.
- Agitate the area with a pile brush or cylindrical brush agitation, such as the iCapsol Mini/ ProCaps by Windsor/ Prochem OR the XLerator (XL North). NEVER USE A ROTARY BONNET or ROTARY BRUSH for mechanical agitation. Cylindrical agitation will assist the surfactant solution in lifting soil from the pile fiber and pile lifting of the face yarn.

- Extract the surfactant solution and attached soil particles using an extractor with fresh water only. Do not use a detergent solution in the rinse tank. The use of an Extraction Rinse/ Acidic Rinse is suggested.
- After thoroughly rinsing, continue to extract the area using "dry" strokes (no water injection) until suitable moisture removal is attained. Under no circumstance should any textile flooring product be allowed to remain wet for more than 8 hours.

Other considerations:

Soiling that reoccurs more than 24 hours following cleaning often may be attributed to detergent residues that were not adequately rinsed. Evaluate detergency by pouring water onto pile fiber and briskly agitating with a spotting brush. Look for foaming or other signs of detergent residue. If detergent is present, continue to extract these areas until detergent is thoroughly rinsed. In severe situations, an acid rinse may be applied as a pre-spray or added to the extractor rinse tank to neutralize detergent residues. In severe situations, or in areas of Salt and Ice Melt Compound utilization, an acidic, extraction rinse may be applied as a pre-spray and added to the extractor rinse tank to neutralize high pH residues.

Some primary cleaning methods, such as the Windsor iCapsol System; Racine Industries HOST System, the milliCare System and carpet Cleaner America have been proven effective in maintaining desired appearance levels and improving the quality of overall aesthetic value of all Tandus products. These methods may be used to extend the time between wet extractions.

LIMITED WARRANTY INFORMATION

SECTION 1: RUBBER SHEET FLOORING

Limited 5-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of five (5) years of Commercial use that rubber sheet flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-5).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 2: COMPRESSION MOLDED RUBBER TILE

Limited 5-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of five (5) years of Commercial use that molded rubber tile flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-5).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 3: RUBBER OR VINYL STAIR TREADS

Limited 5-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of five (5) years of Commercial use that rubber or vinyl stair tread products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-5).

SECTION 4: FINISHING BORDERS (WALL BASE & ACCESSORIES)

Limited 2-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of two (2) years of Commercial use that rubber or vinyl wall base and/or accessory products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2).

SECTION 5: VINYL SHEET AND TILE FLOORING

Limited 5-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of five (5) years of Commercial use that vinyl sheet and/or tile flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-5).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 6A: VINYL COMPOSITION TILE AND PLANK

Limited 5-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of five (5) years of Commercial use that vinyl composition tile and plank flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes

the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-5).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 6B: VINYL TILE FLOORING

Limited 10-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of ten (10) years of Commercial use that vinyl tile flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-10).

Tarkett warrants that the products will not wear through for the warranty period of ten (10) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 7: LINOLEUM SHEET FLOORING

Limited 5-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of five (5) years of Commercial use that linoleum sheet flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-5).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 8A: LUXURY TILE AND PLANK

Limited 10-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of ten (10) years of Commercial use that luxury tile and plank flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-10).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 8B: LUXURY TILE AND PLANK

Limited 20-Year Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of twenty (20) years of Commercial use that luxury tile and plank flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); Material Only (Years 3-10); 50% Material Only (Years 11-15); and 25% Material Only (Years 16-20).

Tarkett warrants that the products will not wear through for the warranty period of five (5) years of Commercial use. For claims based on wear-through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 9A: LUXURY TILE AND PLANK (LIGHT COMMERCIAL)

Light Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of seven (7) years of Light Commercial use that luxury tile and plank flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein. Light Commercial applications are defined as foot-traffic only (no rolling loads).

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); Material Only (Years 3-5); and 50% Material Only (Years 6-7).

Tarkett warrants that the products will not wear through for the warranty period of seven (7) years of Light Commercial use. For claims based on wear- through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 9B: LUXURY TILE AND PLANK (LIGHT COMMERCIAL)

Light Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of ten (10) years of Light Commercial use that luxury tile and plank flooring products conform to written specifications and are free of manufacturing defects, subject to the terms and conditions specified herein. Light Commercial applications are defined as foot-traffic only (no rolling loads).

The customer must notify Tarkett of any obvious visual defects prior to installation; otherwise this warranty will not apply. If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); Material Only (Years 3-5); and 50% Material Only (Years 6-10).

Tarkett warrants that the products will not wear through for the warranty period of ten (10) years of Light Commercial use. For claims based on wear- through, the customer must notify Tarkett and permit an inspection of the flooring. If Tarkett determines that the original flooring is worn through, Tarkett will replace or repair the worn flooring at its own cost; however, labor costs will be the customer's responsibility except as provided on the prorated basis described in the prior paragraph.

SECTION 10: UNDERLAYMENT

Limited 10-Year Light Commercial Warranty for Manufacturing Defects: Tarkett warrants from the date of purchase for a period of ten (10) years of Light Commercial use of SureStart™ underlayment with approved Tarkett LVT products, subject to subfloors being prepared & meeting Tarkett Installation Instruction guidelines and subject to the terms and conditions specified herein.

The customer must notify Tarkett of any obvious visual defects or concerns prior to install; otherwise this warranty will not apply.

If the defect is found and Tarkett is notified in writing prior to installation, Tarkett will replace any defective product, at no charge. If the customer believes the product to be defective after installation, the customer must promptly notify Tarkett and permit an inspection of the product. If, upon inspection, Tarkett determines that the product is defective, Tarkett will replace or repair the defective product at its own cost, subject to the limitations in this warranty, and prorated as follows: Material and 100% Reasonable Labor Costs (Year 1); Material and 50% Reasonable Labor Costs (Year 2); and Material Only (Years 3-10).

ALL TARKETT COMMERCIAL PRODUCTS:

This Limited Warranty applies only for products installed, used and maintained according to the written recommendations and specifications provided at the time of material purchase.

Warranty Claim Procedure

To be eligible for replacement under this warranty, the customer must file a claim by giving Tarkett written notice of the defect. This notice must be filed immediately, but in no event more than 10 days following discovery of the defect. Notice shall be given to Tarkett at its corporate address of 30000 Aurora Road, Solon, Ohio 44139. Phone: (800) 899-8916; Fax: (440) 543-5774.

If defective product has been discontinued or is otherwise unavailable, Tarkett reserves the right to select and supply the customer with Tarkett replacement flooring, similar in quality and quantity to the material claimed to be defective.

WARRANTY EXCLUSIONS

The Tarkett Limited Warranty does not apply to:

- The exact matching of shade, color or mottling.
- Tears, burns, cuts or damage due to improper installation or use or improper cleaning agents and maintenance methods.
- Labor costs outside of prorated schedule defined in the warranty.
- Sales of non-first quality materials, i.e., "seconds," "off goods" or other irregular flooring. Such non-first quality materials are sold "AS IS."
- Issues associated with the use of adhesives other than those recommended by Tarkett.
- Issues caused by moisture or alkali in the subfloor. Pre-installation moisture and alkali testing is required and must be made available to Tarkett upon request.
- Issues of discoloration or staining associated with subfloor contamination or markings that bleed through the flooring material.
- Problems caused by installation, uses and maintenance that are contrary to Tarkett's specifications, recommendations or instructions.
- Material installed with obvious defects not notified to Tarkett prior to installation.
- Exterior installations – Tarkett products are designed for interior applications only.
- Fading and/or discoloration resulting from heavy sunlight penetration and ultraviolet ray exposure from direct or glass-filtered sunlight.
- Damage to flooring products caused by high or spiked heels, improper protectors/casters or furniture rests. Some rolling-type casters on furniture or appliances may damage resilient flooring. Warranty as to the suitability of the factory-installed casters rests with the furniture or appliance manufacturers. To avoid Tarkett warranty exclusions, casters must be suitable for use on resilient flooring.
- Damage to flooring products from pallet jack and tow-motor traffic.
- Premature wear or deterioration from spikes and skate blade exposure.
- Variations in color or embossing between products, photography or printed color illustrations.

- Installation of Tarkett flooring in work or commercial areas exposed to oil and grease, such as commercial kitchens or butcher shops. Defiant™ Oil and Grease-Resistant Rubber tiles are recommended in such situations.
- Additional expense associated with overtime, replacing or moving appliances or furniture, business interruptions, loss of use or other related costs associated with the replacement of the flooring.
- Shifting, cracking, or movement of the substrate or foundation.
- Hydrostatic pressure, flooding, standing water or moisture on the surface of the substrate.
- Issues related to exposure to heavy rolling loads (Light Commercial Products).

WARRANTY DISCLAIMER

EXCEPT AS STATED HEREIN, TARKETT MAKES NO WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED. ALL IMPLIED WARRANTIES WHICH MAY ARISE BY LAW, IMPLICATION OF LAW OR APPLICATION OF COURSE OF DEALING, PERFORMANCE OR USAGE OF TRADE INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, ARE EXPRESSLY DISCLAIMED AND EXCLUDED. ANY ORAL STATEMENTS ABOUT THE PRODUCTS DESCRIBED HEREIN ARE NOT WARRANTIES, SHOULD NOT BE RELIED UPON BY BUYER, DO NOT FORM ANY PART OF THE BASIS OF THE BARGAIN, AND ARE NOT PART OF THIS OR ANY OTHER LIMITED WARRANTY. NO AGENT, DISTRIBUTOR OR REPRESENTATIVE OF TARKETT, EXCEPT AN AUTHORIZED OFFICER OF TARKETT, SHALL HAVE AUTHORITY TO AGREE TO ANY TERM, CONDITION OR PROVISION INCONSISTENT HEREWITH OR NOT CONTAINED HEREIN. IN NO EVENT SHALL TARKETT BE LIABLE TO BUYER FOR INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES, INCLUDING WITHOUT LIMITATION, DAMAGES OR LOSS OF PROFIT ARISING OUT OF OR RELATING TO ANY BREACH OF THIS WARRANY, REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT, OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

These warranties provide specific legal rights; these and other rights may vary from state to state. To learn the legal rights in a specific state, consult the local or state Consumer Affairs Office or the State Attorney General.

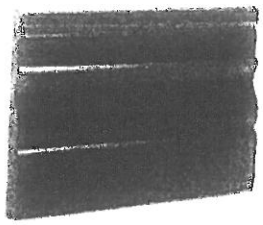
Johnsonite®

Rubber & Vinyl Wall Base

Maintenance Instructions

Routine Cleaning

Johnsonite Rubber and Vinyl Wall Base are maintained with regular wiping with a soft, wet cloth. A mild soap may be added to the water. Coarse scrubbing media or harsh cleaning chemicals may damage the surface of the wall base.



For further questions please contact Johnsonite Customer Service or Technical Services Department at 1-800-899-8916.

Johnsonite

Millwork® Resilient Wall Base

Installation and Maintenance Instructions

Introduction

Johnsonite Millwork Resilient Wall Base replicates the look of a finely routed wood crown molding, but is manufactured with the most advanced technology and from the highest quality resilient materials to assure dimensional stability, precision fit, and uniform height and gauge. Johnsonites unique finish resists scuffing, gouging, will not fade, discolor, or crack with age and is easy to maintain.

The highest quality of materials and workmanship are employed in the manufacture of Johnsonite Millwork Resilient Wall Base products and careful inspection is made before shipment. However, a quality installation is the responsibility of the installer and we recommend that all materials be checked for satisfactory color match before you begin installation.

Johnsonite cannot accept any responsibility for loss or damage that may result from the use of this information, due to the possibility of variations of processing or working conditions and/or workmanship outside our control. Users are advised to confirm the suitability of this product by performing their own tests.

Handling and Storage

1. Johnsonite Millwork Resilient Wall Base and adhesives must be site conditioned at room temperature for 24 hours prior to, during, and after the installation. **Room temperature must be between 65° and 75° F (18° and 22° C).**

2. Care must be taken not to pull the wall base excessively when removing it from the carton or unrolling the coils. **The wall base will not shrink, but it will relax to its original length, if stretched.**

Surface Preparations

1. Floors and walls must be clean, dry, free of dust, all paints, wallpaper, and all other foreign matter, which may affect adhesive bonding.

2. **Do not install Johnsonite Millwork Resilient Wall Base over vinyl wall coverings or epoxy painted surfaces using acrylic latex water-based adhesives. (Note: Some high solids containing latex paints formulations may impede the adhesive drying process similar to epoxy paint.)**

3. **Never install Johnsonite Millwork Resilient Wall Base on surfaces that will be exposed to drastic temperature changes or moisture.**

4. **Equipment/Materials Requirements:**

   - Standard or Sliding Compound Miter Saw, Radial Arm Saw, or Table Saw equipped with a Carbide or Diamond tip blade with 80 teeth or greater
   - Approved Johnsonite Adhesive 1/8" square-notched trowel for acrylic adhesive
   - Brush or roller for contact bond adhesive
   - Utility knife
   - Straight edge
   - Tape measure
   - Carpenter's square and protractor
   - Hand roller

Millwork Wall Base Installation

1. Cut the Millwork Resilient Wall Base to the required lengths using a Standard or Sliding Compound Miter Saw, Radial Arm Saw, or Table Saw equipped with a Carbide or Diamond tip blade with 80 teeth or greater.

   Note: When butting wall base seams together, it may be necessary to square cut the factory edge if butt ends do not align.

2. For installations on **porous wall surfaces**, spread Apply Johnsonite #960 Resilient Wall Base adhesive to the ribbed surface (back) of the wall base with an 1/8" square-notched trowel. **The adhesive should cover 80% of the back surface.** Leave a 1/4" (6.35mm) uncovered space at the top of the wall base to prevent the adhesive from oozing onto the wall above the base when installed.

3. For installations on **non-porous wall surfaces** (i.e.: metal, epoxy paint, ceramics, etc.) apply Johnsonite #945 Contact Bond adhesive to both the wall surface and the back of the wall base. Allow adhesive to thoroughly dry to the touch. The adhesive will turn from "white to clear" when dry. Carefully position the wall base on the wall surface.

   Note: Once contact is made to the wall surface, the wall base cannot be moved.

4. Position wall base on wall surface and roll with hand roller. **Always roll back to starting point to prevent stretching the wall base.**

5. Clean-up: Remove wet adhesive with a water dampened cloth. If adhesive has dried, use a cloth dampened with mineral spirits.

Optional Quarter Round and Shoe Moulding Installation

1. The 1/2" quarter round (QTR-A) and 1-1/2" shoe moulding (SHU-A) are provided with a pressure sensitive adhesive backing for ease of installation.

2. After the Millwork Wall Base has been installed, wipe down the surface of the wall base using denatured alcohol on a clean white rag to remove any contaminants. Place the quarter round or shoe moulding profile on the floor with the adhesive backing facing the wall base.

3. Remove the release paper from the adhesive backing and press the moulding firmly against the face of the wall base. (Do not adhere the moulding to the floor) Roll with a 2" hand roller to ensure proper adhesion.

Millwork Wall Base Corner Installation

Johnsonite Millwork Resilient Wall Base Inside and Outside Corners are fabricated utilizing the same equipment and techniques required for traditional wood molding or baseboard profiles.

Outside Corners:

1. Position a sufficient length of wall base on the wall so that it tightly abuts the previously installed section and extends past the corner.

2. Using a scribe or pencil, mark the wall corner bend location along the top edge of the wall base.

3. Set the saw blade angle to the required miter angle for the corner using a protractor.

4. Place the wall base section against the saw fence or miter guide so the wall base is laying flat on the machine table with the contoured (show) surface facing up and perpendicular to the saw blade.

5. Align the mark on the top edge of the wall base with the saw blade and cut the wall base to the proper miter angle. Repeat the above procedure for the other side of the corner.

6. Place the two mitered sections of wall base on the corner and check for proper fit. Trim, if necessary, to obtain a tight fit at the corner.

7. Apply the adhesive to the ribbed back of one section of the wall base corner, position the section in place, and roll with a hand roller to ensure proper adhesion to the wall surface.

8. Repeat procedure #7 for the opposite side of the corner. Attention should be given to a tight and even fit to the corner.

   Note: To obtain a tighter and more secure fit between the two mitered sections at the corner, glue the two mitered areas together with contact bond adhesive.

Inside Corners:

1. Set the saw blade angle to the required miter angle for the corner using a protractor.

2. Place the wall base section against the saw fence or miter guide so the wall base is laying flat on the machine table with the contoured (show) surface facing up and perpendicular to the saw blade.

3. Cut the wall base to the proper miter angle. Repeat the above procedure for the other side of the corner.

4. Place the two mitered sections of wall base on the inside corner and check for proper fit. Trim, if necessary, to obtain a tight fit at the corner.

5. Apply the adhesive to the ribbed back of one section of the wall base corner, position the section in place, and roll with a hand roller to ensure proper adhesion to the wall surface.

6. Repeat procedure #5 for the opposite side of the corner. Attention should be given to a tight and even fit to the corner. (Note: To obtain a tighter and more secure fit between the two mitered sections at the corner, glue the two mitered areas together with contact bond adhesive.

Maintenance

Johnsonite Millwork Resilient Wall Base is maintained with regular wiping with a soft, wet cloth. A mild soap may be added to the water. An acrylic wax may be applied to increase the gloss level when desired. Coarse scrubbing media or harsh cleaning chemicals may damage the surface of the wall base.

HOMOGENEOUS TILE AND SHEET

iQ™ Maintenance Instructions

Johnsonite
A Tarkett Company

iQ Granit™, iQ Natural, and iQ Optima®

Introduction

Johnsonite's iQ flooring solutions are produced with high quality raw materials, unique manufacturing processes, and innovative surface treatments. This innovative technology produces a glass hard surface that requires only dry buffing to restore the original appearance and requires no polish and no finish for life.
The following guidelines are recommended for the proper care and maintenance of the floor.

Post Installation / Initial Cleaning

Job site conditions will cause grit and dirt to accumulate. Initial cleaning must not be performed until 72 hours after installation. However, it is necessary the floor be swept and protected until maintenance begins.

1. Thoroughly sweep or vacuum the flooring to remove all loose dirt and grit.
2. Prepare a cleaning solution using one of the recommended pH neutral cleaners identified on the reference chart below.
3. The dilution ratio depends on light to heavy soil conditions. Follow the manufactures label instructions.
4. Apply the cleaning solution with a nylon or rayon mop.
5. Let the cleaning solution dwell for 5 to 15 minutes (dwell time is based on soil conditions of the floor). **IMPORTANT** – Do not allow the solution to dry.
6. Scrub the flooring using a single disc rotary machine (175 – 350 RPM) equipped with a red pad.
7. Remove the cleaning solution using a wet vacuum or a mop.
8. Rinse the floor thoroughly with clean water.
9. Allow the flooring to dry completely.

NOTE: The cleaning process may need to be repeated on heavily soiled floors.

Preventive Care

1. An effective barrier matting system should be installed at all entrances to reduce cleaning costs and extend the life of the floor.
2. Protect the flooring from damage by using good quality protective feet and casters for chairs, tables, and other furniture using products designed for resilient floors. Caster or wheel damage can be avoided with the use of chair pads.
3. Do not use steel wool, strong solvents (Lestoil, Top Job, etc. and similar products), gasoline, turpentine, and acetone.
4. Sweeping compounds or mops treated with petroleum solvents, silicone compounds or loose abrasives can damage the flooring.
5. Coatings such as shellac, lacquer, varnish, and paste wax or those containing aromatic solvents are not recommended.
6. Some disinfectants and insecticide sprays contain oil or solvents which may settle on the floor in sufficient quantity to discolor, cause slipperiness, and harm the floor covering.

Routine / Daily Cleaning

It is very important to clean the flooring at a frequency consistent with the amount and type of traffic and soil conditions. Daily cleaning is recommended.

1. Thoroughly sweep or vacuum the flooring to remove all loose dirt and grit.
2. Prepare a cleaning solution using one of the recommended pH neutral cleaners identified on the reference chart below.
3. The dilution ratio depends on light to heavy soil conditions. Follow the manufactures label instructions.
4. Damp mop the cleaning solution onto the floor with a nylon or rayon mop. In place of damp mopping, when the space or area will allow, utilizing an auto scrubber equipped with a red pad will ease and expedite the daily routine. Check the manufacturers label instructions for proper use.
5. Allow the flooring to dry completely.
6. Remove minor stains and scuffs in conjunction with the damp mopping. Use a white or red pad if required.

Periodic / Deep Cleaning

When Routine / Daily Cleaning no longer provides adequate results, a more aggressive deep cleaning is required to thoroughly clean the floor.

1. Thoroughly sweep or vacuum the flooring to remove all loose dirt and grit.
2. Prepare a cleaning solution using one of the recommended pH neutral cleaners identified on the reference chart below.
3. The dilution ratio depends on light to heavy soil conditions. Follow the manufactures label instructions.
4. Apply the cleaning solution with a nylon or rayon mop.
5. Let the cleaning solution dwell for 5 to 15 minutes (dwell time is based on soil conditions of the floor). **IMPORTANT** – Do not allow the solution to dry.
6. Scrub the flooring using a single disc rotary machine (175 – 350 RPM) equipped with a red pad.
7. Remove the cleaning solution using a wet vacuum or a mop.
8. Rinse the floor thoroughly with clean water.
9. Allow the flooring to dry completely.

NOTE: The cleaning process may need to be repeated on heavily soiled floors.

Dry Buffing: For customers who prefer to dry buff the flooring.

1. Thoroughly clean the floor prior to beginning the buffing procedure.
2. Buff the floor using a single disc, high speed, rotary machine (maximum 1500 RPM) equipped with a white pad.
3. Frequency of buffing will be determined by the amount and type of traffic.

NOTE: To avoid damage, care must be taken when dry buffing.

Flooring may be maintained by following a conventional floor finish maintenance system if desired. Conventional floor finish maintenance systems require periodic stripping of the floor finish. The use of floor finish and stripper to maintain Johnsonite iQ Vinyl Tile and Sheet flooring is optional and is not required.

limited warranty

product warranty: nora systems, Inc. ("nora"), warrants its nora®, norament®, and noraplan® rubber flooring, norament® rubber stairtreads, (except for the safety grit strip), accessories and adhesives, ("products") to be free of defects in material or workmanship, for one year from the date of purchase from nora. In addition, nora warrants against excessive wear of the listed products as set forth below, and nora warrants the conductivity of its Electro Static Dissipative, ("ESD") flooring system (flooring and adhesive) as set forth below.

EXCEPT FOR THE LIMITED WARRANTIES SET FORTH HEREIN, nora EXTENDS NO OTHER WARRANTIES OR GUARANTEES, EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR EXACT MATCHING OF SHADE, COLOR OR MOTTLING. nora HEREBY DISCLAIMS ANY OTHER WARRANTY OR GUARANTEE UNLESS EXPRESSLY AUTHORIZED AND ENDORSED IN WRITING AS SET FORTH BELOW.

No agent, employee or representative of nora is authorized to make any warranty or guarantee concerning the products. Any alteration, amendment or waiver of this Limited Warranty must be in writing and signed by an officer of nora.

excessive wear warranty: nora warrants the following products will not wear in excess of the following measurements which shall be prorated from the date of purchase:

norament products	<.0025" wear per year
noraplan products	<.0035" wear per year
norament stairtreads	<.0025" wear per year

conductivity warranty: nora warrants the following ESD flooring system products, installed with nora's conductive adhesive (acrylic or PU), when tested according to the test procedures of ESD S7.1-94 and ASTM-F-150 under >30% relative humidity at room temperature will measure between:

norament® grano ed	10^6 - $<10^9$ OHMS
noraplan® environcare™ ed / mega ed	10^6 - $<10^9$ OHMS

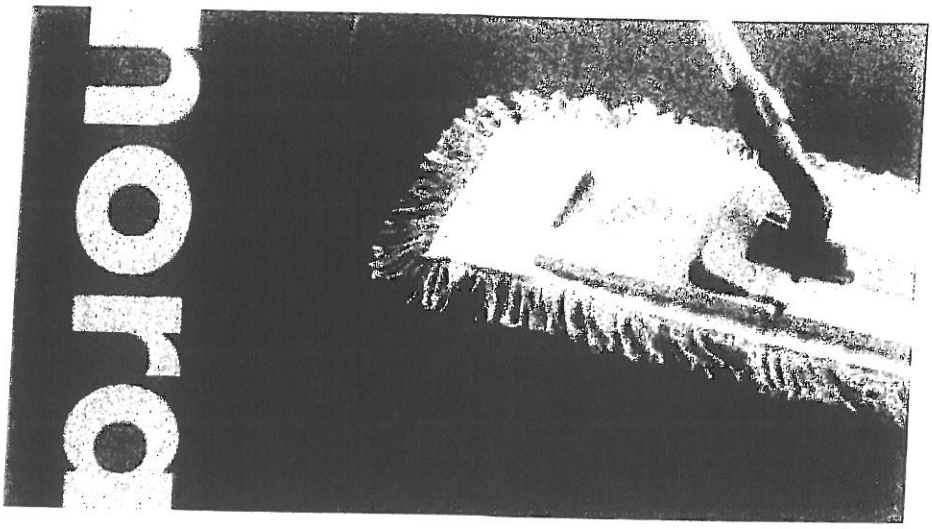
Warranty for other conditions supplied upon request.

notice of claims: To make a claim under any warranty the buyer or end user must provide written notice to nora at 9 Northeastern Blvd., Salem, NH 03079, within thirty (30) days of discovery of any alleged defect of the product. nora must be given the opportunity to inspect and examine the product.

limitation of liability: nora shall not be directly or indirectly liable for any losses, claims or damages regarding any products that have not been installed and maintained according to nora's installation and maintenance guides, that were damaged by a third party, that were installed over an improper subsurface or improperly prepared subfloor, that were improperly repaired, or that were affected by any other mechanical influences including stilettos. Office chairs/furniture wheels shall be type W according to EN 12529. Excluded from this warranty – "fading or discoloration from prolonged, excessive exposure to sunlight or heat". nora shall not be liable for any losses, claims, or damages in excess of the cost of the products invoiced by nora. nora shall not be liable for any incidental, consequential, enhanced or punitive damages. nora reserves the right to replace at no cost that portion of the products that are alleged to be defective but excluding all costs of transportation and installation. nora's maximum liability whether in tort, contract, or otherwise shall be the cost of the products invoiced by nora.

This limited warranty and the installation and maintenance guides are subject to change. Please contact nora for the latest versions. For additional information regarding usage in recommended applications, please refer to www.nora.com/us or call 1-800-332-NORA. Warranty periods commence on the date of purchase of the product by the buyer or end user, whichever is first

governing law; venue: The rights and obligations of the parties hereto and the interpretation, construction and effect of any provision hereof or any contract formed pursuant hereto shall be governed by and construed in accordance with the laws of the state of New Hampshire, without reference to its conflict of law rules.



Supersedes all previous information. Effective March 2012.

Maintenance

Cleaning and maintaining nora rubber flooring.

Your nora rubber flooring requires no finishing, waxing or sealing. All nora floor cove nonporous and dirt-repellant surface—eliminating the need to use unfriendly, harsh c Understanding how to properly clean and maintain your new rubber floor, even by us keep it looking attractive for years to come. Follow the tips below and download the s for your application.

Quick Maintenance Tips

1. Always use "wet floor" signs and/or caution tape when performing any wet clea
2. Refer to MSDS for proper personnel protection requirements before using clea
3. Do not flood the floor.
4. The floor will be slippery when wet or contaminated with foreign materials. Pror foreign materials to maintain the slip-resistant properties of the flooring.
5. Never use grit brushes, black or brown cleaning pads.
6. Use a red cleaning pad for all norament and noraplan surfaces.
7. Make sure to maintain a good walk-off area in the entrance of the facility, in ad mopping.
8. If required, dry buff nora floor coverings with a white cleaning pad or carpet cot
9. Do not allow any metal furniture or trash cans to be in contact with the wet floo

Vintage
PREFINISHED HARDWOOD FLOORING

Vintage Installation and Maintenance Information

This Installation and Warranty Card is for all Vintage Product lines.

General Installation Instructions for all products

Ensure the site environmental conditions are suitable for installation and take record. This includes: Relative Humidity, Subfloor or Concrete Moisture Reading, condition of product to be layed, sources of water or humidity extremes. Do not continue, if any of the conditions in these directions and warranties are not met and/or according to the NWFA instructions.

Ensure all other trade activities are completed as they may impact the quality of the installed flooring. Wood flooring is one of the last products to be installed at a construction site. Window, door, dry walling and painting and HVAC activation (on for >7 days) must be completed and dry before installation begins. This is to avoid humidity extremes and damages that void the warranty.

Acclimatize the product according to the product directions (many Vintage products are designed to install and perform better without acclimatization). See more information below.

Ensure the subfloor is perfectly level (1/8" per 8'). Level high spots and fill low spots as required. Ensure the subfloor is firmly anchored ensuring no movement, flex or squeaking.

Ensure the subfloor is less than 12% MC and record readings, subfloor must be within 4% of the actual floor being installed.

Thoroughly sweep and vacuum the area the flooring is to be installed.

Prepare installation along longest straightest wall first using long pieces for starting row and across (perpendicular to) floor joist.

Open and select products from multiple boxes to ensure an appropriate mix of lengths, wood character and color.

Inspect each piece before installation. Do not install any defective piece or piece that has a color, character or grain etc. that may not suit the look of the floor and may be displeasing to the consumer. These pieces can be cut and used for starters, installed in a less conspicuous location (E.g. Closet, under Cabinets etc.) or discarded. If you choose not to install these pieces please note they are not covered by Vintage's warranty.

Preparation of Plywood & Concrete Subfloor

Vintage Hardwood Flooring recommends that all Vintage Hardwood Flooring be installed with a minimum of 5/8" (15.8750 mm) A.P.A. approved, C.S.P/D.F.P. stamped plywood, or 3/4" O.S.B. Underlay grade PS2-92 rated, or concrete slab. The use of particleboard as a subfloor will automatically void the warranty. Consult your Authorized Vintage Dealer for recommendations on your specific subfloor application. Any failure of Vintage Hardwood Flooring relating to improper subfloors, or subfloor preparation is not the responsibility of Vintage Hardwood Flooring, and will not be covered under warranty. Sweep and vacuum subfloor. Ensure that old carpets, oils, foreign particles, protruding nails, carpet glues, etc., are removed prior to installation. For wood subfloors, make sure they are level, clean, dry and securely fastened. Repair and/or replace any section that is rotted or damaged. Always follow local building codes.

Do not install Vintage's Pioneered Solid hardwood flooring over concrete unless an acceptable plywood subfloor and vapor barrier is firmly anchored over sleepers and a dehumidifier is in place to continuously remove excess humidity from the room.

Moisture Content
Acceptable subfloors & ground levels installations for Vintage Product

Pioneered Solid	Plywood, OSB	At or above ground level only	Nail
Crafted Engineered	Plywood, OSB or Concrete	At, above or below ground level	Nail, glue or float
Solid Sawn	Plywood, OSB or Concrete	At, above or below ground level	Nail, glue or float
Northern Solid Sawn	Plywood, OSB or Concrete	At, above or below ground level	Nail, glue or float
U-LOC	Plywood, OSB or Concrete	At, above or below ground level	Float

Plywood: The maximum moisture content (MC) for plywood should never exceed 12%
Concrete: The maximum moisture content for concrete should never exceed 12%
The difference between the flooring and the subfloor should never exceed 4%

Tools & Accessories - For all types of Installations

Table saw, miter saw, measuring tape, nail set, hammer, tapping block, nail gun (manual or pneumatic), square, chalk line, putty fill, broom, dustpan and Vintage Cleaning Kits. Always consult the dealer you purchased your flooring from for appropriate installation tools.

Tools & Accessories - Nail Down
15 lb felt or equivalent, nail gun or staple gun (manual or pneumatic), square, chalk line, putty fill, broom, dustpan and Vintage Cleaning Kits. See Chart #4 for nail gun & cleat recommendations.

Tools & Accessories - Glue Down
Trowel, cleaning solvent and moisture cured glue – See Chart #5 for recommendations.

NOTE: It is extremely important that you use the proper trowel to ensure maximum coverage and produce a good bond between subfloor and flooring. You may also require a 100-150 pound roller.

Tool & Accessories - Floating Floors
Vintage T & G glue, Vintage's Premium Underpad, mineral solvents (for cleaning glue), and shims.

** All flooring strips should be installed perpendicular (right angle), to the floor joists. In some applications, installing parallel to floor joist may be required for aesthetic reasons. Consult your dealer, installer, and developer for their recommendations and building code requirements.

Installation - Expansion Gap allowances

Pioneered 3/4"	Leave 3/4" around entire room
Crafted 9/16"	For Nail & glue down leave 1/2". Floating leave 5/8" around entire room
Solid Sawn 3/4"	Leave 3/4" around entire room
Northern Solid Sawn 3/4"	Leave 3/4" around entire room
U-LOC 5/8"	For rooms up to 26'x 52'- Leave 1/2" (13 mm)
	For rooms up to 33'x 66'- Leave 5/8" (16 mm)
	For rooms up to 39'x 79'- Leave 3/4" (19 mm)

For floating floors a 3/4" expansion gap must be left up against all vertical obstructions

(Chart #1)

Material Acclimatization

Pioneered:
Open boxes fully (never just the ends) and allow the wood to acclimate to the ambient temperature of the room. The wood must be given 48-72 hours at approx. 23° C (72°F) and a relative humidity of 40% before installation. Special note: In some instances you may not be able to acclimate flooring.

When the relative humidity is too high or to low (above 50 % and below 40 % RH), acclimating may not be suitable. Always consult your hardwood flooring dealer or installer for their recommendations. Expansion and contraction caused by acclimating is not covered under this warranty.

Crafted, Solid Sawn, Northern Solid Sawn & U-LOC: Do not acclimate. Flooring must be installed immediately upon opening the boxes.

Hardwood flooring should be one of the last items installed when renovating your home. For new construction, the heating system must be operating for at least one week (7 days) at normal residential temperatures (approx. 70°F / 22°C) prior to installation.

Additional Allowance Recommendations

This will cover waste, defects or personal preference of boards. It is the installer's and owner's responsibility that all pieces be inspected, and graded prior to installation. If any piece does not meet installer/owner's personal standard, do no install these pieces. If you choose not to install pieces because of appearance, length of piece, or your personal visual standards, this will not be considered part of the 5% defect allowance. It is also recommended to have additional materials kept in case of future repairs.

2 1/4" - 4 3/8" widths	5% additional
5" - 10" widths	8% additional

(Chart #2)

Important Notes

FOR ALL INSTALLATIONS - ALWAYS WORK FROM 5-6 DIFFERENT BOXES AT ONE TIME

The installer is the final grader. Installer/homeowner will take full responsibility for all flooring that is installed, even if the primary owner of the residence is absent at the time of installation. If you are unsure of any requirements, please consult a Vintage dealer prior to installation. Although Vintage Hardwood Flooring takes every precaution to ensure that Vintage's Hardwood Flooring is graded and shipped to industry standards, we suggest you inspect each piece of Vintage Hardwood Flooring before installation. Boards that you may not like the look of, or contain a mark that you think will affect the look of the floor should be used as cut pieces for your start/end pieces. You may also use these pieces in less conspicuous areas such as in closets or under couches and sofa's etc.

Nailed Down Application

See Chart #4 for nail gun and cleat recommendations

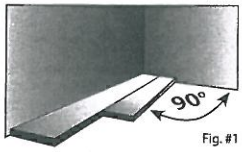

Fig. #1

Step #1 – Mark your starting line using a chalk line, draw a guide line out from the starting wall by measuring out the width of one board plus (see Chart #1). This line is where your first strip of flooring is going, and also allows for the expansion gap. It is very important for the starting line to be straight and square (see Fig. #1).

Step #2 – Install the strips
Face nail or glue using a moisture cured adhesive (best practice) on the first row of strips with the grooved side facing the wall; put the nails as close to the wall as possible. This way, the quarter round will cover the nail heads. You may have to face nail for the first few rows before there is enough room to use the nail/staple gun. It must be nailed/stapled down or glued by hand rather than with the hardwood floor-nailing machine because of the vertical wall obstruction. When clearance allows, start using the hardwood floor nail/staple gun. Nails/staples should be spaced a minimum 2"- 3" (57 – 76 mm) from both ends of the boards, and for all other nails/staples, see Chart #3. Measure and cut the strip to the required length to finish the first row. The remaining section should be used to start the second row, in order to minimize cut waste. The strip selection for completing the first row must be long enough to yield a remaining section of adequate length. Leave the required expansion gap (Chart #1) between the wall and the end of each strip in each row. The subsequent rows must be installed in the same manner. Don't be afraid to waste a few strips in order to adjust and test the nailing machine. See Hardwood Floor Nailing Tips. When you reach the last few rows, you may not be able to complete these rows with the nail/staple gun, due to vertical obstructions. Toe nail, face nail, or glue the last remaining rows.

NOTE : You may have to rip the last strips along the wall in order for them to fit properly. Don't forget to leave the minimum space for expansion (Chart #1).

Step #3 - Finally
Install the transition pieces, baseboards and/or quarter round moldings. Following the initial installation, vacuum thoroughly and clean the floor with your Vintage Hardwood Cleaning Kit. For detailed installation guidelines for your specific installation, contact your Authorized Vintage Hardwood Flooring Dealer.

Installing over a crawl space: You may install over a crawl space providing care has been taken to cover all areas of exposed earth with a 6 mm C.G.S.B polyethylene. You must also ensure that sufficient cross ventilation exists so that no moisture will accumulate and be absorbed in the wood flooring. Follow local building codes.

Wood Displacement (Dimples on Surface)

Hardwood Flooring, dense smooth woods in particular, may show dimpling on the surface from the displacement of wood by the fastener. Vintage Flooring should not dimple providing installation is adhered to. Therefore, dimpling is not covered under Vintage's warranty. It is the responsibility of the installer to monitor and take immediate action if dimpling occurs. (i.e adjusting air pressure, using smaller cleats, adjust/repair nail driver pin, adjust nailer shoe angle etc).

Nailing Pattern/Schedule

	Ends of the boards	Along the board
Pioneered (all widths)	2"-3"	6"-8"
Crafted (all widths)	2"-3"	4"-6"
Solid Sawn (3 1/4"-4")	2"-3"	6"-8"
Solid Sawn (5"-10")	2"-3"	4"-6"
Northern Solid Sawn (3 1/4")	2"-3"	6"-8"
Northern Solid Sawn (4 3/8"-5")	2"-3"	4"-6"

(Chart #3)

Hardwood flooring Nail Gun & Fastener Recommendations

Pioneered Solid	16 gauge or 18 gauge 1 3/4" - 2" cleats
Crafted Engineered	Bostitch EHF1838K staple gun using 18 gauge 1 1/2" staples
Solid Sawn	18 gauge 1 3/4" - 2" cleats
Northern Solid Sawn	16 gauge or 18 gauge 1 3/4" - 2" cleats

Recommendation based on the approved subfloors. Anything outside of this guideline, contact a Vintage dealer.

(Chart #4)

Hardwood Floor Tips

Here are a few tips to make your job easier, should you decide to use a hardwood floor nailer or staple gun.

1. Prevent any scratches and indentations on the surface of the board by keeping the nailer plate (base) clean, free from nicks and scratches at all times. Also by putting down the nailer/stapler on the plywood or on a piece of cardboard, not directly on the prefinished floor.
2. Make sure the nailer/stapler base is squared and sits well on the edge of the strip to ensure the nails /staples are secured into the nailing channel at the proper angle to prevent dimpling and damaging the edges of the strips.
3. Verify regularly the hardwood floor nailer/stapler is in working condition to prevent damages to the strips.
4. Start the second row and subsequent rows with a strip of at least 6" (150 mm) longer or shorter than the strip used in the previous row. This will eliminate unsightly step effects. The remainder of the floor should follow this rule to ensure an aesthetically pleasing floor.

*Pneumatic nailer. Air pressure should be adjusted adequately for each species of hardwood floor being installed and checked regularly (always try it before using) so that the cleats are seated properly in the nailing channel to avoid dimpling. *Great attention to detail during fabrication on the part of the Vintage Hardwood Flooring team ensures exceptional QUALITY in the finished product. Longevity of hardwood floors is directly related to proper installation and lifetime commitment to appropriate care and maintenance.

Glue Down Installation Instructions

Step #1 – Mark your starting line Vintage Flooring recommends that your Vintage Hardwood Flooring be installed parallel to the longest, straightest wall in the room. Start by measuring out from the wall 10 boards wide. Example: for 3.25" Solid Sawn flooring, 10 x 3.25" = 32.50", plus the expansion gap of ¾" which totals 33.25" from the wall. See Chart #1 for expansion gap widths for all products. Using a chalk line draw a guideline parallel to the wall based on the above measurements. This will eliminate any ripping of material at the end of the job for the last row. Using the straightest pieces of 1"x 2"x 8' length of wood and 2-inch concrete nails or screws, fasten the strips to the concrete. Your first row of starter boards will butt against this, so make sure that the strips are in line with the chalk line because this will determine how straight your floor will be.

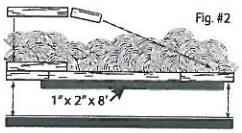

Fig. #2

Note: If you are cutting a piece that has not been set aside for cutting, make sure it is long enough to yield your next row's starting piece. Leave the expansion gap (See Chart #1) between the wall and the end of each strip in each row. See Fig #2.

Step #2 – Spread the adhesive
NOTE: Vintage Hardwood Flooring: only recommends installations when a moisture-cured polymer glue is used. Follow directions of glue manufacturer. Do not use latex/water based glues. Apply the recommended adhesive with a trowel according to the manufacturer's installation instructions (found on adhesive pail) for the specific adhesive that is being used.

SPECIAL NOTE: Open time and installation on adhesives vary from manufacturer to manufacturer so read instructions carefully before starting. Open time can also be affected greatly depending on the temperature and humidity. See Chart #5 for Adhesive recommendations.

Step #3 – Install the strips
You should inspect each piece of Vintage Hardwood Flooring before installation. Boards that you may not like the look of, or with a flaw that you think will affect the look of the floor, should be used as the cut pieces for your start and/or end pieces. You may also choose to put these pieces in less conspicuous areas such as closets or under couches, etc. Start your first piece with the tongue facing the area that will be completed last. Line up the tongue of the boards against the holding strip, and then press the board into the adhesive. Working from left to right, lay the next board and continue working towards the right, until you reach the wall and require a cut piece. Choose one of the pieces set aside for cutting and cut the desired length. NOTE: If you are cutting a piece that has not been set aside for cutting, make sure it is long enough to yield your next row's starting piece. Leave the expansion gap between the wall and the end of each strip in each row. Start the second row with a strip of at least 6" (150 mm) longer or shorter than the strip used in the first row. This will eliminate unsightly step effects. The remainder of the floor should follow this rule to ensure an aesthetically clean looking floor. Minimize adhesive from getting into the tongue or groove; otherwise, the strips of the flooring may not fit tightly. If adhesive gets on the finished side of the strips, clean immediately with appropriate cleaning products - see adhesive manufacturer's recommendations.

Flooring may require slight tapping in order to ensure a tight fit. You may use 3M's blue tape (if required), to hold pieces together until glue bond has developed. If a roller is required to obtain maximum adhesion, wrap a foam sheet around it to minimize any damage to the surface of the floor. When you get to the end of the wall, you may require a pry bar to get the pieces tight. Use shims where required until the glue has dried.

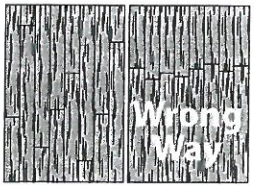
Step #4 – Installation of Accessories & Cleaning
After the floor has dried, you may install the baseboards and quarter rounds. Make sure that the nails penetrate the wall and not the floor. NOTE: Always keep left over pieces for future use. Flooring may become damaged and require replacing several pieces. It's a good idea to have the same production dates put aside. Use a vacuum to pick up any dust and loose fibers. Using your Vintage Cleaning Kit, available at all Authorized Vintage Dealers or visit us at www.vintageflooring.com and follow instructions and clean the whole floor.

Moisture Cured Adhesive Recommendations

For all glue down installations of Crafted, Solid Sawn or Northern Solid Sawn Dural, AF2130 or equivalent Urethane based or polymer adhesives are acceptable. Vintage does not warranty the adhesive, check manufacturers warranty information.

Floating Floor Installation Instructions

Sweep and vacuum the subfloor before laying any material. Make sure that any high points in the subfloor are removed, cleaned and sanded and any low points are filled with leveling compound.



Vintage's Premium Underpad Installation

For installations of Vintage Crafted, Solid Sawn, Northern Solid Sawn or U-LOC

Step #1 - After the subfloor has been cleaned, roll out Vintage's premium acoustic underpad. Unroll the underpad with the film coated (shiny side) facing down against the subfloor. Cut the underlayment about 2" longer than the room length. Butt the edge of the first sheet, (the edge without the over lapping film), along wall and trim to fit adjacent walls. Bring the edge of the adjoining sheet to the first sheet so that the edges of the foam meet and the overlapping film underlies the second sheet. Secure the edges of the foam together with tape strips. Repeat this procedure until the entire room is covered; Vintage recommends running 2" of underlay up the sides of the walls. This excess will be covered by the baseboards. It will prevent excess moisture from the concrete migrating to the floor.

Crafted Solid Sawn & Northern Solid Sawn Products

Step #2 – Laying the wood floor
Using the longest pieces available, lay the first row against the longest and straightest wall. Carefully apply glue into top of groove along the whole length of the piece, using Vintage's T & G glue (available at your Authorized Vintage Dealer) specially designed for Vintage's hardwood flooring. Lay the first piece with the grooved edge against the wall. If the wall is not square, use wedges/shims between the flooring strips and the wall to achieve the desired expansion gap. Start the second row with a strip of at least 6" (150mm) longer or shorter than the strip used in the first row. This will eliminate unsightly step effects. The remainder of the floor should follow this rule to ensure an aesthetically pleasing floor. Clean any glue that gets on the finished side of the flooring before the glue dries. Flooring pieces may require slight tapping in order to ensure a tightfit. You may use 3M's blue tape, if required, to hold pieces together until glue bond has fully developed. Rip the strips for the last row to the required width, not forgetting to allow for expansion. Use a crowbar to ensure tight fitting boards, use shims to hold in place until glue has dried. Remove the shims 24 hours after installation.

U-LOC Installation

Step #2 Laying the wood flooring
Insert the tongue at the side of the board into the groove at 45 (degrees) angle. Use both hands to apply equal pressure to the board. Line up the far left side of the board to be positioned with the end of the previous board installed. Lightly press the board down to lock in place. Never force boards and remove debris that could get in the way of the locking system. For aesthetical reasons, on starting the next row, always make sure to stagger the end joints by at least 6" (15.24 cm). Try to use cut piece from previous row to start new row. Vintage's U-LOC flooring uses a drop loc end joint. Simply drop one end over the adjacent end and they fall into place. Proceed with the subsequent boards in similar manner to complete the row. All joints shall have a tight fit. Leave an appropriate gap between the wall and the flooring for expansion.

To lay the last row, boards must be at least 1 1/2" wide to attach properly, don't forget the expansion gap. Moldings shall be fastened to the adjacent wall by nail or screw, not the floor, overlapping the expansion gap allowance. If the molding is attached to the floor, the floor will be pinched and will not expand and contract as it is made to perform.

General Care & Maintenance for all Vintage Hardwood Floors

Vacuum and sweep your floor as often as required to eliminate dust and debris from your floor. This may have to be done on a daily basis; depending on the amount of traffic in your home. Use Vintage's Maintenance Kit as needed to remove grime.

Never clean your hardwood floor with water or use a cleaner that is mixed with water. Do not use vinegar, bleach, household cleaners or any oil based detergent on your hardwood flooring. These can also leave a greasy and/or cloudy film or damage the finish.

Keep floor mats at all entranceways to keep dirt and moisture from being tracked on your floor. Place walk off mats at all exterior entrances. This will capture much of the harmful dirt before it ever reaches the hardwood floor. Shake out, wash and vacuum mats and rugs frequently.

To avoid water marks, never let spills of any type remain on the surface of the floor. Wipe up spills immediately. Rotate area rugs occasionally to minimize discoloration from sunlight.

Use adequate floor protection (felt pads) under all furniture and chair legs, in order to ease their movements and to prevent scratches and dents. Replace as required or regularly.

When moving heavy furniture or appliances, put a large heavy blanket underneath them to avoid scratches and dents.

Do not wear high heels on your hardwood floor. Spiked shoes exert approximately 1000 pounds per square inch. Old, unprotected tips will dent any hardwood floor.

Try to maintain an average humidity level of 45% in order to minimize the expansion and contraction in your floor. Use a hygrometer to help monitor humidity levels through out the home. Available on Vintage's website or dealer.

Minimize surface scratches by keeping your pets nails trimmed.

Heavy Gauge or Deep Scratch Repair:
Vacuum and clean the floor with Vintage Floor Cleaner and let the floor dry. If you have removed the finish and stain and are seeing the unfinished wood, use color matched pen & fill stick to color the unfinished wood fibers (if the floor is natural no stain is required.) Stay within the line and try not to color on the unaffected area. Vintage has color touch up kits to match all standard colors offered. Let dry.

Care and Maintenance for UV Urethane Oil finish floors

Vintage Flooring recommends the Loba care and maintenance products to be used on any Vintage UV oiled flooring. Loba and Vintage have tested with these products on all Vintage UV Oil hardwood flooring.

Regular dirt and dust removal for residential:
Vacuum and sweep your floors as often as required to eliminate dust and debris from your floor.

Light traffic for residential use: 3-7 days. Use the Vintage Hardwood Cleaning kit that has been specially formulated to eliminate streaking and residue. Never clean your hardwood with a steam mop, wet mop or use vinegar or bleach.

Note: Before using any Oil product, prepare a sample or test area to determine compatibility, appearance and desired results.

UV Oil Maintenance care for residential:
Minor, superficial scratches as well as dull areas on the surface can be sealed and protected and in some cases can be completely removed by applying Loba Aqua Oil.

1. Vacuum and clean the floor with Vintage Hardwood Floor Cleaner and let the floor dry.
2. Apply a thin film of Loba Aqua Oil with a rag or a mop on the affected area or over the entire floor. The product will dry quickly and the floor can be walked on carefully. Resume normal use after 12 hours. Loba Aqua Oil can be used as frequently as desired. The product will form a sacrificial layer which will wear off with regular use. Therefore it is recommended to reapply the product regularly, or as required. If you notice any portion of the floor that is starting to fade and is showing signs of wear, this is an indicator that you should be applying a coat of the Loba Aqua Oil.

For complete recoating of the UV Urethane please contact an authorized Loba dealer for professional care.

Vintage Installation and Maintenance Information

This Installation and Warranty Card is for all Vintage Product lines.

General Installation Instructions for all products

3/4" (19 mm) Solid

For all Smooth, Wire Brushed and Etched Pioneered floors

- Product Specifications: 3/4" (19 mm) Solid
- Grades Available: Estate, Select-V & Heritage
- Widths Available: 2 1/4" (57 mm), 3" (76 mm), 3 1/4" (83 mm), 4 1/4" (108 mm)
- Lengths: Random lengths 10" - 84" (254-2134 mm), Averages: 32" - 38" (813-965 mm) depending on grade
- Installation: Nail - At or above ground
- Radiant Heat: No, can use Crafted, Solid Sawn, Northern Solid Sawn or U-LOC

9/16" (13.7 mm) Engineered

For all Smooth, Wire Brushed and Etched Crafted floors

- Product Specifications: 9/16" (13.7 mm) Engineered
- Grades Available: Estate, Select-V
- Widths Available: 3 1/2" (89 mm), 5" (127 mm)
- Lengths: Random lengths 14" - 72" (356-1829 mm), Average: 32" (813 mm)
- Installation: Nail, glue or float - At, above or below ground level
- Radiant Heat: Yes * Check species list

3/4" (19 mm) Solid Sawn

For all Smooth, Hand Scraped, Wire Brushed and Etched Solid Sawn floors

- Product Specifications: 3/4" (19 mm)
- Grades Available: Estate, Select-V, Character
- Width Available: 3 1/4" (83 mm), 4" (100 mm), 5" (127 mm), 7" (180 mm), 10" (250 mm)
- Lengths: Random lengths 16" - 84" (406-2134 mm), Averages: 38" - 48" (965-1219 mm) depending on species and grade
- Installation: Nail, glue or float - At, above or below ground level
- Radiant Heat: Yes * Check species list

3/4" (19 mm)
Northern Solid Sawn

For all Smooth, Wire Brushed and Etched Northern Solid Sawn floors

- Product Specification: 3/4" (19 mm)
- Grades Available: Estate, Select-V, Character
- Widths Available: 3 1/4" (84 mm), 4 3/8" (112 mm), 5" (127 mm)
- Lengths: Random lengths 15" - 84" (381 - 2134 mm), Averages 32" - 42" (813 - 1066 mm) depending on species and grade.
- Installation: Nail, glue or float - At, above or below ground level
- Radiant Heat: Yes * Check species list

7/16" (11 mm) U-LOC

For all Smooth U-LOC floors

- Product Specifications: 7/16" (11 mm) Click
- Grades Available: Estate, Select-V
- Widths Available: 4 1/4" (109 mm)
- Lengths: Fixed lengths 46.14" (1172 mm), 32.36" (822 mm), 28.8" (732 mm), 23.07" (586 mm), 17.32" (440 mm), 13.77" (350 mm)
- Installation: Float - At, above or below ground level
- Radiant Heat: Yes * Check species list

For more details or technical specifications, please contact a Vintage Dealer or our Website.

	Vintage Wear Warranties	
	Pearl & Semi Gloss	UV Urethane Oil
Residential Wear Warranty	25-Year	10-Year
Commercial Wear Warranty	3-Year	1-Year

Congratulations on purchasing one of the highest quality prefinished hardwood floors. Your premium Vintage Hardwood Floor will provide you with a lifetime of memorable moments. Products may be manufactured in one of Vintage's worldwide manufacturing facilities, but all are prefinished in Canada. Contact a Vintage dealer for more information.

Warranty Program takes effect: February 2014 replacing all previous versions.

Warranties

Lifetime Structural Warranty for Residential Installations

Vintage Hardwood Flooring has strict processing controls and every piece is put through a rigorous quality control system. Vintage warranties all the product collections to the original owner of a non-commercial floor in its original manufactured condition to be free from; delamination, milling defects and grading for the lifetime of the floor. This warranty excludes the standard defect allowance of 5% for widths below 4" and 8% for 4 1/4" and over. The relative humidity in the residence must be targeted at 45% and the maximum ranges in the specific product warranty never exceeded. Radiant heat warranty is limited as specified in the radiant heat section. The warranty does not cover the normal movement and reactions of wood to humidity and damages as listed in the exclusion list. To fulfill this warranty, the owner must ensure the pre-installation, installation, maintenance and care guidelines are complied with. Vintage Hardwood Flooring's liability for this warranty is limited solely to the defect amount in excess of the standards above and is for the flooring material only.

Residential Wear Warranty: 25-Year for Pearl & Semi gloss finished floors

This warranty guarantees to the original purchaser that the standard Vintage Semi-gloss and Pearl finishes will not wear through or peel for 25 years from the date of purchase. Oil and Custom gloss finishes are not covered by this warranty. The product must be in its original purchased condition. The wear warranty is applicable to non-structural defects only. Checks, lines or peeling that appear on the surface of knots, checks, cracks, holes, color variation and other related natural character allowed for in the grades are not covered under this warranty. The floor must be installed and maintained in accordance to Vintage's installation and maintenance guidelines. See warranty exclusions for other limitations.

3 Year Finish Wear through Warranty for Commercial Installations
(Special Ordered as "Commercial Finish")

This warranty guarantees to the original commercial purchaser that the standard Vintage Semi-gloss and Pearl finish will not wear through or peel for 3 years from the date of purchase in a commercial environment. Heavy traffic environments, including exterior main access ways are excluded. Oil and Custom gloss finishes are not covered by this warranty. The product must be in its original purchased condition. The wear warranty is applicable to non-structural defects only. Checks, lines or peeling that appear on the surface of knots, checks, cracks, holes, color variation and other related natural character allowed for in the grades are not covered under this warranty. The floor must be installed in accordance to Vintage's installation guidelines.

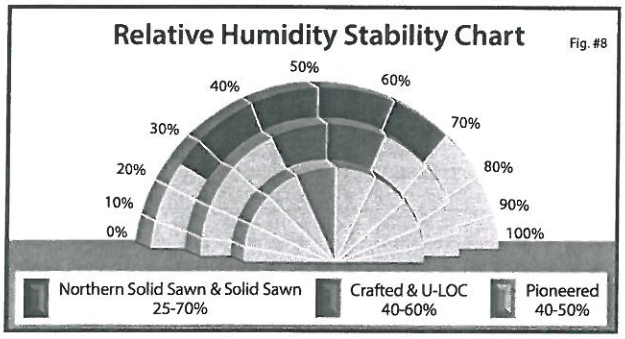
The floor must be regularly maintained in accordance with Vintage Hardwood Floorings guideline to validate this Warranty. The sole remedy pursuant to this warranty shall be limited to the repair, refinishing or replacement of the floor at the discretion of Vintage Hardwood Flooring to correct the issue. Any attempt to modify, repair or replace products prior to authorization of Vintage Hardwood Flooring will void this warranty. See warranty exclusions for other limitations.

10 Year Limited Residential Wear Warranty – UV Urethane Oil finish (Not an Oxidative Oil)
(1-Year Commercial)

Vintage warranties to the original purchaser that it's UV Urethane Oil will not wear through the finish in normal residential use within 10 years from the purchase date. The thin finish of UV Oil must be carefully maintained, including regular care and maintenance that cleans and protects the floor. Failure to care and maintain the floor for any period, as described in the Vintage care instructions, can lead to failure of the floor and will void the warranty. Wear warranty excludes items listed under exclusions. Vintage recommends refreshing the floor as soon as wear or dulling is observed to provide a protective coat to avoid or correct minor damages. Refreshing may cause variances in the finish if any residue is missed by cleaning or due to varying amounts of refresher applied. Vintage does not warranty gloss variation or contamination resulting from the refresher application. Vintage's thin UV Urethane Oil coat will wear through in heavy traffic areas or where sources of grit or damage are higher. Therefore place mats/rugs in such areas to protect the finish (i.e. Entrance ways, fridges, sink area, etc). In the event the raw wood is exposed due to damage or excessive wear, it is essential to carefully clean and refresh the area to avoid the "wash-out" and discoloration of the underlying stain. Repairs to damage and excessive traffic/wear are not covered by the warranty. Consult a professional when recoating or extensive repairs are required.

Humidity Control (Gapping, Cupping and Splits)

Relative Humidity is the ratio of the actual amount of water vapor contained in the air at a given temperature to the maximum amount of water vapor that the air at a given temperature can hold, expressed as a percent. In other words, relative humidity is the absolute humidity divided by the absolute humidity at saturation of air at the same temperature.



Wood is a hygroscopic material. Always containing water, it constantly exchanges water vapor with the air, picking it up when atmospheric relative humidity is high, and giving it off when relative humidity is low. Since wood swells as it adsorbs water, and shrinks as it releases water, both its moisture content and its dimensions are controlled by the relative humidity of the surrounding air. Wood moisture content is equal to the weight of water contained in the wood divided by the oven dry weight of the wood, expressed as a percent.

Inside homes however, where the relative humidity (RH) of outdoor air drawn inside is drastically altered by heating it and cooling it without humidification or dehumidification. Wide seasonal swings in relative humidity in wood moisture content and dimension changes occur. Since warm air can hold more water vapor than cold air, the relative humidity of air with a certain absolute humidity can be changed by simply changing its temperature. If in winter, for example, outside air at 20°F (-6°C) and 65% RH is drawn inside and warmed to 70°F (20°C) without humidification, its relative humidity drops to about 10%. In summer, outside air at 70°F (20°C) and 60% RH that flows into a basement at 60°F (15°C) will end up at 82% RH. In order to minimize this movement, the relative humidity must be maintained according to product specifications for Pioneered solid anything higher and the flooring will start to cup, anything lower and the floor will start to gap and may check and split in winter months.

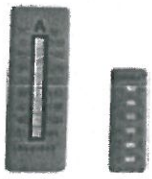
Special Note for Crafted, Solid Sawn, Northern Solid Sawn and U-LOC
Although these products are more stable, they can still react to changes in relative humidity according to the season. Minor cupping, crowing, face distortions, etc, is considered normal when near the limits of the stability warranty and is not covered under this warranty. Raising or lowering your humidity level towards the middle of the warranty range will resolve this issue.

Vintage's Crafted, Solid Sawn, Northern Solid Sawn, & U-LOC Hardwood Flooring will perform extremely well with high humidity. However, if the humidity drops below warranted levels the face lamella will start to contract. The construction of these products is such that the core material will minimize the face lamella's contraction. If the humidity drops below warranted levels the core will continue to do its job and minimize the contraction again. However, there comes a point where the face lamella is under so much stress, and the core is not allowing the face to move (minimize cupping) that the face lamella has no other choice but to relieve its pressure by stress cracking. Stress cracking is NOT covered under this warranty.

Vintage manufactures and stores solid wood flooring in a controlled environment. It is important to check and document both the ambient humidity and the moisture of the subfloors in the rooms before installation. Humidity outside the allowed range or subfloors more than 2% difference in moisture on 3 1/4" and wider floors (4% difference on 3" and narrower) will cause the floors to expand/shrink and cup. Wet subfloors and high humidity environments can cause gapping and create splits as the wood dries and returns to a normal humidity levels. Un-insulated heat ducts or radiant heat also cause extreme drying leading to gapping and splitting. Gapping, Cupping and splits resulting from moisture & humidity excesses are not covered under Vintages Warranty. Generally, wood flooring should not be installed over crawl spaces. If necessary, ensure the crawl space has a 6 mil CGSB polyethylene over all exposed earth and that sufficient cross ventilation exists in order that no moisture accumulation occurs. Follow local building codes.

Radiant Heat Instructions & Warranty

New Concrete that is less than 60 days Old – Radiant heat must be turned on and left on for a period of 45 days prior to installation of the Vintage flooring material. Turning the radiant heat on will allow the moisture that is in the concrete to evaporate from the concrete. If the concrete is not dried and the floor is installed, the moisture that is in the concrete will migrate into the wood floor. Perform a calcium chloride or polyfilm test to determine moisture content of the concrete. The Radiant heat must be turned off for at least 48 hours prior to installing any flooring for a conditioning period. Older Concrete – Heating and or cooling concrete must be done slowly. Vintage flooring requires that the radiant heat be turned on for a minimum of 72 hours prior to installing Vintage flooring material. Vintage flooring also requires that the radiant heat system be turned off for at least 48 hours prior to installing any flooring. Turning the heating system off allows for the concrete to properly condition.



Note: Not conditioning the concrete will void all Vintage Warranties.
Maximum Tube Temperature out of boiler: 129°F (54°C)
Maximum Concrete Temperature: 81°F (27°C) (Below hardwood flooring)

**IMPORTANT ** when using any radiant heat system other than the in slab system referred to above, you must confirm with your heating contractor that the Maximum Temperature of the surface of the subfloor (below the hardwood flooring) CANNOT EXCEED 81°F (27°C).

The humidity level in the home MUST be maintained ABOVE the listed levels in order to validate the warranty *.

Pioneered Hardwood Flooring 40%
*Engineered Crafted Hardwood Flooring 40%
*Solid Sawn Hardwood Flooring 25%
*Northern Solid Sawn Flooring 25%
*U-LOC Hardwood Flooring 40%

A common problem that happens is that the floor will cup and/or crack when the radiant heat is "cranked up" by individuals that are cold. Cranking the heat above the maximum temperate recommended by Vintage will void the warranty. In order to confirm that the floor maximum temperature is not exceeded Vintage will require "thermal sensor stickers" to be applied in strategic areas of the floor and heating system. Thermal sensor stickers are strips of tape with crystals that change to black at a specific temperature. If the heat on the substrate below the hardwood flooring exceeds 81°F (27°C), or the tube temperature out of the boiler exceeds 129°F (54°C) these crystals will turn black. Once they turn black you cannot reverse the color change. Vintage flooring will require 1 thermal tape to be placed on the main tube coming out from the heating unit in the home. Vintage flooring will also require a thermal sensor tape on the subfloor placed within 6" of the wall and the sensor must be placed over the heat tube. Thermal sensors will be mandatory in order for Vintage to warranty radiant installations. If using radiant heat systems other than concrete slab, 3 sensors must be place in various locations on the floor.

If a problem occurs and Vintage is required to inspect a potential claim, Vintage will require that these thermal sensors are removed for verification of temperature. If these sensors are not available to Vintage in accordance with our installation guidelines, the claim will be denied. It is extremely important that the sensors be placed in an area where it can be extracted by Vintage for temperature verification. Vintage requires that the installer draw a diagram on the placement of the sensors in the main heat floor area. This diagram must be submitted to the homeowner and Vintage Flooring for record keeping.

The Radiant Heat Compliance form must be completed and signed to validate radiant heat warranty. A copy must be submitted to Vintage Flooring with the purchase order when ordering a floor. It is the responsibility of the dealer to provide this completed form when ordering material. In signing this compliance form it is agreed that the homeowner will not exceed the maximum temperature as per the above mentioned Vintage guidelines. It is also agreed that the thermal sensor strips will be installed in accordance with these guidelines. The homeowner will also keep a record of the placement of these sensor strips so that they know where the location is, and will make them available for extraction in the unlikely event of a claim.

Installation on radiant heat system

Species	
Hickory	No
Rift & Quarter Sawn Brazilian Cherry	No
Maple	Yes*
Tigerwood	Yes*
Red Oak	Yes
White Oak	Yes*

Effective February, 2014

* Indicates species that are more susceptible to movement and special attention must be taken to adhere to maximum temperatures.

For more detailed information about the Radiant heat warranty, please contact a Vintage dealer.

Warranty Exclusions

The following are excluded from all Vintage warranties

Any damage or failures, but not limited, to the following are not covered by Vintage's warranty.

The finish wear surface must be easily noticeable and cover at least 15% of the total floor area for a claim to be considered.

Damage or structure failure relating to installation and interior conditions that do not comply with Vintage's installation requirements.

Damage due to improper care or failure to comply with Vintage's maintenance and care instructions.

Structural Defects natural in the wood where the finish cracks, contains voids, or color variation that appear on the surface of a knot, check, split, hole or similar naturally occurring wood character in the grade.

Natural expansion, contraction and tensions caused by woods reaction to humidity variations.

Wood displacement due to nailing, stapling or installation (i.e. Dimpling & Nail pops)

Gloss changes due to wear or use, including variation in replacement boards.

Damage due to water, spills, steaming, excessive cleaner, wet mopping, moisture, sink /dishwasher / pet bowl / planter spills that will cause distortion of the wood and blistering and peeling of the finish.

Dents, scratches, high heel marks, pet damage, chemical & adhesive damage. Use of tape except 3M blue tape.

Natural discoloration of the finish, aging, fading or darkening of the wood and excessive exposure to sunlight, including uneven discoloration under rugs & furniture.

Natural color and character marks in the wood as allowed in the grade (Samples do not show all possible character marks allowed in the entire floor).

Environmental extremes of heat, dryness or humidity that exceed the product specified humidity range.

Construction damage, in particular on textured surfaces, can contaminate the naturally occurring or intended undulations in the surfaces (I.e. Drywall dust).

In all cases, any warranty, remedy, or repair must first be approved by Vintage Hardwood Flooring.

Action taken prior to Vintage's approval will void the warranty claim.

The corrective action to remedy any warranty issue is the exclusive right of Vintage Hardwood Flooring.

This Warranty only applies to defects in excess of the 5% on boards under 4" and 8% on boards 4 1/4" or over.

Vintage's liability under this warranty is limited to the replacement or repair, of any portion of the floor, solely at Vintage's discretion, and only up to the total purchase price of the floor (excluding installation). Vintage will not be liable for other costs, including labor, installation, moving, or accommodation costs.

The warranty is only to the original purchaser and cannot be transferred.

Any defect or warranty claim must be submitted in writing to Vintage Hardwood Flooring within 6 months of the occurrence of the issue giving rise to the claim.

Filing a Claim

To file a claim, contact your authorized Vintage Hardwood Flooring Dealer or Builder where you made your purchase. They will assess and complete a claim form if warranted, that will require the details of original purchase, payment confirmation, installation, environment conditions and details of the issue.

Vintage at its discretion reserves the right to: be provided detailed pictures of the floor, access for inspection, and/or removal of samples for analysis.

BŌLYÜ

Warranty

NEXTERRA™

Nexterra Warranty

This limited lifetime* warranty applies only to purchasers of BOLYU Contract (BOLYU) products for indoor commercial installations. This limited warranty is valid only if signed below by BOLYU's authorized Representative, the Owner, and by the Flooring Contractor. Provided the carpet has been installed and maintained in the specified commercial location in strict accordance with BOLYU's instructions, procedures and the Owner meets its obligation hereunder, including the use of BOLYU recommended Nexterra pressure sensitive adhesives, BOLYU (subject to the following limitations and remedies) warrants to the designated Owner the following:

I. Items Under Warranty

1. WEAR- BOLYU warrants that Nexterra will not wear more than 10% of its surface pile weight from abrasive wear for the lifetime* of the carpet. By abrasive wear is meant fiber loss from the carpet through normal abrasion, not crushing or flattening of the carpet pile in any area, nor due to abnormal usage of the carpet.

2. STATIC PROCTECTION- BOLYU warrants that Nexterra will not give static discharges in excess on 3.5 KV for the lifetime* of the carpet when tested in accordance with the AATCC Test Method #134-1979.

3. TUFT BIND - BOLYU warrants that Nexterra will not lose tuft bind integrity for the lifetime* of the carpet when tested in accordance with test method ASTM D-1335-67.

4. EDGE RAVEL - BOLYU warrants that Nexterra will not edge ravel along seams for the lifetime* of the carpet.

5. ZIPPERING – BOLYU warrants that Nexterra will not zipper or develop continuous pile runners for the lifetime* of the carpet. This portion of the warranty protects against zippering regardless of the average tuft bind properties, under dry or wet conditions as it might be during cleaning.

6. PILLING AND FUZZING - BOLYU warrants that Nexterra will not exhibit pilling or fuzzing for the lifetime* of the carpet

7. DELAMINATION – BOLYU warrants that Nexterra will not delaminate for the lifetime* of the carpet. Chair pads are not required, but are recommended for optimum textural performance.

8. DIMENSIONAL STABILITY - BOLYU warrants that Nexterra will maintain it's dimensional stability and will not dome or curl for the lifetime* of the carpet when installed per our recomendations.

*Lifetime defined as long as the carpet remains installed in the original location and is owned by the orginal purchaser.

II. Limitations - This warranty does not include:

1. Disfigurement or damage caused by abnormal use or any damage to the carpet not arising out of a defect to the carpet. For example, the warranty does not cover tears, burns, cuts, installation on stairs or damage resulting from improper cleaning methods, or damage in transit.

2. Abuse by any athletic equipment such as roller skates, ski boots, or golf shoes.

3. Differential fading due to light exposure, shading, pile crush, dye lot differences, and soiling.

4. Any condition that would have had a visible defect upon inspection prior to installation.

5. Any condition resulting from other than ordinary wear, or from any use for which the product was not designed.

III. Obligations of Owner

1. The Owner must submit notice of all claims under this limited warranty to BOLYU within the specified warranty period.

2. Claims must be submitted in writing and delivered to:

BOLYU Contract Carpets

Attention: Product Services Group

P.O. Box 1447

Chatsworth, Georgia 30705

3. All areas in which carpet is to be replaced under the terms of this limited warranty must be cleared of all equipment, furnishings, partitions, and the like that have been installed over carpet subsequent to the original carpet installation, at the owners expense.

IV. Warranty Remedies

1. After receipt of proper written notice of claim, BOLYU will designate a representative to inspect that carpet with the Owners representative and BOLYU will meet all warranty obligations.

2. Subject to any monetary adjustment as may be agreed to upon in writing by BOLYU, and subject to the above warranty limitations and Owner obligation. BOLYU shall repair or, in its sole discretion, replace any designated carpet sold by it containing a defect covered by the above Nexterra limited warranty, at no expense to the owner.

3. Any replacement will be made with a comparable product selected by BOLYU from the then-current BOLYU running line. However, BOLYU's obligation shall not include the reimbursing of any indirect costs or consequential damages, however, incurred. By way of example, and not limitation, damages arising from interruption of use of the spaces affected, nor expenses in removing furniture from the affected area be included in our obligation.

4. The remedies provided in connection with the Nexterra warranty are expressly in lieu of any other remedies provided under any other expressed or implied warranty, INCLUDING ANY WARRANTY BY MODEL OR SAMPLE AND ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS, and of any other obligation on the part of BOLYU.

V. Mediation/Arbitration

1. If a dispute arises out of or relates to this limited warranty, or the breech thereof, and if said dispute cannot be settled through direct discussions, the parties agree to first endeavor to settle the dispute in an amicable manner by mediation administered by the American Arbitration Association under its Commercial Mediation Rules, before resorting to arbitration. Thereafter, any unresolved controversy or claim

arising out of or relating to this limited warranty, or breech thereof, shall be settled by arbitration administrated by the American Arbitration Association in accordance with its Commercial Arbitration Rules, and judgment upon the Award rendered by the arbitrator(s) may be entered in any court have jurisdiction thereof.

2. Neither party not the arbitrators may disclose the existence, content, or results of any arbitration hereunder without the prior written consent of both parties.

3. Arbitrators shall be appointed as provided by the American Arbitration Association Commercial Arbitration Rules.

4. In rendering the award, the arbitrator shall determine the rights and obligations of the parties according to the substantive and procedural laws of Georgia.

VI. BOLYU hereby issues its Nexterra warranty to the Owner named below. This limited warranty is only valid when this form is properly executed by the Flooring Contractor, the Owner and BOLYU Contract Carpets.

Warranty
AVALAR® SD
AVALAR® RE

The warranties below are only applicable to Beaulieu Commercial products manufactured with 100% AVALAR® SD or AVALAR® RE nylon for indoor use. Installation in a *traffic* environment unsuitable for carpet or failure to sustain a routine carpet maintenance program (as recommended by Beaulieu Commercial) will void these warranties.

AVALAR®SD & AVALAR®SDX Lifetime* Stain Removal Limited Warranty

Beaulieu Commercial warrants for the useful life of the carpet made exclusively with AVALAR® SD & AVALAR®RE solution-dyed nylon, when installed and maintained as recommended by Beaulieu Commercial, will resist permanent stains caused by spills of all substances, subject to the following limitations. This warranty specifically excludes general soiling, discoloration, appearance change due to pile distortion, and exposure to substances or contaminants that degrade or destroy nylon yarn or the color of the carpet. Also, this warranty specifically excludes carpet that has been surface-treated with materials not recommended or approved by Beaulieu Commercial, or which has been subjected to abnormal use or conditions or to cleaning agents or maintenance methods not recommended or approved by Beaulieu Commercial.

THIS IS NOT A CLEANING CONTRACT. In order to make a claim under this warranty, the owner must have attempted to remove the stain within 24 hours after occurrence of the spill, USING ONLY THOSE CLEANING AGENTS AND PROCEDURES RECOMMENDED BY Beaulieu Commercial, and must notify Beaulieu immediately if stain removal is not successful. The original purchaser must also identify the type of stain and the method used to clean it. For approved cleaning agents and removal procedures, maintenance recommendations and other conditions of this warranty, refer to Beaulieu Commercial's "Total Solution Carpet Care Guide". If additional information or assistance is required, or in order to notify Beaulieu Commercial of an unsuccessful attempt to remove a stain, call 1-800-451-1250. Claims under this guarantee must be submitted in writing to Beaulieu Commercial c/o Product Services Group, P.O. Box 1447, Chatsworth, GA 30705.

In addition, the owner must furnish to Beaulieu Commercial the ORIGINAL PROOF OF PURCHASE and non-returnable samples of the carpet for testing, and must permit a Beaulieu Commercial Representative access to the installed carpet in order to attempt to remove the stain. If, in testing and analysis performed by Beaulieu Commercial, and subject to the other limitations set forth herein, the tested carpet or the cleaned area is found to have a rating of less than 4 under the AATCC Gray Scale for Evaluating Change in Color, Beaulieu Commercial will pay for the attempted removal of the stain by the Beaulieu Representative, or replace the original carpet in the affected area, up to 100 times the size of the stain, free of charge, including installation. No charges for floor preparation or for movement or replacement of equipment, furnishings, partitions, etc., will be allowed. At Beaulieu's option, we will refund to the owner the original purchase price of the carpet in the affected area, up to 100 times the size of the stain. If the stain is removed using Beaulieu Commercial's recommended procedures, all stain removal costs will be the responsibility of the owner.

AVALAR®SD & AVALAR®RE Lifetime* Carpet Static Limited Warranty

Beaulieu Commercial warrants, for the useful life of the carpet, products made with Avalar®SD or Avalar®RE nylon, when installed and maintained as recommended by Beaulieu Commercial, will be shock proof to human beings, subject to the following limitations:

If human comfort is affected by shock, the owner must notify the carpet manufacturer and permit Beaulieu Commercial to test the carpet. If, in testing by Beaulieu and subject to the other limitations contained herein, the carpet generates static above 3.5 kv (the threshold of normal human sensitivity is 3.5 kv), when tested in accordance with AATCC test method 134 at 20% relative humidity and 70°F, Beaulieu Commercial will replace the original carpet in the affected room or area, free of charge, including installation, except that no charges for moving or replacing equipment, furnishings, partitions, etc., will be allowed.

AVALAR®SD & AVALAR® RE Colorfast Carpet Limited Warranty

Beaulieu Commercial warrants that products manufactured with 100% AVALAR®SD & AVALAR®RE nylon, when installed and maintained as recommended by Beaulieu Commercial, FOR INDOOR USE ONLY and subject to the other limitations set forth herein, will be colorfast against exposure to light and atmospheric contaminants as specified below:

Colorfastness to Light:

Beaulieu Commercial warrants, for the useful life of the carpet from the date of the original installation, products made with AVALAR®SD & AVALAR®RE will not display or evidence a significant change in color due to exposure to light.

In order to make a claim under this warranty, the owner must notify Beaulieu Commercial and furnish non-returnable samples of the carpet for testing. If, in testing by Beaulieu and subject to the other limitations set forth herein, (1) the carpet is found to have a rating of 3 or less under the Gray Scale for Evaluating Change in Color, AND (2) such rating is determined to be the result of exposure to light for a period of time not to exceed 200 Xenon Fadeometer hours of such exposure, when tested in accordance with the AATCC 16E test method, Beaulieu Commercial will replace the original carpet in the affected room or area, free of charge, including installation, except that no charges for moving or replacing equipment, furnishings, partitions, etc., will be allowed.

Colorfastness to Atmospheric Contaminants:

Beaulieu Commercial warrants, for the useful life of the carpet, products made with AVALAR®SD & AVALAR®RE will not display or evidence a significant change in color due to exposure to atmospheric contaminants (Ozone or Oxides of Nitrogen).

In order to make a claim under this warranty, the owner must notify Beaulieu Commercial and furnish non-returnable samples of the carpet for testing. If, in testing by Beaulieu and subject to the other limitations set forth herein, (1) the carpet is found to have a rating of 3 or less under the Gray Scale for Evaluating Change in Color, AND (2) such a rating is determined to be the result of Ozone exposure for a period of time not to exceed 8 cycles, when tested in accordance

with the AATCC 129 test method, or Oxides of Nitrogen exposure for a period of time not to exceed 8 cycles, when tested in accordance with the AATCC 164 test method, Beaulieu Commercial will replace the original carpet in the affected room or area, free of charge, including installation, except that no charges for moving or replacing equipment, furnishings, partitions, etc., will be allowed.

Colorfastness to Light:

Beaulieu Commercial warrants, for the useful life of the carpet from the date of the original installation, products made with AVALAR®SD & AVALAR®RE will not display or evidence a significant change in color due to exposure to light.

In order to make a claim under this warranty, the owner must notify Beaulieu Commercial and furnish non-returnable samples of the carpet for testing. If, in testing by Beaulieu and subject to the other limitations set forth herein, (1) the carpet is found to have a rating of 3 or less under the Gray Scale for Evaluating Change in Color, AND (2) such rating is determined to be the result of exposure to light for a period of time not to exceed 200 Xenon Fadeometer hours of such exposure, when tested in accordance with the AATCC 16E test method, Beaulieu Commercial will replace the original carpet in the affected room or area, free of charge, including installation, except that no charges for moving or replacing equipment, furnishings, partitions, etc., will be allowed.

Colorfastness to Atmospheric Contaminants:

Beaulieu Commercial warrants, for the useful life of the carpet, products made with AVALAR®SD & AVALAR® RE will not display or evidence a significant change in color due to exposure to atmospheric contaminants (Ozone or Oxides of Nitrogen).

In order to make a claim under this warranty, the owner must notify Beaulieu Commercial and furnish non-returnable samples of the carpet for testing. If, in testing by Beaulieu and subject to the other limitations set forth herein, (1) the carpet is found to have a rating of 3 or less under the Gray Scale for Evaluating Change in Color, AND (2) such a rating is determined to be the result of Ozone exposure for a period of time not to exceed 8 cycles, when tested in accordance with the AATCC 129 test method, or Oxides of Nitrogen exposure for a period of time not to exceed 8 cycles, when tested in accordance with the AATCC 164 test method, Beaulieu Commercial will replace the original carpet in the affected room or area, free of charge, including installation, except that no charges for moving or replacing equipment, furnishings, partitions, etc., will be allowed.

These warranties state the entire liability of Beaulieu Commercial with respect to the product warranted, except for any warranties of merchantability or fitness for a particular use, which are hereby limited to the duration of the applicable express warranty. In particular, these warranties do not cover incidental or consequential damages of any kind, nature or description, which may be claimed as a result of carpet failure or carpet replacement. (Note: Some states prohibit limitations on the duration of implied warranty, as well as the exclusion or limitation of incidental or consequential damages, so the above limitations may not apply to you. These warranties give you specific legal rights, and you may also have other rights, which may vary from state to state.)

*Lifetime defined as long as the carpet remains installed in the original location and is owned by the orginal purchaser.

Manufacturer Warranty

www.clipso.com

Guarantee Terms and Limitations

The Manufacturer, hereinafter known as CLIPSO® Americas, Inc. guarantees, for a period of ten years, that the goods are free from any defect that could affect their resistance to heat and cold or affect their colors in the normal conditions of exposure to light, to the exclusion of any other guarantee of any other type. It is hereby expressly agreed that the products shall be installed by professional installers trained in the installation techniques specific to CLIPSO products. The vendor shall not be liable in any way if the goods are not installed by such personnel.

The Manufacturer shall have no liability in the following cases:

- Defects due to a design made specifically by the customer.
- Defects resulting entirely or partly from normal wear, damage or accidents attributable to the customer or third party.
- Product modification.
- Abnormal or atypical use or use that does not comply with good workmanship or the requirements and recommendations of CLIPSO.
- Installation by personnel with no training in the specific installation techniques of CLIPSO as stated above.
- Installation of the product where exposed directly to weather and/or direct sunlight.
- Defects during and after the installation of the CLIPSO Coverings using other manufacturers' profiles/track rather than the CLIPSO profiles/track.

The customer shall indemnify the Manufacturer against any claim from its insurers or other parties with whom it has contractual relations on the Manufacturer or its insurers beyond the limits and exclusions above. The Manufacturer's guarantee shall always be limited to the replacement of all or part of the goods recognized to be defective, to the exclusion of any liability or compensation for any reason. The third-party liability of the Manufacturer for any cause other than injury or serious misconduct shall be limited to an amount equal to the payment received for the sale of the product.

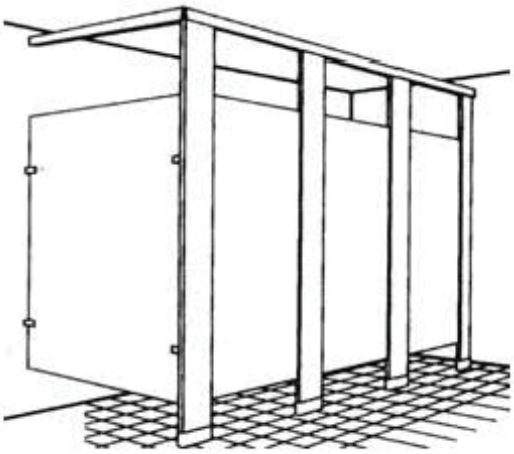
Clipso Cleaning & Maintenance

www.clipso.com

CLIPSO® Technical Fabric is a polyester fabric coated with polyurethane, which under most circumstances, protects it from absorbing odors. It is hydrophobic and anti-static, thus requiring little or no maintenance.

The CLIPSO Cleaner and Cleaning Glove

If cleaning is required, CLIPSO provides a cleaning spray called "Clipso Cleaner" (Ref# O-CCL10E) (500mL), and a cleaning glove (Ref# O-GN20E), which can be ordered by contacting us at contactusa@clipso.com or 646-422-0919 ext. 704.



How to Clean CLIPSO Fabric?

Apply the CLIPSO Cleaner to the microfiber glove (or a soft cloth) and rub gently. If the stain persists, you may repeat this process several times.

Under no circumstance should products containing bleach be used.

CLIPSO does not warranty its products if foreign cleaning substances are applied which may cause discoloration or impact the integrity of the fabric.

CARE AND MAINTENANCE

To provide solid plastic toilet partitions with the proper care and maintenance, the following instructions must be followed:

All surfaces should be cleaned with a mild liquid soap only. The finish should then be wiped and dried. In areas containing showers, either self-contained or tiled-in units, the partitions in these rooms must receive ventilation from the outside so that excess humidity can escape.

Under no circumstance should the following agents be used:

- Abrasive powders or scouring pads
- Water closet cleaners
- Ceramic tile cleaners
- Solutions containing more than 1% by volume of ammonia
- Solutions containing acids or lye
- Solutions containing enzymes

If the above instructions are adhered to, our product provides years of dependable service. Global Partitions shall not accept responsibility for product failure if the above instructions are not followed.

Advisory Bulletin

BOBRICK
BUILDING VALUE SINCE 1906

TB-21 Stainless Steel Cleaning and Maintenance

Always: Wipe or polish with the grain direction of satin finishes.

Remove any cleaning or soap residue from stainless surface with water and wipe dry with clean cloth.

Caution: Avoid cleaning products containing bleach, hydrochloric acids and or chlorides . . . these are frequently found in toilet bowl or tile cleaners and in abrasive scrubbing powders.

Avoid use of steel wool which can leave behind fine particles that cause surface rust.

Avoid use of abrasive cleaners on bright polish stainless steel surfaces.

CONDITION	CLEANING AGENT	METHOD OF APPLICATION
Dirt, smudges, and fingerprints	Use mild cleaning solution or stainless steel cleaners.	Apply cleaner. Wipe off soil using a cloth or sponge for smooth surfaces and a soft brush for textured surfaces. Rinse and dry.
Graffiti	Bobrick Graffiti Remover, part #891099 or equivalent.	Apply cleaner, rub spots with soft cloth or sponge. Rinse and dry.
Stubborn spots, atmospheric discoloration	Liquid or spray stainless steel polish.	As recommended by manufacturer. Rinse or dry.
Mineral deposit or scale from hard water	Bathroom cleaners containing phosphoric acid or acetic acids.	Apply liberally, allow to stand for a few minutes; scrub with coarse toweling or soft bristle brush in direction of grain. Rinse and dry.
"Rust" discoloration resulting from exposure to harsh environmental and or chemical conditions	Appropriate cleaner listed above, plus 3M Scotch Brite pad #7447or equivalent.	Clean surface as above, then rub stained area lightly with 3M Scotch Brite pad. Clean with stainless steel polish. Rinse and dry. Rub only with the grain direction of satin finishes. . . do not use on bright polish stainless steel.

CLEANING INSTRUCTIONS - METAL CABINETS

- Our cabinets by are designed to be maintenance free. However, it is recommended that the outer surface of the cabinet, and the hinge area, be kept clear from debris and dirt, to ensure correct operation of the hinged door.

- If latches, locks or hinges need to be lubricated, use a “3 in 1” type light oil, removing excess with a cloth.

Finish	Description	Cleaning & Maintenance
Painted Steel	Baked-on Powder Coat Paint	Use a soft cloth and mild soap and water.
Aluminum	Aluminum Without Clear Coat	
313/315/Clear	Anodized Aluminum - Dark Bronze, Black , Clear	
US3	Polished Clear Coated Brass	Use a soft cloth and mild soap and water. Never use brass polish or an abrasive cleaner unless you intend to remove all lacquer and totally refinish the product.
US4	Satin Clear Coated Brass	
US9	Polished Clear Coated Bronze	
US10	Satin Clear Coated Bronze	
US10B	Oxidized & Oiled Bronze	Use a soft cloth and a paste furniture wax. Buff lightly so as not to remove the dark oxide coating where it remains.
US32	Polished Stainless Steel	Use a soft cloth and mild soap and water solution. After cleaning, thoroughly rinse with clear water to remove all traces of the solution and wipe dry to prevent water marks from forming. Stains which resist that treatment can usually be removed by polishing in the direction of the grain with a soft cloth and a non-abrasive stainless steel polish. Test in an unobtrusive area.
US32D	Satin Stainless Steel

INTRODUCTION

Anyone who might be expected to use this fire extinguisher should study and understand the information in this manual. Please read it completely and keep it accessible so that it may be reviewed on a periodic basis. OSHA requires training of personnel who might be expected to use an extinguisher in the case of an emergency. Familiarity with this manual and the instruction nameplate on the extinguisher will contribute to successful use of the extinguisher. You should know just what it CAN and CANNOT do, where it is located, how to use it and how to maintain it. Proper and effective use of any fire extinguisher begins with an understanding of the classes of fire. Extinguishers are tested and rated for certain classes and sizes of fires. Some are rated for single classifications, some for multiple classifications and others constitute a hazard if used on certain types of fires.

TYPES AND CLASSES OF FIRES

CLASSES OF FIRES	TYPES OF FIRES	PICTURE SYMBOL
A	Wood, paper, cloth, trash and other ordinary materials	
B	Gasoline, oil, paint and other flammable liquids	
C	May be used on fires involving live electrical equipment without danger to the operator	
D	Combustible metals and combustible metal alloys.	
K	Cooking media (Vegetable or animal oils and fats)	

IMPORTANT THINGS TO REMEMBER!

NEVER DISCHARGE A FIRE EXTINGUISHER INTO ANYONE'S FACE

NEVER THROW AN EXTINGUISHER INTO THE FIRE OR LEAVE IT UNATTENDED IF THE FIRE IS NOT OUT
(Pressure build-up could cause an explosion from even a partially full extinguisher)

KEEP FIRE EXTINGUISHERS AWAY FROM CHILDREN

Water, Water Mist and AFFF and FFFP Foam Extinguishers

The above referred to models are shipped EMPTY – they must be filled and pressurized before being placed into service.

Model 240 – To protect your investment, charge using the Amerex Model 507 Corrosion Inhibitor if your water contains more than 40 P.P.M. of chlorides.

Model 240, 250, 252, 254 – Never use involving live electrical equipment. The nameplate on the extinguishers have the international red slash across the Class C symbol designating the hazard of using them where electricity is involved.

Model B270, B272 – Water Mist Extinguishers must be charged using deionized water to avoid contaminates. These extinguishers are UL Listed for **Class A and Class C fires.**

Never use Water Mist, Water, AFFF or FFFP Foam extinguishers for fires in cooking media. The water in all could flash to steam due to the extremely high temperatures and cause serious burns.

Only the Model 252 FFFP Foam may be used for fires involving water based flammable liquids such as alcohols or ketones.

DO NOT SUBJECT ANY OF THE EXTINGUISHERS IN THIS GROUP TO CONDITIONS WHERE THEY MIGHT FREEZE.

NOTE: Only the Model 240 2½ gallon water extinguisher may be chemically freeze protected to -40º F with the addition of an Amerex Model 506 charge. The 506 is not designed to protect Water Mist, Wet Chemical, AFFF or FFFP Foam extinguishers.

DRY CHEMICAL, DRY POWDER (CLASS D), HALOTRON I, HALON 1211, WET CHEMICAL (CLASS K) AND CARBON DIOXIDE EXTINGUISHERS

These extinguishers are shipped factory charged. **Do not test your extinguisher** since even a small amount of discharge could cause it to lose pressure making it less effective or useless in case of a fire.

Dry chemicals are non-poisonous but either the acidic based (ABC) or alkaline based (Regular or Purple K) chemicals could be an irritant if inhaled. If any physical discomfort is experienced, contact a physician immediately.

Dry chemical is not recommended for fires in delicate electrical equipment or aircraft. Use of this agent may extinguish the fire but may damage the equipment beyond repair.

Neither Halotron I nor Halon 1211 should be used in confined areas smaller than indicated on the extinguisher nameplate, food preparation areas or in the presence of people with cardiac problems. If problems occur, quickly remove the person from the area where the gas is present, apply artificial respiration and transport to a physician.

Never use ABC dry chemical, Halon 1211 or Halotron I fire extinguishers on fires involving chlorine containing oxidizers (example: pool chemicals). A violent explosive reaction could occur with the mixture of chemicals.

Wet Chemical (Class K) Extinguishers are approved for use for fires involving cooking media. Do not subject these extinguishers to conditions where they might freeze

Carbon Dioxide is discharged as a gas (with small particles of snow) at extremely low temperatures and will displace oxygen. Care should be exercised in confined areas. If problems occur, quickly remove the person from the area where the gas is present, apply artificial respiration and transport to a physician. Avoid skin contact which could cause cold burns.

NOTE: As required by OSHA, Material Safety Data Sheets (MSDS) are available for all chemicals contained in these fire extinguishers. Contact your Amerex distributor or Amerex Corporation. In addition, the MSDS information is contained in a special section of all extinguisher labels. All MSDS are available on the Amerex website at www.amerex-fire.com.

MONTHLY

INSPECTION RECORD

FASTEN TO EXTINGUISHER BEFORE INSTALLATION

DO NOT REMOVE

FOLLOW THE INSPECTION INSTRUCTIONS IN OWNER'S MANUAL AND ON THE EXTINGUISHER

Date	Inspected By	Condition

HAVE YOUR EXTINGUISHER PROFESSIONALLY MAINTAINED AND RECHARGED

RECHARGE AFTER ANY USE

IMPORTANT NOTICE TO BOAT OWNERS

If the extinguisher is to be mounted in your boat, make sure that the proper mounting bracket is used. The nameplate (in the area of the UL manifest) says if it is Coast Guard approved and the mounting bracket which MUST be used to complete the approval. You will be cited by the Coast Guard if the correct type of extinguisher and bracket has not been installed.

INSPECTION RECORD
Model No: _____
Serial No: _____
Mfg. Date: _____
Date Installed New: _____

INSPECTION should be performed monthly or more frequently if circumstances dictate. The extinguisher should be checked to see that it is not damaged, the discharge outlet is not blocked, that it is fully charged, the seal is not broken and that the operating instructions are clearly visible.

ANNUAL MAINTENANCE is a more complete inspection of the extinguisher and should be done professionally. It will reveal the need for hydrotesting which must be done on Water Mist, Water, Wet Chemical, Foam and Carbon Dioxide every FIVE YEARS and Dry Chemical, Dry Powder, Halotron I and Halon 1211 extinguishers every TWELVE YEARS. Most local authorities require special tags be attached to the extinguisher to verify this service.

SIX YEAR MAINTENANCE – Every six years extinguishers requiring a 12 year hydrotest shall be emptied and subject to thorough examination of mechanical parts, extinguishing agent and expelling means. When applicable maintenance procedures are done during periodic recharging or hydrotesting, the six year requirement will begin from that date.

RECHARGE should be done professionally immediately after any use by your local Amerex Distributor who has the trained personnel, extinguishing agents and equipment to do it properly. This extinguisher must be recharged with the extinguishing agent specified on the nameplate. Substitutions could cause damage or injury **and will void the warranty.**

DISTRIBUTED BY:

INSTALLATION & DISTRIBUTION

Install, inspect, maintain and test your fire extinguisher in accordance with the National Fire Protection Assoc. Standard 10 "'Portable Fire Extinguishers".

Your fire extinguisher should be mounted in a clean dry area, accessible to possible fire hazards and preferably near an exit. Mount it so that the top is from 3 ½ to 5 feet above the floor and out of the reach of small children.

Use the mounting bracket furnished with the extinguisher or an approved Amerex vehicle bracket if required. Fasten to a solid surface using strong screws or fasteners (not included).

Follow the Mounting Instructions below, particularly in public areas where the extinguisher might be accidentally dislodged from the bracket or have objects placed on it.

MOUNTING INSTRUCTIONS

UL specifies that a hanging device must withstand a vertical force of five times the weight of the charged extinguisher but not less than 100 pounds. The extinguisher bracket should be mounted as follows:

Walls where 2"x4" studs can be found – ALL SIZES: Mount wall hanger bracket securely to stud using two #10 x 1¼" long wood screws through the diagonal smaller holes in the bracket.

Sheetrock – ALL SIZES: Mount a ¾" thick board to the wall using 3/16" toggle bolts – height and width of the board is dependent on extinguisher size. The board should extend a minimum of two inches beyond all sides of the extinguisher profile (excluding hose and horn). Mount wall hanger bracket to board using two #10 x 1" long wood screws as above.

Cinderblock or Cement – ALL SIZES: Mount wall hanger bracket using one ¼" toggle bolt or masonry lead screw expansion anchor through center hole in the bracket. Mount vehicle/marine strap type brackets using two 3/16" toggle bolts or #10 lead screw expansion anchors.

Concrete or Tile Wall – ALL SIZES – Mount wall hanger bracket using one ¼" masonry lead screw expansion anchor through center hole in wall bracket. Mount vehicle/marine strap type brackets using two No. 10 masonry lead screw expansion anchors.

Steel Posts or Beams – ALL SIZES: Special tools and fasteners are required – have extinguisher mounted by a professional fire extinguisher service company.

Tile Walls: Locate in joint.

INSPECTION

Your extinguisher should be inspected monthly, checking for any possible damage, corrosion, leakage or obstructions in the discharge outlet. The tamper seal should be unbroken. The extinguisher should be cleaned so that the instructions on the label are always clearly visible. **Carbon Dioxide** extinguishers should be weighed and the weight verified to be within the tolerances specified on the nameplate (label). **Water Mist, Water, Wet Chemical, Foam, Dry Chemical,** Dry Powder, **Halotron I and Halon 1211** extinguisher pressure gauges should be checked. The indicator will vary slightly due to temperature, but should always be in the GREEN area if it is fully pressurized. Heft or weigh the extinguisher to determine fullness.

IN CASE OF FIRE

1. Have everyone evacuate the area immediately.
2. Call the Fire Department even if the fire appears to be small (small fires quickly become LARGE fires). The Fire Dept. phone number should be posted at every phone.
3. Use your extinguisher properly, according to the instructions on the nameplate and in this manual. A large fire should be fought by professionals. Be prepared to leave the area if the fire cannot be immediately controlled.

HOW TO USE

NOTE: The following instructions are of a general nature, intended to familiarize the user with the basic operating techniques of Amerex hand portable extinguishers. **All operate by removing the ring (safety) pin and squeezing the handles together.** Since extinguishers differ, the extinguisher nameplate must be consulted for specific procedures and starting distances.

1. Hold the extinguisher upright and pull the ring (safety) pin breaking the plastic seal.
2. Stand back from the fire (the minimum distance stated on the nameplate) and aim at the base of the fire nearest you.
3. Keeping the extinguisher upright, squeeze the handles together to discharge and sweep from side to side. Move closer as the fire is extinguished but not so close as to scatter the burning material or liquid.
4. When the fire is out, back away while watching for possible re-ignition.
5. Evacuate and ventilate the area immediately after use. The fumes and smoke from any fire may be hazardous and can be deadly.

NOTE: Whenever possible, protective clothing and breathing equipment should be used while fighting a fire.

1. HOLD EXTINGUISHER UPRIGHT AND PULL THE RING (SAFETY) PIN

2. STAND BACK FROM THE FIRE AND AIM AT THE BASE OF THE FIRE NEAREST YOU

3. SQUEEZE HANDLES TOGETHER & SWEEP THE EXTINGUISHER STREAM SIDE TO SIDE

REMEMBER THIS SIMPLE WORD – P A S S

FIRE EXTINGUISHERS

AMEREX LIMITED 6 YEAR WARRANTY *

Amerex warrants its fire extinguishers to be free from defects in material and workmanship for a period of six (6) years from the date of purchase. During the warranty period, any such defects will be repaired or the defective extinguisher replaced IF THE ORIGINAL GREY TAMPER SEAL IS INTACT AND/OR IF ONLY FACTORY REPLACEMENT PARTS HAVE BEEN USED TO SERVICE THE EXTINGUISHER. This warranty does not cover defects resulting from modification, alteration, misuse, exposure to corrosive conditions, improper installation or maintenance.

ALL IMPLIED WARRANTIES, INCLUDING BUT NOT LIMITED TO, WARRANTIES OF FITNESS FOR PURPOSE AND MERCHANTABILITY, ARE LIMITED TO THE TIME PERIODS STATED ABOVE. IN NO EVENT SHALL AMEREX CORP. BE LIABLE TO INCIDENTAL OR CONSEQUENTIAL DAMAGES.

Some states do not allow limitations on how long an implied warranty lasts or the exclusion or limitation of incidental or consequential damages, so the above limitations or exclusions may not apply to you. Amerex Corp. neither assumes nor authorizes any representative or other person to assume for it, any obligation or liability other than expressly set forth herein. This warranty gives you specific legal right and you may have other rights, which vary from state to state. To obtain performance of the obligation of this warranty, write to Amerex Corp.,P. O. Box 81, Trussville, AL 35173-0081 for instructions.

Limited Warranty

Limited Warranty

Cardiac Science Corporation ("Cardiac Science") warrants to the original purchaser that its AEDs and stated battery operating life will be free of any defect in material and workmanship according to the terms and conditions of this Limited Warranty ("Limited Warranty"). For purposes of this Limited Warranty, the original purchaser is deemed to be the original end user of the product purchased. This Limited Warranty is NONTRANSFERABLE and UNASSIGNABLE.

For How Long?

This Limited Warranty covers the following products or parts for the following time periods:

1. Seven (7) years from the date of the original shipment to the original purchaser for Powerheart AED automated external defibrillators. Warranty duration for the pads, batteries and accessories are covered below.
2. Disposable defibrillation pads shall be warranted until the expiration date.
3. Lithium batteries P/N (9146) have a full operational replacement guarantee of four (4) years from the date of installation into a Powerheart AED.
4. One (1) year from the date of original shipment to the original purchaser for Powerheart AED accessories. The terms of the Limited Warranty in effect as of the date of original purchase will apply to any warranty claims.

What You Must Do:

Please complete and submit the Product Registration online at http://www.cardiacscience.com/services-support/product-registration/.

To obtain warranty service for your product:

Inside the US, call us toll free at 800.426.0337 seven days a week, 24 hours a day. Our technical support representative will try to resolve your issue over the phone. If necessary, and at our sole discretion, we will arrange for service or a replacement of our product.

Outside the US, contact your local Cardiac Science representative.

What We Will Do:

If your Cardiac Science product is returned within 30 days of the date it was purchased, at the direction of a technical support representative, we will repair or replace it with a new product of equal value at no charge to you or offer a full refund of the purchase price, provided the warranty applies. Cardiac Science retains the exclusive right to repair or replace the product or offer a full refund of the purchase price at its sole discretion. SUCH REMEDY SHALL BE YOUR SOLE AND EXCLUSIVE REMEDY FOR ANY BREACH OF WARRANTY.

If your Cardiac Science product is returned, at the direction of a technical support representative, after 30 days but within the warranty period, Cardiac Science, at its sole discretion, will repair your product or replace it. The repaired or replacement product will be warranted subject to the terms and conditions of this Limited Warranty for either (a) 90 days or (b) the remainder of the original warranty period, whichever is longer, provided the warranty applies and the warranty period has not expired.

Obligations and Warranty Limits:

Limited Warranty Obligation: Exclusive Remedy

THE FOREGOING LIMITED WARRANTY IS IN LIEU OF AND SPECIFICALLY EXCLUDES AND REPLACES ALL OTHER EXPRESSED OR IMPLIED WARRANTIES INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Some states do not allow limitations on how long an implied warranty lasts, so this limitation may not apply to you.

NO PERSON (INCLUDING ANY AGENT, DEALER, OR REPRESENTATIVE OF CARDIAC SCIENCE) IS AUTHORIZED TO MAKE ANY REPRESENTATION OR WARRANTY CONCERNING CARDIAC SCIENCE PRODUCTS, EXCEPT TO REFER PURCHASERS TO THIS LIMITED WARRANTY.

YOUR EXCLUSIVE REMEDY WITH RESPECT TO ANY AND ALL LOSSES OR DAMAGES RESULTING FROM ANY CAUSE WHATSOEVER SHALL BE AS SPECIFIED ABOVE. CARDIAC SCIENCE SHALL IN NO EVENT BE LIABLE FOR ANY SPECIAL, PUNITIVE, INDIRECT, CONSEQUENTIAL OR INCIDENTAL DAMAGES OF ANY KIND, INCLUDING, BUT NOT LIMITED TO, EXEMPLARY DAMAGES, COMMERCIAL LOSS FROM ANY CAUSE, BUSINESS INTERRUPTION OF ANY NATURE, LOSS OF PROFITS OR PERSONAL INJURY OR DEATH, EVEN IF CARDIAC SCIENCE HAS BEEN ADVISED OF THE POSSIBILITIES OF SUCH DAMAGES, HOWEVER OCCASIONED, WHETHER BY NEGLIGENCE OR OTHERWISE.

Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

What This Warranty Does Not Cover:

This Limited Warranty does not cover defects or damages of any sort resulting from, but not limited to, accidents, damage while in transit to our service location, product tampering, unauthorized product alterations, unauthorized service, unauthorized product case opening, failure to follow instructions, improper use, abuse, neglect, fire, flood, war or acts of God. Cardiac Science makes no warranty claim as to the compatibility of Cardiac Science products with any non-Cardiac Science products, parts or accessories.

This Limited Warranty is Void if:

1. Any Cardiac Science product is serviced or repaired by any person or entity other than Cardiac Science unless specifically authorized by Cardiac Science.
2. Any Cardiac Science product case is opened by unauthorized personnel or if a product is used for an unauthorized purpose.
3. Any Cardiac Science product is used in conjunction with incompatible products, parts or accessories, including but not limited to batteries. Products, parts and accessories are not compatible if they are not Cardiac Science products intended for use with the Powerheart AED.

If The Warranty Period has Expired:

If your Cardiac Science product is not covered by our Limited Warranty:

Inside the US, call us toll free at 1-800-426-0337 for advice as to whether we can repair your Powerheart AED, and for other repair information, including charges. Charges for non-warranty repairs will be assessed and are your responsibility. Upon completion of the repair, the terms and conditions of this Limited Warranty shall apply to such repair or replacement product for a period of 90 days.

Outside the US, contact your local Cardiac Science representative.

This warranty gives you specific legal rights, and you may also have other rights, which vary from state to state.

Outside the United States:

Contact your local Cardiac Science representative to order devices or accessories and to receive technical support for your AED products.

Defibrillator tracking

Defibrillator manufacturers and distributors are required, under the Safe Medical Devices Act of 1990, to track the location of defibrillators they sell. Please notify Cardiac Science Technical Support in the event that your defibrillator is sold, donated, lost, stolen, exported, destroyed or if it was not purchased directly from Cardiac Science or an authorized dealer.

Product models

This manual is for Powerheart G3 Plus model 9390E and Powerheart G3 Plus Automatic 9390A AED models. They share a basic set of features and differences are noted throughout the manual.

Product references

For purposes of retaining simple, clear instructions in this manual, note the product references used. Features, specifications, operating instructions and maintenance common to product models will be referred to as:

"Powerheart G3 AED", "AED", or "device" refers to both Powerheart G3 model 9390E and Powerheart G3 Automatic model 9390A AEDs unless otherwise noted.

Warranty information

The Powerheart G3 AED *Operator and Service Manual* and any and all information contained herein (except for the *Limited Warranty* chapter) do not constitute any warranty as to the Powerheart G3, Powerheart G3 Automatic or any related products in any manner whatsoever. The *Limited Warranty* chapter in this manual serves as the sole and exclusive warranty provided by Cardiac Science regarding Powerheart G3 AED products.

Safety terms and definitions

The symbols shown below identify potential hazard categories. The definition of each category is as follows:

DANGER

This alert identifies hazards that will cause serious personal injury or death.

WARNING

This alert identifies hazards that may cause serious personal injury or death.

Caution

This alert identifies hazards that may cause minor personal injury, product damage, or property damage.

Safety alert descriptions

The following is a list of Powerheart G3 AED safety alerts that appear in this section and throughout this manual.

Read and understand these safety alerts before operating the AED.

Caution: Read this Operator and Service Manual carefully.

It contains information about your safety and the safety of others. Become familiar with the controls and how to use the AED properly before operating the product.

DANGER! Fire and Explosion Hazard

To avoid possible fire or explosion hazard, do not operate the AED:

- In the presence of flammable gases
- In the presence of concentrated oxygen
- In a hyperbaric chamber

WARNING! Shock Hazard and Possible Equipment Damage

Defibrillation shock current flowing through unwanted pathways is potentially a serious electrical shock hazard and potential damage to the equipment. To avoid this hazard during defibrillation abide by all of the following:

- Do not use in standing water or rain. Move patient to dry area
- Do not touch the patient, unless performance of CPR is indicated
- Do not touch metal objects in contact with the patient
- Keep defibrillation pads clear of other pads or metal parts in contact with patient
- Disconnect all non-defibrillator proof equipment from the patient before defibrillation

WARNING! Battery is Not Rechargeable.

Do not attempt to recharge the battery. Any attempt to recharge the battery may result in an explosion or fire hazard.

WARNING! Possible Radio Frequency (RF) Susceptibility.

Radio-frequency (RF) interference from devices such as cellular phones and two-way radios can cause improper AED operation. The AED should be used at least 6 feet (2 meters) away from RF devices, as stated in accordance with EN 61000-4-3:2002.

WARNING! Possible Interference with Implanted Pacemaker.

Therapy should not be delayed for patients with implanted pacemakers and a defibrillation attempt should be made if the patient is unconscious and not breathing. The AED has pacemaker detection and rejection, however with some pacemakers the AED may not advise a defibrillation shock. (Cummins, R., ed., Advanced Cardiac Life Support; AHA (1994): Ch. 4)

When placing Pads:

- Do not place the pads directly over an implanted device.
- Place the pad at least one inch from any implanted device.

WARNING! Electromagnetic Compatibility.

Use of accessories or cables other than those specified, with the exception of accessories and cables sold by Cardiac Science Corporation as replacement parts for internal components, may result in increased emissions or decreased immunity of the AED.

WARNING! Improper Equipment Placement.

Position the AED away from other equipment. If it is necessary to use the AED adjacent to or stacked with other equipment, then observe the AED to verify normal operations.

Caution: Restricted Use.

Federal law restricts this device for sale by or on the order of a physician or practitioner licensed by law of the state in which he/she practices.

Caution: Lithium Sulfur Dioxide Battery.

Pressurized contents: never recharge, short circuit, puncture, deform, or expose to temperatures above 65°C (149°F). Remove the battery when discharged.

Caution: Battery Disposal.

Recycle or dispose of the lithium battery in accordance with all federal, state and local laws. To avoid fire and explosion hazard, do not burn or incinerate the battery.

Caution: Use only Cardiac Science Approved Equipment.

Using batteries, pads, cables, or optional equipment other than those approved by Cardiac Science may cause the AED to function improperly during a rescue.

Caution: Possible Improper AED Performance.

Using pads that are damaged or expired may result in improper AED performance.

Caution: Serial Communication Cable.

The AED will not function during a rescue when the serial communication cable is connected to its serial port. When the serial communication cable is connected to the AED during a rescue, the prompt "Remove Cable to Continue Rescue" will be heard until you remove the serial communication cable.

Caution: Moving the Patient During a Rescue.

During a rescue attempt, excessive jostling or moving of the patient may cause AEDs to improperly analyze the patient's cardiac rhythm. Stop all motion or vibration before attempting a rescue.

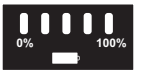
Caution: Systems Statement.

Equipment connected to the analog and digital interfaces must be certified to the respective IEC standards (i.e. IEC 60950 for data processing equipment and IEC 60601-1 for medical equipment).

Furthermore, all configurations shall comply with the system standard IEC 60601-1-1. Anybody who connects additional equipment to the signal input part or signal output part configures a medical system, and is therefore, responsible that the system complies with the requirements of the system standard IEC 60601-1-1.

Caution: Equipment Malfunction.

Portable and RF communications equipment may affect the AED. Always observe the recommended separation distances as defined in the EMC declaration tables.



Caution: Equipment Malfunction.

The AED requires special precautions regarding EMC. Use the AED according to the guidelines of the EMC declaration tables.

Symbol descriptions

The following symbols may appear in this manual, on the AED, or on its optional components. Some of the symbols represent standards and compliances associated with the AED and its use.

Symbol	Description	Symbol	Description
	Caution. Consult accompanying documentation.		Additional information is provided in the AED Operation and Service Manual.

Symbol	Description	Symbol	Description
	Dangerous Voltage: The defibrillator output has high voltage and can present a shock hazard. Please read and understand all safety alerts in this manual before attempting to operate the AED.		Defibrillator Proof Type BF Equipment: The AED, when connected to the patient's chest by the pads, can withstand the effects of an externally applied defibrillation shock.
IP24	The AED is protected against the effects of splashing water in accordance with IEC 60529.		Do not recharge battery.
	Classified by CSA International with respect to electric shock, fire and mechanical hazards only in accordance with CAN/CSA C22.2 No.60601-1:08, EN60601-1 and EN60601-2-4. Certified to CAN/CSA Standard C22.2 No. 60601-1:08.		
	Symbol for ON. Open the lid to turn on the AED.		Indicates the AED battery status. The illuminated areas indicate the remaining battery capacity.
	Check pads. The pads are missing, not connected or have compromised functionality.		Indicates AED requires maintenance by authorized service personnel.
	When the SHOCK indicator is lit, press this button to deliver a defibrillation shock.		Serial communication port

Symbol	Description	Symbol	Description
	A red indicator with a BLACK X means the AED requires operator attention or maintenance, and is not Rescue Ready.		A green indicator without a BLACK X means the AED is Rescue Ready.
	Date of manufacture: year and month.		Date of factory recertification (R): year and month.
	Latex free. Not made with natural rubber latex.		Disposable. Single patient use only.
	Tear here to open.		Position of pads on the chest of patient.
	For use by or on the order of a Physician, or persons licensed by state law.		Separate one pad from blue liner by peeling from the tabbed corner.
	Do not incinerate or expose to open flame.		
	Upper and lower operating temperature limits.		Use pads by this date.
SN	Serial Number	REF	Device model number; battery model number

Electromagnetic emissions standards compliance

Guidance and manufacturer's declaration—electromagnetic emissions

The AED is intended for use in the electromagnetic environment specified below. The customer or the user of the AED should assure that it is used in such an environment.

Emissions test	Compliance	Electromagnetic environment—guidance
RF emissions CISPR 11	Group 1	The AED uses RF energy only for its internal function. Therefore its RF emissions are very low and are not likely to cause any interference in nearby electronic equipment.

Emissions test	Compliance	Electromagnetic environment—guidance
RF emissions CISPR 11	Class B	The AED is suitable for use in all establishments, including domestic establishments and those directly connected to the public low-voltage power supply network that supplies buildings used for domestic purposes.
Harmonic emissions IEC 61000-3-2	Not applicable	
Voltage fluctuations/flicker emissions IEC 61000-3-3	Not applicable	

Guidance and manufacturer's declaration—electromagnetic immunity

The AED is intended for use in the electromagnetic environment specified below. The customer or the user of the AED should assure that it is used in such an environment.

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment—guidance
Electrostatic discharge (ESD) IEC 61000-4-2	±6 kV contact ±8 kV air	±6 kV contact ±8 kV air	Floors should be wood, concrete or ceramic tile. If floors are covered with synthetic material, the relative humidity should be at least 30%
Electrical fast transient/burst IEC 61000-4-4	±2 kV for power supply lines ±1 kV for input/output lines	Not applicable	
Surge IEC 61000-4-5	±1 kV differential mode ±2 kV common mode	Not applicable	

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment—guidance
Voltage dips, short interruptions and voltage variations on power supply input lines 61000-4-11	<5% U_T (>95% dip in U_T) for 0.5 cycle 40% U_T (60% dip in U_T) for 5 cycles 70% U_T(30% dip in U_T) for 25 cycles <5% U_T(>95% dip in U_T) for 5 sec.	Not applicable	
Power frequency (50/60 Hz) magnetic field IEC 61000-4-8	3 A/m	80 A/m	Power frequency magnetic fields should be at levels no higher than those characteristic of a typical location in typical heavy industrial and power plants and the control rooms of H.V. sub-stations.

Note: U_T is the a.c. mains voltage prior to application of the test level.

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment—guidance
Conducted RF	3 Vrms	Not Applicable	
IEC 61000-4-6	150 kHz to 80 MHz outside ISM bands[a]		
	10 Vrms	Not Applicable	
	150 kHz to 80 MHz in ISM bands[a]		

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment—guidance
			Portable and mobile RF communications equipment should be used no closer to any part of the AED, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter.
			Recommended separation distance
Radiated RF	10 V/m	10 V/m	$d = 1.2 \sqrt{P}$ 80 MHz to 800 MHz
IEC 61000-4-3	80 MHz to 2.5 GHz		$d = 2.3 \sqrt{P}$ 800 MHz to 2.5 GHz
			where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and d is the recommended separation distance in meters (m)[b].

Immunity test	IEC 60601 test level	Compliance level	Electromagnetic environment—guidance
			Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey,[c] should be less than the compliance level in each frequency range.[d] Interference may occur in the vicinity of equipment marked with the following 

NOTE 1At 80 MHz and 800 MHz, the higher frequency range applies.

NOTE 2These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

a The ISM (industrial, scientific and medical) bands between 150 kHz and 80 MHz are 6.765 MHz to 6.795 MHz; 13.553 MHz to 13.567 MHz; 26.957 MHz to 27.283 MHz; and 40.66 to 40.70 MHz.

b The compliance levels in the ISM frequency bands between 150 kHz and 80 MHz and in the frequency range 80 MHz to 2.5 GHz are intended to decrease the likelihood that mobile/portable communications equipment could cause interference if it is inadvertently brought into patient areas. For this reason, an additional factor of 10/3 is used in calculating the recommended separation distance for transmitters in these frequency ranges.

c Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the AED is used exceeds the applicable RF compliance level above, the AED should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as re-orienting or relocating the AED.

d Over the frequency range 150 kHz to 80 MHz, field strengths should be less than 1 V/m.

Recommended separation distances between portable and mobile RF communications equipment and the AED

The AED is intended for use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or the user of the AED can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the AED as recommended below, according to the maximum output power of the communications equipment.

Rated maximum output power of transmitter W	Separation distance according to frequency of transmitter m			
	150 kHz to 80 MHz outside ISM bands $d = 1.2\sqrt{P}$	150 kHz to 80 MHz in ISM bands $d = 1.2\sqrt{P}$	80 MHz to 800 MHz $d = 1.2\sqrt{P}$	800 MHz to 2.5 GHz $d = 2.3\sqrt{P}$
0.01	0.12	0.12	0.12	0.23
0.1	0.38	0.38	0.38	0.73
1	1.2	1.2	1.2	2.3
10	3.8	3.8	3.8	7.3
100	12	12	12	23

For transmitters rated at a maximum output power not listed above, the recommended separation distance d in meters (m) can be determined using the equation applicable to the frequency of the transmitter, where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

NOTE 1At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies.

NOTE 2The ISM (industrial, scientific and medical) bands between 150 kHz and 80 MHz are 6.765 MHz to 6.795 MHz; 13.553 MHz to 13.567 MHz; 26.957 MHz to 27.283 MHz; and 40.66 to 40.70 MHz.

NOTE 3An additional factor of 10/3 is used in calculating the recommended separation distance for transmitters in the ISM frequency bands between 150 kHz and 80 MHz and in the frequency range 80 MHz to 2.5 GHz to decrease the likelihood that mobile/portable communications equipment could cause interference if it is inadvertently brought into patient areas.

NOTE 4These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

2 Introduction

- Rescue protocol 2-5
- STAR® biphasic waveform 2-5
- STAR biphasic energy protocols for Powerheart G3 AEDs 2-6
- Operator training requirements 2-8

This section presents information about the AED, its use, and the training requirements for operation.

AED description

The AED is a self-testing, battery-operated automated external defibrillator (AED). After applying the AED's defibrillation pads to the patient's bare chest, the AED automatically analyzes the patient's electrocardiogram (ECG) and advises the operator to press the button and deliver a shock if needed. The AED guides the operator through the rescue using a combination of voice prompts, audible alerts, and visible indicators. For the Powerheart AED G3 Automatic, the AED automatically delivers a shock if needed.

Indications for use

Powerheart AED G3 and Powerheart AED G3 Automatic

The Powerheart AED G3 and the Powerheart AED G3 Automatic devices are intended to be used by personnel who have been trained in its operation. The user should be qualified by training in basic life support or other physician-authorized emergency medical response.

The device is indicated for emergency treatment of victims exhibiting symptoms of sudden cardiac arrest who are unresponsive and not breathing. Post-resuscitation, if the victim is breathing, the AED should be left attached to allow for acquisition and detection of the ECG rhythm. If a shockable ventricular tachyarrhythmia recurs, the device will charge automatically and advise the operator to deliver therapy (G3) or automatically deliver the charge (G3 Automatic).

When a patient is a child or infant up to 8 years of age, or up to 55 lbs (25kg), the device should be used with the Model 9730 Pediatric Attenuated Defibrillation Electrodes. The therapy should not be delayed to determine the patient's exact age or weight.

9131 Defibrillation Electrodes

Cardiac Science 9131 Defibrillation Electrodes are single use and intended to be used in conjunction with Cardiac Science automatic external defibrillators (AED) to monitor and deliver defibrillation energy to the patient.

The electrodes are intended for short term use (<8 hours) and must be used before the expiration date listed on the packaging.

The AED electrodes are used for emergency treatment of cardiac arrest patients over 8 years of age or greater than 55 pounds. The user assesses the patient’s condition and confirms that the patient is unconscious, pulseless and is not breathing prior to applying the electrodes to the skin.

RHYTHMx AED ECG analysis algorithm

The RHYTHMx™ AED ECG analysis algorithm provides ECG detection capabilities. The features available with the AED include the following:

- Detection Rate
- Asystole Threshold
- Noise Detection
- Non-Committed Shock
- Synchronized Shock
- Pacemaker Pulse Rejection
- SVT Discriminators
- Supraventricular Tachycardia (SVT) Rate

Detection rate

All ventricular fibrillation (VF) and ventricular tachycardia (VT) rhythms at or above this rate will be classified as shockable. All rhythms below this rate will be classified as non-shockable. This rate is programmable between 120 bpm (beats per minute) and 240 bpm via MDLink Software by the Medical Director. The default Detection Rate is 160 bpm.

Asystole threshold

The asystole baseline-to-peak threshold is set at 0.08 mV. ECG rhythms at or below 0.08 mV will be classified as asystole and will not be shockable.

Noise detection

The AED will detect noise artifacts in the ECG. Noise could be introduced by excessive moving of the patient or electronic noise from external sources like cellular and radiotelephones. When noise is detected, the AED will issue the prompt “ANALYSIS INTERRUPTED. STOP PATIENT MOTION” to warn the operator. The AED will then proceed to reanalyze the rhythm and continue with the rescue.

Non-committed shock

After the AED advises a shock, it continues to monitor the patient ECG rhythm. If the patient's rhythm changes to a non-shockable rhythm before the actual shock is delivered, the AED will advise that the rhythm has changed and issue the prompt "RHYTHM CHANGED. SHOCK CANCELLED." The AED will override the charge.

Synchronized shock

The AED is designed to automatically attempt to synchronize shock delivery on the R-wave if one is present. If delivery cannot be synchronized within one second, a non-synchronized shock will be delivered.

Pacemaker pulse detection

The AED contains pacemaker pulse detection circuitry to detect pulses from an implanted pacemaker.

SVT discriminators

The AED is supplied with the SVT Discriminator enabled and with the default setting "NO THERAPY FOR SVT". With the factory default setting of "NO THERAPY FOR SVT", the AED will not shock an SVT rhythm.

SVT Discriminators are sophisticated filters that analyze the morphology of the ECG waveforms and distinguish VF/VT from SVT and Normal Sinus Rhythms (NSR). The SVT Discriminator will only be applied to rhythms that fall between the Detection Rate and the SVT Rate. The factory default setting for this feature is "NO THERAPY FOR SVT", however the Medical Director can enable this feature using MDLink on the Powerheart AED.

SVT rate

All rhythms with rates between the Detection Rate and SVT Rate will be screened through a number of SVT Discriminators to classify them into VF/VT or SVT. Rhythms classified as SVT between the two set rates are not shockable. All SVT rhythms above the rates will be classified as shockable. The SVT Rate must be greater than the

Detection Rate and is selectable between 160 and 300 bpm or, “NO THERAPY FOR SVT” can be selected via MDLink Software by the Medical Director.

Rescue protocol

The AED rescue protocol is consistent with the guidelines recommended by the AHA/ERC 2010 Guidelines for Resuscitation and Emergency Cardiac Care.

Upon detecting a shockable cardiac rhythm, the AED advises the operator to press the SHOCK button (9390E only) to deliver a defibrillation shock followed by directions to perform 2 minutes of CPR.

For the Powerheart AED G3 Automatic, upon detecting a shockable rhythm, the AED will automatically deliver a defibrillation shock followed by directions to perform 2 minutes of CPR.

STAR® biphasic waveform

The STAR® Biphasic Waveform is designed to measure the patient’s impedance and deliver a customized shock. This allows the delivery of an optimized energy level to each patient. The energy levels for the Powerheart G3 AED are available in three different defibrillation shock levels.

The Ultra-Low Energy (150 VE), Low Energy (200 VE), and High Energy (300 VE) shocks are variable energy. The actual energy is determined by the patient’s impedance. See Table 2-1 on page 2-6, Table 6-2 on page 6-8, Table 6-3 on page 6-8, and Table 6-4 on page 6-9 for additional information.

STAR biphasic energy protocols for Powerheart G3 AEDs

The STAR Biphasic defibrillation waveform will deliver variable escalating energy that is customized to each patient's needs based upon a patient's thoracic impedance. This customization adjusts for the unique physical differences between patients. The Powerheart G3 AED comes equipped with five different biphasic energy protocols.

The operator, with guidance, direction, and implementation from the designated AED program Medical Director, may select from one of these five protocols when placing the Powerheart G3 AED into service. The Powerheart G3 AED's factory default energy protocol is 200-300-300 Joule (J) escalating Variable Energy (VE). The first shock is delivered within the range of 126J-260J. Subsequent shocks are delivered within a range of 170J-351J.

These protocols are selected by using the MDLink software program. The five biphasic energy protocols available are as follows:

Table 2-1: Biphasic Energy Protocols

Energy Protocols	Shock Sequence[1]	Energy Level (VE)	Energy Range[2] (J)
Factory Default	1	200	126-260
	2	300	170-351
	3	300	170-351
Protocol #2	1	200	126-260
	2	200	126-260
	3	300	170-351
Protocol #3	1	150	95-196
	2	200	126-260
	3	200	126-260

Table 2-1: Biphasic Energy Protocols (continued)

Energy Protocols	Shock Sequence[1]	Energy Level (VE)	Energy Range[2] (J)
Protocol #4	1	150	95-196
	2	150	95-196
	3	200	126-260
Protocol #5	1	200	126-260
	2	200	126-260
	3	200	126-260

[1]The Ultra-Low Energy (150 VE), Low Energy(200 VE) and High Energy(300 VE) shocks are variable energy. The actual energy is determined by the patient's impedance.

[2] Allowable energy range.

Operator training requirements

Persons authorized to operate the AED must have all of the following minimum training:

- Defibrillation training and other training as required by state, province, or country regulations
- Training on operation and use of the AED
- Additional training as required by the physician or Medical Director
- A thorough understanding of the procedures in this manual

Note: Keep valid certificates of training and certification as required by state, province, or country regulations.

3 Getting Started

Contents

- AED indicators 3-2
- Setting the AED internal clock 3-6
- RescueCoach™ voice prompts and text display 3-7

AED indicators

The following indicators are located on the AED.

Rescue Ready status indicator

The status indicator is located on the Powerheart G3 AED handle.

When this indicator is green, the AED is Rescue Ready. This means the AED self-tests have verified the following:

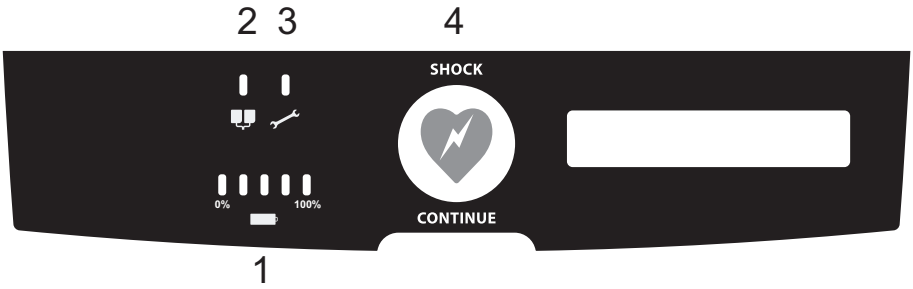
- Battery has an adequate charge
- Pads are properly connected to the AED and functioning
- Integrity of the internal circuitry is good

When the status indicator is red, attention is required.

1. Open the lid of the AED to troubleshoot the issue.
2. The AED may become Rescue Ready (the indicator turns green) after it runs further tests.
3. If the indicator remains red, contact Cardiac Science Technical Support (see *Contact information* on page 1-2) or outside the U.S., your local Cardiac Science representative.

Note: When the status indicator shows not Rescue Ready (the indicator is red) you might hear an intermittent beep. See *Audible maintenance indicator* for troubleshooting information.

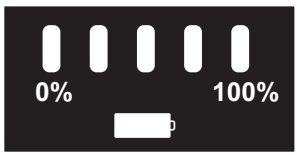
Audible maintenance indicator



When the daily, weekly, or monthly self-test determines attention is required, a beep sounds every 30 seconds until the lid is opened or the battery power is depleted. Opening and closing the lid may deactivate the beep. If the error is not corrected by the next automatic self-test, the beep will be reactivated.

Because the beep is a general indicator that the AED is not Rescue Ready, always open the lid first and allow the AED to perform its self test. If the AED provides a voice prompt but does not change the Rescue Ready indicator to green, note the prompt and contact Cardiac

Science Technical Support (see *Contact information* on page 1-2) or outside the U.S., your local Cardiac Science representative.



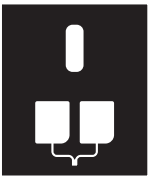
Diagnostic panel

The diagnostic panel has the following indicators:

1 Smartgauge™ battery indicator
2 Pads indicator
3 Service indicator
4 Shock Button (Powerheart G3 model 9390E only)

Smartgauge battery status indicator

The Smartgauge Battery Status Indicator has five LEDs, four green and one red. The right four green LEDs display the remaining capacity of the battery much like a fuel gauge. With use, the green LEDs gradually go out, from right to left, as battery capacity decreases. When the green LEDs go out and the red LED lights up, replace the battery.



Note: When the red LED initially lights up–upon lid opening or at any time during a rescue–a BATTERY LOW prompt will be issued at once. However, the AED is capable of delivering at least 9 defibrillation shocks after the first BATTERY LOW prompt is issued.

When the AED battery cannot deliver any more shocks, the AED shows BATTERY LOW on the text display, and the red battery LED illuminates. To continue the rescue, leave the lid open, remove the battery, and replace with a fresh battery. If battery replacement takes

longer than 60 seconds, the first rescue will be terminated and a second rescue will begin upon insertion of battery.

Note: When the battery is depleted, neither the LED nor the text display illuminates.

Pads indicator

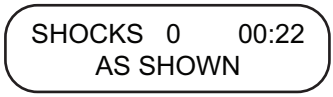
The Pads LED lights up when the pads are:

- Not properly connected to the AED
- Not within operational specifications (cold, dried, damaged)
- Disconnected from the patient during a rescue

Service indicator

The Service LED lights up when the AED detects an error that cannot be corrected by the self test. Contact Cardiac Science Technical Support (see *Contact information* on page 1-2) or outside the U.S., your local Cardiac Science representative.

Shock button



For the Powerheart G3 model 9390E only: The AED has one button called the Shock button. The word Shock and the shock button LED will illuminate red when the AED is ready to deliver a defibrillation shock to the patient.

Text display

The text display has 2 lines of text. The text display provides the operator with information regarding system initialization, text prompts and data during a rescue, and diagnostics.

System initialization occurs when the lid is first opened. The text display shows the operator the identifiers for the internal code, voice prompts and text prompts versions. The text display also shows the current date and time.

During a rescue, the text display shows the number of shocks delivered and the elapsed time from the beginning of the rescue (when the lid was first opened). During CPR, a countdown timer will be displayed. The text version of the voice prompts will also be displayed.

Note: There is a 3 second delay between the time the AED lid is opened and the start of the rescue. This 3 second delay is not included in the elapsed rescue time.

Setting the AED internal clock

For US models, the internal clock is preset to Central Standard Time. You can reset it to your local date and time. To set the clock, you need a Windows XP or newer PC, Rescuelink software installed, and the AED serial cable connected to the PC.

To set the clock:

1. Ensure that the PC is set at the correct local time and date.
2. Open the lid of the AED and run the Rescuelink software on the PC.
3. Connect the cable to the serial port on the AED.
4. Verify that the voice prompt states “Communications Mode”.
5. Click Communications on the main menu. Select AED Date and Time.
6. Click on the Get button to review the current time in the AED.
7. If the time and date is incorrect, click Set to set new time and date. The AED date and time will automatically be updated to the PC’s time and date.

RescueCoach™ voice prompts and text display

The RescueCoach™ voice prompts activate when the AED lid is opened and help guide the operator through the rescue. The AED text display provides a visual display of most of the audible voice prompts.

The following tables list the voice and text prompts and a description of when the prompts are issued.

Table 3-1: Initial instructions

Voice prompt	Text display	Situation
"Stay calm. Follow these voice instructions. Make sure 911 is called now!"	CALL 911!	Plays after lid opening self test, default ON.
"Stay calm. Follow these voice instructions. Make sure Emergency Services are called now!"	CALL EMERGENCY SERVICES NOW!	Medical Director may use MDLink to select this prompt instead of "CALL 911!". MDLink also allows the emergency services and 911prompt to be disabled.

Table 3-2: Preparation

Voice prompt	Text display	Situation
"Begin by exposing patient's bare chest and torso. Remove or cut clothing if needed."	BARE PATIENT'S TORSO REMOVE CLOTHING	Prompts the rescuer to remove patient clothing.

Table 3-2: Preparation (continued)

Voice prompt	Text display	Situation
"When patient's chest and torso are exposed, remove square foil package from lid of AED."	WHEN CHEST IS BARE REMOVE FOIL PACKAGE	Prompts the rescuer to remove the pads from AED lid.
"Tear open foil package across dotted line and remove pads."	TEAR OPEN PACKAGE REMOVE PADS	Prompts the rescuer to open the pad package and remove pads.
"Next, separate one of the white pads completely from blue plastic liner. Begin peeling from the tabbed corner."	PEEL ONE PAD FROM BLUE PLASTIC LINER	Repeats every 3 seconds until the pads are separated. If a pad has been peeled before the prompt starts, this prompt will be skipped. This prompt will be interrupted when pad is peeled.
"Firmly place the pad without the liner on the patient, exactly as illustrated. This pad can be placed on either of the two locations shown."	PRESS PAD FIRMLY TO CHEST AS SHOWN	Prompts the rescuer to place one pad on the patient.
"Next, peel the blue plastic liner off of the second white pad."	PEEL SECOND PAD OFF BLUE PLASTIC LINER	Prompts the rescuer to remove the liner from the second pad.
"Firmly place the second pad on the opposite location, exactly as illustrated."	PRESS PAD FIRMLY AS SHOWN	Repeats until second pad placement is sensed. If the pad is placed before prompt starts then this prompt will be skipped. This prompt will be interrupted when second pad is placed.

Table 3-3: Analysis

Voice prompt	Text display	Situation
"Do not touch patient! Analyzing heart rhythm. Please wait."	DO NOT TOUCH PATIENT ANALYZING RHYTHM	Repeats until analysis of the patient's cardiac rhythm is completed. This prompt will be interrupted when ready to shock.
"Preparing shock. Move away from the patient!"	NO CONTACT WITH THE PATIENT	Repeats while the AED is preparing to deliver a defibrillation shock (charging).

Table 3-4: Delivering shock - Semi-automatic

Voice prompt	Text display	Situation
"Press red flashing button to deliver shock."	PRESS BUTTON TO DELIVER SHOCK	Prompts after the AED is fully charged and ready to deliver the defibrillation shock. The RED SHOCK indicator flashes and the phrase repeats for 30 seconds or until the SHOCK button is pushed.
"Shock delivered"	SHOCK DELIVERED	Prompts when the shock is delivered.

Table 3-5: Delivering shock - Fully automatic

Voice prompt	Text display	Situation
"Shock will be delivered in"	SHOCK IN:	After the AED is fully charged and ready to deliver the defibrillation shock. The SHOCK will automatically be administered approximately three seconds after the end of the voice prompt.
"Three"	THREE	Prompts approximately three seconds prior to delivering shock.
"Two"	TWO	Prompts approximately two seconds prior to delivering shock.
"One"	ONE	Prompts approximately one second prior to delivering shock.
"Shock delivered"	SHOCK DELIVERED	Prompts when the shock is delivered.

Table 3-6: CPR prompts

Voice prompt	Text display	Situation
Note: The AED is shipped from the factory with ENHANCED MODE defaulted ON. The Medical Director may modify the CPR options in MDLink. ENHANCED CPR prompts are listed in this table. Except where noted, prompts apply both to compressions-only CPR and traditional CPR (compressions and breaths).		
"It is now safe to touch the patient."	NOW SAFE TO TOUCH THE PATIENT	Advises the rescuer that it is safe to touch the patient: After the AED delivers a shock After the AED detects a non-shockable cardiac rhythm

Table 3-6: CPR prompts (continued)

Voice prompt	Text display	Situation
"When instructed, give patient 30 rapid compressions then give 2 breaths"	30 COMPRESSIONS 2 BREATHS	This prompt plays at the start of a CPR interval where the AED detects a non-shockable heart rhythm. **Note:** Prompt for traditional CPR only.
"Place heel of one hand on center of chest between nipples."	PLACE ONE HAND ON CENTER OF CHEST	Prompts rescuer to correctly place one hand for giving compressions.
"Place heel of other hand directly on top of first hand. Lean over patient with elbows straight."	PLACE OTHER HAND ON TOP OF FIRST HAND	Prompts rescuer to correctly place other hand and body for giving compressions.
"Press the patient's chest down rapidly one third depth of chest, then release"	PRESS CHEST DOWN FIRMLY	Prompts the rescuer to press down one third depth of patient's chest.
"Start CPR"	START CPR	Prompts to start CPR.
"Press" (30 times at 100/minute) (or) Metronome (30 times at 100/minute) (or) No Prompt (silence) **Note:** Option is selected in MDLink software.	{CPR COUNTER}	CPR counter shows the amount of time remaining for the CPR session.

Table 3-6: CPR prompts (continued)

Voice prompt	Text display	Situation
"Stop compressions"	STOP COMPRESSIONS	Prompts at the end of each CPR round. **Note:** Prompt for traditional CPR only, in enhanced mode.
"Give breath, give breath"	GIVE BREATH	Prompts to give two breaths to patient. **Note:** Prompt for traditional CPR only, in enhanced mode.
"Continue with compressions."	CONTINUE WITH COMPRESSIONS	Prompts in subsequent rounds of the same CPR session. **Note:** This prompt is available only in Enhanced Mode. Prompt for traditional CPR only.
"Stop CPR"	STOP CPR	Prompts to stop CPR.
"Continue CPR"	CONTINUE CPR	Prompts during the CPR interval enabled in the Standard prompt set. Prompts when lid is reopened during CPR cycle.

Table 3-7: Pad issues

Voice prompt	Text display	Situation
"Make sure pad connector is plugged into AED."	CHECK CONNECTOR IS PLUGGED INTO AED	Prompts when defibrillation pads connector is not correctly inserted into pad socket.

Table 3-7: Pad issues

Voice prompt	Text display	Situation
"Press pads firmly to patient's bare skin."	PRESS PADS FIRMLY TO BARE SKIN	Prompts when better pad connectivity to the patient's skin is required because impedance is too high.

Table 3-8: Other prompts

Voice prompt	Text display	Situation
"Battery low"	BATTERY LOW	Occurs once when the battery voltage becomes low, although a rescue can continue for approximately 9 more shocks. When the battery is too low to do a rescue, the following will occur: BATTERY LOW shows on the LCD Smartgauge battery status indicator turns red AED beeps once every 30 seconds while the lid is closed You must replace the battery before continuing with the rescue. If completely depleted, all AED activity will terminate.
"Analysis interrupted. Stop patient motion."	ANALYSIS INTERRUPTED STOP PATIENT MOTION	When the AED detects ECG noise artifact, stop moving or touching the patient. Remove other electronic devices within a 5 meter radius.
"Open lid to continue rescue."	OPEN LID TO CONTINUE RESCUE	When the lid is inadvertently closed during a rescue, this prompt will repeat for 15 seconds.

Table 3-8: Other prompts (continued)

Voice prompt	Text display	Situation
"Rhythm changed. Shock cancelled."	RHYTHM CHANGED SHOCK CANCELLED	When the device is prepared to shock then detects a change in rhythm and therefore cancels the shock.
"Remove cable to continue rescue."	REMOVE CABLE TO CONTINUE RESCUE	When a serial communication cable is connected to the AED during a rescue, the phrase repeats until the cable is disconnected.
"Communications mode"	COMMUNICATIONS MODE	When the lid is open and the serial communication cable is plugged into the AED.
"Service required"	SERVICE REQUIRED	Occurs after the self-tests determine that the AED is not functioning properly. The prompt "SERVICE REQUIRED" will be heard when the lid is opened. The red SERVICE indicator will illuminate. After closing the lid, an alarm beep will be heard until the battery is removed or becomes completely depleted.

4 Data Management

Contents

- Recording rescue data 4-1
- Reviewing rescue data 4-2

The AED is designed for ease of data management and review. The data can be downloaded from the AED and displayed on the PC screen using the Rescuelink software.

Recording rescue data

The AED automatically records Rescuelink data and can store up to 60 minutes of ECG monitoring time in its internal memory. Multiple rescues can be stored in the internal memory, allowing the rescuer to administer additional rescues without downloading the data to a PC. Should the internal memory become full, the AED will purge rescues as needed, beginning with the oldest rescue.

When downloading data, Rescuelink will enable the user to select which rescue to download. See the Rescuelink application HELP files for more information.

Reviewing rescue data

To retrieve data from internal memory:

1. Open the AED lid.
2. Connect the serial cable to the PC and to the AED's serial port under the blue rubber data access cover. The voice prompt will say "Communications Mode."
3. Run the Rescuelink software program.
4. Select Communications, Get Rescue Data.
5. Select Internal Memory of AED then select OK.
6. Select a rescue by clicking on the date and press OK.

WARNING! Electric Shock and Fire Hazard.

Do not connect any telephones or unauthorized connectors to the socket on this equipment.

Caution: Serial Communication Cable.

The serial communication cable is only for use with the AED; it is not to be used with a telephone.

5 Troubleshooting and Maintenance

Contents

- Self-tests 5-1
- Indicator troubleshooting table 5-3
- Scheduled maintenance 5-4
- Authorized repair service 5-6
- Frequently Asked Questions 5-7

This section presents information about the AED diagnostics self-tests, maintenance, and service indications.

Self-tests

The AED has a comprehensive self-test system that automatically tests the electronics, battery, pads, and high voltage circuitry. Self-tests are also activated every time you open and close the AED lid.

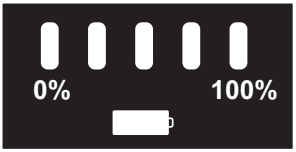
When performing the self-tests, the AED completes the following steps automatically:

1. Turns itself on, and the Status Indicator changes to red.
2. Performs the self-test.
3. If successful, the Status Indicator reverts to green.
4. Turns itself off if the lid is closed.

There are three types of automatic self-tests:

- The daily self-test checks the battery, pads, and the electronic components.

- The weekly self-test completes a partial charge of the high voltage electronics in addition to the items tested in the daily self-test.
- During the monthly self-test, the high voltage electronics are charged to full energy in addition to the items tested in the daily self test.



In addition, self-tests will be initiated upon opening the lid and again upon closing the lid.

If the self-test detects an error, the Status Indicator remains red. Upon closing the lid, an audible alert will be issued. The diagnostic panel under the lid indicates the source of the problem according to Table 5-1 on page 5-3.

Indicator troubleshooting table

The following is a troubleshooting table for the AED indicators.

Table 5-1: Indicator Troubleshooting Table

View	Symptom	Solution
	Red Service indicator (LED) is lit.	Maintenance by authorized service personnel is required. Contact Cardiac Science Technical Support or, outside the U. S., your local Cardiac Science representative.
	Red Pads indicator (LED) is lit.	Connect the pads or replace with a new pair.
	The last battery indicator (LED) is red.	The battery is low. Replace with a new battery.
	Rescue Ready Status indicator is red, and no other indicators on the diagnostic panel are lit.	Replace the battery. If the status indicator remains red, contact Cardiac Science Technical Support or, outside the U. S., your local Cardiac Science representative.

Caution: Temperature Extremes.

Exposing the AED to extreme environmental conditions outside of its operating parameters may compromise the ability of the AED to function properly. The Rescue Ready® daily self-test verifies the impact of extreme environmental conditions on the AED. If the daily self-test determines environmental conditions outside of the AED's operating parameters, the Rescue Ready indicator could change to red (not Rescue Ready) and the AED may issue a "SERVICE REQUIRED" alert to prompt the user to move the AED to environmental conditions within the acceptable operating parameters at once. See Chapter 6, *Technical Data*, for acceptable environmental conditions and *Rescue Ready status indicator* on page 3-2 for information about the Rescue Ready indicator.

Caution: Not Rescue Ready.

Issues other than extreme environmental conditions can cause the AED to become not Rescue Ready. For more information, see *Rescue Ready status indicator* on page 3-2.

Scheduled maintenance

Note: Powerheart G3 AEDs perform weekly partial energy and monthly full energy charges of the high voltage circuitry as part of their extensive self testing regimens. Consequently, Cardiac Science does not recommend that users perform any additional energy tests.

Perform the following tests per the schedule indicated:

Daily maintenance

Check the Status Indicator to ensure that it is GREEN. When the indicator is GREEN, the AED is ready for a rescue. If the indicator is RED, refer to the troubleshooting table on page 5-3.

Monthly maintenance

Perform the following procedure each month (28 days):

1. Open the AED lid.
2. Wait for the AED to indicate status: Observe the change of the STATUS INDICATOR to RED. After approximately 5 seconds, verify that the STATUS INDICATOR returns to GREEN.

3. Check the expiration date on the pads.
4. Check that the battery has adequate charge. If the battery indicator is red, replace the battery.
5. Listen for the voice prompts. Additionally, check the display shows text prompts that correspond to the audio.
6. Close the lid and observe the change of the STATUS INDICATOR to RED. After approximately 5 seconds, verify that the STATUS INDICATOR returns to GREEN.

Annual maintenance

Perform the following tests annually to confirm that the diagnostics are functioning properly and to verify the integrity of the case.

Check the integrity of the pads and circuitry:

1. Open the AED lid.
2. Remove the pads.
3. Close the lid.
4. Confirm that the STATUS INDICATOR turns RED.
5. Open the lid and confirm that the Pad indicator is lit.
6. Reconnect the pads and close the lid.
7. Make sure the expiration date is visible through the clear window of the lid.
8. Check to make sure that the STATUS INDICATOR is GREEN. If the pads are not installed properly, the PAD indicator will illuminate. Contact Cardiac Science Technical Support (see *Contact information* on page 1-2) or outside the U.S., your local Cardiac Science representative.
9. Open the lid and confirm that no diagnostic indicators are lit.
10. Check the expiration date of the pads; if expired, replace them.
11. Check the pads packaging integrity.
12. Close the lid

Check the Integrity of the Service Indicator (LED) and Circuitry:

1. Immediately after opening the AED lid, press and hold the Shock button and confirm that the Service LED is lit (for the Powerheart G3 model 9390E only).
2. Release the Shock button (for the Powerheart G3 model 9390E only).
3. Close the lid.
4. Verify that the STATUS INDICATOR remains RED.
5. Open the lid and confirm that no diagnostic panel indicators are lit.
6. Close the lid.
7. Verify that the STATUS INDICATOR turns GREEN.

Check the integrity of the case:

Examine the molded case of the AED for any visible signs of stress. If the case shows signs of stress, contact Cardiac Science Technical Support (see *Contact information* on page 1-2) or outside the U.S., your local Cardiac Science representative.

Caution: Equipment Damage.

When cleaning the device, use one of the following: Isopropyl Alcohol, Ethanol, a mild soapy water solution, or a 3% hydrogen peroxide solution.

Caution: Equipment Damage.

Keep all cleaning solutions and moisture away from the inside of all defibrillation pads and cable connector openings.

Authorized repair service

The AED has no user-serviceable internal components. Try to resolve any maintenance issues with the AED by using the Troubleshooting Table presented in this chapter. If you are unable to resolve the problem, contact Cardiac Science Technical Support (see *Contact information* on page 1-2) or outside the U.S., your local Cardiac Science representative.

WARNING! Shock Hazard.

Do not disassemble the AED. Failure to observe this warning can result in personal injury or death. Refer maintenance issues to Cardiac Science authorized service personnel.

Note: The warranty will be void upon unauthorized disassembly or service of the AED.

Frequently Asked Questions

Q: Can I give CPR while the AED is analyzing?

A: No. As with all AEDs, the operator should stop CPR compressions during the analysis phase.

Q: Can I transport the victim while the AED is analyzing?

A: No. Vehicle motion may cause noise artifacts that could interfere with proper cardiac rhythm analysis. Stop the vehicle when cardiac rhythm analysis is necessary.

Q: Is it safe for the AED to provide a shock to a patient lying on a conductive floor, antistatic floor, or a metal surface?

A: Yes, it is safe. Using a Powerheart AED on a patient lying on a conductive floor, antistatic floor, or a metal surface does not create a safety hazard for either the device user or the patient.

Q: Do I need to prepare the chest prior to pad application?

A: Special preparation is not usually necessary. The chest should be as clean, dry, and as oil free as possible. Follow your Medical Director's instruction.

Q: What happens if the battery is low?

A: There are several Battery Low conditions that the AED will detect:

Battery Low detected - AED not in use: If a low battery condition is detected during a self test, the AED will beep once every 30 seconds. Remove the battery and replace with a fresh battery.

Battery Low detected – AED in use: When the red LED initially lights up—upon lid opening or at any time during a rescue—a BATTERY LOW prompt will be issued at once. However, the AED is capable of delivering at least 9 defibrillation shocks after the first BATTERY LOW prompt is issued.

Battery too low to charge AED during rescue: When the AED is not capable of delivering any more shocks, a BATTERY LOW prompt is displayed until the battery is replaced or AED activity ends.

To continue the rescue attempt, leave the lid open and replace the battery. When the battery replacement takes longer than 60 seconds, the first rescue is terminated and the AED begins to record the events from then on as a separate rescue.

Battery is completely depleted—No AED function: All AED activity stops until the battery is replaced with a fresh battery.

Q: How do I set the AED internal clock?

A: Set the clock by using the Rescuelink Software Program and a PC. See Setting the AED Internal Clock in Chapter 3.

Q: What happens if I close the lid in the middle of a rescue attempt?

A: If you close the lid during a rescue, you must re-open the lid within 15 seconds to continue the rescue. You will hear the prompt, "Open lid to Continue Rescue." If the lid remains closed for more than 15 seconds, a new rescue will initiate when the lid is reopened.

Note: If the lid is closed during a rescue while the pads are connected to the patient, the STATUS INDICATOR remains GREEN. When the lid is reopened, however, the STATUS INDICATOR will turn RED and then back to GREEN. The rescue may be continued.

Q: My AED is sounding an audible alert. Why? How do I stop it?

A: The audible alert indicates that the self-test detected a need for maintenance or corrective action. Open the device lid and view the indicator on the diagnostic panel. Determine the maintenance required by using the troubleshooting table on page 5-3.

Q: The AED did not sound an audible alert when I removed the pads and closed the lid. Why?

Note: Ensure the battery is installed. The AED will never beep while battery is removed.

A: The lid-closed pad self-test only activates the STATUS INDICATOR. The AED allows time for replacement of the pads—as removing pads is a normal procedure after a rescue—or a battery during the post rescue procedure.

Q: What if I have to perform a rescue in an isolated area and at subzero temperatures?

A: When travel to a rescue involves exposing the AED to extremely cold temperatures for an extended period of time, keep the pads and the battery warm.

6 Technical Data

Contents

- Parameters 6-1
- STAR biphasic waveform 6-7

This section lists the AED parameters and describes the STAR biphasic waveform.

Parameters

Table 6-1: Parameters

Parameter	Detail
Operation	Semi-Automatic (shock advisory) Automatic
Audible Alerts	Voice Prompt Maintenance Alert
Visible Indicators	Status Indicator Battery Status Indicator Service Indicator Pads Indicator Text Display
Rescue Data Storage	Internal with 60 minutes ECG data with event annotation

Table 6-1: Parameters (continued)

Parameter	Detail
Dimensions	Height: 8 cm (3.3 in) Width: 27 cm (10.6 in) Depth: 31 cm (12.4 in)
Weight (Batteries and Pads)	9390: 3.10 kg (6.6 lb)
Operating Environmental Conditions	Temperature: 0°C to 50°C (32°F to 122°F) Humidity: 5% to 95% (non-condensing) Pressure: 57kPa (+15,000ft) to 103kPa (-500ft)
Shipment, Transport, and Storage Environmental Conditions	Temperature: -30°C to 65°C (-22°F to 149°F) (up to 5 days) 20°C to 30°C (68°F to 86°F) (long term) Humidity: 5% to 95% (non-condensing) Pressure: 57kPa (+15,000ft) to 103kPa (-500ft)
Standby Environmental Conditions	Temperature: 0°C to 50°C (0°F to 122°F) (up to 5 days) 20°C to 30°C (68°F to 86°F) (long term) Humidity: 5% to 95% (non-condensing) Pressure: 57kPa (+15,000ft) to 103kPa (-500ft)
Pads	Self-adhesive, disposable defibrillation pads Minimum combined surface area: 228cm^2 Extended length of lead wire: 1.3m
9146 Lithium Battery Specifications	Output voltage: 12VDC Batteries are non-rechargeable Lithium content: 9.2g Check local regulations for disposal information Full Operational Replacement Guarantee (from date of installation): 4 Years Estimated Shelf Life (from date of manufacture): 5 Years Typical Shocks: 290 shocks **Note:** The battery operating life depends on the type of battery, device settings, actual usage, and environmental factors. Battery was tested with G3 Plus device with Standard prompt set and CPR set to 60 seconds.

Table 6-1: Parameters (continued)

Parameter	Detail
Batteries and Capacitor Charge Times	A new battery, after the AED has delivered 15 300VE shocks, typically takes 10 seconds to charge the AED to maximum energy. A battery with reduced capacity will take longer to charge the AED.
AED Self test Sequence	Daily: Battery, pads, internal electronics, Shock button, and software. Weekly: Battery, pads, internal electronics, Shock button, software, and partial energy charge cycle. Monthly (every 28 days): Battery under load, pads, internal electronics, full-energy charge cycle, Shock button, and software. Open Lid (when lid is opened): Battery, pads, internal electronics, Shock button, and software. Close Lid (when lid is closed): Battery, pads, internal electronics, Shock button, and software.

Table 6-1: Parameters (continued)

Parameter	Detail
Safety and Performance	Model 9390 The AED has been designed and manufactured to conform to the highest standards of safety and performance including electromagnetic compatibility (EMC). The 9390 and pads conform to the applicable requirements of the following:  C US CSA: Classified by CSA International with respect to electric shock, fire and mechanical hazards only in accordance with CAN/CSA C22.2 No.60601-1:08, EN60601-1 and EN60601-2-4. Certified to CAN/CSA Standard C22.2 No. 60601-1:08. Electrical, Construction, Safety and Performance: IEC 60601-1 IEC 60601-2-4 Electromagnetic Compatibility (EMC): IEC 60601-1-2 IEC 60601-2-4
Emissions	EM: EN 55011/CISPR 11, Group 1, Class B RTCA DO-160D Section 21, Category M

Shipping and Transportation Conditions	ISTA Procedure 2A
RHYTHMx ECG Analysis Performance	The AED RHYTHMx ECG Analysis system analyzes the patient's ECG and advises you when the AED detects a shockable or non-shockable rhythm. This system makes it possible for a person, with no training in the interpretation of ECG rhythms, to offer defibrillation therapy to victims of sudden cardiac arrest. With a new battery, after the AED has delivered 15 300VE shocks, the maximum time from beginning rhythm analysis until the AED is ready to shock is 17 seconds.

STAR biphasic waveform

The waveform generated by the AED is a Biphasic Truncated Exponential waveform. The following is a graph of the waveform voltage as a function of time when the AED is connected to a 50 Ohm resistive load.

The Biphasic Truncated Exponential (BTE) waveform uses variable energy. The actual energy delivered will vary with the patient's impedance and the device will deliver a shock when impedance is between 25-180 Ohms. Energy will be delivered at three different levels referred to as ultra-low variable energy, low variable energy, and high variable energy as shown in the waveform tables on the following pages.

Table 6-2: Ultra-low Variable Energy (150 VE) Powerheart G3 Waveform

	Phase 1		Phase 2		
Patient's Impedance (Ohms)	**Voltage * (Volts)**	**Duration* (MS)**	**Voltage * (Volts)**	**Duration* (MS)**	**Energy** (Joules)**
25	1393	3.3	743	3.2	145-196
50	1420	4.5	909	3.2	128-173
75	1430	5.8	973	3.2	116-156

13. Service / Maintenance History 172

IMPORTANT: **Read and understand the contents of this manual before operating the equipment.**

1. Receipt Inspection

This equipment was thoroughly inspected prior to leaving the factory. Before placing the equipment in service, it should be thoroughly checked for damage or loss occurring in transit. If any such damage or loss is evident, a claim must be made against the carrier.

2. Handling & Installation Diagrams

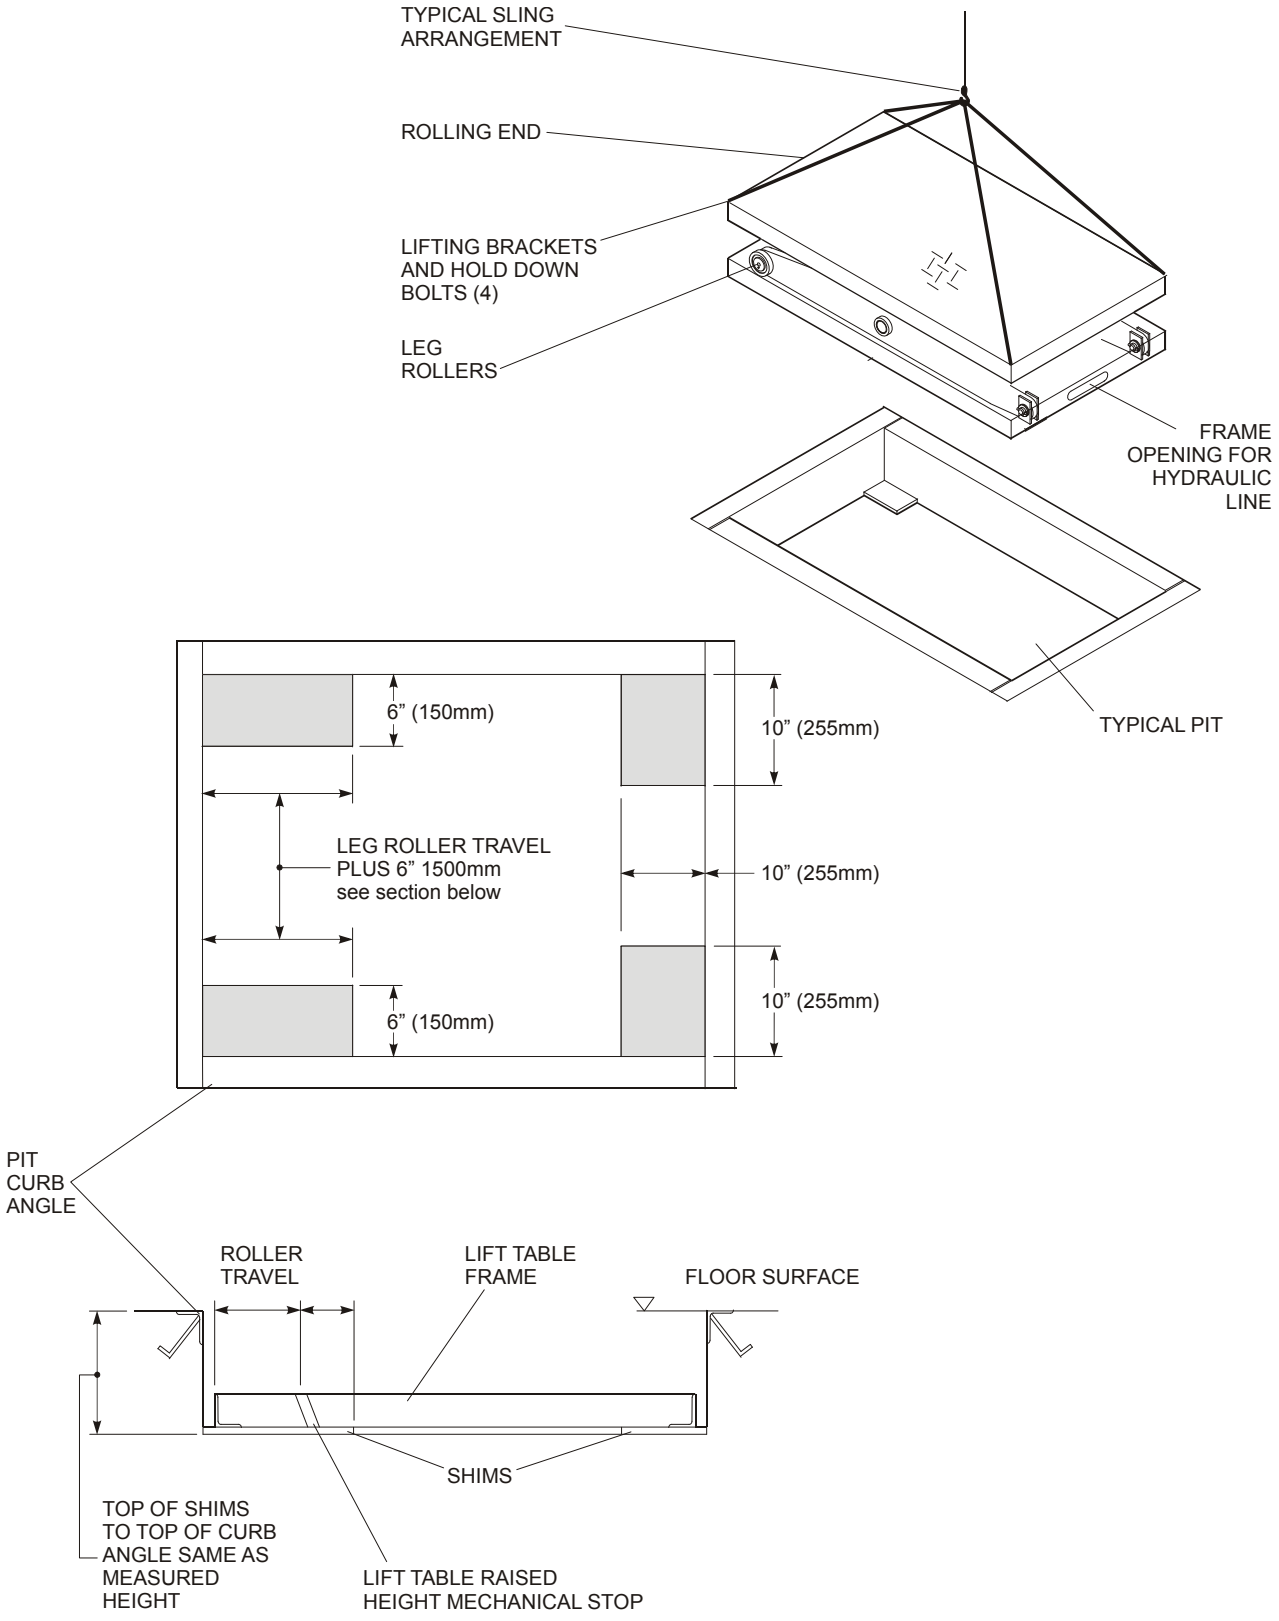

Figure 1 : Elevating Dock Handling and Installation

3. Maintenance Device Detail

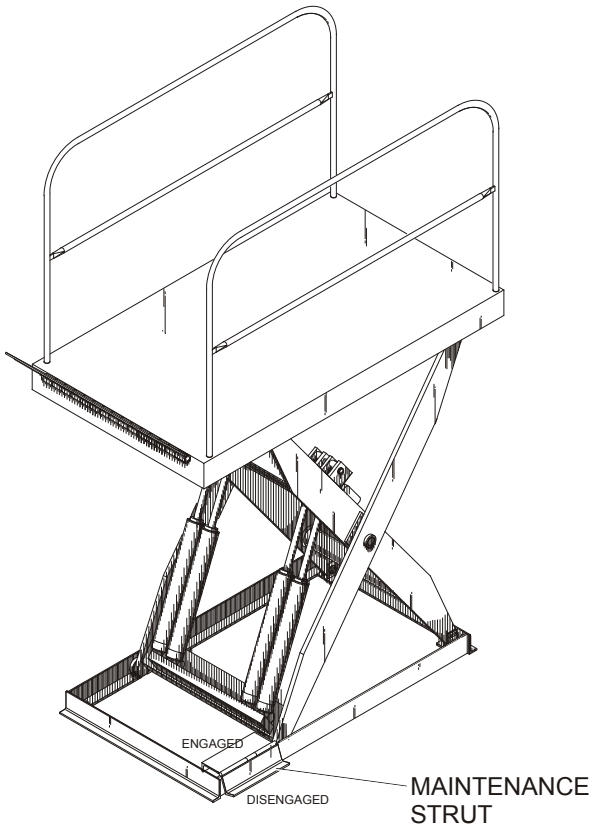

Figure 2 : Maintenance Device Placement

Note: All Stationary Elevating Docks come equipped with a Maintenance Strut as shown in Figure 2. If a Safety Device is not self-contained provided then other means need to make unit safe for maintenance and repairs. An Optional Safety Stand (Part #796-710) is available for use with Semi-Portable Elevating Docks (See Figure 3)

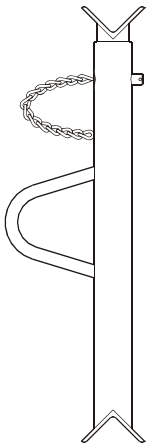

Figure 3 : Maintenance Device - Semi Portables

4. Safety Information

4.1 Owner's Responsibilities

Owner's responsibilities include the following:

1. **Inspection and maintenance**
   The elevating dock shall be inspected and maintained in proper working order in accordance with manufacturer's operating/maintenance manual and safe operating practice.

2. **Removal from service**
   Any elevating dock not in safe operating condition shall be removed from service until it is repaired to original manufacturer's standards.

3. **Repairs**
   All repairs shall be made by authorized personnel in conformance with manufacturer's instructions.

4. **Modifications and alterations**
   Modifications or alterations of industrial scissor lifts shall be made only with written permission of original manufacturer. These changes shall also satisfy all safety recommendations of original equipment manufacturer for particular application of the elevating dock.

4.2 Operator's Responsibilities

Only trained and authorized personnel shall be permitted to operate the elevating dock.

Operator's responsibilities include the following:

1. Read and understand safety/operation information contained herein, or be trained by a qualified person.

2. It is responsibility of operator to be certain that no unsafe conditions exist before using this equipment. Before operating this equipment, inspect it for proper operation and condition. If any unsafe condition exists, remove the elevating dock from service until repairs are made.

3. The elevating dock shall be used in accordance with its intended use and with in manufacturer's limitations and safety rules.

4. Do not exceed rated capacity as indicated on name plates.

5. Ensure that all safety devices are operational and in place.

4.3 Safety Procedures

WARNING!

1. Do NOT operate the elevating dock table or elevating dock unless you have training and authorization.

2. Read, understand and follow these instructions, the hazard warnings on the elevating dock and the warnings/instructions contained in this manual.

3. NEVER go under the elevating dock unless the maintenance device is engaged in accordance with the manufacturers instructions.

4. Prior to using the elevating dock:

   - *Verify that all safety devices supplied with the elevating dock (e.g. guard rails, restraint chains, toe guards and warning bells, if so equipped), are in place and functioning properly.*

   - *Operate the elevating dock through one complete lift/lower cycle and verify its proper operation. At the same time, inspect the unit for any visible or obvious damage. If there is any damage or unusual vibration or noise, remove the unit from service using approved lockout procedures. Notify maintenance personnel immediately.*

5. Do not exceed the units capacity as stated on the nameplate and center loads on the unit. Be aware that the unit may have reduced capacity when loads are rolled over the platform sides or ends. Refer to the nameplate for reduced capacity under these conditions.

6. If load(s) is mobile, secure the load in a fixed position before operating the unit.

7. Prior to operating the unit, ensure that all personnel on or near the unit are aware of its imminent operation, and that no person will be in harms way during its operation.

8. Ensure that objects are clear of the areas beneath or above the platform, and immediately surrounding the perimeter of the unit, while it is in use.

9. Keep area around the unit free of oil, objects and debris that could cause slippage or stumbling into or under the unit.

10. If the unit is equipped with a hinged bridge(s), the bridge must overlap the truck bed a minimum of 4” (100mm) before use. Do NOT use the bridge if it is solely supported by its lifting chain.

11. If maintenance or service is required:
    - *Only authorized service personnel shall provide maintenance/service on the unit.*
    - *Follow approved lock out procedures.*
    - *Do NOT work on or under the unit.*
    - *The unit shall NOT be modified or altered without the written permission of the manufacturer.*

12. When re-locating a Semi-Portable Elevating Dock always use the portable dolly (Part #326-5039) provided *(See Figure 4)*. Center the dolly at the torque bar (opposite the rolling end), lower the deck until it firmly engages with the upper portion of the dolly lift arm.

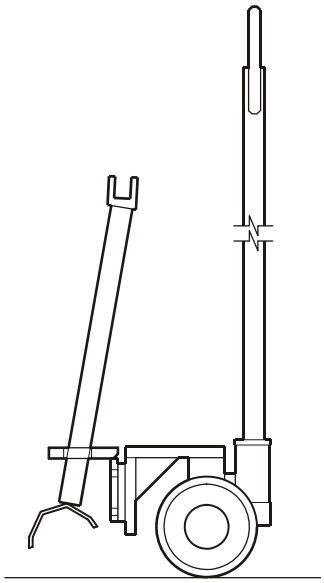

Figure 4 : Portable Dolly

5. Operating Instructions

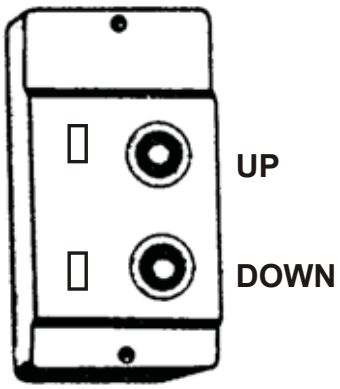

Figure 5 : Typical Push Button Control Station

Note: Manual Reset on Three Phase Only.

1. Read and understand these instructions and safety rules before operating lift.

2. Before using lift, inspect it for proper operation and condition. If any unsafe condition exists, remove unit from service until repairs are made.

3. Before using unit, inspect all safety devices, such as guard rails, snap chains and toe guards to be certain that they are in place and functioning properly.

4. If lift is controlled from a push button station. Station is equipped with constant pressure type buttons labeled with arrows that indicate direction of movement. Pressing and holding "⬆" button will cause unit to rise, pressing and holding "⬇" button will cause unit to lower. Releasing either button will stop movement of lift.

WARNING! : DO NOT EXCEED CAPACITY OF THE UNIT.

5. Prior to placing a load on lift, read and understand unit capacity as labeled on serial number plate. Plate can be found riveted to side of deck assembly. Understand that capacity of lift is expressed as **maximum uniformly distributed load** unit is rated to carry. Unit capacity is down rated for rolling loads or loads concentrated on end(s) or side(s). These down rated capacities can also be found on serial number plate.

WARNING! : TO AVOID BODILY INJURY, STAND CLEAR WHILE THE UNIT IS MOVING.

6. Loading / unloading unit:

   a) If loading/unloading a truck or other mobile vehicle, ensure brakes are set and wheels chocked before proceeding.

   b) Center load on lift platform.

   c) If load is mobile (ie: carts, pallet truck, forklift) set brakes and/or lower load onto platform surface to minimize potential load shift.

   d) Ensure snap chain(s) are securely in position. If unit is equipped with a hinge bridge it must be stored in upright position and secured by safety chain(s).

   e) Using push button station, raise unit so that platform is level or slightly above truck bed.

DANGER! : ENSURE THAT PEOPLE AND OBJECTS ARE CLEAR OF AREAS BENEATH PLATFORM AND IMMEDIATELY SURROUNDING PERIMETER OF UNIT WHILE IT IS IN MOTION.

   f) Lower hinged bridge (if equipped) onto truck bed. Ensure that truck bed and bridge overlap by a minimum of 4" (1 00mm). If overlap is less than 4" (1 00mm) reposition truck to achieve this minimum overlap. (if overlap still cannot be achieved, contact your Blue Giant representative as a longer bridge may be required). Secure bridge in place with safety chain(s).

NOTE: Bridge safety chain must remain slack to Ensure positive contact with vehicle loaded at all times.

WARNING! : DO NOT STAND ON OR APPLY WEIGHT TO HINGED BRIDGE UNLESS IT IS SUPPORTED BY A MINIMUM OF 4" (100MM) OF OVERLAP. NEVER ATTEMPT TO STAND OR APPLY WEIGHT TO HINGED BRIDGE IF SUPPORTED SOLELY BY SNAP CHAINS

   g) Proceed to transfer load.

7. To lower lift, repeat sequence (b) through (e) using "↑" button instead of "↓" button in step (e).

6. Planned Maintenance

WARNING! : DO NOT WORK BENEATH A RAISED DOCK LIFT WITHOUT ENGAGING A MAINTENANCE DEVICE (See Section 3 : Maintenance Device Detail, Figure 2)

WARNING! : ENSURE THAT THE POWER SUPPLY TO CONTROL BOX IS TURNED "OFF" AND LOCKED OUT AS REQUIRED TO ASSURE THAT ELECTRICAL POWER CANNOT BE TURNED "ON" UNEXPECTEDLY.

WARNING! : FAILURE TO FOLLOW THESE WARNINGS COULD RESULT IN SERIOUS INJURY OR DEATH.

Spotting trouble before it happens can prevent costly downtime and extensive repairs and make it possible for service and repairs to be performed when unit is not required for regular operation.

Once a month inspect and lubricate-mechanical, hydraulic and electrical components as outlined below. More frequent inspections are necessary for adverse conditions such as temperature extremes, dirty environment, etc.

Electrical System:

Periodically check for wire and cable damage. Keep water and ice away from power pack.

Mechanical System:

1. Make a safety inspection of complete unit. Check for visible damage or misalignment. Check for excessive wear of all moving parts. Inspect upper limit mechanical stops for damage. Repair if necessary.

2. Lubrication:
   All bearings and bushings are sealed or self-lubricating. However, points shown in *Section 7: Planned Maintenance, Figures 3 & 4* should be oiled once a month with SAE 30 motor oil.

3. Upper limit switches and safety trip bar switches, if so equipped, must be operating.

Hydraulic System:

1. Hydraulic fluid level should be kept to 2" (50mm) above the tank suction fitting with the deck in the fully raised position.

2. Use only approved quality hydraulic fluid. For normal room temperature following oil is recommended: ISO 32 grade oil.

3. Change hydraulic fluid three months after equipment is placed in service and check every twelve months thereafter (more frequently for adverse conditions such as moisture, lower temperature or dusty atmosphere).

4. Leaking or damaged hoses and fittings should be repaired or replaced immediately to prevent loss of fluid and possible damage to hydraulic pump.

5. For safety reasons, the pressure relief valve is factory set. It is set so that unit will lift the rated capacity, but will not lift a load 10% greater. Its function should be checked at least once a year.

TO ORDER PARTS

For prompt service when ordering parts, please provide the following information to your local distributor.
1. Model and Serial number of the equipment.
2. Part number, description and quantity.
3. Shipping instructions.

When in doubt as to part required, please provide a sketch or the used part as a sample.

RECORD HERE FOR FUTURE REFERENCE

On August 23, 2017 ACE performed an Ashrae 110 Fume Hood Test on a Jamestown Fume Hood. The unit being tested was Serial Number 6-170823-1 located at Webster University Lab 478, Interdisciplinary Science Building.

The test was conducted as described in the Ashrae 110 Standard "Method of Testing Performance of Laboratory Fume Hoods". It is being tested as installed.

Velocity readings were measured as described in the Ashrae 110 Standard with an average velocity of 88.5 fpm with the lab door closed. This was measured with the sash at 18"H and 38" W.

Flow visualization (smoke test) is a test to visualize the hood's ability to contain vapors. The test consists of both a small local challenge and a gross challenge to the hood. The intent of this test is to render an observation of the hood's performance as it is typically used.

On the small local challenge with the sash open to 18"H, the center release has a smooth inflow with some turbulence caused by the air being pulled down the front of the sash. When the release was at the work surface, the smoke showed some reverse flow and turbulence at the lip of the dished work surface. The smoke does not travel past the lip back towards the opening. When tested with the sash closed, a release at the top the smoke travels above the sash through the bypass also a release under the airfoil flowed towards the rear. Tests with no escape.

On the large challenge with the sash open to 18 "H, the smoke flows inward and slightly upward with some turbulence and some smoke getting caught in a rolling action in the top of the hood turning back at the opening. A release at the work surface showed a slight reverse flow and some slight turbulence at the lip of the dished work surface. The smoke does not travel past the lip back towards the opening. Tests with no escape.

The tracer gas test was performed on the unit as described in the Ashrae 110 Standard.

The SF-6 containment test was first performed with the sash at 18"H, with the SF-6 release chamber and mannequin on the left side showing good containment for vertical sash opening. The SF-6 containment test was then performed with the SF-6 release chamber and the mannequin in the center and had good containment for vertical sash opening. The SF6 containment test was performed with the mannequin and the SF6 release chamber on the right side where it showed good containment.

Description:
The Unit has a single piece sash . Unit does have an airflow monitor on it.
The exhaust goes out through one panel in the rear of the unit.
The panel is 38'W x 33" H.

Dimensions
Exterior:
48"W
57"H
33"D
Work surface is 36" from the floor
From work surface to the nose of the mannequin = 24"H.

Interior:
38"W
49"H
26" from the rear of the air foil to the back of the unit.
23.5" to the rear or the air foil to the front of the panel along the back side of the unit.

Opening size:
18"H x 38"W .
24.5" H x 38" W with sash full open.

ACE ELECTRIC LAB. SYSTEMS

1550 S. Kingshighway, St. Louis, MO 63110
Phone (314) 771-7272 Fax (314) 771-6956

On August 23, 2017 ACE performed an Ashrae 110 Fume Hood Test on a Jamestown Fume Hood. The unit being tested was Serial Number 6-170823-3 located at Webster University Lab 491, Interdisciplinary Science Building.

The test was conducted as described in the Ashrae 110 Standard "Method of Testing Performance of Laboratory Fume Hoods". It is being tested as installed.

Velocity readings were measured as described in the Ashrae 110 Standard with an average velocity of 84.8 fpm with the lab door closed. This was measured with the sash at 18"H and 62" W.

Flow visualization (smoke test) is a test to visualize the hood's ability to contain vapors. The test consists of both a small local challenge and a gross challenge to the hood. The intent of this test is to render an observation of the hood's performance as it is typically used.

On the small local challenge with the sash open to 18"H, the center release has a smooth inflow with some turbulence caused by the air being pulled down the front of the sash. When the release was at the work surface, the smoke showed some reverse flow and turbulence at the lip of the dished work surface. The smoke does not travel past the lip back towards the opening. When tested with the sash closed, a release at the top the smoke travels above the sash through the bypass also a release under the airfoil flowed towards the rear. Tests with no escape.

On the large challenge with the sash open to 18 "H, the smoke flows inward and slightly upward with some turbulence and some smoke getting caught in a rolling action in the top of the hood turning back at the opening. A release at the work surface showed a slight reverse flow and some slight turbulence at the lip of the dished work surface. The smoke does not travel past the lip back towards the opening. Tests with no escape.

The tracer gas test was performed on the unit as described in the Ashrae 110 Standard.

The SF-6 containment test was first performed with the sash at 18"H, with the SF-6 release chamber and mannequin on the left side showing good containment for vertical sash opening. The SF-6 containment test was then performed with the SF-6 release chamber and the mannequin in the center and had good containment for vertical sash opening. The SF6 containment test was performed with the mannequin and the SF6 release chamber on the right side where it showed good containment.

Terms and Conditions of Sale

1. ACCEPTANCE

No order shall be binding upon us until accepted in writing by an authorized official at Flex-Strut Inc. Any contract for sale of goods, and these Conditions of Sale, shall be governed by and constructed to the Uniform Commercial Code as adopted in the state of Ohio.

2. ERRORS

Should an error be made filling an order, notify Flex-Strut promptly and we will immediatedly attempt to adjust the matter without any expense to the purchaser.

3. CANCELLATION

Cancellation of orders will be accepted only with the understanding that Flex-Strut will be reimbursed for expenses incurred as a result of the cancellation. Orders for special, non-catalogued items are not subject to cancellation after production is started.

4. RETURNED MATERIAL

Permission to return any standard merchandise must be obtained in writing from Flex-Strut in Warren, Ohio . A Returned Goods Autorization (RGA) form will be provided and must accompany the material upon receipt. Request for RGA must be made within 60 days from the date of shipment and be subject to conditions spelled out in the RGA including, but not limited to the following:

a) Return transportation must be pre-paid.

b) Material not in first-class, saleable condition will be subject to the cost of reconditioning.

c) Merchandise credit will be allowed on the basis of the price charged for the merchandise, less handling and re-stocking charge defined in RGA less any outbound freight allowed or paid by Flex-Strut Inc.

d) Returns will only be considered for standard catalog items. Any special, non-catalogued items are not subject to return for credit under any circumstances.

5. PRICES

PRICES ARE SUBJECT TO CHANGE WITHOUT NOTICE.

The price list supercedes and cancels all previous quotations on any part listed in this catalog. Orders are accepted with the understanding that material will be billed at the price in affect at the time of shipment, unless otherwise specified in quotation or order.

6. MINIMUM ORDER

$30.00 NET

7. TERMS

1% 10 DAYS DATE OF INVOICE

NET 30 DAYS DATE OF INVOICE

8. TERMS OF PAYMENT

Failure by customer to meet punctual payment shall subject any further deliveries to be suspended or cancelled at the manufacturer's option; without prejudice to the manufacturer's rights to claim for material supplied or work done at the time of cancellation, and for any loss or injury occasioned thereby.

9. TAXES

Prices are exclusive of all Federal, State and Local Taxes.

10. FINANCE CHARGES

Any amount not timely paid by the customer shall bear interest at the maximum rate permitted by law, not to exceed 1-1/2% per month.

11. FREIGHT

All prices are F.O.B. point of shipment, unless otherwise stated.

12. CATALOG WEIGHTS, DIMENSIONS & DESIGN LOADS

Catalog weights and dimensions are careful estimates but not guaranteed. Design loads are based on testing or by calculations based on static load conditions.

13. DAMAGE OR LOSS IN TRANSIT

Delivery of goods to a carrier at our plant or other shipping point shall constitute delivery to purchaser; and regardless of freight payment all risk of loss or damage in transit shall pass to the purchaser at that time. Purchaser shall make claims for loss or damage to goods while in transit against the carrier; Flex-Strut will assist in securing satisfactory adjustment of such claims.

14. CLAIMS

Claims for defective material, shortages, delays, failures in shipment or delivery for any other cause shall be deemed waived and released by purchaser unless made in writing within 30 days after arrival of material. Under no circumstances shall purchaser install damaged or defective material if claims are to be made.

15. LIABILITY FOR MISUSE

Flex-Strut shall not be liable for damages to property or persons due to improper installation of its material or through attempts to utilize the material under conditions which exceed the designed capabilities.

Purchaser agrees to indemnify and hold harmless from any and all claims, liabilities, damages, costs and expenses asserted against Flex-Strut or incurred by Flex-Strut because of injuries to persons or damages to property resulting from the improper installation or misuse of the material.

16. MATERIAL SUPPLIER ONLY

Flex-Strut is a material supplier and fabricator and not a construction sub-contractor. We assume no responsibilty for any terms, conditions, or special provisions contained in any contract between purchaser and any other party, including, but not limited to, provisions regarding warranties, time and method of payment and retainage, cancellation and penalties for delay in completion.

17. PURCHASER'S SPECIFICATIONS

Purchaser agrees to protect, defend, indemnify, and hold Flex-Strut harmless from and against all claims, liabilities, demands, causes of action, losses, damages, costs and expenses, including by way of description but not by way of limitation, attorney's fees, expenses which may be asserted against us or may be incurred by us arising out of manufacture and/or sale of any material furnished to or for purchaser in compliance with purchaser's designs, plans or specifications, including any claim, demand, or liability on account of actual or alleged infringement of any United States or foreign patent or trademark.

18. WARRANTIES

We guarantee to replace, or at our option to repair, any material which we find in our sole discretion to be defective in material or workmanship provided that a claim, and proof thereof, is made in writing to us within thirty (30) days after purchaser's receipt of material. Our obligation with respect to material found by us to be defective shall be limited to replacement or repair. No other warranty or guarantee of any kind is made, expressed or implied, statutory, by operation of law, or otherwise including warranties for merchantability and fitness for a particular purpose.

An extended 5 year warranty is provided for the 6 tall cabinets in Room 272B.

Date: 7/24/17

Job: 04437A thru D
Webster University
Ship Date: 7/10/17

This is to confirm that Institutional Casework, Inc. (ICI), will warrant wood & metal casework, and equipment provided on project 04437A-D/Webster University/St. Louis, MO.

ICI warrants its products to be free from defects in materials and workmanship, under normal use and service, for three years from date of delivery. ICI makes no warranty, expressed or implied, to the merchantability and fitness for a particular purpose, design, sale, installation or use of its products.

This limited warranty is in lieu of all other warranties, expressed or implied, and ICI, shall not be liable for incidental, special, or consequential damages, losses or expenses, resulting from the use of its products. ICI shall not be responsible for damage to its products by other parties or for improper use of its products.

Within the warranty period, ICI, shall, at its option, repair, replace, or refund the purchase price of defective products. ICI shall be notified immediately of defective products, and be given a reasonable opportunity to inspect the goods prior to return or other disposition. Any returned goods shall be shipped F.O.B. to ICI plant. We do not unilaterally agree to pay charges for finishing or installing replaced casework. ICI will not assume responsibility for field repairs or labor not authorized in writing by ICI.

Products supplied by ICI are subject to tolerances and variations consistent with usages of the trade and regular manufacturing practices with regard to, but not limited to, dimensions, flatness, straightness, composition, physical properties, color, texture and grain.

Fumehoods manufactured by ICI will be covered under standard 3 year warranty; special life time warranty extended on the sash mechanism portion of the warranty referring to #35 case-hardened steel chain, sealed bearings, drive axle and chains attaching points at both sash handle and counterweight.

The warranty with respect to products of another manufacturer sold by ICI is limited to the warranty extended by that manufacturer to ICI.

ICI reserves the right to change design, material, and construction of its products without notice.

Respectfully,

Stephen Burnine

Project: Webster University
Interdisciplinary Science Building
8274 Bidg Bend BLVD
St. Louis, MO 63119

Subject: LEED requirements for MR 6, and MR7

To Whom It May Concern:

The casework for this project is manufactured by Institutional Casework, Incorporated, in Paris, Tennessee. The following is a break-down of the LEED information.

MR 6 Rapidly Renewable Material:

No rapidly renewable material is specified or provided for this project.

MR 7 Certified Materials:

The FSC Chain-of-Custody number for Institutional Casework as indicated on delivery receipt and invoice is RA-COC-001156. A copy of the certificate is attached. The FSC Certified Wood percentage will be 70%. As required by FSC, the invoice will indicate the wood cost and FSC claim, and the delivery receipt will indicate the FSC claim.

Sincerely,

Wayne S. Cathey

RAINFOREST ALLIANCE CERTIFIED

PureBond®
HARDWOOD PLYWOOD

Proven Technology. Soy-Based Adhesive. Cost-Competitive. North American Made. And only from Columbia Forest Products.

The original cost-competitive decorative hardwood plywood without the added formaldehyde. PureBond® is Columbia Forest Products' exclusive formaldehyde-free innovation for hardwood plywood manufacturing.

Replacing traditional urea formaldehyde (UF) hardwood plywood construction with EPA award-winning, soy-based PureBond enables Columbia to eliminate any added urea formaldehyde from standard veneer core and NAUF composite hardwood plywood core panels. That's great news for our employees, fabricators and final consumers who appreciate good indoor air quality.

PureBond®
FABRICATOR NETWORK

Visit **www.cfpwood.com** to find a fabricator in your area.

columbia
FOREST PRODUCTS™

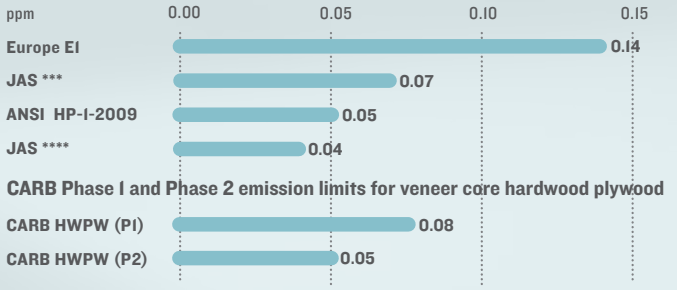
Library in the U.S. Green Building Council's LEED® Platinum head-quarters; fabricated using PureBond® veneer core hardwood plywood with bamboo veneers.

Formaldehyde-free.

When we say PureBond technology is "formaldehyde-free," we're describing our hardwood plywood panels which are comprised of no added urea formaldehyde components and assembled with zero urea-formaldehyde adhesives.

Less Cost. More Benefit.

What really makes PureBond special is that it's cost-competitive with the standard UF construction of most decorative veneer-core hardwood plywood that's made today. That means PureBond veneer core is substantially less expensive than other no-added-formaldehyde alternatives currently available. Additionally, PureBond has been tested to be even more water resistant than UF panels. PureBond urea formaldehyde-free panels have out-performed UF bonded panels in all moisture degradation tests.



Better Living Through Chemistry.

With indoor air quality of increasing importance in today's architectural community, it's no small benefit that PureBond panels contain no added urea formaldehyde. In fact, PureBond veneer core panels are compliant with the U.S. Green Building Council's Leadership in Energy & Environmental Design (LEED®) standards and satisfy the emissions standards of the California Air Resources Board (CARB) regulations.

PureBond® HARDWOOD PLYWOOD

FORMALDEHYDE EMISSION LINE COMPARISON

Foreign standards normalized to ASTM E-1333 large chamber test method

CARB Phase I and Phase 2 emission limits for veneer core hardwood plywood

PureBond® veneer core hardwood plywood meets CARB Phase 2 today!

PureBond Facts:

- Columbia has manufactured over 50 million panels with PureBond formaldehyde-free hardwood plywood technology.
- PureBond veneer core panels are cost-competitive with traditional panels made using UF construction.
- PureBond panels offer improved moisture resistance compared to composite panels made with UF.
- PureBond panels may contribute points for LEED® IEQ 4.4 Credit for Low Emitting Materials: Composite Wood.
- PureBond panels can be specified as FSC® certified upon request.
- PureBond MDF and Particleboard core hardwood plywood is available upon request.
- PureBond is now the mill standard across our North American manufacturing facilities.
- PureBond is exclusive to Columbia Forest Products.

PC-3®

Laboratory Table Top Cement

www.smooth-on.com

PRODUCT OVERVIEW

Smooth-On **PC-3®** Laboratory Table Top Cement is a two-component, black epoxy resin compound designed to join, bond and caulk sections of laboratory counters and tables. This epoxy resin cement is heavily filled and will adhere to vertical surfaces without sagging. It cures at room temperature with extremely low shrinkage. **PC-3®** contains no volatile organic compounds (VOC's) or solvents. It is chemically stable and bonds strongly to natural and artificial stones, most metals, glass, wood and to thermosetting resins such as polyester, phenolic and epoxy. **PC-3®** is available in pint units (2.5 lbs.) or quart units (5.0 lbs.) and is sold in case quantities only. A case of pints contains six units and a case of quarts contains 3 units.

TECHNICAL OVERVIEW

Mix Ratio: 1A : 1B by weight or volume	
Mixed Viscosity: Paste	
Specific Gravity/Volume: 1.4 / 20 cu. in./lb.	
Working Life: 20 minutes (100 g at 73°F/23°C)	
Handling time: 2 hours (0.010 in/0.0254 cm film)	
Color: Black	
Barcol 935 Hardness: 75 (after 24 hours)	
Tensile Strength, psi: 3,000	(ASTM D638-84)
Flexural Strength, psi: 5,000	(ASTM D790-87)
Linear Shrinkage: .003 in/in	
Compressive Yield, psi: 5,000	(ASTM D695-84)
Tensile Shear Adhesion to CR Steel, psi: 3,000	(ASTM D1002-72)

* All values measured after 7 days at 73°F/23°C

PROCESSING RECOMMENDATIONS

PREPARATION...*Safety*

- Use in a properly ventilated area ("room size" ventilation). Wear safety glasses, long sleeves and rubber gloves to minimize contamination risk.

Store and use material at room temperature (73°F/23°C). This product has a limited shelf life and should be used as soon as possible.

Any surface to which the PC-3® will be applied should also be at least 73°F/23°C. Sand surface and wipe clean with fast drying solvent (such as acetone) prior to applying PC-3®. Surface must be clean, dry, and free of all contaminants such as oil, grease, water, dust, etc. Mask adjacent areas with masking tape, then strip tape off as soon as installation is completed. Remove excess or unwanted cement with solvent before it sets.

Because no two applications are quite the same, a small test application to determine suitability for your project is recommended if performance of this material is in question.

MEASURING & MIXING...

Measuring & Mixing **-** It is important that Parts A & B be mixed accurately in equal amounts. Excess amounts of either Part A or B will cause improper curing of the material. After dispensing equal amounts of Parts A & B, mix thoroughly for 5 minutes, making absolutely sure that you scrape the sides and bottom of the mixing container several times. If you notice streaks in the mixed material, it is not mixed thoroughly enough. Normal cure time is 24 hours.

Safety First!

The Material Safety Data Sheet (MSDS) for this or any Smooth-On product should be read prior to use and is available upon request from Smooth-On. All Smooth-On products are safe to use if directions are read and followed carefully. **Keep Out of Reach of Children**

BE CAREFUL **-** PC-3® Part A is irritating to the eyes and skin. Avoid prolonged or repeated skin contact to prevent possible sensitization. Use only with adequate ventilation. If contaminated, flush eyes with water for 15 minutes and seek medical attention. Remove from skin with waterless hand cleaner, then soap and water. Read MSDS before using. PC-3® Part B causes burns to the eyes, may burn the skin and cause sensitization. Vapors irritate the respiratory tract. If contaminated, flush eyes with water for 15 minutes and seek medical attention. Remove from skin with soap and water. Use only with adequate ventilation. During the dismantling of a laboratory counter installation, care must be taken to avoid the inhalation of any dust from the epoxy cement or the counter top material itself. The method for removal is to heat up the PC-3® cement to about 130° - 150° F (hot water temperature) using flameless heat gun, then cutting away the joints with a putty knife or scraper blade. The epoxy is very "rubbery" when hot and cuts easily. If any sanding or sawing is performed, proper respiratory protection is mandatory.

IMPORTANT **-** The information contained in this bulletin is considered accurate. However, no warranty is expressed or implied regarding the accuracy of the data, the results to be obtained from the use thereof, or that any such use will not infringe upon a patent. User shall determine the suitability of the product for the intended application and assume all risk and liability whatsoever in connection therewith.

Safety Data Sheet

SDS No. 203A

Section 1 - Chemical Product and Company Identification

Product/Chemical Name: PC-3® Series Part A
General Use: Epoxy Adhesive
Manufacturer: Smooth-On, Inc.,
5600 Lower Macungie Rd., Macungie, PA 18062
Phone (610) 252-5800, FAX (610) 252-6200
Emergency Contact: Chem-Tel
Domestic: 800-255-3924 International: 813-248-0585

Section 2 - Hazards Identification

Classification of the substance or mixture

Skin irritation – Category 2
Eye irritation – Category 2A
Skin sensitization – Category 1

GHS Label elements, including precautionary statements

Pictogram: 

Signal word: Warning

Health Hazard:	H313	May be harmful in contact with skin
General Precautions:	P101	If medical advice is needed, have product container or label at hand.
	P102	Keep out of reach of children.
	P103	Read label before use.
Prevention Precautions:	P264	Wash with soap and water thoroughly after handling.
	P270	Do not eat, drink or smoke when using this product.
	P272	Contaminated work clothing should not be allowed out of the workplace.
	P280	Wear protective gloves/protective clothing/eye protection/face protection.
Response Precautions:	P302 + P352	IF ON SKIN: Wash with plenty of soap and water
	P303 + P361 + P353	IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water [or shower].
	P305 + P351 + P338	IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.

P332 + P313	If skin irritation occurs: Get medical advice/attention.
P362 + P364	Take off contaminated clothing and wash it before reuse.

Hazards not otherwise classified (HNOC) or not covered by GHS - none

Section 3 - Composition / Information on Ingredients

The following ingredients are hazardous according to OSHA criteria:

CAS	Component	Concentration
25085-99-8	Propane, 2,2-bis[p-(2,3-epoxypropoxy)phenyl]-polymers	15% - 100%

Section 4 - First Aid Measures

Inhalation: Remove source(s) of contamination and move victim to fresh air. If breathing has stopped, give artificial respiration, then oxygen if needed. Contact physician immediately.
Eye Contact: Flush eyes with plenty of water. If irritation persists, seek medical attention.
Skin Contact: In case of skin contact, wash thoroughly with soap and water.
Ingestion: Do not induce vomiting unless instructed by a physician. Never give anything by mouth to an unconscious person.
After first aid, get appropriate in-plant, paramedic, or community medical support.

Section 5 - Fire-Fighting Measures

Flammable Classification: Non-Flammable
Extinguishing Media: Water Fog, Dry Chemical, and Carbon Dioxide Foam
Unusual Fire or Explosion Hazards: None known.

Fire-Fighting Instructions: Use water spray to cool fire-exposed surfaces and to protect personnel. Shut off "fuel" to fire. If a leak or spill has not ignited, use water spray to disperse the vapors. Either allow fire to burn under controlled conditions or extinguish with foam or dry chemical. Try to cover liquid spills with foam.

Further information: Because fire may produce toxic thermal decomposition products, wear a self-contained breathing apparatus (SCBA) with a full face piece operated in pressure demand or positive-pressure mode.

Section 6 - Accidental Release Measures

Spill /Leak procedures:
Only properly protected personnel should remain in the spill area; dike and contain spill; absorb or scrape up excess into suitable container for disposal; wash area with dilute ammonia solution. Stop or reduce discharge if it can be done safely**.**

Environmental precautions:
No special environmental precautions required.

Section 7 - Handling and Storage

Handling Precautions: Use good general housekeeping procedures. Wash hands after use.

Storage Requirements: Keep container(s) tightly closed and properly labeled. Store in cool, dry, well ventilated place away from heat, direct sunlight, strong oxidizers and any incompatibles. Store in approved containers and protect against physical damage. Keep containers securely sealed when not in use. Indoor storage should meet OSHA standards and appropriate fire codes. Containers that have been opened must be carefully resealed to prevent leakage. Empty containers retain residue and may be dangerous. Avoid water contamination.

Section 8 - Exposure Controls / Personal Protection

Respiratory Protection: Respiratory protection is not normally required when using this product with adequate ventilation. Should a respirator be needed, follow OSHA respirator regulations 29 CFR 1910.134 and European Standards EN 141, 143 and 371; wear an MSHA/NIOSH or European Standards EN 141, 143 and 371 approved respirators equipped with organic vapor cartridges.

Hand Protection: Handle with gloves. Wear any liquid-tight gloves such as butyl rubber, neoprene or PVC. Gloves must be inspected prior to use. Use proper glove removal technique to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Eye Protection: Safety glasses with side shields per OSHA eye- and face-protection regulations 29 CFR 1910.133 and European Standard EN166. Contact lenses are not eye protective devices. Appropriate eye protection must be worn instead of, or in conjunction with contact lenses.

Other Protective Clothing/Equipment: Additional protective clothing or equipment is not normally required. Provide eye bath and safety shower.

Comments: Never eat, drink, or smoke in work areas. Practice good personal hygiene after using this material, especially before eating, drinking, smoking, using the toilet, or applying cosmetics. Wash thoroughly after handling.

Section 9 - Physical and Chemical Properties

Appearance : Black paste
Odor/Threshold: Mild odor
pH: N.A. (non-aqueous)
Melting Point/Freezing Point: N.A.
Low/High Boiling Point: N.A.
Flash Point: >485 °F
Evaporation Rate: Not available
Flammability: f.p. at or above 200 °F
UEL/LEL: Not available

Vapor Pressure: None (Polymeric Resin)
Vapor Density (Air=1): >1
Specific Gravity (H_2O=1, at 4 °C): 1.40
Water Solubility: negligible
Partition coefficient: Not available
Auto-ignition temperature: Not available
Decomposition temperature: Not available
Viscosity: Paste
% Volatile: Nil

Section 10 - Stability and Reactivity

Stability: These products are stable at room temperature in closed containers under normal storage and handling conditions.
Polymerization: Hazardous polymerization cannot occur.
Chemical Incompatibilities: Strong bases, and acids.
Hazardous Decomposition Products: Thermal oxidative decomposition can produce carbon oxides and traces of incompletely burned carbon compounds.

Section 11- Toxicological Information

Skin Corrosion/Irritation: no data
Serious Eye Damage/Irritation: no data
Respiratory/Skin Sensitization: no data
Germ Cell Mutagenicity: no data
Carcinogenicity: no data
Reproductive Toxicity: no data
Specific Target Organ Toxicity – Single Exposure: no data
Specific Target Organ Toxicity – Repeated Exposure: no data
Aspiration Hazard: no data
Acute Toxicity: no data
Chronic Exposure: no data
Potential Health Effects – Miscellaneous: no data

Section 12 - Ecological Information

Toxicity: no data
Persistence and Degradability: no data
Bioaccumulative Potential: no data
Mobility in Soil: no data
Other Adverse Effects: no data

Section 13 - Disposal Considerations

Disposal: Under RCRA it is the responsibility of the user of the product to determine at the time of disposal whether the product meets RCRA criteria for hazardous waste. Waste management should be in full compliance with federal, state and local laws.

Empty containers retain product residue which may exhibit hazards of material, therefore to not pressurize, cut, glaze, weld or use for any other purposes. Return drums to reclamation centers for proper cleaning and reuse.

Section 14 - Transport Information

DOT	IATA	IMDG
Not Regulated	Not Regulated	Not Regulated

Section 15 - Regulatory Information

TSCA Inventory Status (40 CFR710): All components of this formulation are listed in the TSCA Inventory.
SARA 302 Components: No chemicals in this material are subject to reporting requirements of SARA Title III, Section 302

SARA 313 Components: This material does not contain any chemical components with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313

SARA 311/312 Hazards: Acute Health Hazard.

California Proposition 65**:** This product does not intentionally contain any chemicals which have been identified by the state of California to cause cancer, birth defects or other reproductive harm.

Disclaimer: The information contained in this Safety Data Sheet (SDS) is considered accurate as of the version date. However, no warranty is expressed or implied regarding the accuracy of the data. Since the use of this product is not within the control of Smooth-On Inc., it is the user's obligation to determine the suitability of the product for its intended application and assumes all risk and liability for its safe use.

This SDS is prepared to comply with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as prescribed by the United States (US) Occupational Safety and Health Administration (OSHA) Hazard Communication Standard (29 CFR 1910.1200), the Canadian Workplace Hazardous Materials Information System (WHMIS), and European Union Regulation (EC) No 1907/2006 of the European Parliament and of the Council of 18 December 2006 (REACH).

Classifications of the chemical in accordance with 29 CFR 1910.1200, signal word, hazard and precautionary statement(s), symbol(s) and other information are based on listed concentration of each hazardous ingredient. Unlisted ingredients are not "hazardous" per the OSHA Hazard Communication Standard (29 CFR 1910.1200), WHMIS and EC No 1907/2006 and are considered trade secrets under US Federal Law (29 CFR and 40 CFR), Canadian Law (Health Canada Legislation), and European Union Directives.

Care and Maintenance of Epoxy Resin Laboratory Work Surfaces

Epoxy Resin work surfaces are durable, non-porous, man-made stone products that are relatively unaffected by most chemicals, heat, flame and moisture. These super-tough surfaces' physical properties are seldom compromised; however, they do require periodic care and maintenance throughout the life of the lab or school room to keep the surfaces looking like new. Whether you are a facility owner, manager, custodian or lab user, it is helpful to know how to maintain the good appearance of your lab's work surfaces.

Chemical Resistant · Non-Absorbant · Self-Extinguishing

Regular Care Procedures

Durcon recommends instituting a regimen of monthly or quarterly inspections of all surfaces, sinks and joints, plus daily or weekly cleanings to maintain your epoxy resin's original finish and to help ensure a safe, uncontaminated working environment. The following list contains items you may wish to have on-hand for regular cleaning and to handle most problems that may occur.

- Acetone or Paint Thinner
- Crystal Simple Green®
- White Scotch Brite® Pads (always use moist or wet)
- Finish Oil (Mineral Oil)
- Murphy's Oil
- Clean Rags or Sponges
- Chamois Cloth
- Mild Soap or Household Cleaner
- Two-part Smooth-On® epoxy grout

Note: Never use wax or polish containing wax on epoxy resin work surfaces or sinks. Also, never use abrasive pads, powders or liquids (such as Soft Scrub) as dulling of the surface will result.

Work Surface Care

Promptly wipe up all spills. Acetone should be used (where allowed) to thoroughly clean surfaces. Apply and wipe away with a paper towel or a clean rag. As an alternative, Crystal Simple Green® (or comparable household cleaning product) can be used to clean surfaces.

An occasional application of finish oil or Murphy's Oil® can restore the luster to the surface, but remember; too much oil can cloud the surface.

- Apply oil by pouring the minimum amount of oil necessary to cover the surface area onto a clean rag.
- Thoroughly rub in oil using a circular motion.
- Wipe away excess oil with a clean rag.
- A chamois can be used to buff the surface to the desired sheen.

Epoxy Resin Sink Care

Laboratory sink areas usually present the greatest cleaning and maintenance challenges. Sinks are a collection point for dirty and wet lab ware which leaves liquids, residue and chemicals on the surface for extended periods of time. Sink areas will require a more thorough cleaning regimen than dry bench tops as well as more frequent inspections. Sink inspections should include all sink surfaces and joints in sink the area including the outlet joint and the sink rim joint above and below the work surface. Cracked or pitted joints should be filled immediately with two-part Smooth-On® epoxy grout to prevent leaking and damage to the supporting casework.

Marring, Scratches & Stains

If there is a more serious cleaning issue it is important to identify the problem before trying to remedy it.

Marring

Most metals are softer than the work surface and can leave a mar if pulled across the top. Marring is matter left on the surface that appears as a line and remains smooth to the touch. Marring can almost always be removed with acetone or with mild cleaning products and elbow grease.

Always try the softest cloth and the weakest solution (soap and water) first.

If marring persists, progress to a white Light Duty Scotchbrite® Pad moistened with stronger solutions. Never use a dry Scotchbrite pad or a more abrasive pad and always apply the minimum amount of pressure required on the surface to remove the mar.

Scratches

Harder metals, abrasives and heavy or sharp items can dig into the surface resulting in a scratch. Scratches usually appear as a lighter shade of the surface and will be rough to the touch. Scratches in epoxy resin are permanent but will not affect work surface performance.

An aesthetic remedy for scratches is coloring in the void with a permanent marker. This option will never perfectly match the color and gloss of the surrounding surface.

Stained Surfaces

Staining can be caused by chemicals left to dry on the surface. Chemical stains usually lighten or bleach the surface but can also roughen and even crack the top. Like scratches, chemical stains are permanent and, if they have caused too much damage, you may need to replace of the top.

Special Care Issues

Epoxy resin products (especially glued in sinks) are subject to thermal shock and are not warranted against damage from liquid nitrogen or dry ice. Possible effects caused by the improper disposal of these materials include joint failure and/or sink fractures.

Work Surface Care

The performance of Durcon epoxy resin work surfaces will not be compromised by normal laboratory use. Maintaining the appearance depends upon good housekeeping practices. If you wish, copy and post the following "Do's and Don'ts" around the lab as a reminder to users.

Do's

- Do clean up liquid and dry spills immediately
- Do protect the feet of lab apparatus with rubber, felt or a protective pad
- Do place a trivet under all hot containers and components
- Do extinguish all flames on the worksurface
- Do apply a thin coat of finish oil or Murphy's Oil periodically
- Do educate all users in the proper care of epoxy resin work surfaces

Don'ts

- Do not drag items across the surface
- Do not cut, chop or strike items directly on the surface
- Do not drop items onto the surface
- Do not use abrasive sandpaper or metallic scouring pads on work surfaces or sinks
- Do not store chairs on the worksurface without a protective covering such as cardboard
- Do not melt dry ice with hot water directly on the surface or in the sink as the thermal shock may break the joints or cause the sink to fracture
- Do not wax the surface (or use polish containing wax)

By following these simple guidelines your Durcon laboratory work surfaces will look good for the life of the lab. Please take time to share this document with your lab workers and cleaning personnel and institute a maintenance program to help ensure the safety and beauty of your lab. If you have further questions, please contact our customer service department at 512-595-8000 or send an e-mail to sales@durcon.com.

U.S. WARRANTY

All products sold by Durcon Incorporated™ shall conform to the customer's written specifications for such products and shall be free of defects in material and workmanship for a period of one year from the date of shipment. Product performance with regard to heat resistance, chemical resistance or physical properties will meet or exceed the published test results. Durcon Incorporated expressly disclaims any warranty based on testing of product samples.

If a customer notifies Durcon Incorporated within 30 days after the expiration of the warranty period of a failure of a product under this warranty, Durcon Incorporated shall conduct an inquiry to determine the nature and source of the defect. If the defect is covered by the warranty, Durcon Incorporated shall replace the product or correct the defect, at Durcon Incorporated's option, without cost to the customer. Durcon Incorporated's liability for breach of warranty shall be limited to replacement of materials or repair of the defective product until the defect is corrected. It does not include any repairs, adjustments, alterations, or replacements required as a result of normal wear and tear, installation not in accordance with the installation and layout instructions provided by Durcon Incorporated with the product, use of the product in a manner for which the product was not designed or customer error or omission in specifications provided to Durcon Incorporated. This warranty does not include expenses incurred by the customer to correct defects in Durcon Incorporated product without prior written authorization from Durcon Incorporated. Durcon Incorporated shall not be liable for any incidental or consequential damages of a customer arising from breach of Durcon Incorporated product warranty, including (without limitation) the customer's loss of use or loss of profit.

THE REPAIR/REPLACEMENT OBLIGATIONS OF DURCON INCORPORATED SET FORTH ABOVE ARE THE CUSTOMER'S EXCLUSIVE REMEDIES FOR ALL CONTRACT OR TORT LIABILITIES OF DURCON INCORPORATED. THERE ARE NO WARRANTIES, EXPRESS OR IMPLIED, OTHER THAN AS SET FORTH ABOVE. IMPLIED WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED.

The foregoing warranty shall be governed by the laws of the State of Texas.

General Care & Maintenance

Oak Casework Finish:

Exposed oak cabinet and casework surfaces -

Oak doors and drawer faces -

Exposed shelves and exposed interiors -

Care:

Wipe off spills immediately. Clean the surface with mild soap and warm water. Wipe dry with a soft cloth.

Maintenance:

Waxing of new furniture is not necessary. However, after several years of service, if desired, a good coat of furniture wax may be applied.

Touch ups:

Scuffs and scratches can be treated by applying a thin coat of cleaning wax, *"Liquid Gold"* or a similar product. Follow product's directions for buffing and drying. This will not repair a scuff or scratch, but will make it less noticeable.

Plastic Laminate Door/Drawer Faces:

Care:

Wipe off spills immediately. Clean the surface with mild soap and warm water or with a liquid glass cleaner. Rinse with clean water and wipe dry. Do not use steel wool or abrasive cleaners.

Maintenance:

A thin coat of quality paste wax may be applied for added protection.

Touch ups:

Scuffs and scratches can be treated by applying a thin coat of cleaning wax or a similar product. Follow product's directions for buffing and drying. This will not repair a scuff or scratch, but will make it less noticeable.

Metal Surfaces:

Exposed metal cabinet surfaces -

Faucets, exposed surfaces of gas cocks, turrets, etc.

Note:

Even the most regular, consistent cleaning will not deter the normal corrosive processes of metal surfaces by chemicals. The proper care, handling and storage of such materials is mandatory.

Care:

Fixtures:

Wipe off any spills or splashes immediately. Clean the surface with mild soap and warm water or with a liquid glass cleaner. Rinse with clean water and wipe dry with a soft cloth. Do not use steel wool or abrasive cleaners.

Metal Storage Cabinets, Fume Hoods, Vents, Aquaria covers, etc.

Wipe off any spills or splashes immediately. Clean the surface with mild soap and warm water or with a liquid glass cleaner. Rinse with clean water and wipe dry with a soft cloth. Do not use steel wool or abrasive cleaners.

7.0 Care and Maintenances

7.1 Care and Maintenance of Painted Steel Casework

Clean all exposed casework and hardware surfaces as needed using a high-grade, cream-based furniture polish. We recommend Johnson Wax. The polish forms a protective coating on surfaces that may come in contact with harmful chemicals. If the casework is heavily soiled, wipe it clean with Naptha or Mineral Spirits before you apply polish. Check drawers and cupboards often for chemical spills or leaks. Prompt clean-up will help prevent permanent damage. Any nicks or scratches in the cabinet finish should be refinished with touch-up paint or rust may result. Air dry touch-up paint is supplied for each different color selection.

Introduction

Cleanliness and stainless steel are closely related and, in many applications, each is dependent upon the other. In the handling of food, chemicals, pharmaceuticals and in the use of stainless steel as a construction material (roofs, wall panels, entry ways, signs, etc.), stainless steel provides the degree of corrosion resistance that is necessary to prevent product contamination or surface rusting. However, stainless steel performs best when clean - *cleanliness is essential for maximum resistance to corrosion.*

This handbook describes various practices for cleaning stainless steel during manufacturing and in use. This includes methods for removing free-iron contamination on stainless steel surfaces that may have been picked up from metal working tools, and for removing general accumulation of dirt, grime and surface stains that occur during normal handling and exposure to the elements.

The reader should keep in mind that there are few specific rules for a cleaning procedure. Accordingly, the methods discussed in this handbook are suggestions. Each manufacturer or used, after obtaining competent advice with respect to their individual requirements, should select methods appropriate to those requirements.

What is Stainless steel

Stainless steel is not a single alloy, but rather the name applies to a group of iron-based alloys containing a minimum 10.5% chromium. Other elements are added and the chromium content increased to improve the corrosion resistance and heat resisting properties, enhance mechanical properties, and/or improve fabricating characteristics. There are over 50 stainless steel grades that were originally recognized by the American Iron and Steel Institute (AISI). Three general classifications are used to identify stainless steel. They are:

1) Metallurgical structure
2) The AISI numbering system (200, 300 and 400 series number)
3) The Unified Numbering System, which was developed by the American Society for Testing Materials (ASTM) and the Society of Automotive Engineers (SAE) to apply to all commercial metals and alloys.

The various types of stainless steel are detailed in a designer handbook, “Design Guidelines for the Selection and Use of Stainless Steel,” available from the Specialty Steel Industry of North America (SSINA). Several other publications are also available, including: “Stainless Steel Fabrication,” “Stainless Steel Fasteners,” “Stainless Steel Finishes,” Stainless Steel Specifications,” and “Stainless Steel Architectural Facts,” to mention a few.

Alloy Types

304 is the basic chromium-nickel austenitic stainless steel and has been found suitable for a wide range of applications. It is the most readily available in a variety of product forms. This grade is easy to form and fabricate with excellent resistance to corrosion.

304L is the low carbon version of 304. It is sometimes specified where extensive welding will be done.

316 offers more corrosion-resistance through the addition of molybdenum. This grade is desirable where the possibility of severe corrosion exists, such as heavy industrial atmospheres and marine environments.

316L is the low carbon version of 316

430 is a straight chromium ferritic stainless steel with lower corrosion resistance than the 300 series. It is principally employed for interior use.

Cleaning of Stainless Steel

Stainless steels need to be cleaned for aesthetic considerations and to preserve corrosion resistance. Stainless steel is protected from corrosion by a thin layer of chromium oxide. Oxygen from the atmosphere combines with the chromium in the stainless steel to form this passive chromium oxide film that protects from further corrosion. Any contamination of the surface by dirt, or other material, hinders this passivation process and traps corrosive agents, reducing corrosion protection. Thus, some form of routine cleaning is necessary to preserve the appearance and integrity of the surface. Stainless steels are easily cleaned by many different methods. They actually thrive with frequent cleaning, and, unlike some other materials, it is impossible to "wear out" stainless steel by excessive cleaning. The effect of surface/pattern roughness, grain/pattern orientation, and designs that allow for maximum rain cleaning (exterior applications) should be considered.

Types of Surface contaminants

Dirt - Like any surface that is exposed to the environment, stainless steel can get dirty. Dirt and soil can consist of accumulated dust and a variety of contaminates that come from many sources, ranging from the wind to everyday use. These contaminates will vary greatly in their effect on appearance and coercivity and ease of removal. While some may be easily removed, others may require specific cleaners for effective removal. It may be necessary to identify the contaminate or experiment with various cleaners. Frequently, warm water with or without a gentle detergent is sufficient. Next in order are mild non-scratching abrasive powders such as typical household cleaners. These can be used with warm water, bristle brushes, sponges, or clean cloths.

Ordinary carbon steel brushes or steel wool should be avoided as they may leave particles embedded on the surface which can lead to RUSTING.

For more aggressive cleaning, a small amount of vinegar can be added to the scouring powder.

Cleaning should always be followed by rinsing in clean hot water.

When water contains mineral solids, which leave water spots, it is advisable to wipe the surface completely with dry towels.

Fingerprints and Stains - Fingerprints and mild stains resulting from normal use in consumer and architectural applications are the most common surface contaminates. Fortunately, these usually affect only appearance and seldom have an effect on corrosion resistance. They are easy to remove by a variety of simple cleaning methods. Fingerprints are probably the most troublesome marks to remove from the surface of smooth polished or bright finished stainless steel. Fortunately, they can be removed with a glass cleaner or by gentle rubbing with a paste of soda ash (sodium carbonate) and water applied with a soft rag. Once again, this should be followed by a thorough warm water rinse. There are several special surface finishes where fingerprints present special problems: polished No. 6, etched, some abrasive blasted finishes, and light electrochemical colors applied over satin or brushed finishes. (NOTE: there are several special finishes designed to withstand fingerprints: embossed, swirl patterns, lined patterns, etc.)

Shop oil and Grease - Shop oils, which may carry grease, grit and metal chips, commonly produce surface soiling after many shop operations. Greases and other contaminates may also soil surfaces in food preparation and many other household and commercial situations. These soils may be corrosive in themselves or may not allow the surface to maintain passivity, and so periodic removal is a necessity. Initially, soap or detergent and water may be tried or a combination of detergent and water plus a solvent. The removal of oil and grease from stainless steel parts by immersion in chemical solvents is frequently used with cold-formed or machined parts that are laden with lubricants. This process, in its simplest form, consists of bringing liquid solvent into contact with the surface to be cleaned and allowing dissolution to take pace; for example, washing a surface with trichloroethylene or similar liquid or stirring a batch of small parts in a container of solvent. Non-halgenated solvents, such as acetone, methyl alcohol, ethyl alcohol, methyl ethyl ketone, benzene, isopropyl alcohol, toluene, mineral spirits, and turpentine work well.

Many of these solvents are widely used as individual cleaners, but there are thousands of blended or compound cleaners on the market. Users are advised to contact suppliers of solvents for information on their applications on stainless steel.

Types of cleaners and methods

General Precautions

In selecting cleaning practices, consider the possibility of scratching and the potential for post-cleaning corrosion caused by incompletely removed cleaners. Scratching can occur on a bright mirror finish by cleaners that contain hard abrasives, or even by “grit” in wash water. This is usually not a problem on dull finishes, or those surfaces finished with a coarse polishing grit. The best preventative measure is to avoid using abrasive cleaners unless absolutely necessary. When abrasives are needed, first experiment on a inconspicuous area. A “soft abrasive” such as pumice, should be used. Abrasives can permanently damage some colored and highly polished finishes. Advice should be obtained from the finish supplier when cleaning special finishes. Many cleaners contain corrosive ingredients which require thorough post-clean rinsing with clean water, however, thorough rinsing is recommended for all cleaning procedures.

Clean Water and Wipe - The simplest, safest, and least costly method that will adequately do the job is always the best method. Stainless surfaces thrive with frequent cleaning because there is no surface coating to wear off stainless steels. A soft cloth and clean warm water should always be the first choice for mild stains and loose dirt and soils. A final rinse with clean water and a dry wipe will complete the process and eliminate the possibility of water stains.

Solvent Cleaning - Organic solvents can be used to remove fresh fingerprints and oils and greases that have not had time to oxidize or decompose. The preferred solvent is one that does not contain chlorine, such as acetone, methyl alcohol, and mineral spirits. There are many compounded or blended organic cleaners that are commercially available and attempt to optimize both cleanability and safety attributes. Cleaning can be accomplished by immersing smaller articles directly into the solvent, wiping with solvent-impregnated cloths, or by sophisticated vapor or spray methods. The wiping technique sometimes leaves a streaked surface.

Job	Cleaning Agents*	Comments
Routine Cleaning	Warm Water, Soap, Ammonia, Detergent	Apply with sponge or soft cloth. Can be used on all finishes.
Fingerprints and Smears	3M Stainless Steel Cleaner and Polish, Arcal 20,Lac-O-Nu, Lumin Wash, O'Cedar Cream Polish, Stainless Shine	Provides barrier film to minimize fingerprints. Can be used on all finishes.
Stubborn Stains and Discoloration	3M Stainless Steel Cleaner and Polish, Allchem Concentrated Cleaner, Samae, Twinkle, Cameo Copper Cleaner Grade FFF or Grade F, Italian Pumice, Whiting or talc, Liquid Nu Steel, Copper's or Revere Stainless Steel Cleaner, Household Cleaners, Lumin Cleaner, Zud Restoro, Sta-Clean, Highlite, Allen Polish, Penny-Brite, Copper-Brite	Rub lightly using dry damp cloth in the direction of polish lines on the stainless steel
Grease and Blood Burnt-on or Baked-on Foods.	Scotch-Brite Power Pad 2001, Easy-Off, De-Grease-It, 4% to 6% hot solution of such agents as tri-sodium polyphosphate, 5% to 15% caustic soda solution	Excellent removal on acids, all finishes. Particularly useful where rubbing is not practical
Grease and Oil	Any good commercial detergent or caustic cleanser.	Apply with sponge or soft cloth in direction of polish lines.
*Note: Use of proprietary names is intended only to indicate a type of cleaner and does not constitute an endorsement. Omission of any proprietary cleanser does not imply its inadequacy. All products should be used in strict accordance with instructions on package.		

Commercial Cleaners - Many commercial cleaners compounded from phosphates, synthetic detergents, and alkalis are available for the cleaning of severely soiled or stained stainless surfaces. When used with a variety of cleaning methods, these cleaners can safely provide effective cleaning. Manufacturers should be consulted and their recommendations followed whenever using cleaners of this kind. The general precautions stated above also pertain to these cleaners.

Household Cleaners - Household cleaners fall into two categories: detergent (non-abrasive) and abrasive cleaners. Both are effective for many mild dirt, stain, and soil deposits, as well as light oils such as fingerprints. The abrasive cleaners are more effective but introduce the possibility of scratching the surface. However, the degree of abrasiveness will vary greatly with the particular product, and some brands will produce noticeable scratching on only the most highly polished and some colored surfaces. All of these cleaners vary widely with respect to their acidity and the amount of chloride they contain. A neutral cleaner low in chloride is preferred unless the user is assured that the surface can be thoroughly rinsed after cleaning. The fact that the label states "for stainless steel" is no guarantee that the product is not abrasive, not acidic or low in chloride. The cleaning method generally employed with these cleaners is to apply them to the stainless surface and follow by cloth wiping, or to wipe directly with a cleaner-impregnated soft cloth. In all cases, the cleaned surface should be thoroughly rinsed with clean water and wiper dry with soft cloth if water streaking is a consideration.

8.0 Warranty

Casework Warranty

Jamestown Metal Products guarantees the metal casework for the above referenced building to be free from defects of Jamestown's workmanship or materials and agrees that it will, for a period of three (3) year from the date of acceptance, repair and/or replace, at its own expense, any materials furnished by Jamestown that may develop such defects due to, or arising from, its own workmanship or material. It is understood, however, that the liability of Jamestown Metal Products here under is limited to the making of such repairs or replacements.

Fume Hood Applications

If your fume hood is to protect you, it must be designed to be compatible with the type of work that will be performed. For example, working with radioisotopes or carcinogens requires a fume hood with a non-absorbent lining (usually stainless steel) designed to be easily decontaminated.

Today, energy efficiency is a high priority. A HOPEC (Hand Operated Positive Energy Control) fume hood is an energy saving and extremely safe alternative fume hood design.

Only a specially designed laboratory fume hood should be used for perchloric acid procedures. This fume hood type should be clearly labeled and its use restricted to only perchloric acid procedures.

Other specialized applications may require explosion proof fixtures, electrical receptacles, non-combustible liner materials or fire extinguisher systems.

Never use a fume hood that has not been designed for the type of procedure being performed!

To be sure your fume hood is the right one for the work you are doing, you may contact your local jamestown representative or give us a call at 716-665-5313. Our website at *www.jamestown.com* is an excellent source for frequently updated technical information and reference materials about fume hoods and other laboratory equipment. You can also email us for information at *info@jamestown.com*.

Common Fume Hood Types

Bench Fume Hoods:

Most common hood type used for general chemistry procedures. Specialized versions include; ADA Bench Hoods for access by handicapped personnel, OS Height Hoods with larger interior height for work requiring intermediate sized equipment, HOPEC, Radioisotope and Perchloric hoods as described above.

Walk-In Hoods:

A floor-to-ceiling fume hood for chromatography, distillation, pilot plant mock-ups, vat drug preparations and other procedures requiring large equipment inside the containment chamber.

Your Safety is our Top Priority!

Your new Jamestown Fume Hood is the result of extensive research and development to design fume hoods that are economical, efficient and the safest on the market. The design, materials and construction are periodically reviewed to assure an even better and safer product.

But you, the fume hood operator, are the single most important safety feature in the laboratory.

No matter how safe the fume hood system is designed to be, the operator must follow certain procedures for it to work safely and efficiently.

We urge you to become familiar with the recommended fume hood practices outlined in this booklet in addition to those published by your organization but, most important, make a habit of applying them every day. We think you'll agree it's the best way to help ensure a safe, healthy work environment for you and your co-workers.

Our fume hoods, as manufactured, are the safest in the industry but we need your cooperation to keep them that way in your environment.

Maintain an appropriate attitude towards safety.

Every laboratory should have written procedures for handling emergencies such as:

- "Runaway experiments"
- Fire
- Explosion
- Power failure
- Blower failure
- Service fixture failure

These procedures should be posted in a prominent place and all laboratory workers must be familiar with them in order to react appropriately in an emergency situation.

"What if..." drills should be run when a fume hood is first installed, or when staff or procedures change. In surprising numbers of instances, misplaced fire extinguishers, inaccessible fuse boxes and blocked exits are only discovered during such a mock emergency.

Safety drills are not only for the new employee. Long-time employees need reinforcement of safety procedures also.

Aerodynamic Principle & Safety

A Jamestown Fume Hood is designed to contain harmful contaminants and vent them out of the work space. It provides an enclosed area that has a protective air barrier between you and the harmful materials you work with. The directional air flow caries the contaminants towards the rear of the hood and dilutes them with large quantities of air to safely exhaust the hood.

If anything disrupts this air flow, the fume hood's ability to protect you will be seriously reduced**.**

Follow these important safety procedures to ensure proper air flow within the hood:

- **Use the illumination provided and be sure the hood is operational.**

Always turn on the interior light for proper illumination of the work area. Verify the exhaust system is working properly and that air is entering and flowing through the fume hood before starting fume producing activities. Be certain you know how to turn on the hood. In many facilities it is automatically controlled by the HVAC system. In others, control of each hood is local at an on/off switch located on or near the unit.

Verify you have a proper face velocity at or above 100 FPM through the sash opening you select before beginning fume-evolving activities. To confirm that your fume hood's exhaust system is working properly we recommend equipping the fume hood with an air flow monitoring device. Correct face velocity can be assured by periodically checking air flow with a hand-held velometer. Refer to page 10 for more specific information regarding velocity alarms.

- **Verify proper baffle settings.**

Safe and proper fume hood operation requires an understanding of the function of fume hood baffles as well as the HVAC system. Operators should not adjust the baffle settings once they have been balanced by qualified HVAC personnel.

- **Set-ups and apparatus should be as far back from the fume hood face as is possible for safety and optimum performance.**

When you stand in front of the hood with the sash open, the airflow passing your body creates a zone of low pressure directly in front of you extending in about four inches. Since contaminants can enter this area of turbulence from inside the hood, all experiments and equipment should be placed at least six inches behind the plane of the sash, behind the protective air barrier. The further back you can place the source of contaminants, the greater protection a hood can provide. However, don't place items you're using so far back that you need to lean your head or face into the hood during procedures.

- **Allow air flow at the work surface.**

Do not block the lower rear baffle slot of the fume hood. Large, bulky objects should not be placed directly on the fume hood working surface. Block such objects up two or three inches to permit a flow of air underneath and into the lower rear baffle exhaust opening.

- **Avoid rapid movement in front of the fume hood face.**

Avoid rapid movement and excessive personnel passage in front of the fume hood. Air disturbances so created may draw fumes out of the hood.

- **Operate the hood with the sash closed as much as possible.**

While working at the fume hood, open the sash only as far as you need to for access to your work area. The lowered sash increases the distance between your breathing zone and the area where fumes could escape into the lab. It also offers added protection by acting as a solid barrier against splashing chemicals or debris from explosions or runaway experiments.

- **Never store chemicals in the hood.**

Use of laboratory hoods as storage enclosures for corrosive, toxic or flammable materials may jeopardize fume hood performance and create unnecessary hazards. Limit materials within the hood to those required for immediate use.

Today, virtually all packaging is designed to safely contain reagents. Any leaky package should be disposed of immediately and appropriately, not stored in the fume hood. Clean up spills as soon as possible. Always use grounded electrical equipment.

- **Avoid extreme heat.**

Never permit the temperature of the sash surface to reach or exceed 160^{o} F, as laminated safety glass cracks at this temperature. We recommend our standard tempered glass, instead of safety glass, as it is stable up to 400^{o} F.

Black hood liner material, such as epoxy, can also absorb invisible infrared light from heated objects and may crack under heat stress.

- **Maintain lab safety instructional materials.**

Design a videotape outlining your organization's safety procedures, and be sure new employees view this tape. Jamestown can supply a video of this nature, but it lacks specific chemical information and procedures that only you, as the end user, can provide.

In summary, safety in fume hood operation involves three concepts:

- **Following accepted procedures.**
- **Avoiding questionable procedures.**
- **Maintaining the structural integrity of the equipment and the safety awareness of the laboratory staff.**

Clean Fume Hood = Safe Fume Hood

Periodic cleaning of the fume hood interior.

A neat and clean fume hood is not only aesthetically advantageous but also safer and easier to "shut down" in case of an emergency! Clean up any chemical spillage as soon as possible. All worktops recommended by Jamestown are "dished" to help contain spills. Use only cleaning materials recommended for use in conjunction with the procedures being conducted within the hood. By keeping the fume hood clean, the chemical residues of your procedures will have less time to potentially damage the internal components, thereby minimizing the risk of a possibly catastrophic failure of a key hood component.

The following are basic cleaning and maintenance procedures which can be performed by the fume hood operator. Confirm that the cleaning agents being used will not react with the chemicals being used in the hood.

CLEANING

- **Polyglass Liner:**

Can be cleaned with mild soap and water. For persistent stains use our polyglass liner cleaner (part number: SP26), acetone (with a thorough wipe-down afterwards due to flammability), JSS #22 Remove or #400 automotive sandpaper.

- **Sash Glass:**

Can be cleaned with a commercial glass cleaner.

- **Painted Steel Surfaces:**

Can be cleaned with mild soap and water, ethyl alcohol or commercial glass cleaner.

- **Epoxy Liner and Worktops:**

Can be cleaned with mild soap and water, solvent or commercial glass cleaner.

- **Plumbing Fixtures:**

Fixtures are coated with a corrosive resistant coating. Clean with mild soap or detergent only. Do not use an abrasive cleanser.

Basic Maintenance

Schedule frequent maintenance checks of the condition of sash components, exhaust system and load bearing parts.

The very nature of the materials used in a fume hood, harmful or corrosive chemical fumes, can lead to deterioration of the fume hood's components due to the long-term effects of any chemical reactions. Any metallic load-bearing member inside the hood needs to be checked frequently for corrosive deterioration. Be aware of vertical sash counterbalance systems utilizing cables that can release the sash in guillotine fashion of the cable snaps. Horizontal sashes have been known to break loose and cave into the hood when corroded suspension systems give way. Internal back baffle panels have broken free of their deteriorated hanger brackets.

Newer style hoods by most manufacturers combat some of these problems by eliminating or chemically coating the metal parts in question. Jamestown has incorporated a chain driven sash counterweight system that eliminates the possibility of fraying cables or fractured pulleys.

BASIC MAINTENANCE

- **Sash:**

A properly balanced sash, at 50% open, should not move up or down without operator assistance. If the sash is out of balance, do not attempt to adjust it yourself. No portion of the sash mechanism is user adjustable. Contact the appropriate maintenance department for your facility or a Jamestown representative.

- **Velocity Alarm:**

Test the velocity alarm daily by placing your finger over the thermistor reference hole on the front cover plate. Face velocity readout should quickly drop to zero and the audio alarm should sound.

- **Fans and Ductwork:**

Be sure your maintenance staff schedules frequent checks of the fume hood's fans and face velocities. Because the ductwork system is exposed to toxic and corrosive fumes, it is a vulnerable link in your lab's exhaust system and requires vigilant monitoring.

Instructions for Perchloric Fume Hoods

Perchloric acid, $HClO_4$, is unforgiving if not handled correctly. Its acidity is nominal but each molecule essentially carries around four extra oxygen atoms which like to react, burn, or explode; whichever is easiest.

Concentrated perchloric acid should never be heated. Old bottles of acid should be discarded as hazardous waste. It can be expected to react with most types of plastics, except PVC or Teflon.

Perchloric acid may form contact explosives with some shaft bearing lubricants. Only fluorocarbon lubricants should be used on perchloric acid fume hood exhaust fans. We recommend the exhaust streams for these hoods be dedicated and not mixed with other fume hood exhaust streams.

Periodic cleaning of the perchloric acid fume hood interior.

Due to the explosive and reactive nature of perchloric acid salts that accumulate in the hood and ductwork, the washdown system in your fume hood should be used after every use or at minimum, once a day. In continuous use applications washdown the hood at week's end.

Discontinue experiments in the hood and remove devices that could be damaged by water. Switch the exhaust system off, then turn on the washdown bar to flush water through the hood system. The rear baffles should be flushed for at least five minutes. Next, police the hood interior with a sponge, thoroughly rinsing the sponge to remove chemical residue. Be sure the hood interior is completely dry before replacing your equipment.

In most cases, the fume hood ductwork washdown system interfaces with the hood washdown system. Check with the appropriate party in your facility to determine how your system operates. Test the system with an empty hood before attempting a washdown procedure.

Other special considerations for perchloric acid hoods:

Any components used in conjunction with perchloric acid experiments, such as distillation racks, should be fabricated from stainless steel not aluminum.

Instructions for HOPEC Fume Hoods

HOPEC (Hand Operated Positive Energy Control) fume hoods look slightly different than our ISOLATOR hood but they work in much the same fashion. It also addresses concerns such as ADA (Americans with Disabilities Act) and LCV (Low Constant Volume). The main difference being:

- The fume hoods are designed to be operated with at least 50% of the combination sash closed. This condition is achieved by either:

1. Having the vertical portion of the sash completely closed and the horizontal panel(s) open for operation.

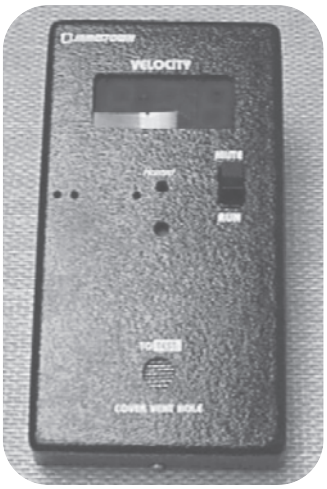
2. Having the horizontal panels fully closed and the vertical portion of the sash raised not more than 15".

- The hood is deeper than an ISOLATOR hood due to the design of the front airfoil. The airfoil is bright yellow to remind the operator to keep all experiments and equipment at least six inches behind the plane of the sash.

Velocity Alarms

Air is drawn into the fume hood by its exhaust system which creates a pressure difference between the surrounding room and the hood interior. The speed of the air passing through the sash is called the face velocity. Proper face velocity is required to protect the operator and surrounding area from harmful components inside the hood.

There are two different models of velocity alarms available to choose from.



Alnor Velocity Alarm

The Alnor AirGard 335 Velocity Alarm has audible and visual indicators. In dangerous situations a continuous audible alarm will alert the operator. An electronic bar graph moves back and forth through universally recognized zones, red - yellow - green, as the velocity changes. Corresponding large colored LEDs also illuminate. A digital display can be enabled to view velocity quantitatively.

Jamestown Digital Velocity Alarm

This unit will give the fume hood operator a continuous digital readout of fume hood face velocity. If the face velocity drops below a preset alarm set point an audio alarm and flashing red LED display will alert the operator of dangerous situations that may arise.

Always verify you have a proper face velocity before beginning fume hood activities. Remember to test the velocity alarm every day and that everything is running correctly. If it is not, make sure the proper maintenance department for your facility is contacted immediately. Do not use the fume hood until this condition has been corrected.

Velocity Alarm Calibration Instructions

Calibration of Jamestown Digital Velocity Alarm

1. Power up the alarm and set the switch to “Run”, calibrate as follows:

    a. There are three calibration potentiometer holes located on the alarm face plate.
    b. With the fume hood and make-up air off, turn the left most potentiometer (RP2) until the digital counter just moves off zero. Now turn the potentiometer back in the other direction until the reading barely returns to zero.

2. Turn the fume hood and make-up air on. Using the sash or damper adjustment, or both, set the face velocity at the desired sash setting to the desired alarm set point (10 to 100 FPM) using a velometer, not the velocity alarm.

3. Remove the alarm cover and select the one of the ten numbered DIP switches (SW1) that corresponds to your alarm set point. Move the DIP switch to the right (On position). Replace the alarm face plate.

4. Turn the set screw on the center potentiometer (RP1) until the alarm signal activates.

5. Using the sash or damper adjustment, or both, set the fume hood velocity to 100 FPM using a velometer, not the velocity alarm. Adjust the rightmost potentiometer (RP3) until the digital readout is 100 FPM. Alarm is now calibrated and ready for use.

Alarm is now set to digitally read the average face velocity and activate the alarm if the desired minimum value is not held. **Note**: Audio alarm can be muted by activating the Mute switch, but the warning light cannot be turned off.

Calibration of Alnor Velocity Alarm

Please refer to the AirGard 335 owner’s manual for proper calibration of this device or visit their website for manuals and information at www.alnor.com.

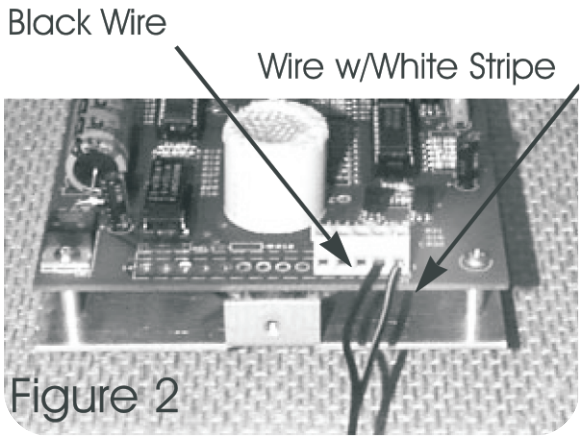


Figure 2

Procedures for Trained Personnel

The following maintenance items should be undertaken only by building maintenance, trained fume hood or HVAC installation personnel.

- **Periodic inspection of the ductwork system.**

At least twice a year the exhaust duct and fan integrity should be inspected. Check for localized corrosion, broken fan parts and debris clogs. If items such as tissue, paper or foil are used in the hood, it is possible for them to be drawn into the baffle/duct system, forming blockages that reduce air flow.

- **Periodic smoke tests.**

At least twice a year we recommend running a smoke test on each hood. Smoke sticks and other testing materials are available for purchase from Jamestown.

- **Periodic testing of the velocity alarm.**

At least once a year test the accuracy of the velocity alarm by using a hand held velometer.

- **If the sash becomes "cocked".**

If the contact between the airfoil and the sash handle is not continuous and flush, loosen both sprockets, on the side that is not making contact with the airfoil, from axle contact by loosening the 3/32" Allen screws (two per sprocket). Close the sash fully making sure it is flush against the airfoil. Verity the chain is properly seated on the sprockets. Re-tighten the Allen Screws on each sprocket.

- **If the sash is out of balance.**

Note: If the sash is a combination sash, first verify all horizontal sliding panels are in place.

Contact your Jamestown representative, who can supply additional small weights to balance the sash. Attachment instructions will accompany the counterweight pieces.

- **If the sash does not operate smoothly or makes noise.**

Contact your Jamestown representative immediately for an inspection. The chain mechanism should not require lubrication. This may be a symptom of a more serious problem.

- **If the sash glass breaks.**

Replacement sash units may be ordered through your Jamestown representative. Do not attempt to replace the glass without first requesting a copy of the instructions for sash replacement.

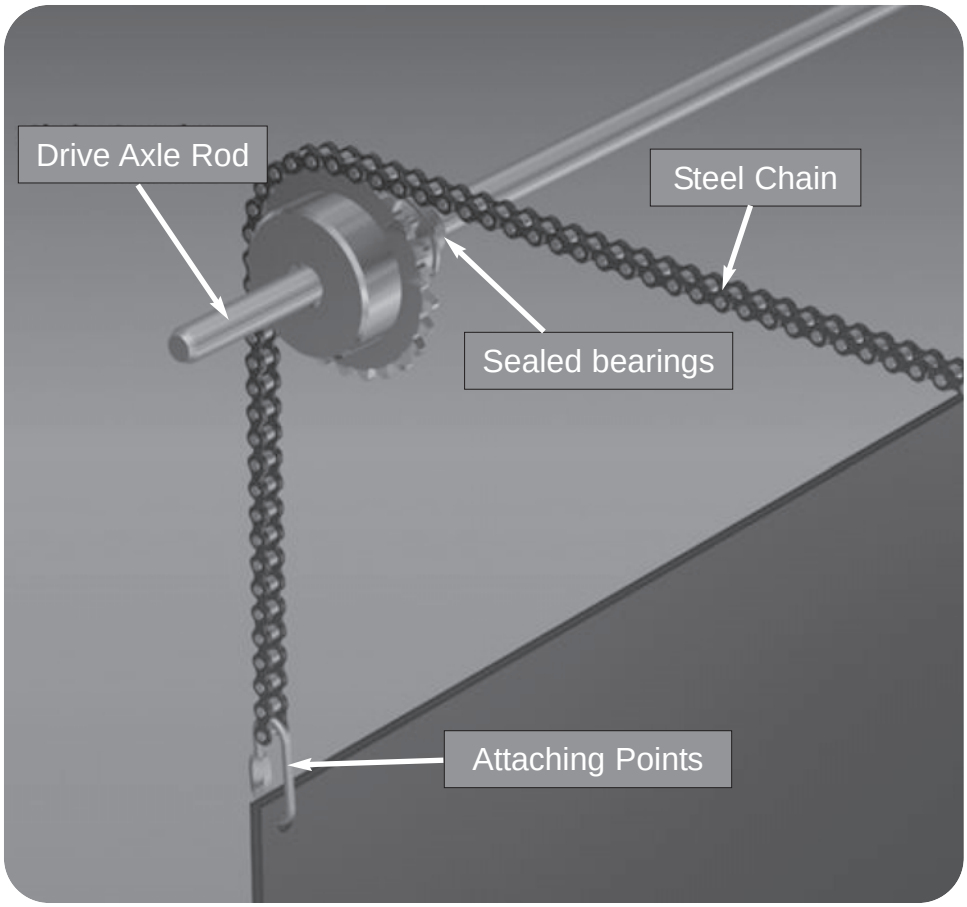
Fume Hood Safety Labels

If the instructional label on your fume hood is missing or is illegible, we have, for your convenience and safety, reproduced it on this page. Use a copy of this as a temporary safety measure but be sure to contact your local representative or Jamestown Metal Products for an immediate replacement.

FUME HOOD OPERATING INSTRUCTIONS

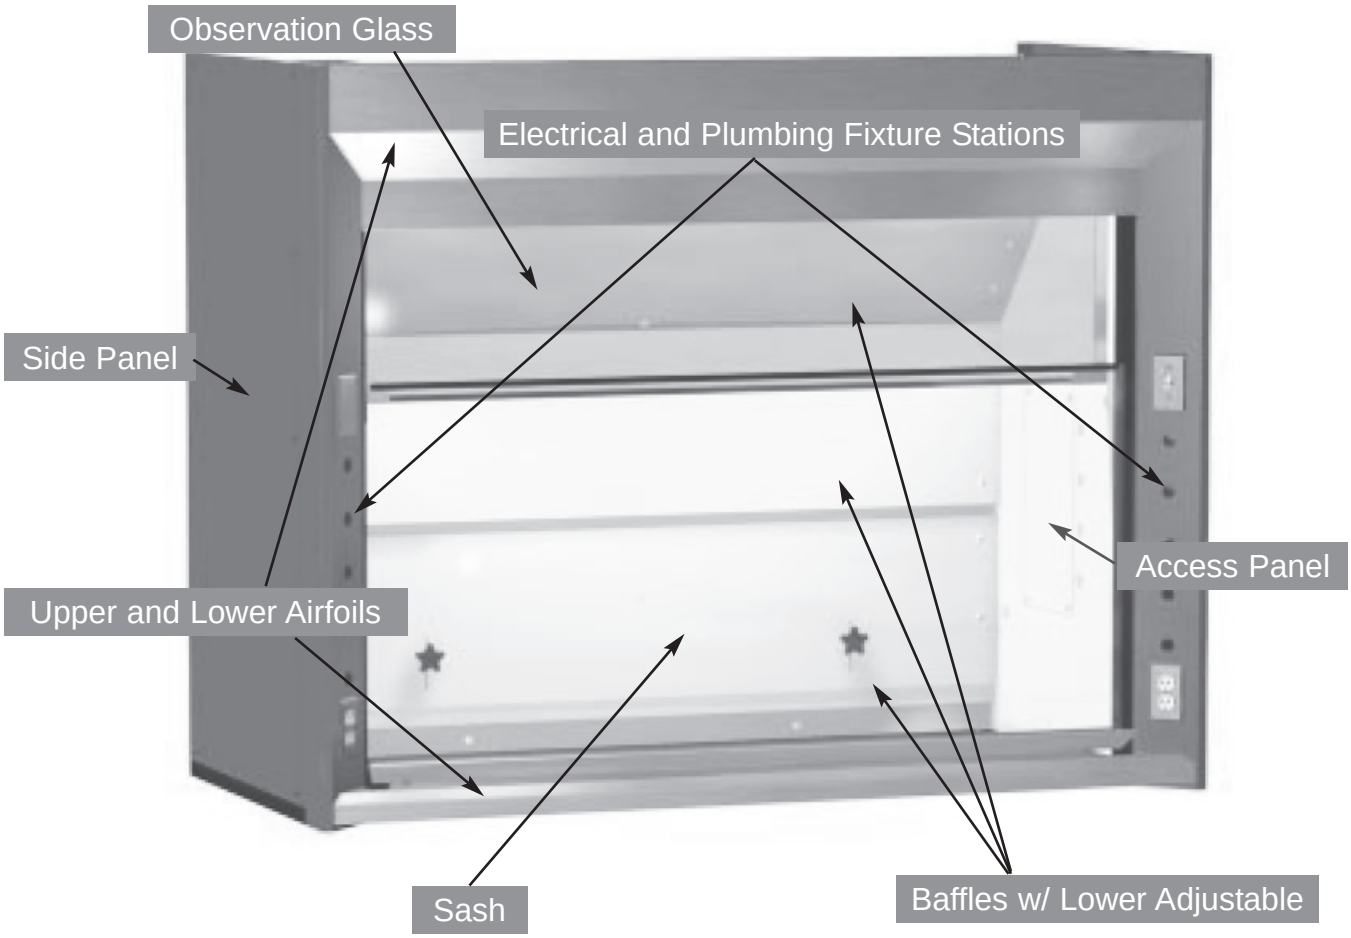
1. Before using the fume hood, make sure the light is on and the proper face velocity is present. Immediately report any malfunction of the exhaust system!
2. Maintain a protective barrier between yourself and all active procedures.
3. Keep active procedures at least 6" behind the plane of the sash.
4. Operate the fume hood with the sash closed whenever possible.
5. Do not obstruct the baffle openings or place large or bulky items directly on the work surface where they could obstruct the proper airflow through the fume hood.
6. Do not obstruct the airflow at bottom airfoil.
7. Do not place your head inside the fume hood. Keep your hands outside as much as possible.
8. Avoid storing containers of corrosive or volatile liquids in the fume hood.
9. Wipe up any spillage immediately.
10. Wear safety goggles at all times.
11. Do not misuse the hood or use materials which the hood has not been designed for.
12. Ensure that all laboratory workers are following company safety policies and procedures, as well as any additional guidelines supplied by the manufacturer of the hood. Be familiar with suggested maintenance procedures.

PERCHLORIC ACID FUME HOOD OPERATING INSTRUCTIONS



1. Keep all perchloric acid procedures under scrupulous control. Never allow the reagent to come into close proximity with any plastic, except PVC or Teflon.
2. Never use this hood with reagents other than perchloric acid.
3. When your use of this hood is finished, or, at minimum, once a day, run a washdown cycle for at least ten minutes. Switch fan off, then run the cycle, being sure the washdown trench drain is clear at all times.
4. Before using the fume hood, make sure the light is on and the proper face velocity is present. Immediately report any malfunction of the exhaust system!
5. Maintain a protective barrier between yourself and all active procedures.
6. Keep active procedures at least 6" behind the plane of the sash.
7. Operate the fume hood with the sash closed whenever possible.
8. Do not obstruct the baffle openings or place large or bulky items directly on the work surface where they could obstruct the proper airflow through the fume hood.
9. Do not obstruct the airflow at bottom airfoil.
10. Do not place your head inside the fume hood. Keep your hands outside as much as possible.
11. Avoid storing containers of corrosive or volatile liquids in the fume hood.
12. Wipe up any spillage immediately.
13. Wear safety goggles at all times.
14. Do not misuse the hood or use materials which the hood has not been designed for.
15. Ensure that all laboratory workers are following company safety policies and procedures, as well as any additional guidelines supplied by the manufacturer of the hood.

PERCHLORIC ACID IS COMBUSTIBLE, REACTIVE AND EXPLOSIVE. USE EXTREME CAUTION.



Product Warranty

Jamestown Metal Products for a period of three years, from date of shipment, warrant that furnished products shall be free from defects in material and workmanship. Jamestown Metal Products shall also warrant the products to be as represented and will repair or replace any part, under normal use, if examination discloses it to have been defective within the warranty period.

Jamestown Metal Products for the life of the sash mechanism warrant that furnished products shall be free from defects in material and workmanship. Sash mechanism refers to the #35 case-hardened steel chain, sealed bearings, drive axle rod and chain attaching points at both sash handle and counterweight.

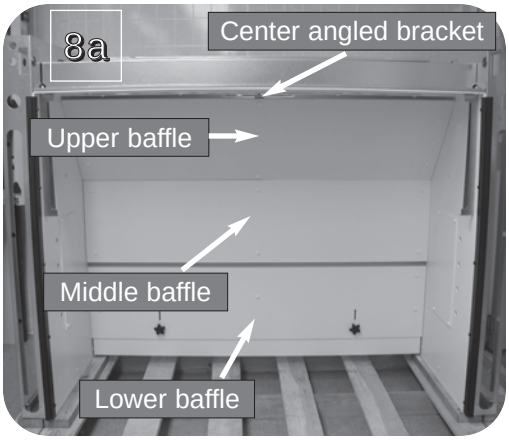
“Knock-Down” Overview / Bench Hood

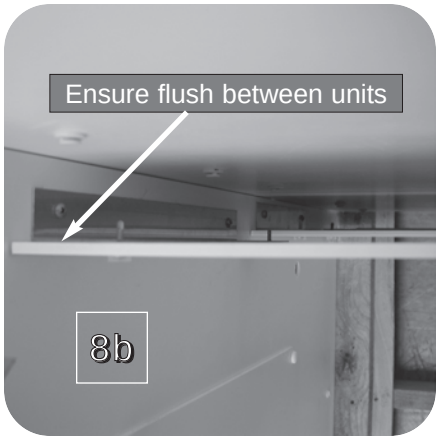
A bold number system is used to follow the steps for assembly. A subscript system is also in place next to the various components throughout the manual to aid the reader in recognition of those components with a visual reference provided in the rear of this manual.

Care has been taken on the “strategical” presentation of assembly, shying away from the “tactical” assembly, as you can give instructions on how to go from point A to point B but there are many methods and preferences to this goal.

A component and check-off list has been provided, as the heading suggests, to inventory the shipped crate for completeness and to mark off the components as they are used to assure the hood is properly assembled.



EXAMPLE



8. Using #10 x 3/4”[13a] screws with base[3] attachments, screw in the bottom, middle and lower baffle units to the center bracket supports and side bracket supports [8a]. Attach the center angled bracket[2]. Check that the baffle units are secure and flush against the bracket supports by visual inspection or physically feeling behind the baffles [8b].

*Paragraph number (**8.**) refers to corresponding picture box(s).

*Subscripts ([13a], [3], [2]) denote the component number on pages 27 & 28 for visual reference.

*Lettered outlined number ([8a], [8b]) signifies specific picture box.

Inventory & Check-off List

Pack List #1

- ☐ Upper baffle
- ☐ Middle baffle
- ☐ Lower baffle
- ☐ Back frame liner
- ☐ Observation glass / smoked
- ☐ Sash
- ☐ Side panels x 2
- ☐ Lower adjustable baffle

Pack List #2

- ☐ Axle rods x 2
- ☐ Lower airfoil
- ☐ Upper airfoil
- ☐ Ceiling Soffit (If included)

Pack List #3

- ☐ Fascia panel x 2
- ☐ End frame assembly x 2

Pack List #4

- ☐ Top frame assembly
- ☐ Back frame panels x 2

Pack List #5

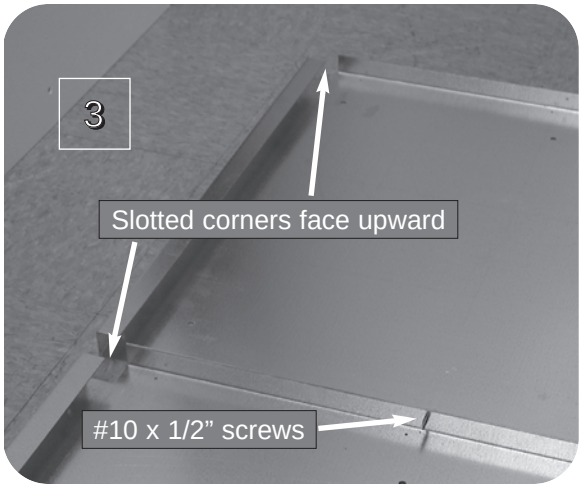
- ☐ Counterweight / J-plate & insert

Pack List #6 # = JMP Part Number

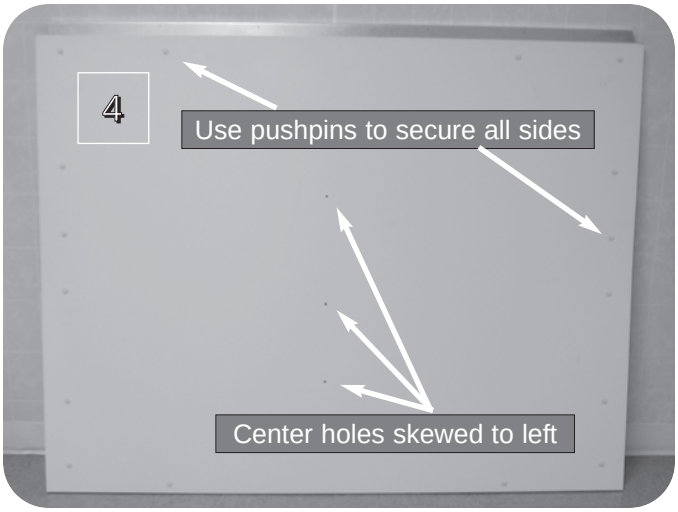
- ☐ #10 x 3/4" screws[13a] x 50 #02300447
- ☐ #10 x 1/2" screws[13b] x 50 #02300443
- ☐ #8 x 1/2" screws[13c] x 20 #02300434
- ☐ U-Tapped clip[1] x 2 #02150414
- ☐ Screw base[3] x 50 (Integral with screw caps)
- ☐ Screw caps[6] x 50 / white #02750410 / black #02750409
- ☐ Viewpass bracket set x 2
- ☐ Center baffle support x 3
- ☐ Side baffle support x 6
- ☐ Nylon bolt and nut[10] x 1 #02750407
- ☐ Baffle knob & bolt[8] x 2 / knob #02450400 / bolt #02100415
- ☐ Center angled bracket[2] #40038408
- ☐ Plug caps, various[11] x 40
- ☐ Chain x 2 #02800493
- ☐ Sprockets[14] x 4 #02800427
- ☐ Spacer collar[7] 1/2" dia. x 4 #02800438
- ☐ Connecting chain link[9] x 4 #02800496
- ☐ Threaded chain connector[16] x 2 #02500496
- ☐ Rubber bumper / black[5] x 2 #02750413
- ☐ PVC pushpin[12] x 50 #02750490
- ☐ Sash stop[15] x 2 #40039200
- ☐ *Assorted electrical components
- ☐ *Assorted plumbing components

*Varies with options ordered.

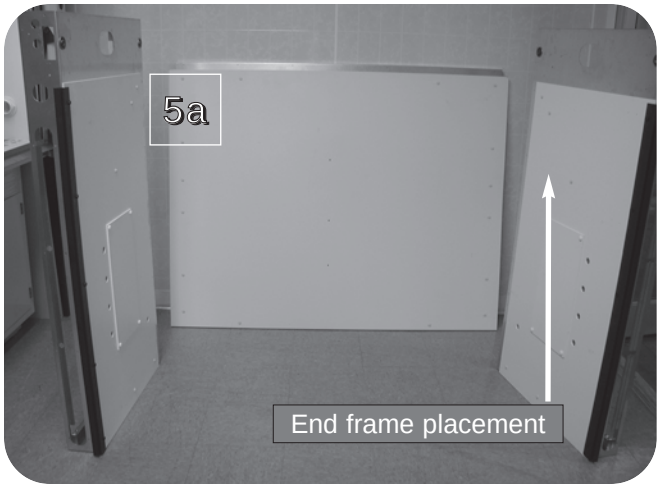
"Knock-Down" Assembly



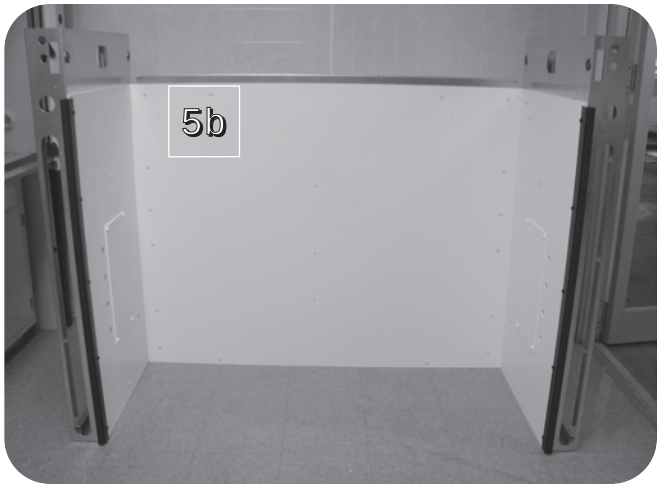
1. Set and level fume hood worktop and base cabinets per manufacturer recommendations.



2. Place counterweight at rear of worktop such that the hanging holes are topmost and weight is leaning against the wall with smooth side of J-plate facing to the front.

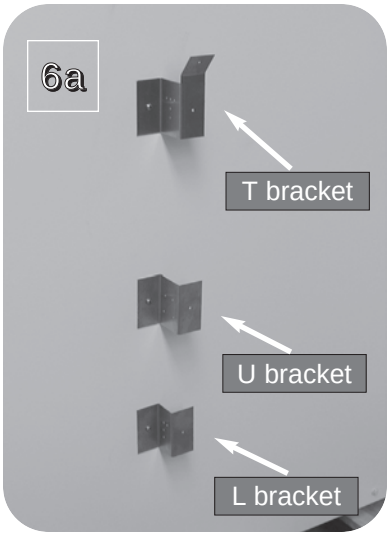


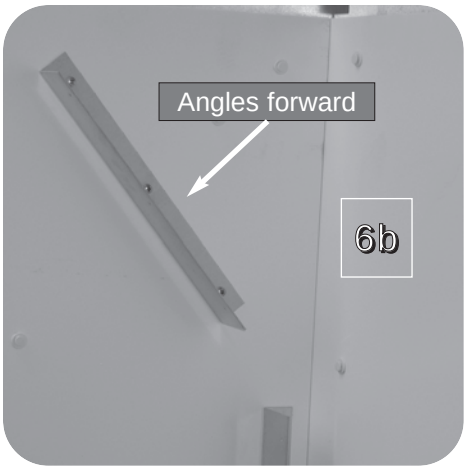
3. Attach the 2 back frame panels. The slotted corners are the top parts of the frame. Use #10 x 1/2"13b screws to attach.



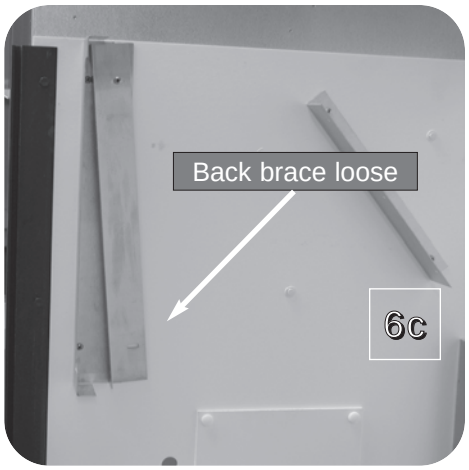
4. Attach the liner to the smooth side of the back frame panel. Line up the hole slots and use the PVC pushpins12 to secure. Top of the back frame is with the center holes skewed to the left. Place the back frame against the wall in front of the counterweight.

5. Take the 2 end frames, liner inward - right side up, attach them to the back frame panel using #10 x 1/2"13b screws [5a]. You can use vice grips to hold the back frame and end frames in place to keep them stable to assemble [5b]. Use #10 x 1/2"13b screws to attach.

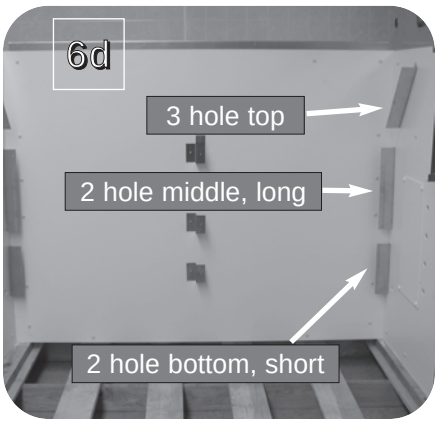




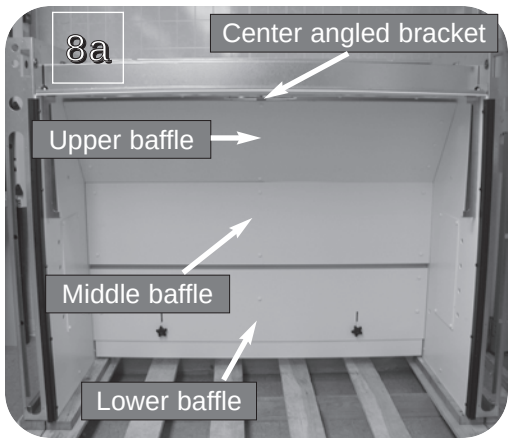
"Knock-Down" Assembly



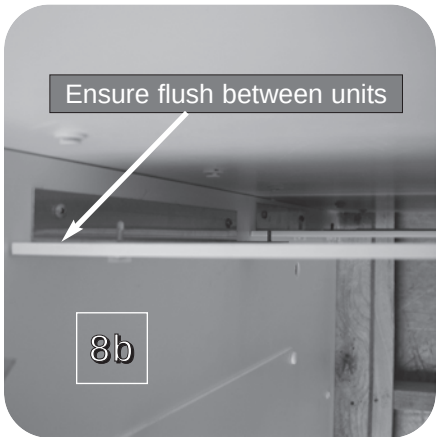
6. Assemble the baffle bracket supports. For side support use short 2 hole for the bottom, long 2 holes for the middle and 3 hole for angled top [6d]. For the center use the code punched center baffle brackets. T-punched bracket for the top portion, U-punched for the middle portion and L-punched for the lower portion [6a]. The reason for the offset holes is for the angled center bracket supports so when attached the holes are centerline with the hood. Then attach the side bracket supports for the viewpass glass [6c]. Only secure the back brace on the top loosely leaving the bottom hole free. This will provide easy insertion later on with the viewpass. #10 x 3/4"[13a] screws are to be used. Be sure to attach side supports with angle facing forward [6b].

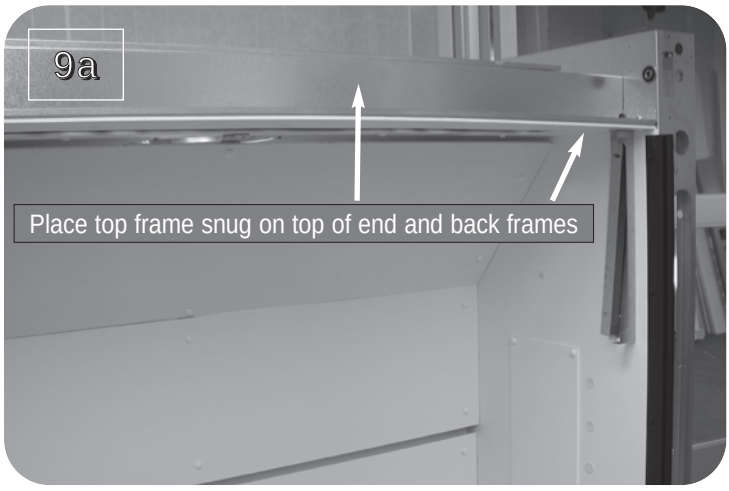


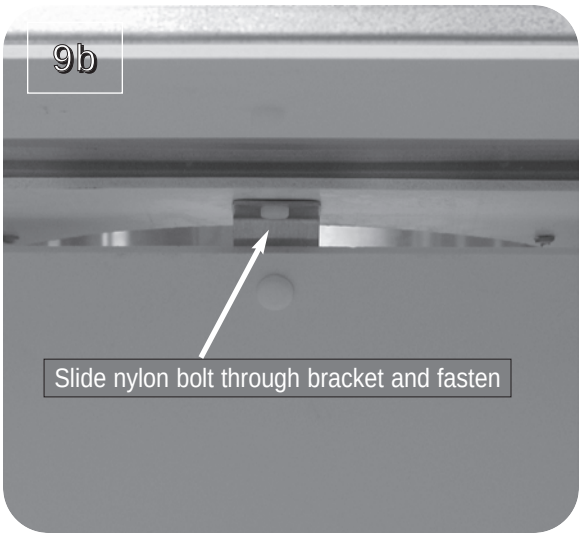
7. Assemble the lower baffle section. Use the lower baffle and lower adjustable baffle. Combine both units correctly using adjustable baffle knob and carriage bolt[8].

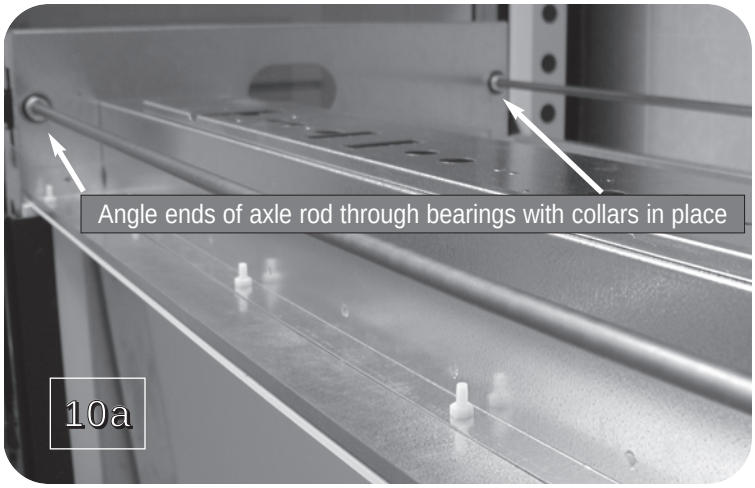


8. Using #10 x 3/4"[13a] screws with base[3] attachments, screw in the bottom, middle and lower baffle units to the center bracket supports and side bracket supports [8a]. Attach the center angled bracket[2]. Check that the baffle units are secure and flush against the bracket supports by visual inspection or physically feeling behind the baffles [8b].

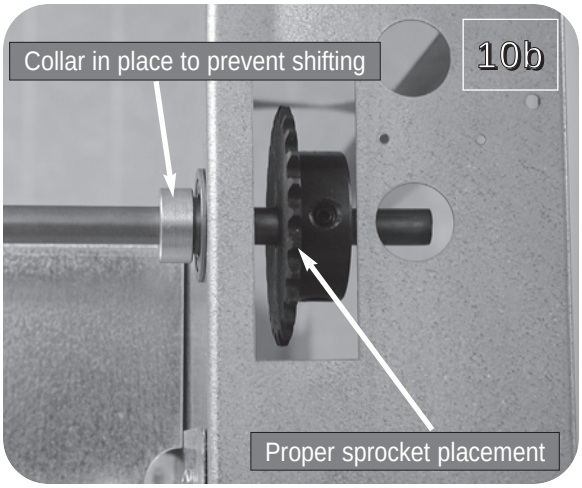






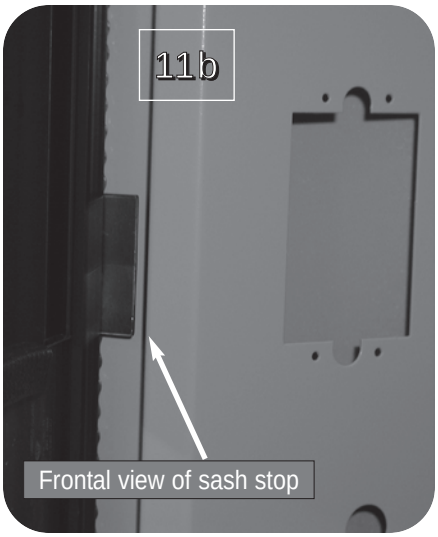


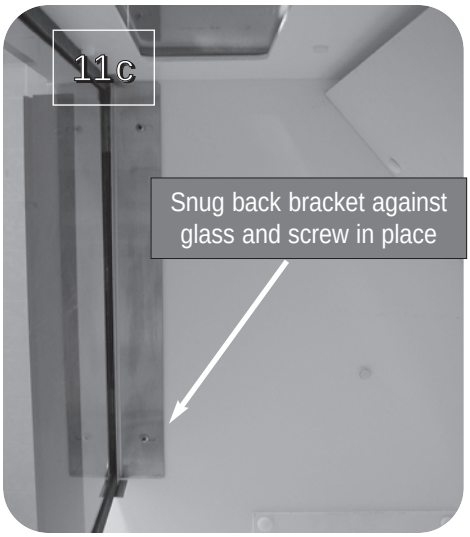
"Knock-Down" Assembly



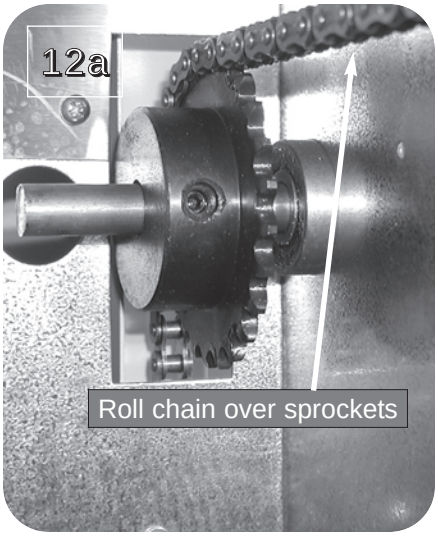
9. Place top hood portion into place with lightbox to front of fume hood [9a]. Around the sides and back of top frame use #10 x 1/2" screws[13b] to attach to back and end frame. After the top is secured use a white nylon bolt and nut[10] to attach the center angled bracket[2] to the fume hood top [9b].

10. Slip one end of the axle rod, angling it, through one of the side bearings[4] [10a]. Slip on 2 collar spacers[7] on the axle rod. Slip the rod through a little further to be able to get in the other end. In the process be sure to attach the sprockets[14] as they have to be in place just after the insertion of the axle rods. Be sure the sprocket teeth side are faced toward the interior of the hood [10b]. Position the axle rods so as to have even spacing from the rod ends to the outside of the end frame. Once everything is in place tighten down the collar spacers to keep the rods from shifting. Repeat the procedure with the back axle rod and components.

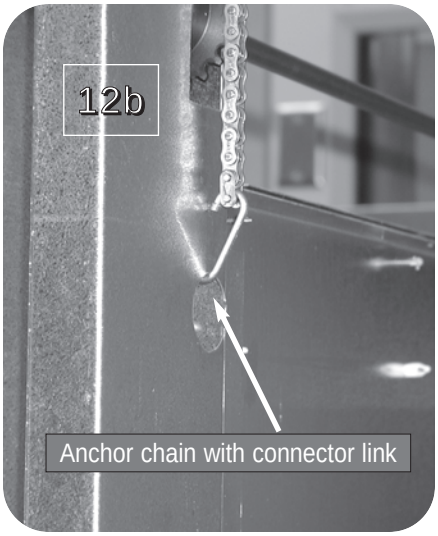




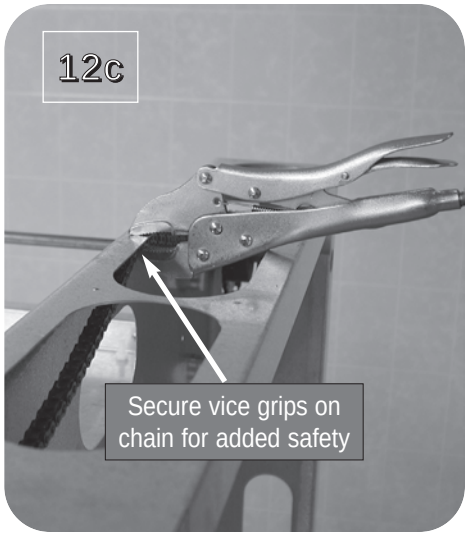
"Knock-Down" Assembly

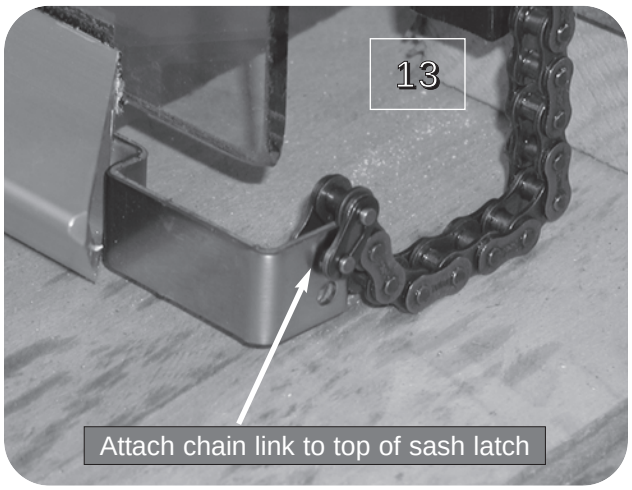


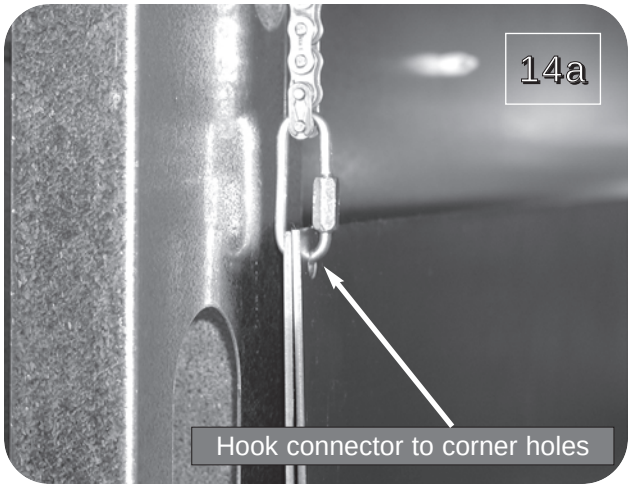
11. At the front of the end frames, insert the sash stop[15] into the vertical slot located approximately in the middle of the end frame assembly [11a]. Use #10 x 1/2"[13b] screws to fasten the sash stops. This prevents the sash glass from dangerously derailing from the sash track via the top [11b]. Place the smoked observation glass into the brackets by sliding in from the bottom. Tighten down the bottom back brace to secure in place [11c] using #10 x 3/4" screw[13a].



12. Now it is time to lay the chains in place. Roll each chain over the sprockets[14] [12a] and attach the threaded chain link[16] to the back end and secure to an opening, as shown in picture, to keep from rolling off the sprockets [12b]. For extra security for when you attach the sash glass, use the vice grips to anchor the chains as shown in picture [12c].



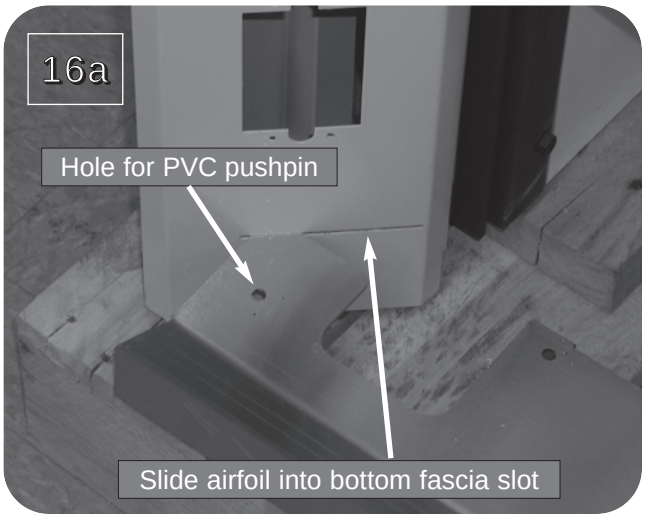


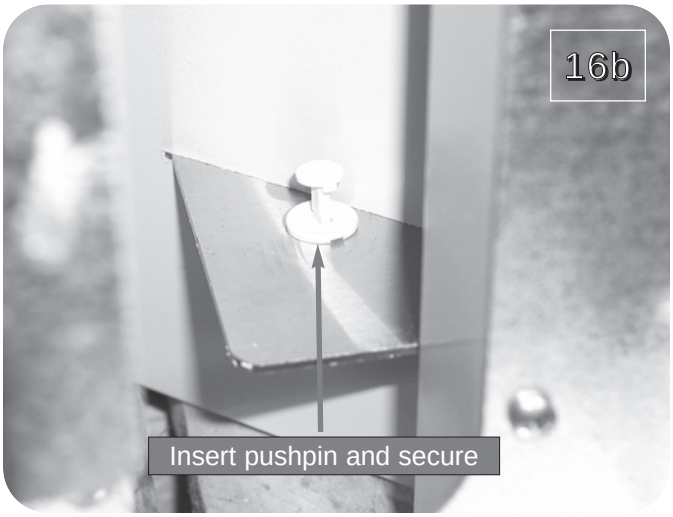


"Knock-Down" Assembly

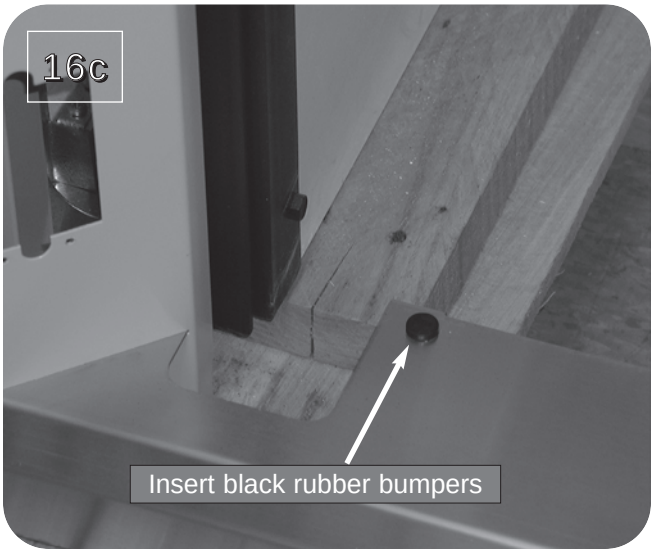
13. Sash glass installation. Slide the hood forward with enough room to raise the sash glass into the black PVC track slot. Use something to support the sash from the bottom, a reliable and safe support, to give enough space to attach the chain end to the sash chain attachment point using the chain link connector[9] as shown in picture. Once the sash is attached it is time to connect the counterweight to the back end of the chain.

14. Once the sash is attached it is time to connect the counterweight to the back end of the chain. Lift the counterweight ends and attach the threaded chain connector[16] to the hole positions on the corners of the counterweight [14a]. Screw down the threaded chain connector to secure the counterweight to the chain assembly [14b]. You can now release the vice grips holding the chain in place and raise the sash to a clear position to move the hood back into place.



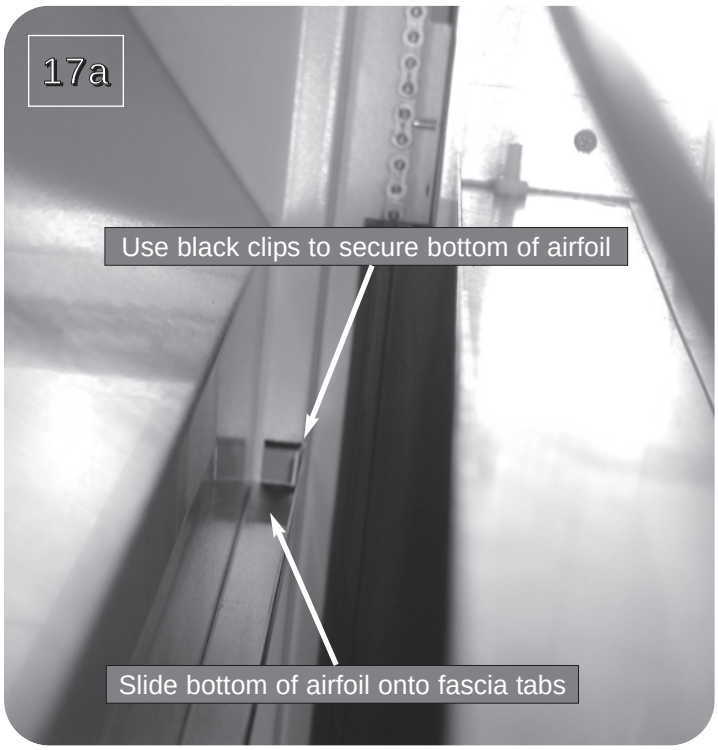


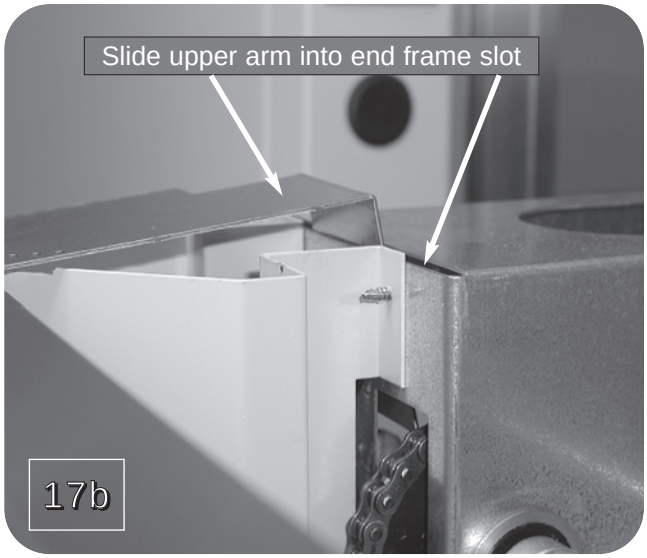
"Knock-Down" Assembly

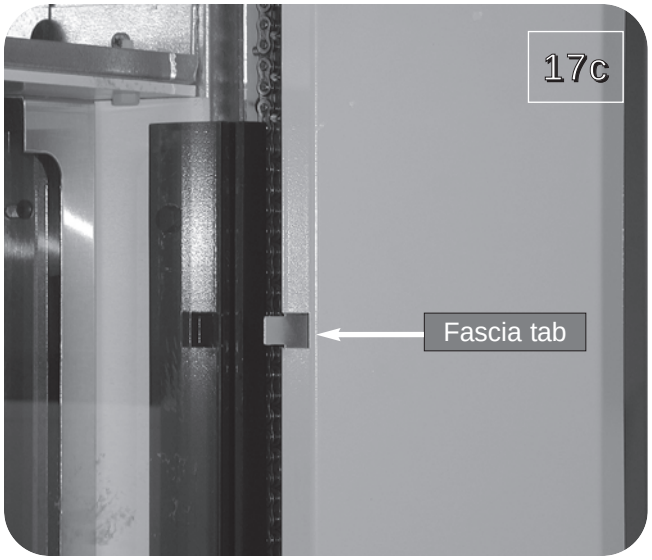


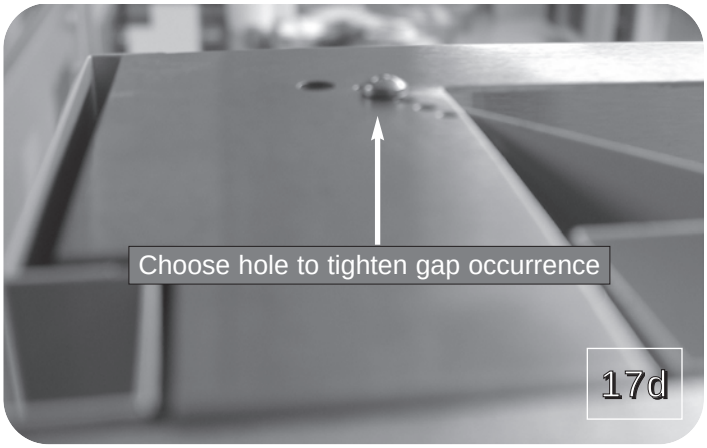
15. Put the fascias on securing the interior row first and then the exterior next with #8 x 1/2" screws[13c].

16. Once the fascias are in place, with the sash raised a few inches, slide the lower airfoil corners into the fascia slots provided until flush with the fascia face [16a]. Then from the interior of the end frames place a PVC pushpin[12] in to the hole provided and secure [16b]. Plug in the 2 black rubber bumpers[5] on the lower airfoil top [16c].



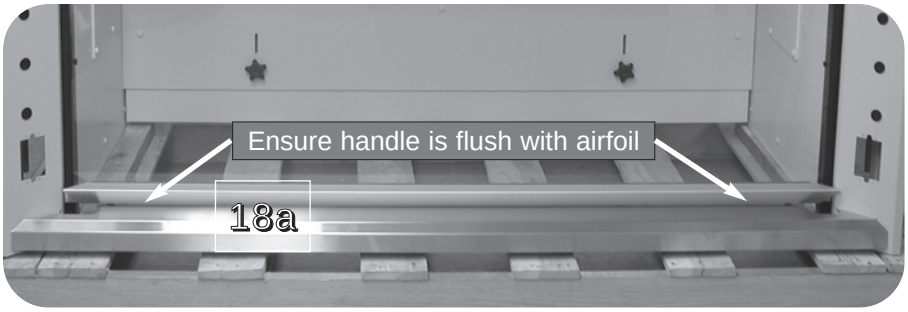


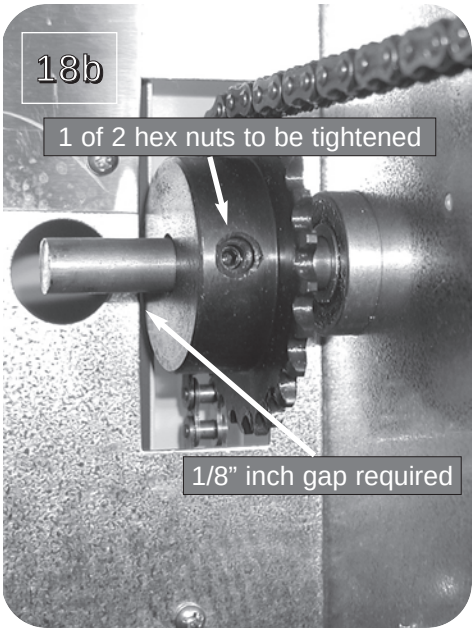


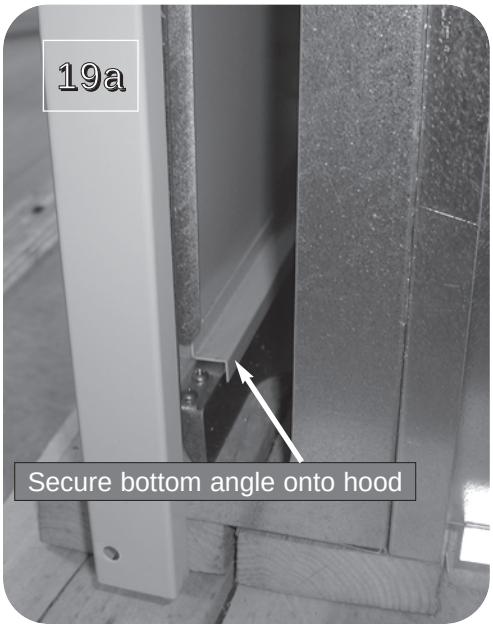


"Knock-Down" Assembly

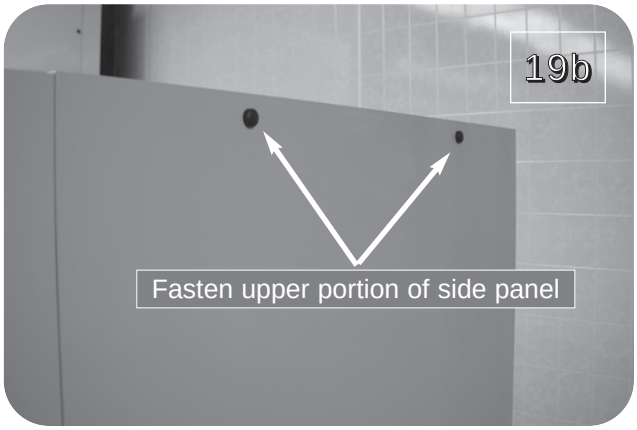
17. Care should be taken on this next step to prevent fascia scratching. Slide the bottom part of the upper airfoil [17a] onto the tabs on the fascia [17c]. Keeping the bottom in place, bend the upper airfoil arms on the top to slide into the end frame slot as shown in picture [17b]. Secure the arms on the interior of the end frame with #8 x 1/2"[13c] screws. Use black clips[1] to attach fascia tabs to lower part of the airfoil [17a]. Scrutinize the airfoil sides to see if gapping is occurring between the airfoil and fascia. Choose one of the five holes on airfoil arm, using a #10 x 3/4"[13a] screw, to tighten any gap occurrences [17d].







"Knock-Down" Assembly



18. Level the sash glass by either raising the sash to sit flush against the sash stops[15] or lowering the sash to sit flush against the bottom airfoil [18a]. Tighten the sprockets[14] with a proper size allen wrench. Be sure to set the sprockets the proper distance prior to leveling the sash [18b]. The ends as shown should be approximately 1/8" of an inch from the side as shown in picture.

19. Using the bottom angle on the side panel cover, overlap to secure lower section onto hood [19a]. Screw in top portion with #10 x 3/4" screw[13a] with base[3] and then cover with cap[6] [19b].

Design and Installation Guidelines

Hole Sizing

WaterSaver fixtures are furnished with standard size inlet shanks to penetrate the deck or wall surface. Minimum hole sizes for thes below:

Inlet Shank	Minimum Hol
3/8" IPS Shank (all fixtures with BI131 series turret, BI158 flange, most mixing faucets, etc.)	3/4" (.750)
1/2" IPS Shank (L2700 series faucets, deck mounted eye washes, but except L600 series faucets)	7/8" (.875)
1/2" IPS Shank (L600 series faucets)	1-1/8" (1.125)
3/4" IPS Shank (electric pedestal boxes, AAP100/101 burette sockets)	1-1/8" (1.125)
1-3/16" dia. Shank (L400 series and L2200 series faucets)	1-3/8" (1.375)

Pipe Sizing and Material

Requirements for the size and material of supply piping are generally covered by local plumbing codes. Reference should be made laying out piping for service fixtures and safety equipment. Pipe sizing is also affected by the number of fixtures or outlets installed typical piping standards for single fixtures and outlets are as follows:

Service	Piping Material	Mi
Gas	Black Iron	3/8
Air/Vacuum	Copper	3/8
Special Gases	Copper or Stainless Steel	3/8
Steam	Black Iron	3/8
Water	Copper	3/8
Distilled, Deionized and Ultra-Pure Water	PVC/Polypropylene/PVDF	1/2
Emergency Showers	Copper	1"
Eye, Eye/Face Wash and Drench Hose Units	Copper	1/2
Safety Stations	Copper	1-1

Installation Procedures

Installation Procedures Installing WaterSaver laboratory faucets, valves and safety equipment requires the use of common plumbin techniques. Observing the following guidelines will help to assure troublefree installation:

1. Thoroughly clean and flush supply lines prior to installing faucets and valves. Pipe shavings, scale, tape and other debris a pipe and into a faucet or valve when the system is activated. This debris can damage valve components and interfere with th the faucet or valve.

2. When placing a faucet or valve on a laboratory countertop or wall, secure the fixture using the lockwasher and locknut. Ti sufficiently to secure the fixture to the counter or wall. Do not overtighten.

3. Generally, WaterSaver fixtures have American National standard taper pipe threads (NPT) on the inlet. Use Teflon tape o seal these threads. Do not apply the sealant in a way that will permit it to enter into the faucet or valve. The faucets which do r (such as our L400 series, L600 series and L2200 series) are furnished with 1/2" OD slip joint connections.

4. Observe the maximum test and working pressures for faucets and valves. Testing or using a valve at pressures for which result in leakage or failure. Refer to the Valve Selection Guide on page 5 for information on maximum test and working pressu

5. Do not use valves for services and applications for which they are not intended. In particular: • Ground key cock valves ar and vacuum service only and at pressures of less than 40 PSI. • Valves for oxygen service and high purity gases must be spe lubricated and packed. Ground key cock valves and needle valves which have not been specially cleaned are not acceptable. be used for gas services only. They are generally not suitable for use with water or steam.

6. To prevent surface damage, use caution when applying a wrench or other tool to the exterior of a faucet or valve.

7. Every WaterSaver faucet is fully assembled at the factory. This includes installing the gooseneck into the faucet body and the gooseneck. Mounting shanks are furnished loose (designated by the suffix "WS") or assembled (designated by the suffix "

8. WaterSaver valve assemblies (such as needle valve or ground key cock valve assemblies) are factory assembled, inspec Mounting shanks are furnished loose (designated by the suffix "WS") or assembled (designated by the suffix "WSA"), as order permits us to test the connections between the valve, the mounting fitting (turret or flange) and the mounting shank. Factory as minimizes the field labor required to install the fixture and minimizes the possibility of damaging the fixture's finish during instal

9. Clean faucets and valves using a soft cloth and soapy water. Do not use abrasives, detergents or other cleaners which ca the fixture. In particular, do not use any solvent in or near a faucet or valve. Solvents can dissolve the lubricants used in the va

WaterSaver Faucet Co.

Innovative Products for Research

WARRANTY

All products are carefully manufactured, tested, inspected and packed. Water Saver Faucet Company (the "Company") unconditionally warrants all products against manufacturing defects. If any item, within one year after purchase, proves defective due to faulty workmanship or material, the Company will, at its option, repair the defective item or furnish a new item of the same type. No labor, transportation or other consequential damages will be allowed in any such case. Any modification, alteration or repair to an item manufactured by the Company by other than an authorized representative of the Company will nullify this warranty.

As the installation and use of the Company's products is beyond its control, no warranty of any kind is made by the Company as to the effects of such use or the results to be obtained therefrom. It is the Buyer's responsibility to select the appropriate product for the use which is intended and which will satisfy any applicable governmental codes, rules and regulations. The Company is not responsible for any losses which may result from selection and/or installation of products which are unsuitable or improper for a particular application, or which do not satisfy any governmental codes, rules or regulations.

Under-the-Counter Cabinet

Installation and Maintenance Instructions

Please unpack these cabinets carefully. If any damage is evident, immediately notify the delivering freight carrier and the supplier of your SciMatCo Under-the-Counter cabinet.

You have just purchased the finest cabinet designed solely for the safe storage of hazardous chemicals. Please read the manual thoroughly before using this product. Only store chemicals in the compartments which are designed to hold these chemicals. Please keep this manual on hand for future reference.

> ***Caution:*** *Always use eye, face, hand, and body protection when using this cabinet.*

I. Unpacking the Cabinets

The best method of unpacking the cabinets is as follows.

A) Remove staples, tape and banding material from the top and bottom of the carton.

B) Open the top of the box and remove the four (4) packing corners. Gently lift the carton off the product.

C) Move the cabinet to its appropriate location. Make sure the surface on which you would like to set the cabinet can support the weight of the cabinet and its contents.

You must level the cabinet to insure proper door operation. Four leveling feet located at the bottom of the cabinet are to be used for this purpose.

> ***Caution:*** *Do not locate your cabinet near open flame, spark or heat or any source of ignition.*

II. Assembly

Your Under-the-Counter cabinets come fully assembled so no assembly is needed.

> ***Warning:*** *Always close and secure cabinet doors after removing your chemicals.*

III. Maintenance

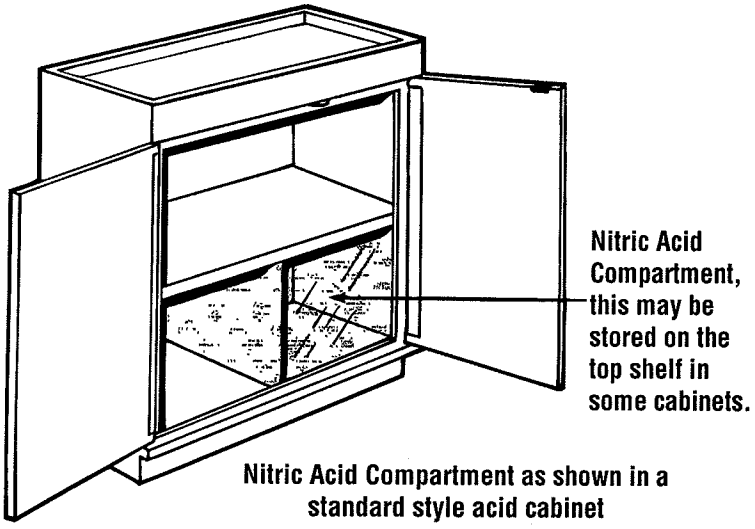
Acid Storage Compartment

Your SciMatCo Under-the-Counter acid cabinet is constructed of 1" thick, high density plywood, painted with several coats of a lacquer paint and then painted with three (3) coats of clear epoxy. This cabinet was designed to give you years of trouble free service with minimal maintenance.

> ***Caution:*** *Always use eye, face, hand and body protection when cleaning this cabinet.*

The inside of the acid cabinet should occasionally be wiped off using a weak solution of sodium phosphate tribasic. Having a good cleaning program and following it will help you get many years of service out of you cabinet. The ratio is 45 grams of sodium phosphate tribasic to one gallon of water.

©2000 SciMatCo All Rights Reserved



The cabinets should also be completely emptied three (3) times a year and cleaned thoroughly using this solution. Remember, the greatest stress is placed on the cabinet during the hot summer months. Acid bottles are designed to vent and will vent excessively during periods of high temperatures. Keep this in mind when planning your cleaning schedule. Having a good cleaning program and following it will assure you that you will get many years of service out of your cabinet.

Any scratches in the painted surface of the cabinet should be repainted at once. You can order an epoxy touch up paint kit from us. Please refer to the replacement parts list at the end of this manual for the appropriate catalog number.

The wooden hinges, on your acid cabinet, is designed for long life, however, they may occasionally squeak. If this occurs, a lubricant, such as a petroleum spray can be used on the hinges to relieve this problem.

Danger: *Do not store perchloric acid in this cabinet or in the company of any other chemicals. Always store perchloric acid alone. Perchloric acid forms explosive crystals, which can cause an explosion.*

Warning: *Absolutely no flammable materials should ever be stored in the acid section of the cabinet. This provision excludes all acids which may also be flammable.*

Nitric Acid Compartment as shown in a standard style acid cabinet

Flammables Compartment

Your Under-the-Counter flammables cabinet is constructed of 1" thick, high density plywood, painted with several coats of a lacquer paint and then painted with three coats of a clear epoxy. This cabinet was designed to give you years of trouble free service with minimal maintenance.

The flammables compartment should be occasionally wiped off with a wet cloth, using warm water and a common household cleaner. Any scratch in the cabinet should also be repaired immediately by touching them up with the epoxy touch up kit which is available from us.

Your flammables compartment has an all metal hinge. From time to time it may squeak. You may use a petroleum base lubricant on this door hinge to relieve this problem.

Warning: *Absolutely no acid or corrosive materials should ever be stored in the flammables section of the cabinet.*

IV. Nitric Acid Storage
(Acid Compartment only)

There is an urgent need to keep the nitric acid separate from the acetic acid in your acid cabinets. The combination of these two substances has resulted in fires and in small explosions. We offer an accessory for our acid cabinets which has been designed especially for the storage of nitric acid. The use of this welded polypropylene container dramatically reduces the possibility of the mixtures of these two dangerous substances. Please use part number SC8071 when ordering and contact your dealer for pricing.

Warning: *If you do not wish to purchase the optional Nitric Acid Compartment, please do not store the acetic and nitric acid in the same cabinet. A fire or explosion may result.*

IMPORTANT SAFETY INFORMATION. READ ALL INSTRUCTIONS BEFORE USING.

⚠ WARNING

Read all safety instructions before using the product. Failure to follow these instructions may result in fire, electrical shock, serious injury or death.

STATE OF CALIFORNIA PROPOSITION 65 WARNING

The California Safe Drinking Water and Toxic Enforcement Act requires the Governor of California to publish a list of substances known to the state to cause cancer, birth defects or other reproductive harm, and requires businesses to warn customers of potential exposure to such substances.

⚠ WARNING This product contains one or more chemical known to the State of California to cause cancer, birth defects or other reproductive harm.

Self-clean ovens can cause low-level exposure to some of these substances, including carbon monoxide, during the cleaning cycle. Exposure can be minimized by venting with an open window or using a ventilation fan or hood.

⚠ WARNING GENERAL SAFETY INSTRUCTIONS

- Use this appliance only for its intended purpose as described in this Owner's Manual.
- Be sure your appliance is properly installed and grounded by a qualified installer in accordance with the provided installation instructions.
- Do not attempt to repair or replace any part of your oven unless it is specifically recommended in this manual. All other servicing should be transferred to a qualified technician.
- Before performing any service, disconnect the power supply at the household distribution panel by removing the fuse or switching off the circuit breaker.
- Do not leave children alone—children should not be left alone or unattended in an area where an appliance is in use. They should never be allowed to climb, sit or stand on any part of the appliance.
- **⚠ CAUTION:** Do not store items of interest to children in cabinets above an oven - children climbing on the oven to reach items could be seriously injured.
- Use only dry pot holders—moist or damp pot holders on hot surfaces may result in burns from steam. Do not let pot holders touch hot heating elements. Do not use a towel or other bulky cloth in place of pot holders.
- Never use your appliance for warming or heating the room.
- Do not touch the heating elements or the interior surface of the oven. These surfaces may be hot enough to burn even though they are dark in color. During and after use, do not touch, or let clothing or other flammable materials contact any interior area of the oven; allow sufficient time for cooling first. Other surfaces of the appliance may become hot enough to cause burns. Potentially hot surfaces include the oven vent opening, surfaces near the opening and crevices around the oven door.
- Do not heat unopened food containers. Pressure could build up and the container could burst, causing an injury.
- Do not use any type of foil or liner to cover the oven bottom or anywhere in the oven, except as described in this manual. Oven liners can trap heat or melt, resulting in damage to the product and risk of shock, smoke or fire.
- Avoid scratching or impacting glass doors or control panels. Doing so may lead to glass breakage. Do not cook on a product with broken glass. Shock, fire or cuts may occur.
- Cook meat and poultry thoroughly—meat to at least an internal temperature of 160°F and poultry to at least an internal temperature of 180°F. Cooking to these temperatures usually protects against foodborne illness.

SAVE THESE INSTRUCTIONS

⚠ WARNING KEEP FLAMMABLE MATERIALS AWAY FROM THE OVEN

Failure to do so may result in fire or personal injury.

- Do not store or use flammable materials in or near an oven, including paper, plastic, pot holders, linens, wall coverings, curtains, drapes and gasoline or other flammable vapors and liquids.
- Never wear loose-fitting or hanging garments while using the appliance. These garments may ignite if they contact hot surfaces, causing severe burns.
- Do not let cooking grease or other flammable materials accumulate in or near the oven. Grease in the oven or near the oven may ignite.

⚠ WARNING IN THE EVENT OF A FIRE, TAKE THE FOLLOWING STEPS TO PREVENT INJURY AND FIRE SPREADING

- Do not use water on grease fires. Never pick up a flaming pan.
- If there is a fire in the oven during baking, smother the fire by closing the oven door and turning the oven off or by using a multi-purpose dry chemical or foam-type fire extinguisher.
- If there is a fire in the oven during self-clean, turn the oven off and wait for the fire to go out. Do not force the door open. Introduction of fresh air at self-clean temperatures may lead to a burst of flame from the oven. Failure to follow this instruction may result in severe burns.

⚠ WARNING OVEN SAFETY INSTRUCTIONS

- Stand away from the oven when opening the oven door. Hot air or steam which escapes can cause burns to hands, face and/or eyes.
- Keep the oven vent unobstructed.
- Keep the oven free from grease buildup. Grease in the oven may ignite.
- Place oven racks in desired location while oven is cool. If rack must be moved while oven is hot, do not let pot holder contact hot heating element in oven.
- When using cooking or roasting bags in the oven, follow the manufacturer's directions.
- Pulling out the standard racks to their stop-locks or the extension rack to its fully open position is a convenience in lifting heavy foods. It is also a precaution against burns from touching hot surfaces of the door or oven walls.
- Do not leave items such as paper, cooking utensils or food in the oven when not in use. Items stored in an oven can ignite.
- Never place cooking utensils, pizza or baking stones, or any type of foil or liner on the oven floor. These items can trap heat or melt, resulting in damage to the product and risk of shock, smoke or fire.

⚠ WARNING SELF-CLEANING OVEN SAFETY INSTRUCTIONS

The self-cleaning feature operates the oven at temperatures high enough to burn away food soils in the oven. Follow these instructions for safe operation.

- Do not touch oven surfaces during self-clean operation. Keep children away from the oven during self-cleaning. Failure to follow these instructions may cause burns.
- Before self-cleaning the oven, remove shiny silver colored oven racks (on some models), the probe, any aluminum foil, and any broiler pan, grid, and other cookware. Only porcelain coated oven racks may be left in the oven.
- Before operating the self-clean cycle, wipe grease and food soils from the oven. Excessive amount of grease may ignite, leading to smoke damage to your home.
- If the self-cleaning mode malfunctions, turn the oven off and disconnect the power supply. Have it serviced by a qualified technician.
- Do not clean the door gasket. The door gasket is essential for a good seal. Care should be taken not to rub, damage or move the gasket.
- Do not use oven cleaners. No commercial oven cleaner or oven liner protective coating of any kind should be used in or around any part of the oven.

SAVE THESE INSTRUCTIONS

Thank You! ... for your purchase of a GE Brand appliance.

Register Your Appliance: Register your new appliance on-line at your convenience!

www.geappliances.com/service_and_support/register/

Timely product registration will allow for enhanced communication and prompt service under the terms of your warranty, should the need arise. You may also mail in the pre-printed registration card included in the packing material.

GE Electric Range Warranty

GEAppliances.com

All warranty service is provided by our Factory Service Centers, or an authorized Customer Care® technician. To schedule service on-line, visit us at www.geappliances.com/service_and_support/, or call 800.GE.CARES (800.432.2737). Please have serial number and model number available when calling for service.

Servicing your appliance may require the use of the onboard data port for diagnostics. This gives a GE factory service technician the ability to quickly diagnose any issues with your appliance and helps GE improve its products by providing GE with information on your appliance. If you do not want your appliance data to be sent to GE, please advise your technician not to submit the data to GE at the time of service.

For the period of one year from the date of the original purchase. GE will provide any part of the range which fails due to a defect in materials or workmanship. During this limited one-year warranty, GE will also provide, free of charge, all labor and in-home service to replace the defective part.

What GE will not cover:

- Service trips to your home to teach you how to use the product.
- Improper installation, delivery or maintenance.
- Failure of the product if it is abused, misused, modified or used for other than the intended purpose or used commercially.
- Replacement of house fuses or resetting of circuit breakers.
- Damage to the product caused by accident, fire, floods or acts of God.
- Incidental or consequential damage caused by possible defects with this appliance.
- Damage caused after delivery.
- Product not accessible to provide required service.
- Service to repair or replace light bulbs, except for LED lamps.

EXCLUSION OF IMPLIED WARRANTIES

Your sole and exclusive remedy is product repair as provided in this Limited Warranty. Any implied warranties, including the implied warranties of merchantability or fitness for a particular purpose, are limited to one year or the shortest period allowed by law.

This warranty is extended to the original purchaser and any succeeding owner for products purchased for home use within the USA. If the product is located in an area where service by a GE Authorized Servicer is not available, you may be responsible for a trip charge or you may be required to bring the product to an Authorized GE Service location for service. In Alaska, the warranty excludes the cost of shipping or service calls to your home.

Some states do not allow the exclusion or limitation of incidental or consequential damages. This warranty gives you specific legal rights, and you may also have other rights which vary from state to state. To know what your legal rights are, consult your local or state consumer affairs office or your state's Attorney General.

Warrantor: General Electric Company. Louisville, KY 40225

Extended Warranties: Purchase a GE extended warranty and learn about special discounts that are available while your warranty is still in effect. You can purchase it on-line anytime

www.geappliances.com/service_and_support/shop-for-extended-service-plans.htm

or call 800.626.2224 during normal business hours. GE Consumer Home Services will still be there after your warranty expires.

Staple your receipt here. Proof of the original purchase date is needed to obtain service under the warranty.

Have a question or need assistance with your appliance?

Try the GE Appliances Website (**www.geappliances.com/service_and_support/**) 24 hours a day, any day of the year! For greater convenience and faster service, you can now download Owner's Manuals, order parts or even schedule service on-line.

Schedule Service: Expert GE repair service is only one step away from your door. Get on-line and schedule your service at www.geappliances.com/service_and_support/ Or call 800.GE.CARES (800.432.2737) during normal business hours.

Parts and Accessories: Individuals qualified to service their own appliances can have parts or accessories sent directly to their homes (VISA, MasterCard and Discover cards are accepted).Order on-line today, 24 hours every day or by phone at 800.626.2002 during normal business hours.

Instructions contained in this manual cover procedures to be performed by any user. Other servicing generally should be referred to qualified service personnel. Caution must be exercised, since improper servicing may cause unsafe operation.

Real Life Design Studio: GE supports the Universal Design concept of products, services and environments that can be used by people of all ages, sizes and capabilities. We recognize the need to design for a wide range of physical and mental abilities and impairments. For details of GE's Universal Design applications, including kitchen design ideas for people with disabilities, check out our Website today. For the hearing impaired, please call 800.TDD.GEAC (800.833.4322).

Contact Us: If you are not satisfied with the service you receive from GE, contact us on our Website with all the details including your phone number, or write to:

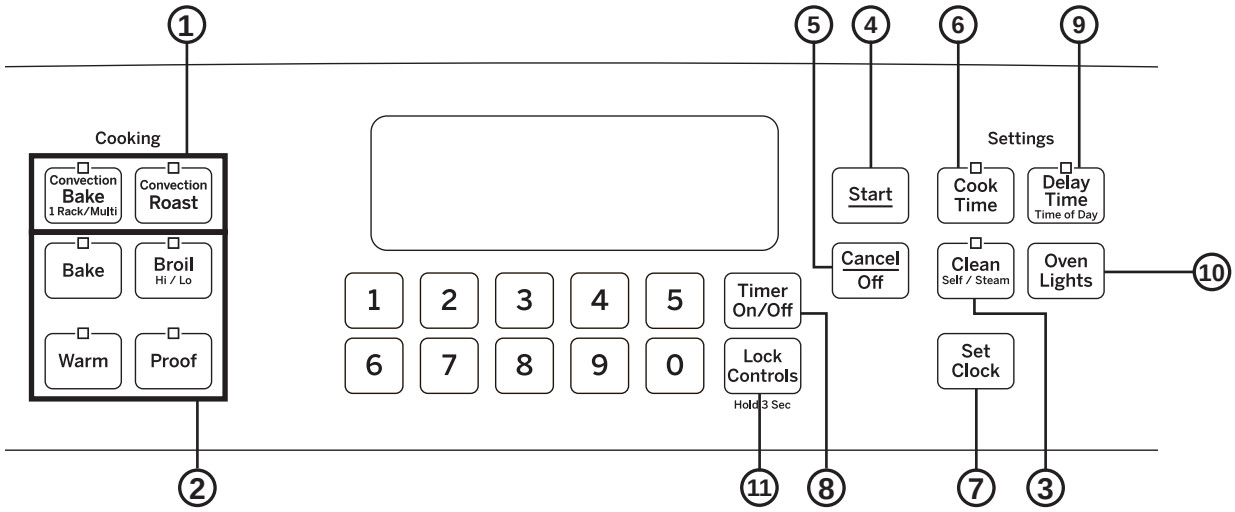
*The large broiler pan does not fit in 20"/24" ranges.
**The XL broiler pan does not fit in 24" wall ovens, 27"drop ins or 20"/24" ranges

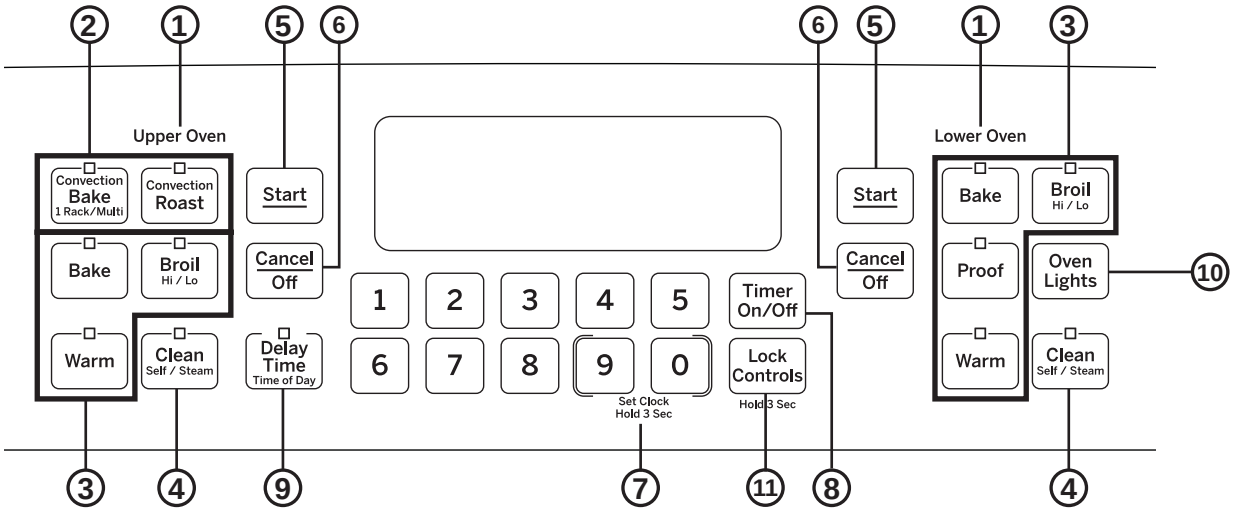


How to Remove Protective Shipping Film and Packaging Tape

Carefully grasp a corner of the protective shipping film with your fingers and slowly peel it from the appliance surface. Do not use any sharp items to remove the film. Remove all of the film before using the appliance for the first time.

To assure no damage is done to the finish of the product, the safest way to remove the adhesive from packaging tape on new appliances is an application of a household liquid dishwashing detergent. Apply with a soft cloth and allow to soak.

NOTE: The adhesive must be removed from all parts. It cannot be removed if it is baked on.



Single Wall Oven

1. **Convection Cooking Modes:** Convection cooking modes use increased air circulation to improve performance. The type of benefit depends on the mode. Your oven has the following convection cooking modes: Convection Bake (1 Rack/Multi) and Convection Roast. See the Cooking Modes section for more information.
2. **Traditional Cooking Modes:** Your oven has the following traditional cooking modes: Bake, Broil Hi/Lo, Proof and Warm. See the Cooking Modes section for more information.
3. **Clean:** Your oven has two cleaning modes: Self Clean and Steam Clean. See the Cleaning the Oven section for important information about using these modes.
4. **Start:** Must be pressed to start any cooking, cleaning, or timed function.
5. **Cancel/Off:** Cancels ALL oven operations except the clock and timer.
6. **Cook Time:** Counts down cooking time and turns off the oven when the cooking time is complete. Press the **Cook Time** pad, use the number pads to program a cooking time in hours and minutes, then press **Start.** This can only be used with Traditional Bake, Convection Bake, Convection Bake Multi, and Convection Roast.
7. **Clock:** Sets the oven clock time. Press the **Set Clock** pad and the number pads to program the clock. Press **Start** to save the time.
8. **Timer:** Works as a countdown timer. Press the **Timer** pad and the number pads to program the time in hours and minutes. Press the **Start** pad. The oven will continue to operate when the timer countdown is complete. To turn the timer off press the **Timer** pad
9. **Delay Time:** Delays when the oven will turn on. Use this to set a time when you want the oven to start. Press the **Delay Time** pad and use the number pads to program the time of day for the oven to turn on then press **Start**. Press the desired cooking mode and temperature then press **Start**. A cook time may also be programmed if desired. Follow the directions under Cook Time for setting this feature. This can only be used with Bake, Convection Bake (1 Rack/Multi), Convection Roast and Self-Clean.

   NOTE: When using the delay time feature, foods that spoil easily—such as milk, eggs, fish, stuffings, poultry and pork—should not be allowed to sit for more than 1 hour before or after cooking. Room temperature promotes the growth of harmful bacteria. Be sure that the oven light is off because heat from the bulb will speed harmful bacteria growth.
10. **Oven Light(s):** Turns the oven light(s) on or off.
11. **Lock Controls:** Locks out the control so that pressing the pads does not activate the controls. Press and hold the **Lock Controls** pad for three seconds to lock or unlock the control. **Cancel/Off** is always active, even when the control is locked.

Double Wall Oven

1. **Upper Oven and Lower Oven:** Designates which oven the controls will operate.
2. **Convection Cooking Modes:** Convection cooking modes use increased air circulation to improve performance. The type of benefit depends on the mode. Your oven has the following convection cooking modes: Convection Bake (1 Rack/Multi) and Convection Roast. See the Cooking Modes section for more information.
3. **Traditional Cooking Modes:** Your oven has the following traditional cooking modes: Bake, Broil Hi/Lo, Warm and Proof (lower oven only). See the Cooking Modes section for more information.
4. **Clean:** Your oven has two cleaning modes: **Self Clean** and **Steam Clean**. See the Cleaning the Oven section for important information about using these modes. Note that proof cannot be run when running a clean mode in the upper oven.
5. **Start:** Must be pressed to start any cooking, cleaning, or timed function.
6. **Cancel/Off:** Cancels ALL oven operations except the clock and timer.
7. **Clock:** Sets the oven clock time. Press the **9** and **0** pads and hold for 3 seconds. Use the number pads to program the clock. Press **Start** to save the time.
8. **Timer:** Works as a countdown timer. Press the **Timer** pad and the number pads to program the time in hours and minutes. Press the **Start** pad. The oven will continue to operate when the timer countdown is complete. To turn the timer off press the **Timer** pad.
9. **Delay Time:** Delays when the oven will turn on. Use this to set a time when you want the oven to start. Press the **Delay Time** pad and use the number pads to program the time of day for the oven to turn on then press **Start**. Press the desired cooking mode and temperature then press **Start**. This can only be used with Bake, Convection Bake (1 Rack/Multi), Convection Roast and Self-Clean.

   NOTE: When using the delay time feature, foods that spoil easily—such as milk, eggs, fish, stuffings, poultry and pork—should not be allowed to sit for more than 1 hour before or after cooking. Room temperature promotes the growth of harmful bacteria. Be sure that the oven light is off because heat from the bulb will speed harmful bacteria growth.
10. **Oven Light(s):** Turns the oven light(s) on or off in both ovens. Note that lights in both ovens will not turn on if the door is opened while the other oven is in a clean mode.
11. **Lock Controls:** Locks out the control so that pressing the pads does not activate the controls. Press and hold the **Lock Controls** pad for three seconds to lock or unlock the control. **Cancel/Off** is always active, even when the control is locked.

Special Features

There are several different special features on your wall oven. To change the settings of these special features, press the **BAKE** and **BROIL** pads at the same time and hold for three seconds. "**SF**" will appear in the display. Select the feature you want to change. When the change has been made, press the **START** key to save the change and return to the time of day.

Adjust the Oven Temperature

This feature allows the oven baking and convection baking temperature to be adjusted up to 35ºF hotter or down to 35ºF cooler. Use this feature if you believe your oven temperature is too hot or too cold and wish to change it. **For double oven models, the upper and lower ovens are adjusted separately.** This adjustment affects Bake, and Convection Bake (1 Rack/Multi) modes. No other cooking modes are affected.

Press the **Bake** pad to select the oven to be adjusted. Press the **Bake** pad again to enter the temperature adjustment mode. A number between 35 and - 35 will display. Use the number pads to set the desired temperature adjustment and use the **Bake** pad to change between negative and positive.

Press the **Start** pad to save the temperature adjustment.

End of Timer Signals

This is the tone that signals the end of a timer. The tone can be continuous (Con bEEP) or one repeating beep (bEEP). A continuous setting will continue to sound a tone until a button on the control is pressed. Press the **Broil** pad to view the current setting and then to change the setting.

Fahrenheit or Celsius Temperature Display

The oven control is set to use Fahrenheit temperatures (F), but you can change it to use Celsius temperatures (C). Press the number **6** and **8** pads at the same time to view the current setting, press again to change the setting.

Clock Display

This feature specifies how the time of day will be displayed or if no time of day will be displayed. You can select a standard 12-hour clock (12 H), 24-hour military time display (24 H), or for no clock displayed (oFF). Press the **Clock** pad to view the current setting, press again to change the setting.

Auto Recipe Conversion

When using Convection Bake 1 Rack or Convection Bake Multi Rack cooking options, Auto Recipe Conversion will automatically convert the regular baking temperatures entered to convection bake cooking temperatures when turned on. Note that this option does not convert convection bake cooking times, it only converts temperatures. Press the **Convection Bake (1 Rack/Multi)** pad to view the conversion setting, press again to toggle between On (Con On) and Off (Con oFF).

Sound Volume

This feature allows the oven tone volume to be adjusted between high (HI bEEP HI), medium (Std bEEP Std), low (Lo bEEP Lo) and off (oFF bEEP oFF). Press the number **1** and **5** pads at the same time to view the current setting or to change the setting. The control will sound the oven tone at the new volume level each time the sound level is changed.

12-hour auto shut-off and Sabbath

Options for this feature are “12 SHdn”, “no SHdn” and “SAbbAtH”.

12-hour auto shut-off turns off the oven after 12 hours of continuous operations.

Sabbath mode disables the oven lights (the oven light will not turn on when the door is opened), all sounds (the control will not beep when a button is pressed), Convection, Broil, Warm, Proof, Cook Time, Timer, Clock, and Delay Time functions. Sabbath mode can only be used with Bake. This feature conforms to the Star-K Jewish Sabbath requirements.

Press and hold the **Bake** and **Broil** pads for 3 seconds to enter special features.

Press the **Delay Time** pad to view the current setting and then to change the setting.

To use Sabbath mode, select “SAbbAtH” and press **Start**. A **]** will appear in the display and the clock will not display.

Note that if you have a double wall oven, when you place the control into Sabbath mode, both ovens are now in Sabbath mode and available for cooking.

Once in Sabbath mode, at any time you can press **Bake**, use the number pads to enter a temperature between 170F and 550F, and press **Start**. No sound will be given when the keys are pressed. At a random time between 30 seconds and 1 minute, **][**, will appear in the display indicating the oven is running.

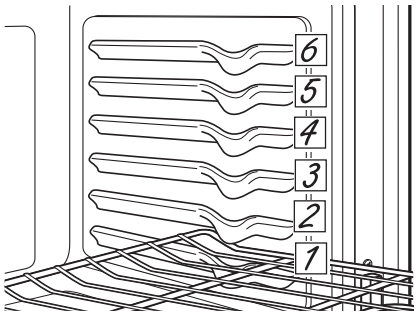
Note that both ovens of a double wall oven can be used in Sabbath mode. Each oven can be programmed to a different temperature and each oven must be programmed separately.

If you need to adjust the temperature, press **Bake**, use the number pads to enter a new temperature between 170F and 550F, and press **Start**.

To turn the oven off, press **Cancel/Off** at any time. **The oven will immediately turn off** and **][** will change to **]** indicating that the oven has turned off.

Note that each oven of a double wall oven must be turned off separately.

To exit Sabbath mode, make sure that the oven is turned off. Press and hold the **Bake** and **Broil** pads for 3 seconds to enter special features then press **Delay Time** until either “**12 Shdn**” or “**no Shdn**” is in the display and press **Start**.



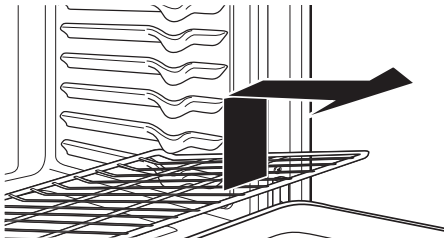
NOTE: If power outage occurs during Sabbath mode the unit will remain in Sabbath mode but off when power is restored.

If you wish to use the Cook Time feature (if available) to bake in the oven and then have the oven automatically turn off, you will need to press the Cook Time button, enter a cooking time duration, and press Start. Then enter special features to start Sabbath mode as detailed above.

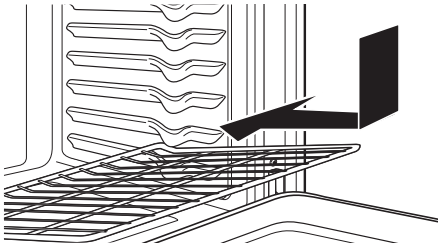
Oven Racks

Your oven has six rack positions. Recommended rack positions for various types of foods are provided in the Cooking Guide. Adjusting rack position is one way to impact cooking results. For example, if you would prefer darker tops on cakes, muffins, or cookies, try moving food one rack position higher. If you find foods are too brown on top try moving them down next time.

When baking with multiple pans and on multiple racks, ensure there is sufficient space between pans to allow air to flow.



Flat Racks



When placing and removing cookware, pull the rack out to the bump (stop position) on the rack support.

To remove a rack, pull it toward you, tilt the front end up and pull it out.

To replace, place the curved end of the rack (stop-locks) onto the oven supports, tilt up the front of the rack and push the rack in.

Racks may become difficult to slide, especially after a self-clean. Put some vegetable oil on a soft cloth or paper towel and rub onto the left and right edges.

Aluminum Foil and Oven Liners

⚠CAUTION: **Do not use any type of foil or oven liner to cover the oven bottom. These items can trap heat or melt, resulting in damage to the product and risk of shock, smoke or fire. Damage from improper use of these items is not covered by the product warranty.**

Foil may be used to catch spills by placing a sheet on a lower rack, several inches below the food. Do not use more foil than necessary and never entirely cover an oven rack with aluminum foil. Keep foil at least 1-1/2” from oven walls to prevent poor heat circulation.

Cookware

Cookware Guidelines

The material, finish, and size of cookware affect baking performance.

Dark, coated and dull pans absorb heat more readily than light, shiny pans. Pans that absorb heat more readily can result in a browner, crisper, and thicker crust. If using dark and coated cookware check food earlier than minimum cook time. If undesirable results are obtained with this type of cookware consider reducing oven temperature by 25º F next time.

Shiny pans can produce more evenly cooked baked goods such as cakes and cookies.

Glass and ceramic pans heat slowly but retain heat well. These types of pans work well for dishes such as pies and custards.

Air insulated pans heat slowly and can reduce bottom browning.

Keep cookware clean to promote even heating.

Cooking Modes

Your new oven has a variety of cooking modes to help you get the best results. These modes are described below. Refer to the Cooking Guide section for recommendations for specific foods. Remember, your new oven may perform differently than the oven it is replacing.

Baking and Roasting Modes

Select a mode for baking and roasting based on the type and quantity of food you are preparing. When preparing baked goods such as cakes, cookies, and pastries always preheat the oven first. Follow recipe recommendations for food placement. If no guidelines are provided, center food in the oven.

Traditional Bake

The traditional bake mode is intended for single rack cooking. This mode uses heat primarily from the lower element but also from the upper element to cook food. To use this mode press the **Bake** pad, enter a temperature, and then press **Start**. Preheating is generally recommended when using this mode.

Convection Bake 1 Rack

The Convection Bake 1 Rack mode is intended for single rack cooking. This mode uses heat from the lower element and also the upper and rear elements, along with air movement from the convection fan to enhance evenness. Your oven is equipped with Auto Recipe Conversion, so it is not necessary to convert the temperature when using this mode. To use this mode press the **Convection Bake (1 Rack/Multi)** once, enter a temperature, and then press **Start**. Preheating is generally recommended when using this mode.

Convection Bake Multi Rack

The Convection Bake Multi Rack mode is intended for baking on multiple racks at the same time. This mode uses heat primarily from the rear element but also heat from the upper and lower elements, along with air movement from the convection fan to enhance cooking evenness. Your oven is equipped with Auto Recipe Conversion, so it is not necessary to convert the temperature when using this mode. Baking time might be slightly longer for multiple racks than what would be expected for a single rack. To use this mode press the **Convection Bake (1 Rack/Multi)** pad **twice**, enter a temperature, and then press **Start**. Always preheat when using this mode.

Convection Roast

The Convection Roast mode is intended for roasting whole cuts of meat on a single rack. This mode uses heat from the lower, upper, and rear elements along with air movement from the convection fan to improve browning and reduce cooking time. It is not necessary to convert temperature. Check food earlier than the recipe suggested time when using this mode or use a meat probe. To use this mode press the **Convection Roast** pad, enter a temperature, and then press **Start**. It is not necessary to preheat when using this mode.

Broiling Modes

Always broil with the door closed. The broil element in this oven is very powerful. Monitor food closely while broiling. Use caution when broiling on upper rack positions as placing food closer to the broil element increases smoking, spattering, and the possibility of fats igniting. For best performance center food below the broil heating element. **Broiling on rack position 6 is not recommended.**

Try broiling foods that you would normally grill. Adjust rack positions to adjust the intensity of the heat to the food. Place foods closer to the broil element when a seared surface and rare interior is desired. Thicker foods and foods that need to be cooked through should be broiled on a rack position farther from the broiler or by using Broil Lo.

Broil Hi

The Broil Hi mode uses intense heat from the upper element to sear foods. Use Broil Hi for thinner cuts of meat and/or foods you prefer less done on the interior. To use this mode press the **Broil** pad once and then press **Start**. It is not necessary to preheat when using this mode.

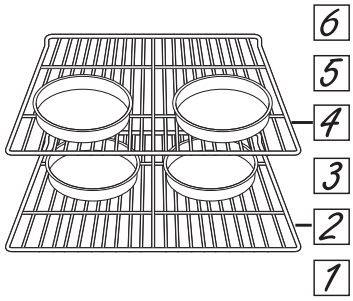
Broil Lo

The Broil Lo mode uses less intense heat from the upper element to cook food thoroughly while also producing surface browning. Use Broil Lo for thicker cuts of meat and/or foods that you would like cooked all the way through. To use this mode press the **Broil** pad **twice** and then press **Start**. It is not necessary to preheat when using this mode.

Proof

Proof mode is designed for rising (fermenting and proofing) bread doughs. Press the **Proof** pad and then press **Start.** Cover dough well to prevent drying out. Bread will rise more rapidly than at room temperature. Note that for double wall ovens, proof can not be run when running a clean mode in the lower oven.

Warm



Warm mode is designed to keep hot foods hot for up to 3 hours. To use this mode, press the **Warm** pad then press **Start.** Cover foods that need to remain moist and do not cover foods that should be crisp. Preheating is not required. Do not use warm to heat cold food other than crisping crackers, chips or dry cereal. It is also recommended that food not be kept warm for more than 2 hours.

Cooking Guide

FOOD TYPE	RECOMMENDED MODE(S)	RECOMMENDED RACK POSITION(S)	ADDITIONAL SUGGESTIONS
Baked Goods			
Layer cakes, sheet cakes, bundt cakes, muffins, quick breads on a Single Rack	Traditional Bake	3	Use shiny cookware.
Layer cakes* on Multiple Racks	Traditional Bake	2 and 4	Ensure adequate airflow (see illustration below).
Chiffon cakes (angel food)	Traditional Bake	1	Use shiny cookware.
Cookies, biscuits, scones on a Single Rack	Traditional Bake	3	Use shiny cookware.
Cookies, biscuits, scones on Multiple Racks	Convection Bake Multi Rack	2 and 4 1, 3 and 5	Ensure adequate airflow.
Beef & Pork			
Hamburgers	Broil Hi	5	Use a broil pan; move food down for more doneness/less searing. Watch food closely when broiling. For best performance center food below the broil heating element.
Steaks & Chops	Broil Hi	5	Use a broil pan; move food down for more doneness/less searing. Watch food closely when broiling. For best performance center food below the broil heating element.
Roasts	Convection Roast	2 or 3	Use a low sided pan such as a broil pan. Preheating is not necessary.
Poultry			
Whole chicken	Convection Roast	2 or 3	Use a low sided pan such as a broil pan.
Bone-in chicken breasts, legs, thighs	Broil Hi	1	If breaded or coated in sauce avoid Broil Hi modes. Broil skin side down first. Watch food closely when broiling. For best performance when broiling, center food below the broil heating element.
	Broil Lo Traditional Bake Convection Bake 1 Rack	3	
Boneless chicken breasts	Broil Lo Traditional Bake Convection Bake 1 Rack	3	Move food down for more doneness/less searing and up for greater searing/browning when broiling. For best performance when broiling, center food below the broil heating element.
Whole turkey	Convection Roast	1 or 2	Use a low sided pan such as a broil pan.
Turkey Breast	Convection Roast	2 or 3	Use a low sided pan such as a broil pan.
Fish	Broil Lo	5 (1/2 thick or less) 4 (>1/2 inch)	Watch food closely when broiling. For best performance center food below the broil heating element.
Casseroles	Convection Bake 1 Rack Traditional Bake	3	
Frozen Convenience Foods			
Pizza, french fries, tator tots, chicken nuggets, appetizers on a Single Rack	Convection Bake 1 Rack Traditional Bake	3	Use shiny cookware.
Pizza, french fries, tator tots, chicken nuggets, appetizers on Multiple Racks	Convection Bake Multi Rack	2 and 4	Use shiny cookware.

*When baking four cake layers at a time, use racks 2 and 4. Place the pans as shown so that one pan is not directly above another.

Cook food thoroughly to help protect against food borne illness. Minimum safe food temperature recommendations for food safety can be found at **www.IsItDoneYet.gov**. Make sure to use a food thermometer to take food temperatures.

Cleaning The Oven

Be sure electrical power is off and all surfaces are cool before cleaning any part of the oven.

Control Panel

It's a good idea to wipe the control panel after each use. Clean with mild soap and water or vinegar and water, rinse with clean water and polish dry with a soft cloth.

Do not use abrasive cleansers, strong liquid cleansers, plastic scouring pads or oven cleaners on the control panel—they will damage the finish.

Oven Exterior

Do not use oven cleaners, abrasive cleansers, strong liquid cleansers, steel wool, plastic scouring pads, or cleaning powders on the interior or exterior of the oven. Clean with a mild soap and water or vinegar and water solution. Rinse with clean water and dry with a soft cloth. When cleaning surfaces, make sure that they are at room temperature and not in direct sunlight.

If stain on the door vent trim is persistent, use a mild abrasive cleaner and a sponge-scrubber for best results.

Spillage of marinades, fruit juices, tomato sauces and basting liquids containing acids may cause discoloration and should be wiped up immediately. Let hot surfaces cool, then clean and rinse.

Stainless Steel Surfaces (on some models)

Do not use a steel wool pad; it will scratch the surface.

To clean the stainless steel surface, use warm sudsy water or a stainless steel cleaner or polish. Always wipe the surface in the direction of the grain. Follow the cleaner instructions for cleaning the stainless steel surface.

To inquire about purchasing cleaning products including stainless steel appliance cleaner or polish read the Assistance and Accessories sections at the beginning of this manual.

Oven Interior

The interior of your new oven can be cleaned manually or by using the Steam Clean or Self Clean modes.

Spillage of marinades, fruit juices, tomato sauces and basting liquids containing acids may cause discoloration and should be wiped up immediately. Let hot surfaces cool, then clean and rinse.

Manual Cleaning

Do not use oven cleaners, abrasive cleaners, strong liquid cleansers, steel wool, scouring pads, or cleaning powders on the interior of the oven. Clean with a mild soap and water or vinegar and water solution. Rinse with clean water and dry with a soft cloth. When cleaning surfaces, make sure that they are at room temperature.

Steam Clean Mode

Steam clean is intended to clean small spills using water and a lower cleaning temperature than Self-Clean.

To use the Steam Clean feature, wipe grease and soils from the oven. Pour one cup of water into the bottom of the oven. Close the door. Press the **Clean** pad **twice** and then press **Start**. The oven door will lock. You can not open the door during the 30 minute steam clean as this will decrease the steam clean performance. At the end of the steam clean cycle the door will unlock. Wipe out any excess water and any remaining soil.

Self Clean Mode

Read Self-Cleaning Oven Safety Instructions at the beginning of this manual before using Self Clean Mode. Self clean uses very high temperatures to clean the oven interior. The oven door will lock when using this feature. Before operating the self-clean cycle, wipe up grease and soils from the oven. Remove all items from the oven other than enameled (dark color) racks. Shiny or silver racks and any cookware or other items should all be removed from the oven before initiating a self-clean cycle. Close the door. Press the **Clean** pad once and a default self-clean time is displayed. The clean time can be changed to any time between 3:00 and 5:00 hours by using the number pads to enter a different time and pressing **Start**. For heavily soiled ovens, the maximum 5 hour clean time is recommended. If you wish to use the default time, press the **Start** pad immediately after pressing the **Clean** pad. The oven will turn off automatically when the self-clean cycle is complete. The door will stay locked until the oven has cooled down. After the oven has cooled down wipe any ash out of the oven.

IMPORTANT: The health of some birds is extremely sensitive to the fumes given off during the self-cleaning cycle of any range. Move birds to another well-ventilated room.

Flat Racks

Flat racks can be left in the cavity during self-clean (if enameled racks, not shiny) or can be washed with warm, soapy water.

Racks may be more difficult to slide, especially after a self-clean. Put some vegetable oil on a soft cloth or paper towel and rub onto the left and right edges.

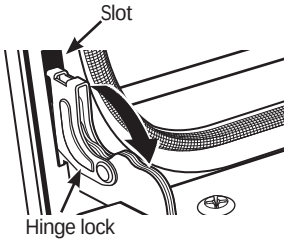
Maintenance

Oven Light Replacement

⚠ WARNING **SHOCK OR BURN HAZARD:** Before replacing oven light bulb, disconnect the electrical power to the oven at the main fuse or circuit breaker panel. Failure to do so may result in electric shock or burn.

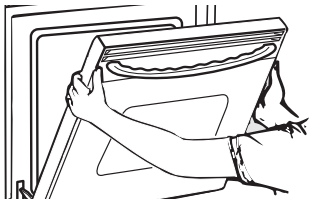
⚠ CAUTION **BURN HAZARD:** The glass cover and bulb should be removed when cool. Touching hot glass with bare hands or a damp cloth can cause burns.

1. Disconnect power at the main fuse or circuit breaker panel.
2. Remove oven racks.
3. Slide a flat blade screwdriver between the housing and the glass light cover.
4. Support the glass light cover with two fingers to prevent the cover from falling to the bottom of the oven.
5. Gently twist the screwdriver blade to loosen the glass light cover. Be careful not to chip the oven coating.
6. Remove the glass light cover.
7. Remove the bulb by firmly grasping and sliding the bulb straight out until the two prongs have cleared the ceramic holder.
8. Do not touch the glass of the new replacement bulb with your fingers. It will cause the bulb to fail when it lights. Grasp the replacement bulb with a clean towel or facial tissue with the prongs facing down. Align the two prongs in the ceramic holder, pressing gently until the bulb is securely in the ceramic socket.
9. Slide the protective lens into the holder and push until the clips snap into the housing.
10. Reconnect power.



Lift-Off Oven Door

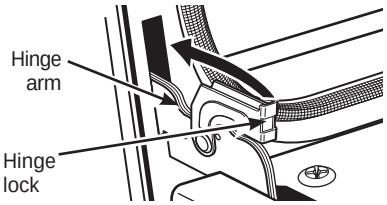
The door is very heavy. Be careful when removing and lifting the door.



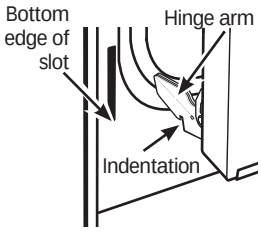
Do not lift the door by the handle.

To remove the door:

1. Fully open the door.
2. Pull the hinge locks down toward the door frame, to the unlocked position. A tool, such as a small flat-blade screwdriver, may be required.
3. Firmly grasp both sides of the door at the top.
4. Close door to the door removal position. The door should be open approximately 3" with no obstruction above the door.
5. Lift door up and out until both hinge arms are clear of the slots.



Pull hinge locks down to unlock



Removal position

To replace the door:

1. Firmly grasp both sides of the door at the top.
2. Starting on the left side, with the door at the same angle as the removal position, seat the indentation of the hinge arm into the bottom edge of the hinge slot. The notch in the hinge arm must be fully seated into the bottom of the slot. Repeat for right side.
3. Fully open the door. If the door will not fully open, the indentation is not seated correctly in the bottom edge of the slot.
4. Push the hinge locks up against the front frame of the oven cavity, to the locked position.
5. Close the oven door.

Push hinge locks up to lock

Troubleshooting tips ... Before you call for service

Save time and money! Review the charts on the following pages first and you may not need to call for service.

Problem	Possible Cause	What To Do
My new oven doesn't cook like my old one. Is something wrong with the temperature settings?	**Your new oven has a different cooking system from your old oven and therefore may cook differently than your old oven.**	For the first few uses, follow your recipe times and temperatures carefully. If you still think your new oven is too hot or too cold, you can adjust the temperature yourself to meet your specific cooking preference. **NOTE:** This adjustment affects Bake, Convection Bake 1 Rack and Convection Bake Multi temperatures; it will not affect Convection Roast, Broil or Clean.
Food does not bake properly	**Oven controls improperly set.**	See the Cooking Modes section.
	Rack position is incorrect or rack is not level.	See the Cooking Modes section and Cooking Guide.
	Incorrect cookware or cookware of improper size being used.	See the Cookware section.
	Oven temperature needs adjustment.	See the Special Features section.
	Ingredient substitution	Substituting ingredients can change the recipe outcome.
Food does not broil properly	**Oven controls improperly set.**	Make sure you select the appropriate broil mode.
	Improper rack position being used.	See Cooking Guide for rack location suggestions.
	Food being cooked in a hot pan.	Make sure cookware is cool.
	Cookware not suited for broiling.	Use a pan specifically designed for broiling.
	Aluminum foil used on the broiling pan and grid has not been fitted properly and slit as recommended.	If using aluminum foil conform to pan slits.
	In some areas the power (voltage) may be low.	Preheat the broil element for 10 minutes.
Oven temperature too hot or too cold	**Oven temperature needs adjustment.**	See the Special Features section.
Oven does not work or appears not to work	**A fuse in your home may be blown or the circuit breaker tripped.**	Replace the fuse or reset the circuit breaker.
	Oven controls improperly set.	See the Using the Oven section.
	Oven is in Sabbath Mode.	Verify, that the oven is not in Sabbath Mode. See the Special Features section.
“Crackling” or “popping” sound	**This is the sound of the metal heating and cooling during both the cooking and cleaning functions.**	This is normal.
Why is my range making a "clicking" noise when using my oven?	**Your range has been designed to maintain a tighter control over your oven's temperature. You may hear your oven's heating elements "click" on and off more frequently than in older ovens to achieve better results during baking, broiling, convection, and self-clean cycles.**	This is normal.
Clock and timer do not work	**A fuse in your home may be blown or the circuit breaker tripped.**	Replace the fuse or reset the circuit breaker.

Troubleshooting tips ... Before you call for service

Problem	Possible Cause	What To Do
Oven light does not work	**Light bulb is loose or defective.**	Tighten or replace bulb.
	Pad operating light is broken.	Call for service.
Oven will not self-clean	**The temperature is too high to set a self-clean operation.**	Allow the oven to cool and reset the controls.
	Oven controls improperly set.	See the Cleaning the Oven section.
Excessive smoking during clean cycle	**Excessive soil or grease.**	Press the **Cancel/Off** pad. Open the windows to rid the room of smoke. Wait until the **LOCKED** light goes off. Wipe up the excess soil and reset the clean cycle.
Excessive smoking during broiling	**Food too close to burner element.**	Lower the rack position of the food.
Oven door will not open after a clean cycle	**Oven too hot.**	Allow the oven to cool below locking temperature.
Oven not clean after a clean cycle	**Oven controls improperly set.**	See the Cleaning the Oven section.
	Oven was heavily soiled.	Clean up heavy spillovers before starting the clean cycle. Heavily soiled ovens may need to self-clean again or for a longer period of time.
"LOCK DOOR" flashes in the display	**The self-clean cycle has been selected but the door is not closed.**	Close the oven door.
LOCKED light is on when you want to cook	**The oven door is locked because the temperature inside the oven has not dropped below the locking temperature.**	Press the **Cancel/Off** pad. Allow the oven to cool.
“F— and a number or letter” flash in the display	**You have a function error code.**	Press the **Cancel/Off** pad. Allow the oven to cool for one hour. Put the oven back into operation.
	If the function code repeats.	Disconnect all power to the oven for at least 30 seconds and then reconnect power. If the function error code repeats, call for service.
Display goes blank	**A fuse in your home may be blown or the circuit breaker tripped.**	Replace the fuse or reset the circuit breaker.
	The clock is turned off.	See the Special features section.
	Oven is in Sabbath Mode.	Verify that the oven is not in Sabbath Mode. See the Special Features section.
Power outage, clock flashes	**Power outage or surge**	Reset the clock. If the oven was in use, you must reset it by pressing the **Cancel/Off** pad, setting the clock and resetting any cooking function.
“Burning” or “oily” odor emitting from the vent	**This is normal in a new oven and will disappear in time.**	To speed the process, set a self-clean cycle for a minimum of 3 hours. See the Cleaning the Oven section.
Strong odor	**An odor from the insulation around the inside of the oven is normal for the first few times the oven is used.**	This is temporary and will go away after several uses or a self-clean cycle.
Fan noise	**A cooling fan may automatically turn on.**	This is normal. The cooling fan will turn on to cool internal parts. It may run for up to 1-1/2 hours after the oven is turned off.
My oven door glass appears to be "tinted" or have a "rainbow" color. Is this defective?	**No. The inner oven glass is coated with a heat barrier to reflect the heat back into the oven to prevent heat loss and keep the outer door cool while baking.**	This is normal. Under certain light or angles, you may see this tint or rainbow color.

Troubleshooting tips ... Before you call for service

Problem	Possible Cause	What To Do
Sometimes the oven takes longer to preheat to the same temperature	**Cookware or food in oven**	The cookware or food in the oven will cause the oven to take longer to preheat. Remove items to reduce preheat time.
	Number of racks in oven	Adding more racks to the oven will cause the oven to take longer to preheat. Remove some racks.
	Different cooking modes	The different cooking modes use different preheat methods to heat the oven for the specific cooking mode. Some modes will take longer than others (i.e. convection bake multi).

INFORMACIÓN IMPORTANTE DE SEGURIDAD LEA TODAS LAS INSTRUCCIONES ANTES DE USAR

⚠ ADVERTENCIA

Lea todas las instrucciones antes de usar el producto. Si no se siguen estas instrucciones se podrán producir incendios, descargas eléctricas, lesiones graves o la muerte.

ADVERTENCIA DE LA PROPOSICIÓN 65 DEL ESTADO DE CALIFORNIA

La Ley sobre Agua Potable Inocua y Tratamiento de Residuos Tóxicos de California (California Safe Drinking Water and Toxic Enforcement Act) solicita al Gobernador de California que publique una lista de sustancias que el estado reconoce que producen cáncer, defectos de nacimiento u otros daños reproductivos y solicita a los empresarios que adviertan a sus clientes sobre la posible exposición a tales sustancias.

⚠ ADVERTENCIA Este producto contiene uno o más químicos que el Estado de California entiende que producen cáncer, defectos en el nacimiento u otros daños reproductivos.

Los hornos con limpieza automática pueden ocasionar exposiciones de bajo nivel a algunas de estas sustancias, incluyendo monóxido de carbono, durante el ciclo de limpieza. La exposición puede ser minimizada si se ventila con una ventana abierta o si se usa un ventilador o campana.

⚠ ADVERTENCIA INSTRUCCIONES GENERALES DE SEGURIDAD

- Use este electrodoméstico sólo para su propósito original, como se describe en el Manual del Propietario.
- Solicite que un instalador calificado instale su electrodoméstico y que esté adecuadamente conectado a tierra, de acuerdo con las instrucciones de instalación provistas.
- No intente reparar o reemplazar ninguna parte del horno, a menos que se recomiende específicamente en este manual. Cualquier otra reparación deberá ser realizada por un técnico calificado.
- Antes de realizar cualquier servicio técnico, desconecte el suministro de corriente desde el panel de distribución del hogar, retirando el fusible o desconectando el disyuntor.
- No deje a los niños solos – no se deberá dejar a los niños solos o fuera de su radio de atención en el área donde el electrodoméstico se encuentre en uso. Nunca se les deberá permitir trepar, sentarse o pararse sobre ninguna parte del electrodoméstico.
- **⚠ PRECAUCIÓN:** No coloque artículos de interés para los niños sobre los gabinetes que están sobre un horno – si los niños se trepan sobre el horno para llegar a estos artículos podrían sufrir lesiones graves.
- Use sólo mangos de ollas secas – los mangos húmedos sobre superficies calientes pueden producir quemaduras debido al vapor. No deje que los mangos de las ollas toquen los elementos que están calientes. No use una toalla u otra tela voluminosa para reemplazar el mango de las cacerolas.
- Nunca use el electrodoméstico para calentar o calefaccionar la habitación.
- No toque el elemento calentador ni la superficie interior del horno. Es posible que estas superficies estén demasiado calientes como para quemar, aunque su color sea oscuro. Durante y después del uso, no toque ni permita que telas u otros materiales inflamables toquen cualquier área interior del horno; espere a que haya pasado un tiempo suficiente para que se enfríen. Otras superficies del electrodoméstico se podrán calentar lo suficiente como para ocasionar lesiones. Las superficies potencialmente calientes incluyen la abertura de la ventilación del horno, superficies cercanas a la abertura y grietas alrededor de la puerta del horno.
- No caliente envases de comida que no hayan sido abiertos. Se podría acumular presión y el envase podría explotar, ocasionando una lesión.
- No use ningún tipo de aluminio o cobertor para cubrir el fondo del horno o cualquier parte del horno, excepto como se describe en este manual. Los cobertores de horno pueden atrapar el calor o derretirse, ocasionando daños sobre el producto y el riesgo de descargas, humo o incendios.
- Evite las ralladuras o impactos sobre las puertas de vidrio o los paneles de control. Hacer esto podrá producir la rotura de vidrios. No cocine un producto con un vidrio roto. Es posible que se produzcan descargas, incendios o cortes.
- Cocine carnes y carnes de ave en forma completa – la carne por lo menos a una temperatura interna de 160º F y la carne de ave por lo menos a una temperatura interna de 180º F. Normalmente la cocción a estas temperaturas es una protección contra las enfermedades transmitidas por la comida.

GUARDE ESTAS INSTRUCCIONES

⚠ ADVERTENCIA MANTENGA LOS MATERIALES INFLAMABLES ALEJADOS DE LA COCINA

Si esto no se cumple, se podrán sufrir lesiones personales graves o incendios.

- No guarde ni use materiales inflamables en o cerca de un horno, incluyendo papel, plástico, mangos de ollas, trapos, cobertores de pared, cortinas, paños y gasolina u otros vapores y líquidos inflamables.
- Nunca use prendas holgadas o que cuelguen mientras usa el electrodoméstico. Estas prendas se podrán incendiar si entran en contacto con superficies calientes, ocasionando quemaduras graves.
- No permita que la grasa de la cocción u otros materiales inflamables se acumulen en o cerca del horno. La grasa que está en o cerca del horno se podrá incendiar.

⚠ ADVERTENCIA EN CASO DE INCENDIO, SIGA LOS SIGUIENTES PASOS PARA EVITAR LESIONES O LA PROPAGACIÓN DEL FUEGO

- DNo use agua sobre el fuego de la grasa. Nunca tome una olla que se esté incendiando.
- Si hay un incendio en el horno durante el horneado, ahogue el fuego cerrando la puerta del horno y apagando el mismo o usando un químico seco multipropósito o un extintor de incendio con espuma.
- En caso de que haya fuego en el horno durante el ciclo de limpieza automática, apague el horno y espere a que el fuego se extinga. No fuerce la puerta para abrirla. La entrada de aire fresco sobre las temperaturas de la limpieza automática podrá conducir a la producción de llamas en el horno. Si no se siguen estas instrucciones, se podrán producir quemaduras graves.

⚠ ADVERTENCIA INSTRUCCIONES DE SEGURIDAD DEL HORNO

- Manténgase alejado del horno al abrir la puerta del mismo. El aire caliente o el vapor que sale puede causar quemaduras en las manos, rostro y/u ojos.
- Mantenga desobstruida la ventilación del horno.
- Mantenga el horno libre de acumulación de grasa. La grasa del horno se puede incendiar.
- Coloque los estantes del horno en la ubicación deseada mientras éste se encuentra frío. Si es necesario mover el estante mientras el horno está caliente, evite que el mango de la olla tenga contacto con el elemento calentador en el horno.
- Al usar las bolsas para cocinar o dorar en el horno, siga las instrucciones del fabricante.
- Es conveniente empujar hacia afuera los estantes estándares hasta el tope o empujar el estante extensible hasta la posición completamente abierta para levantar comidas pesadas. Esto también es una precaución contra quemaduras por tocar superficies calientes de la puerta o las paredes del horno.
- No deje productos tales como papel, utensilios de cocina ni comida en el horno cuando éste no se encuentre en uso. Los artículos guardados en el horno se pueden incendiar.
- Nunca coloque los utensilios de cocina, piedras para pizza u horneado o cualquier otro tipo de aluminio o cobertor en la base del horno. Estos ítems pueden atrapar el calor o derretirse, ocasionando daños sobre el producto y el riesgo de descargas, humo o incendios.

⚠ ADVERTENCIA INSTRUCCIONES DE SEGURIDAD DEL HORNO CON LIMPIEZA AUTOMÁTICA

La función de limpieza automática usa el horno en temperaturas lo suficientemente altas como para consumir la suciedad de comida que haya dentro del horno. Para un funcionamiento seguro, siga estas instrucciones.

- No toque las superficies del horno durante el ciclo de limpieza automática. Mantenga a los niños alejados del horno durante la limpieza automática. Si no se siguen estas instrucciones, se podrán producir quemaduras.
- Antes de usar el ciclo de limpieza automática del horno, retire los estantes de color gris brillante (en algunos modelos), la sonda, cualquier papel de aluminio, y cualquier bandeja para asar, rejilla, u otros utensilios. Sólo se pueden dejar dentro del horno los estantes para horno cubiertos de porcelana.
- Antes de utilizar el ciclo de limpieza automática, limpie la grasa y restos de comida que haya en el horno. Una cantidad excesiva de grasa se puede incendiar, lo cual puede producir daños con humo en su hogar.
- Si el modo de limpieza automática funciona de forma incorrecta, apague el horno y desconecte el suministro de corriente. Solicite el servicio de un técnico calificado.
- No limpie la junta de la puerta. La junta de la puerta es esencial para un buen sellado. Se debe tener cuidado de no frotar, dañar ni mover la junta.
- No use limpiadores para horno. No se deberá usar limpiadores comerciales para horno ni revestimientos de protección para hornos de ningún tipo en o alrededor de cualquier parte del horno.

¡Gracias! ... por su compra de un electrodoméstico de la Marca GE

Registre su Electrodoméstico: ¡Registre su electrodoméstico nuevo a través de Internet, según su conveniencia!

www.geappliances.com/service_and_support/register/

Un registro puntual de su producto permitirá una mejor comunicación y un servicio más puntual de acuerdo con los términos de su garantía, en caso de surgir la necesidad. También puede enviar una carta en la tarjeta de inscripción pre-impresa que se incluye con el material embalado.

Garantía de la Cocina Eléctrica de GE

GEAppliances.com

Todo el servicio de garantía es provisto por nuestros Centros de Servicio de Fabricación, o un técnico autorizado de Servicio al Cliente (Customer Care®). Para programar una visita del servicio técnico a través de Internet, visítenos en www.geappliances.com/service_and_support/, o llame al 800.GE.CARES (800.432.2737). Cuando llame para solicitar el servicio, tenga los números de serie y de modelo disponibles.

Para realizar el servicio técnico de su electrodoméstico se podrá requerir el uso de datos del puerto de abordaje para su diagnóstico. Esto da al técnico del servicio de fábrica de GE la habilidad de diagnosticar de forma rápida cualquier problema con su electrodoméstico, y de ayudar a GE a mejorar sus productos al brindarle a GE la información sobre su electrodoméstico. Si no desea que los datos de su electrodoméstico sean enviados a GE, solicitamos que le indique a su técnico no entregar los datos a GE en el momento del servicio.

Durante el período de un año desde la fecha original de compra. GE le brindará cualquier parte de la cocina que falle debido a un defecto en los materiales o la fabricación. Durante esta garantía limitada de un año, GE también proveerá, sin costo, todo el trabajo y el servicio en el hogar relacionado con el reemplazo de la parte que presente defectos.

Qué no cubrirá GE:

- Viajes del técnico del servicio a su hogar para enseñarle sobre cómo usar el producto.
- Instalación, entrega o mantenimiento inadecuados.
- Fallas del producto en caso de abuso, mal uso, modificación o uso para propósitos diferentes al original o uso comercial.
- Reemplazo de fusibles de la casa o reinicio de disyuntores.
- Daños ocasionados sobre el producto por accidente, incendio, inundaciones o catástrofes naturales.
- Daños incidentales o consecuentes causados por posibles defectos sobre este producto.
- Daño causado después de la entrega.
- Producto no accesible para brindar el servicio requerido.
- Solicite el servicio técnico para reparar o reemplazar las lámparas, excepto las lámparas LED.

EXCLUSIÓN DE GARANTÍAS IMPLÍCITAS

Su única y exclusiva alternativa es la reparación del producto, como se indica en la Garantía Limitada. Las garantías implícitas, incluyendo garantías implícitas de comerciabilidad o conveniencia sobre un propósito particular, se limitan a un año o al período más corto permitido por la ley.

Esta garantía se extiende al comprador original y a cualquier dueño subsiguiente de productos comprados para uso hogareño dentro de EE.UU. Si el producto está en un área donde no se encuentra disponible un Proveedor Autorizado del Servicio Técnico de GE, usted será responsable por el costo de un viaje o se podrá requerir que traiga el producto a una ubicación del Servicio Técnico de GE Autorizado para recibir el servicio. En Alaska, la garantía excluye el costo de envío o llamadas del servicio a su hogar.

Algunos estados no permiten la exclusión o limitación de daños fortuitos o consecuentes. Esta garantía le da derechos legales específicos y es posible que tenga otros derechos legales que varían entre un estado y otro. Para conocer cuáles son sus derechos legales, consulte a la oficina de asuntos del consumidor local o estatal o al Fiscal de su estado.

Garante: General Electric Company. Louisville, KY 40225

Garantías Extendidas: Adquiera una garantía extendida de GE y aprenda sobre descuentos especiales que están disponibles mientras su garantía aún está vigente. La puede adquirir en cualquier momento a través de Internet en

www.geappliances.com/service_and_support/shop-for-extended-service-plans.htm

o llamando al 800.626.2224 durante el horario comercial habitual. Los Servicios para el Consumidor Hogareño de GE aún estarán allí cuando su garantía caduque.

Abroche su recibo aquí. Para acceder al servicio técnico de acuerdo con la garantía deberá contar con la prueba de la fecha original de compra.

¿Desea realizar una consulta o necesita ayuda con su electrodoméstico?

¡Consulte el Sitio Web de Electrodomésticos de GE (**www.geappliances.com/service_and_support/**) durante las 24 horas, cualquier día del año! Para mayor conveniencia y un servicio más rápido, ahora puede descargar el Manual del Propietario, ordenar piezas o incluso programar el servicio técnico a través de Internet.

Servicio Programado: El servicio de reparación de expertos de GE está a sólo un paso de su puerta. Entre a Internet y programe su servicio en www.geappliances.com/service_and_ support/ o llame al 800.GE.CARES (800.432.2737) durante el horario de atención comercial.

Piezas y Accesorios: Aquellas personas calificadas para realizar el servicio técnico sobre sus propios electrodomésticos podrán solicitar el envío de piezas o accesorios directamente a sus hogares (se aceptan las tarjetas VISA; MasterCard y Discover). Ordene a través de Internet hoy, durante las 24 horas o en forma telefónica al 800.626.2002 durante el horario de atención comercial.

Las instrucciones que figuran en este manual cubren los procedimientos que serán realizados por cualquier usuario. Otros servicios técnicos generalmente deberían ser derivados a personal calificado del servicio. Se deberá tener cuidado, ya que una reparación indebida podrá hacer que el funcionamiento no sea seguro.

Estudio de Diseño de la Vida Real: GE apoya el concepto de Diseño Universal en productos, servicios y ambientes que pueden ser usados por personas de todas las edades, tamaños y capacidades. Reconocemos la necesidad de realizar diseños para una amplia gama de habilidades e incapacidades físicas y mentales. Para más detalles sobre las aplicaciones de Diseño Universal de GE, incluyendo ideas de diseño de cocinas para personas con incapacidades, visite nuestro sitio web hoy. Sobre casos de incapacidad auditiva, comuníquese al 800.TDD.GEAC (800.833.4322).

Contáctenos: Si no se encuentra satisfecho con el servicio que recibió de GE, comuníquese con nosotros a través de nuestro sitio web con todos los detalles, incluyendo su número telefónico, o escriba a:

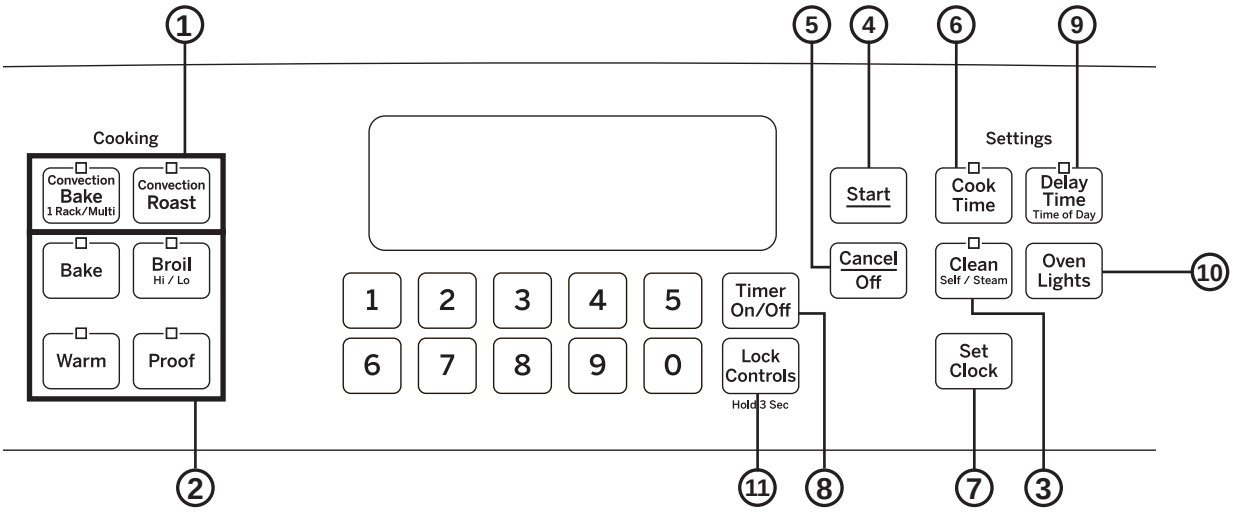
*La olla para asar grande no entra en cocinas de 20”/24”.
**La olla XL no entra en hornos de pared de 24”, empotrables de 27” o cocinas de 20”/24”.

Cómo Retirar la Película Protectora de Envío y la Cinta de Embalaje

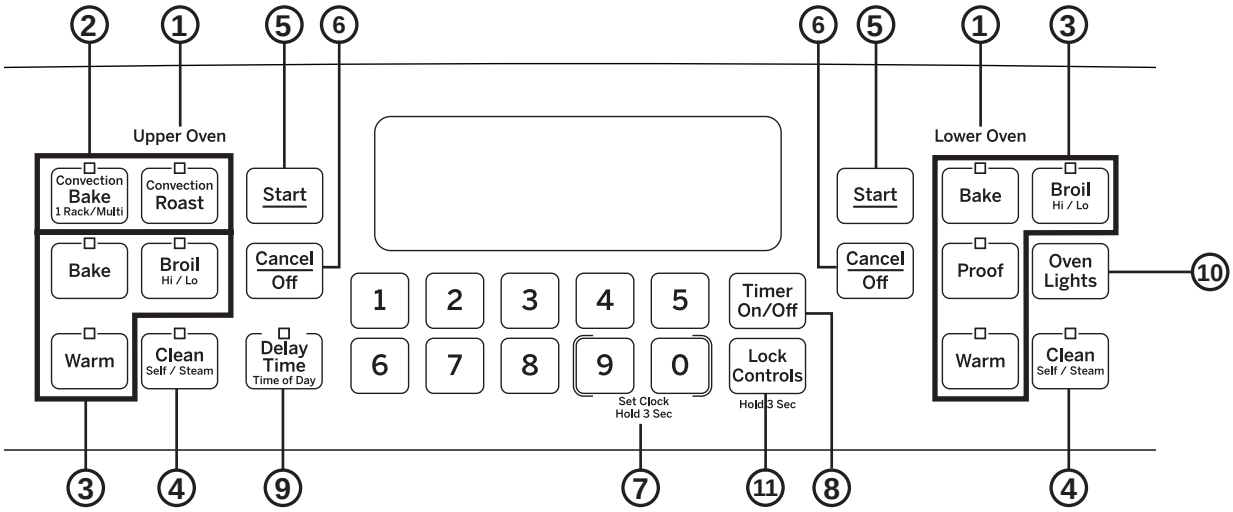


Con cuidado tome un extremo de la película protectora de envío con los dedos y lentamente retire la misma de la superficie del electrodoméstico.

No utilice ningún producto filoso para retirar la película. Retire toda la película antes de usar el electrodoméstico por primera vez.

Para asegurar que no haya daños sobre el acabado del producto, la forma más segura de retirar el adhesivo de la cinta de embalaje en electrodomésticos nuevos es aplicando un detergente líquido hogareño para lavar platos. Aplique con una tela suave y deje que se seque.

NOTA: El adhesivo deberá ser eliminado de todas las partes. No se puede retirar si se hornea con éste dentro.



Horno de Pared Simple

1. **Convection Cooking Modes (Modos de Cocción por Convección):** Los modos de cocción por convección utilizan una circulación de aire incrementada para mejorar el rendimiento. El tipo de beneficio depende del modo. Su horno cuenta con los siguientes modos de cocción por convección: Convection Bake (Hornear por Convección) (1 o Múltiples Estantes) y Convection Roast (Asar por Convección). Para más información, consulte la sección de Modos de Cocción.
2. **Traditional Cooking Modes (Modos de Cocción Tradicionales):** Su horno cuenta con los siguientes modos de cocción tradicionales: Bake (Hornear), Broil Hi (Asar Alto), Broil Lo (Asar Bajo), Proof (Leudar) y Warm (Calentar). Para más información, consulte la sección de Modos de Cocción.
3. **Clean (Limpieza):** El horno cuenta con dos modos de limpieza: Self Clean (Limpieza Automática) y Steam Clean (Limpieza con Vapor). Para acceder a información importante sobre el uso de estos modos, consulte la sección de Limpieza del Horno.
4. **Start (Iniciar):** Se deberá presionar para comenzar cualquier función de cocción, limpieza o por tiempo.
5. **Cancel/Off (Cancelar/ Apagar):** Cancelar TODAS las operaciones del horno excepto el reloj y el temporizador.
6. **Cook Time (Tiempo de Cocción):** Cuenta el tiempo de cocción y apaga el horno cuando el tiempo de cocción está completo. Presione la tecla **Cook Time (Tiempo de Cocción)**, use las teclas numéricas para programar un tiempo de cocción en horas y minutos, y luego presione **Start (Iniciar).** Esto sólo puede ser usado con Traditional Bake (Horneado Tradicional), Convection Bake (Hornear por Convección), Convection Bake Multi (Hornear por Multi Convección), y Convection Roast (Dorar por Convección).
7. **Clock (Reloj):** Configure la hora del reloj del horno: Presione la tecla **Set Clock (Configurar Reloj)** y las teclas numéricas para programar el reloj. Presione **Start (Iniciar)** para guardar la configuración de la hora.
8. **Timer (Temporizador):** Funciona como un temporizador con cuenta regresiva: Presione la tecla **Timer (Temporizador)** y las teclas numéricas para programar el tiempo en horas y minutos. Presione la tecla **Start (Iniciar)** El horno continuará funcionando cuando la cuenta regresiva del temporizador se haya completado. Para apagar el temporizador, presione la tecla **Timer (Temporizador)**.
9. **Delay Time (Tiempo de Retraso):** Genera un retraso cuando el horno es encendido. Use esta tecla para configurar el momento en que desea que el horno se inicie. Presione la tecla **Delay Time (Tiempo de Retraso)** y use las teclas numéricas para programar la hora del día en que desea que el horno se encienda y presione **Start (Iniciar)**. Presione el modo de cocción deseado y la temperatura y luego presione **Start (Iniciar)**. Si lo desea, también puede ser programado un tiempo de cocción. Siga las instrucciones de Cook Time (Tiempo de Cocción) para configurar esta función. Esto sólo puede ser usado con Bake (Hornear), Convection Bake (1 Rack/Multi) (Hornear por Convección, 1 o Múltiples Estantes) Convection Roast (Dorar por Convección) y Self-Clean (Limpieza Automática).

   NOTA: Al usar la función de tiempo de retraso, las comidas que se echan a perder rápidamente, tales como leche, huevos, pescado, rellenos, ave y cerdo, no se deberán dejar reposar por más de 1 hora antes y después de la cocción. La temperatura ambiente estimula el desarrollo de bacterias nocivas. Asegúrese de que la luz del horno esté apagada, ya que el calor de la lámpara acelerará el crecimiento de bacterias nocivas.
10. **Oven Light(s) (Luz(es) del Horno):** Enciende o apaga la luz(es) del horno.
11. **Lock Controls (Controles de Bloqueo):** Bloquean el control de modo que al presionar las teclas no se activen los controles. Mantenga presionada la tecla **Lock Controls (Controles de Bloqueo)** durante tres segundos para bloquear o desbloquear el control. La función **Cancel/Off (Cancelar/ Apagar)** siempre está activa, incluso cuando el control está bloqueado.

Horno de Pared Doble

1. **Upper Oven and Lower Oven (Horno Superior y Horno Inferior):** Designa qué horno operarán los controles.
2. **Convection Cooking Modes (Modos de Cocción por Convección):** Los modos de cocción por convección utilizan una circulación de aire incrementada para mejorar el rendimiento. El tipo de beneficio depende del modo. Su horno cuenta con los siguientes modos de cocción por convección: Convection Bake (1 Rack /Multi) (Horneado por Convección, 1 o Múltiples Estantes) y Convection Roast (Asar por Convección). Para más información, consulte la sección de Modos de Cocción.
3. **Traditional Cooking Modes (Modos de Cocción Tradicionales):** Su horno cuenta con los siguientes modos de cocción tradicionales: Bake (Hornear), Broil Hi (Asar Alto), Broil Lo (Asar Bajo), Proof (Leudar) (Horno Inferior) y Warm (Calentar). Para más información, consulte la sección de Modos de Cocción.
4. **Clean (Limpieza):** El horno cuenta con dos modos de limpieza: Self Clean (Limpieza Automática) y Steam Clean (Limpieza con Vapor). Para acceder a información importante sobre el uso de estos modos, consulte la sección de Limpieza del Horno.
5. **Start (Iniciar):** Se deberá presionar para comenzar cualquier función de cocción, limpieza o por tiempo.
6. **Cancel/Off (Cancelar/ Apagar):** Cancelar TODAS las operaciones del horno excepto el reloj y el temporizador.
7. **Clock (Reloj):** Configure el tiempo del reloj del horno. Mantenga presionadas las teclas **9** y **0** durante 3 segundos. Use las teclas numéricas para programar el reloj.. Presione **Start (Iniciar)** para guardar la configuración de la hora.
8. **Timer (Temporizador):** Funciona como un temporizador con cuenta regresiva: Presione la tecla **Timer (Temporizador)** y las teclas numéricas para programar el tiempo en horas y minutos. Presione la tecla **Start (Iniciar)** El horno continuará funcionando cuando la cuenta regresiva del temporizador se haya completado. Para apagar el temporizador, presione la tecla **Timer (Temporizador)**.
9. **Delay Time (Tiempo de Retraso):** Genera un retraso cuando el horno es encendido. Use esta tecla para configurar el momento en que desea que el horno se inicie. Presione la tecla **Delay Time (Tiempo de Retraso)** y use las teclas numéricas para programar la hora del día en que desea que el horno se encienda y luego presione **Start (Iniciar)** Presione el modo de cocción deseado y la temperatura y luego presione **Start (Iniciar)**. Esto sólo puede ser usado con Bake (Hornear), Convection Bake (Hornear por Convección, 1 o Múltiples Estantes) Convection Roast (Dorar por Convección) y Self-Clean (Limpieza Automática).

   NOTA: Al usar la función de tiempo de retraso, las comidas que se echan a perder rápidamente, tales como leche, huevos, pescado, rellenos, ave y cerdo, no se deberán dejar reposar por más de 1 hora antes y después de la cocción. La temperatura ambiente estimula el desarrollo de bacterias nocivas. Asegúrese de que la luz del horno esté apagada, ya que el calor de la lámpara acelerará el crecimiento de bacterias nocivas.
10. **Oven Light(s) (Luz(es) del Horno):** Enciende o apaga la luz(es) en ambos hornos. Se debe observar que las luces de ambos hornos no se encenderán si la puerta es abierta mientras el otro horno se encuentra en el modo de limpieza.
11. **Lock Controls (Controles de Bloqueo):** Bloquean el control de modo que al presionar las teclas no se activen los controles. Mantenga presionada la tecla **Lock Controls (Controles de Bloqueo)** durante tres segundos para bloquear o desbloquear el control. La función **Cancel/Off (Cancelar/ Apagar)** siempre está activa, incluso cuando el control está bloqueado.

Funciones especiales

Existen varias funciones especiales en su horno de pared. Para modificar las configuraciones de estas funciones especiales, mantenga presionadas las teclas **BAKE (Hornear)** y **BROIL (Asar)** al mismo tiempo durante tres segundos. "**SF**" aparecerá en la pantalla. Seleccione la función que desee modificar. Una vez realizado el cambio, presione la tecla **START (Iniciar)** para guardar dicho cambio y regrese a la hora del día.

Ajuste de la Temperatura del Horno

Esta función permite que la temperatura de horneado del horno y de horneado por convección sean ajustadas hasta 35ºF más caliente o 35ºF más fría. Use esta función si piensa que la temperatura de su horno es demasiado caliente o demasiado fría y desea modificarla. **Para los modelos con horno doble, los hornos superior e inferior se ajustan de forma separada**. Este ajuste afecta los modos Bake (Hornear), y Convection Bake (1 Rack/Multi) (Hornear por Convección, 1 o Múltiples Estantes). Ningún otro modo de cocción se ve afectado.

Presione la tecla **Bake (Hornear)** para seleccionar el horno que será ajustado. Presione la tecla **Bake (Hornear)** nuevamente para ingresar el modo de ajuste de temperatura. Se exhibirá un número entre 35 y – 35. Use las teclas numéricas para configurar el ajuste de temperatura deseado y use la tecla **Bake (Hornear)** para realizar cambios en forma descendente y ascendente. Presione la tecla **Start (Iniciar)** para guardar el ajuste de temperatura.

Sonido de Finalización del Temporizador

Se trata de un tono que indica la finalización de un temporizador. El tono puede ser continuo (bEEP Cont) o un pitido repetido (bEEP). Una configuración continua seguirá haciendo que un tono suene hasta que un botón del control sea presionado. Presione la tecla **Broil (Asar)** para visualizar la configuración actual y luego modifique la configuración.

Selección de Temperatura Fahrenheit o Celsius

El control del horno está configurado para su uso con temperaturas Fahrenheit (F), pero lo puede modificar a temperaturas Celsius (C). Presione las teclas numéricas **6** y **8** al mismo tiempo para visualizar la configuración actual; presione nuevamente para modificar la configuración.

Pantalla del Reloj

Esta función especifica cómo la hora del día será exhibida o si no se exhibirá la hora del día. Puede seleccionar el reloj con hora estándar de 12 horas (12 H), la hora militar de 24 horas (24 H), o que no se exhiba ningún reloj (oFF) (Apagado). Presione la tecla **Clock (Reloj)** para visualizar la configuración actual, y vuelva a presionar la misma para modificar la configuración.

Conversión de Auto Recipe

Al usar las opciones de cocción Convection Bake 1 Rack (Hornear por Convección en 1 Estante) o Convection Bake Multi Rack (Hornear por Convección en Múltiples Estantes), Auto Recipe Conversion (Conversión de Auto Receta) convertirá de forma automática las temperaturas de horneado regular ingresadas a temperaturas de cocción de horneado por convección cuando se active. Se debe observar que esta opción no convierte los tiempos de cocción del horneado por convección, sino sólo las temperaturas. Presione la tecla **Convection Bake (1 Rack/Multi) (Hornear por Convección en 1 o Múltiples Estantes)** para visualizar la configuración de conversión; vuelva a presionar para alternar entre On (Con On) (Encendido Continuo) y Off (Con Off) (Apagado Continuo).

Volumen del Sonido

Esta función permite que el volumen del tono del horno sea ajustado entre alto (HI bEEP HI) (Pitido Alto), medio (Std bEEP Std) (Pitido Estándar) y apagado (oFF bEEP oFF) (Pitido Apagado). Presione las teclas numéricas **1** y **5** al mismo tiempo para visualizar la configuración actual o para modificar la configuración. El control hará que el tono del horno suene en el nuevo nivel de volumen cada vez que el nivel de sonido sea modificado.

Apagado automático de 12 horas y Modo Sabático

Las opciones de esta función son “12 SHdn” (Apagar Luego de 12 Horas), “no SHdn” (No Apagar) y “SAbbAtH” (Sabático).

El apagado automático de 12 horas apaga el horno luego de 12 horas de operaciones continuas.

El modo sabático desactiva las luces del horno (la luz del horno no se encenderá cuando la puerta sea abierta), todos los sonidos (el control no emitirá un pitido cuando se presione un botón), los modos de Convección, los modos de Asado, Calentar, Leudar, Tiempo de Cocción, Temporizador, Reloj, y las funciones de Tiempo Retrasado. El modo sabático sólo puede ser usado con la función Bake (Hornear). Esta función se activa conforme con los requisitos Sabáticos Judíos de la Estrella K.

Mantenga presionadas las teclas **Bake (Hornear)** y **Broil (Asar)** durante 3 segundos para ingresar al modo de funciones especiales.

Presione la tecla **Delay Clock (Reloj Retrasado)** para visualizar la configuración actual y luego para modificar la configuración.

Para usar el modo Sabbath (Sabático), seleccione “SAbbAtH” (Sabático) y presione **Start (Iniciar)**. Aparecerá una **]** en la pantalla y el reloj no será exhibido. Observe que si cuenta con un horno de pared doble, al colocar el control en el modo Sabático, ambos hornos están ahora en el modo sabático y están disponibles para la cocción.

Una vez en el modo Sabbath (Sabático), en cualquier momento puede presionar **Bake (Hornear)**; use las teclas numéricas para ingresar una temperatura entre 170ºF y 550ºF, y presione **Start (Iniciar)**. No se emitirá ningún sonido cuando las teclas sean presionadas. En un momento al azar entre los 30 segundos y 1 minuto, **][**, aparecerá en la pantalla indicando que el horno está en funcionamiento.

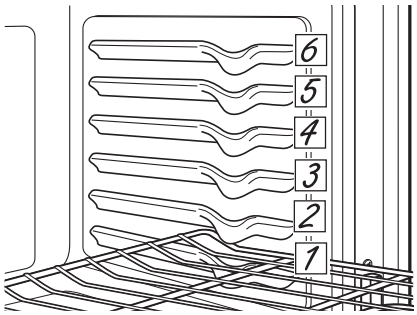
Observe que ambos hornos de un horno de pared doble pueden ser usados en el modo sabático. Cada horno puede ser programado en una temperatura diferente y cada horno debe ser programado por separado.

Si necesita ajustar la temperatura, presione **Bake (Hornear)**, use las teclas numéricas para ingresar una nueva temperatura entre 170º F y 550º F, y presione **Start (Iniciar)**.

Para apagar el horno, presione **Cancel/Off (Cancelar/ Apagar)** en cualquier momento. **El horno se apagará inmediatamente** y el ícono, **][** cambiará a **]**, indicando que el horno fue apagado.

Observe que cada horno de un horno de pared doble se deberá apagar por separado.

Para salir del modo sabático, asegúrese de que el horno esté apagado. Mantenga presionadas las teclas **Bake (Hornear)** y **Broil (Asar)** durante 3 segundos para ingresar a las funciones especiales, luego presione **Delay Time (Tiempo Retrasado)** hasta que “**12 Shdn**” (Apagar Luego de 12 Horas) o “**no Shdn**” (No Apagar) aparezcan en la pantalla y presione **Start (Iniciar)**.

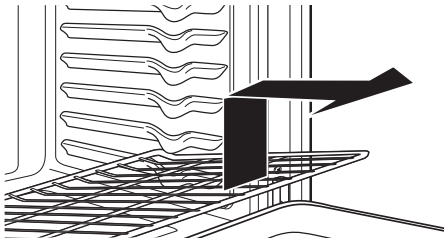


NOTA: Si se produce un corte de corriente durante el modo Sabático, la unidad permanecerá en el modo Sabático pero apagada cuando vuelva la corriente.

Si desea usar la función Cook Time (Tiempo de Cocción) (si está disponible) para hornear en el horno y luego hacer que éste se apague de forma automática, deberá presionar el botón Cook Time (Tiempo de Cocción), ingresar una duración del tiempo de cocción, y presionar Start (Iniciar). Luego ingrese a las funciones especiales para iniciar el modo Sabbath (Sabático), como se detalla más arriba.

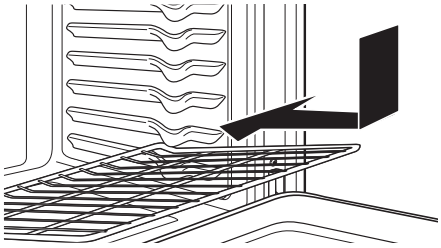
Estantes del Horno

El horno cuenta con seis posiciones de estantes. En la Guía de Cocción, se brindan recomendaciones de posiciones de los estantes para diferentes tipos de comidas. Se ajusta un estante en una dirección para afectar los resultados de cocción. Por ejemplo, si se prefieren partes superiores más oscuras en tartas, panecillos o galletas, pruebe moviendo la comida a un estante que se encuentre una posición más arriba. Si encuentra que las comidas están demasiado doradas en la parte superior, pruebe moviendo las mismas más abajo la próxima vez.



Al hornear con múltiples ollas y en múltiples estantes, asegúrese de que haya suficiente espacio entre las ollas para que fluya el aire.

Flat Racks



Al colocar y retirar utensilios de cocina, empuje el estante hacia afuera del tope (posición de detención) sobre el soporte del estante.

Para retirar el estante, empuje el mismo hacia usted, incline el extremo frontal hacia arriba y empuje hacia afuera.

Para hacer un reemplazo, coloque el extremo curvo del estante (bloqueadores) en los soportes del horno, incline hacia arriba el frente y empuje el estante hacia adentro.

Es posible que resulte difícil deslizar los estantes, especialmente luego de la limpieza automática. Coloque aceite vegetal en una tela húmeda o toalla de papel y frote sobre los extremos izquierdo y derecho.

Papel de Aluminio y Cobertores del Horno

⚠ PRECAUCIÓN: **No use ningún tipo de aluminio o cobertor de horno para cubrir el fondo del horno. Estos ítems pueden atrapar el calor o derretirse, ocasionando daños sobre el producto y el riesgo de descargas, humo o incendios. Los daños por uso inadecuado de estos ítems no están cubiertos por la garantía del producto.**

Se podrá usar aluminio para evitar derrames, colocando una hoja sobre un estante inferior varias pulgadas debajo de la comida. No use más aluminio que el necesario y nunca cubra totalmente el estante de un horno con papel de aluminio. Mantenga el aluminio a por lo menos 1 1/2” de las paredes del horno, para evitar una circulación deficiente del calor.

Utensilios

Pautas de Uso de Utensilios

El material, el acabado y el tamaño de los utensilios afectan el horneado.

Las ollas oscuras, revestidas y opacas absorben el calor más rápidamente que las ollas claras y brillantes. Al usar ollas que absorben el calor más rápidamente, las comidas podrán resultar más doradas, crocantes y con una capa más gruesa.

Si utiliza utensilios oscuros y revestidos, controle la comida antes del tiempo mínimo de cocción. Si se obtienen resultados no deseados con este tipo de utensilios, considere la posibilidad de reducir la temperatura del horno en 25º F la próxima vez.

Las ollas brillantes pueden producir resultados de horneado más parejos en tortas y galletas.

Las ollas de vidrio y cerámica calientan con lentitud, pero retienen bien el calor.

Estos tipos de ollas funcionan bien con platos tales como tartas y postres con natilla.

Las ollas con aislante de aire calientan lentamente y pueden producir fondos dorados.

Mantenga los utensilios limpios para una cocción más pareja.

Modos de Cocción

Su nuevo horno posee una variedad de modos de cocción para que pueda obtener los mejores resultados. Estos modos se describen a continuación. Para acceder a recomendaciones para comidas específicas, consulte la sección de la Guía de Cocción. Recuerde que es posible que su nuevo horno funcione de manera diferente que aquel que está reemplazando.

Modos de Horneado y Dorado

Seleccione un modo para hornear y dorar basado en el tipo y cantidad de comida que está preparando. Al preparar comidas horneadas tales como tartas, galletas y masas, siempre precaliente el horno primero. Siga las recomendaciones de la receta sobre la colocación de la comida. Si no se brindan pautas, centre la comida en el horno.

Horneado Tradicional

El modo de horneado tradicional está pensado para la cocción en un solo estante. Este modo usa el calor principalmente desde el elemento inferior, pero también desde el elemento superior para cocinar la comida. Para usar este modo, presione la tecla **Bake (Hornear)**, ingrese una temperatura, y luego presione **Start (Iniciar)**. El precalentamiento generalmente se recomienda al usar este modo.

Horneado por Convección en 1 Estante

El modo Convection Bake 1 Rack (Horneado por Convección en 1 Estante) está pensado para la cocción en un solo estante. Este modo utiliza el calor del elemento inferior y también de los elementos superior y trasero, junto con el movimiento del ventilador de la convección, para que la cocción sea más pareja. El horno está equipado con la función Auto Recipe Conversion (Conversión de Receta Automática); de modo que no es necesario convertir la temperatura al usar este modo. Para usar este modo, presione la tecla **Convection Bake (1 Rack/Multi) (Hornear por Convección en 1 o Múltiples Estantes)**, ingrese una temperatura, y luego presione **Start (Iniciar)**. El precalentamiento generalmente se recomienda al usar este modo.

Honeado por Convección en Estantes Múltiples

El modo Convection Bake Multi Rack (Honeado por Convección en Estantes Múltiples) está pensado para honear en múltiples estantes al mismo tiempo. Este modo utiliza el calor principalmente desde el elemento trasero, pero también calienta desde los elementos superior e inferior, junto con el movimiento de aire desde el ventilador por convección para mejorar una cocción pareja. El horno está equipado con la función Auto Recipe Conversion (Conversión de Receta Automática); de modo que no es necesario convertir la temperatura al usar este modo. Es posible que el tiempo de horneado sea un poco más prolongado con estantes múltiples, en comparación con lo que se espera con un solo estante. Para usar este modo, presione la tecla **Convection Bake (1 Rack/Multi) (Hornear por Convección en 1 o Múltiples Estantes) dos veces**, ingrese una temperatura, y luego presione **Start (Iniciar)**. Siempre realice el precalentamiento al usar este modo.

Dorar por Convección

El modo Convection Roast (Dorado por Convección) está pensado para dorar cortes enteros de carne en un solo estante. Este modo utiliza el calor de los elementos inferior, superior y trasero, junto con el movimiento del ventilador por convección, a fin de mejorar el dorado y reducir el tiempo de cocción. No es necesario convertir la temperatura. Cuando use este modo, o si usa la sonda, controle la comida antes que el tiempo sugerido en la receta. Para usar este modo, presione la tecla **Convection Bake (Hornear por Convección)**, ingrese una temperatura, y luego presione **Start (Iniciar)**. No es necesario realizar el precalentamiento al usar este modo.

Modo para Asar

Siempre ase con la puerta cerrada. El elemento para asar en el horno es muy potente. Monitoree la comida de cerca al asar. Tenga cuidado al asar en posiciones de estantes superiores, ya que colocar la comida más cerca del elemento para asar incrementa el humo, salpicaduras y la posibilidad de que se incendien las grasas. **No se recomienda asar en el estante de la posición 6.**

Intente asar las comidas que normalmente haría a la parrilla. Ajuste las posiciones de los estantes para ajustar la intensidad del calor a la comida. Coloque las comidas más cerca del elemento para asar, cuando se desee una superficie más cocinada y un interior poco cocido. Las comidas más gruesas y las comidas cuyo interior debe ser cocinado deberían ser asadas en un estante en una posición alejada del usado para asar, o usando las funciones Broil Lo (Asar Bajo).

Asar Alto

El modo Broil Hi (Asar Alto) usa calor intenso del elemento superior para soasar las comidas. Use la función Broil Hi (Asado Alto) para cortes más delgados de carne y/o comidas que prefiera que queden menos cocinadas en su interior. Para usar este modo, presione la tecla **Broil (Asar)** una vez en **Traditional (Tradicional)** y luego presione **Start (Iniciar)**. No es necesario realizar el precalentamiento al usar este modo.

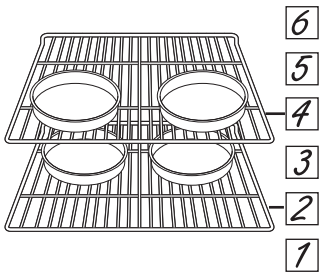
Asar Bajo

El modo Broil Lo (Asar Bajo) usa menos calor intenso del elemento superior para cocinar la comida completamente mientras también se realiza el dorado superficial. Use la función Broil Lo (Asado Bajo) para cortes de carne más gruesos y/o comidas que desee que queden completamente cocinadas. Para usar este modo, presione la tecla **Broil (Asar) dos veces** y luego presione **Start (Iniciar)**. No es necesario realizar el precalentamiento al usar este modo.

Leudar

El modo Proof (Leudar) está diseñado para elevar (fermentar y leudar) masas de pan. Presione la tecla **Proof (Leudar)** y luego presione **Start (Iniciar).** Cubra bien la masa para evitar que se seque. El pan se elevará más rápidamente que a temperatura ambiente. Se deberá observar que con los hornos de pared doble, la función para leudar no se podrá activar cuando se esté usando un modo de limpieza en el horno inferior.

Calentar



El modo Warm (Calentar) está diseñado para mantener comidas calientes hasta durante 3 horas. Para usar este modo, presione la tecla **Warm (Caliente)** y luego presione **Start (Iniciar).** Cubra las comidas que necesitan mantener la humedad y no cubra aquellas comidas que deberían quedar crocantes. No se requiere precalentar las mismas. No use la función Warm (Calentar) para calentar comida fría, excepto galletas crujientes, papas fritas o cereales secos. También se recomienda que la comida no se mantenga caliente por más de dos horas.

Guía de Cocción

TIPO DE COMIDA	MODO(S) RECOMENDADO(S)	POSICIÓN(ES) DE ESTANTES RECOMEN-DADA	SUGERENCIAS ADICIONALES
Productos Horneados			
Tortas con capas, tortas rectan-gulares, roscas, panecillos, pan rápido en un Solo Estante	Horneado Tradicional	3	Use utensilios brillantes.
Tortas con capas* en Múltiples Estantes	Horneado Tradicional	2 y 4	Asegúrese de que haya un flujo de aire adecuado (Vea la ilustración).
Tortas de grasa (pastel de ángel)	Horneado Tradicional	1	Use utensilios brillantes.
Galletas, galletitas, bizcochitos en un Solo Estante	Horneado Tradicional	3	Use utensilios brillantes.
Galletas, galletitas, bizcochitos en Múltiples Estantes	Horneado por Convección Múltiples Estantes	2 y 4 1, 3 y 5	Asegúrese de que haya un flujo de aire adecuado.
Bife y Cerdo			
Hamburguesas	Asar Alto	5	Use una olla para asa; precaliente 5 minutos si usará el Modo para Asar por Convección. Mueva la comida hacia abajo para que quede más preparada y menos soasada. Preste atención a la comida al asarla. Para un mejor rendimiento, centre la comida debajo del elemento calentador para asar.
Bifes y Chuletas	Asar Alto	5	Use una olla para asar; Mueva la comida hacia abajo para que quede más preparada y menos soasada. Preste atención a la comida al asarla. Para un mejor rendimiento, centre la comida debajo del elemento calentador para asar.
Dorados	Dorado por Convección	2 o 3	Use una olla chata tal como una olla para asar. No se requiere precalentarla.
Ave			
Pollo entero	Dorado por Convección	2 o 3	Use una olla chata tal como una olla para asar.
Pechugas, patas, muslos con huesos	Asar Alto	1	Si se empanó o cubrió con salsa, evite los modos Broil Hi (Asar Alto). Ase del lado de la piel hacia abajo primero. Preste atención a la comida al asarla. Para un mejor rendimiento, centre la comida debajo del elemento calentador para asar.
	Asado Bajo Horneado Tradicional Horneado por Convección en 1 Estante	3	
Pechugas de pollo deshuesadas	Asado Bajo Horneado Tradicional Horneado por Convección en 1 Estante	3	Mueva la comida más abajo para que quede más preparada y menos soasada y más arriba para soasar/ dorar al asar. Para un mejor rendimiento, centre la comida debajo del elemento calentador para asar.
Pavo entero	Dorado por Convección	1 o 2	Usa una olla chata tal como una olla para asar.
Pechuga de Pavo	Dorado por Convección	2 o 3	Use una olla chata tal como una olla para asar.
Pescado	Asado Bajo	5 (mitad del grosor o menos) 4 (>1/2 pulgada)	Precaliente 5 minutos al Asar por Convección. Preste atención a la comida al asarla. Para un mejor rendimiento, centre la comida debajo del elemento calentador para asar.
Cazuelas	Horneado por Convección en 1 Estante Horneado Tradicional	3	
Comidas Congeladas a Conveniencia			
Pizza, papas fritas, tator tots, patitas de pollo fritas, aperitivos en un Solo Estante	Horneado por Convección en 1 Estante Horneado Tradicional	3	Use utensilios brillantes.
Pizza, papas fritas, tator tots, patitas de pollo fritas, aperitivos en Múltiples Estantes	Horneado por Convección Múltiples Estantes	2 y 4	Use utensilios brillantes.

*Al hornear cuatro tortas con capas a la vez, use los estantes 2 y 4. Coloque las ollas como se muestra, de modo que no quede una olla encima de la otra.

Cocine la comida completamente para evitar que se produzcan enfermedades a partir de la comida. Puede encontrar recomendaciones sobre temperatura mínima para cocinar de forma segura en **www.IsItDoneYet.gov**. Asegúrese de usar un termómetro de comidas para medir la temperatura de las mismas.

Limpieza del Horno

Asegúrese de que la corriente eléctrica esté apagada y que todas las superficies estén frías antes de limpiar cualquier parte del horno.

Panel de Control

Una buena idea es limpiar el panel de control luego de cada uso. Limpie con un jabón suave y agua o vinagre y agua, enjuague con agua limpia y pula en seco con una tela suave.

No use limpiadores abrasivos, limpiadores líquidos fuertes, almohadillas para fregar de plástico ni limpiadores de horno en el panel de control; dañarán el acabado.

Exterior del Horno

No use limpiadores de horno, limpiadores abrasivos, limpiadores líquidos fuertes, estropajos de acero, almohadillas para fregar de plástico, ni polvos limpiadores en el interior o el exterior del horno. Limpie el mismo con agua y jabón o una solución de vinagre y agua. Enjuague con agua limpia y seque con una tela seca. Al limpiar supeficies, asegúrese de que estén a temperatura ambiente y fuera del contacto con la luz solar. Si las manchas en el borde de la ventana de la puerta son persistentes, use un limpiador abrasivo suave o una esponja con estropajo para obtener un mejor resultado. El derrame de adobo, jugos de fruta, salsas de tomate y líquidos para humedecer que contengan ácidos pueden ocasionar descoloración y se deberán limpiar de inmediato. Deje que las superficies calientes se enfríen, y luego limpie y enjuague.

Superficies de Acero Inoxidable (en algunos modelos)

No use virutas de acero; éstas dañarán la superficie. Para limpiar la superficie de acero inoxidable, use agua tibia con jabón o un limpiador o pulidor para acero inoxidable. Siempre limpie la superficie en la dirección del veteado. Siga las instrucciones del limpiador para limpiar la superficie de acero inoxidable. Para realizar consultas sobre la adquisición de productos, incluyendo limpiadores o pulidores para electrodomésticos de acero inoxidable, lea las secciones de Asistencia y Accesorios, en el comienzo de este manual.

Interior del Horno

El interior de su nuevo horno puede ser limpiado de forma manual o utilizando los modos Steam Clean (Limpieza con Vapor) o Self Clean (Limpieza Automática).

El derrame de adobo, jugos de fruta, salsas de tomate y líquidos para humedecer que contengan ácidos pueden ocasionar descoloración y se deberán limpiar de inmediato. Espere a que las superficies calientes se enfríen, y luego limpie y enjuague.

Limpieza Manual

No use limpiadores de horno, limpiadores abrasivos, limpiadores líquidos fuertes, estropajos de acero, almohadillas para fregar, ni polvos limpiadores en el interior del horno. Limpie el mismo con agua y jabón o una solución de vinagre y agua. Enjuague con agua limpia y seque con una tela seca. Al limpiar supeficies, asegúrese de que estén a temperatura ambiente y fuera del contacto con la luz solar.

Modo de Limpieza con Vapor

La limpieza con vapor está pensada para limpiar pequeños derrames usando agua y a una temperatura de limpieza más baja que la función Self-Clean (Limpieza Automática).

Para usar la función Steam Clean (Limpieza con Vapor), limpie las grasas y suciedades del horno. Vierta una taza de agua en la parte inferior del horno. Cierre la puerta. Presione la tecla **Clean (Limpiar) dos veces** y luego presione **Start (Iniciar)**. La puerta del horno se trabará. No podrá abrir la puerta durante los 30 minutos de la limpieza con vapor, ya que esto reducirá su rendimiento. Al finalizar el ciclo de limpieza al vapor, la puerta se destrabará. Limpie cualquier exceso de agua y cualquier suciedad que haya quedado.

Modo de Limpieza Automática

Lea las Instrucciones de Seguridad del Horno con Limpieza Automática, en el comienzo de este manual antes de usar el modo Self Clean (Limpieza Automática). Este modo usa temperaturas muy altas para limpiar el interior del horno. Cuando use esta función, la puerta del horno se trabará. Antes de utilizar el ciclo de limpieza automática, limpie la grasa y restos de comida que haya en el horno. Retire todos los artículos del horno, excepto los estantes esmaltados (color oscuro). Los estantes brillantes o de plata y cualquier utensilio u otros artículos deberían ser retirados del horno antes de iniciar un ciclo de limpieza automática. Cierre la puerta. Presione la tecla **Clean (Limpiar)** y se exhibirá un tiempo de limpieza automática por omisión. El tiempo de limpieza puede ser modificado en cualquier momento entre las 3:00 y las 5:00 horas, usando las teclas numéricas para ingresar un tiempo diferente y presionando **Start (Iniciar)**. Si desea usar el tiempo por omisión, presione la tecla **Start (Iniciar)** inmediatamente luego de presionar la tecla **Clean (Limpiar)** El horno se apagará de forma automática cuando el ciclo de limpieza automática sea completado. La puerta permanecerá bloqueada hasta que el horno se haya enfriado. Una vez que el horno se haya enfriado, limpie cualquier ceniza que haya quedado en el horno.

IMPORTANTE: Las emanaciones producidas por el ciclo de autolimpieza de cualquier horno afectan la salud de algunas aves de manera notoria. Procure llevar sus aves a otra habitación bien ventilada.

Estantes Planos

Los estantes planos se podrán dejar en la cavidad durante la limpieza automática (si se trata de estantes esmaltados, no brillantes) o se podrán lavar con agua caliente y jabón.

Es posible que resulte más difícil deslizar los estantes, especialmente luego de la limpieza automática. Coloque aceite vegetal en una tela húmeda o toalla de papel y frote sobre los extremos izquierdo y derecho.

Mantenimiento

Reemplazo de la Lámpara del Horno

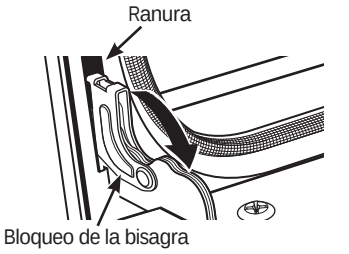
⚠ ADVERTENCIA

PELIGRO DE DESCARGA O QUEMADURAS: Antes de reemplazar la lámpara de luz del horno, desconecte la conexión eléctrica del horno del fusible principal o del panel del disyuntor. Si esto no se cumple, se podrá producir una descarga eléctrica o un incendio.

⚠ PRECAUCIÓN

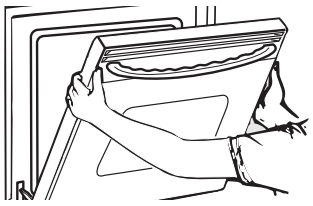
RIESGO DE INCENDIO: La tapa de vidrio y la lámpara de luz se deberán retirar cuando estén frías. Tocar el vidrio caliente sin protección en las manos o con un trapo húmedo puede ocasionar quemaduras.

1. Desconecte la corriente desde el fusible principal o el panel del disyuntor.
2. Retire los estantes del horno.
3. Deslice un destornillador de punta plana entre la caja y la tapa de luz de vidrio.
4. Apoye la tapa de luz de vidrio con dos dedos para evitar que se caiga al fondo del horno. Tenga cuidado de no astillar la cubierta del horno.
5. De forma suave, gire la punta del destornillador para aflojar la tapa de luz de vidrio.
6. Retire la tapa de luz de vidrio.
7. Retire la lámpara sosteniendo firmemente y deslizando la misma hacia afuera, hasta que las dos clavijas hayan dejado el soporte de cerámica.
8. No toque el vidrio de la nueva lámpara con los dedos. Esto hará que la lámpara falle al dar luz. Tome la lámpara de reemplzado con una toalla limpia o un pañuelo de papel con las clavijas hacia abajo. Aliñe las dos clavijas en el soporte de cerámica, presionando suavemente hasta que la lámpara quede asegurada en la ficha de cerámica.
9. Deslice las lentes protectoras del soporte y presione hasta que las pinzas queden enganchadas en la caja.
10. Vuelva a conectar la corriente.



Puerta del Horno Desmontable

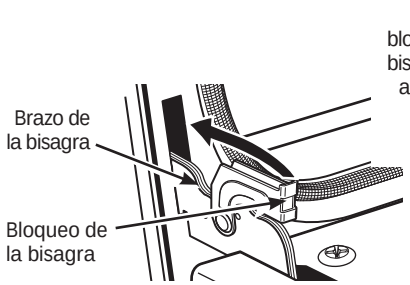
La puerta es muy pesada. Tenga cuidado al retirar y levantar la puerta.



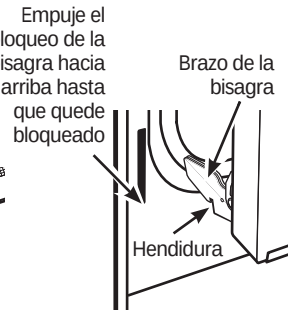
No levante la puerta usando la manija.

Para retirar la puerta:

1. Abra la puerta totalmente.
2. Empuje los bloqueos de la bisagra hacia abajo en dirección a la estructura de la puerta, hasta la posición desbloqueada. Es posible que necesite una herramienta tal como un destornillador pequeño de punta plana.
3. Firmemente tome ambos lados de la puerta por la parte superior.
4. Cierre la puerta hasta la posición de retiro de la misma. La puerta debería ser abierta aproximadamente a 3”, sin obstrucción sobre la misma.
5. Levante la puerta hacia arriba y afuera, hasta que los brazos de las bisagras queden fuera de las ranuras.



Empuje los bloqueos de la bisagra hacia abajo para desbloquear



Posición de retiro

Para reemplazar la puerta:

1. Firmemente tome ambos lados de la puerta por la parte superior.
2. Comenzando desde el lado izquierdo, con la puerta en el mismo ángulo de la posición de retiro, apoye la hendidura del brazo de la bisagra en el extremo inferior de la ranura de la bisagra. La abertura en el brazo de la bisagra deberá estar totalmente apoyada en la parte inferior de la ranura. Repita el procedimiento del lado derecho.
3. Abra la puerta totalmente. Si la puerta no se abre totalmente, la hendidura no está correctamente apoyada en el extremo inferior de la ranura.
4. Empuje los bloqueos de la bisagra contra la estructura frontal de la cavidad del horno, hasta la posición de bloqueo.
5. Cierre la puerta del horno.

Extremo inferior de la ranura

Consejos para la Solución de Problemas... Antes de solicitar el servicio técnico

¡Ahorre tiempo y dinero! Primero revise los cuadros que aparecen en las siguientes páginas y es posible que no necesite solicitar reparaciones.

Problema	Causa Posible	Qué Hacer
Mi horno nuevo no cocina como el anterior. ¿Hay algún problema con las configuraciones de temperatura?	**Su horno nuevo cuenta con un sistema de cocción diferente con relación al anterior y, por lo tanto, es posible que cocine de forma diferente.**	En los primeros usos, use los tiempos y temperaturas de su receta con cuidado. Si aún piensa que su horno nuevo cocina con demasiado calor o demasiado frío, podrá ajustar el termostato usted mismo para aplicar su preferencia de cocción específica. **NOTA:** Este ajuste afecta las temperaturas de Bake (Hornear), Convection Bake 1 Rack (Hornear por Convección en 1 Estante) y Convection Bake Multi (Hornear por Convección Múltiple); no afectará las funciones Convection Roast (Dorar por Convección), Broil (Asar), o Clean (Limpiar).
La comida no se hornea de forma apropiada	**Controles del horno configurados de forma incorrecta.**	Consulte la sección Modos de Cocción.
	La posición del estante es incorrecta o el estante no está nivelado.	SeConsulte la sección Modos de Cocción y la Guía de Cocción.
	Uso de una cacerola incorrecta o de una cacerola de tamaño incorrecto.	Consulte la sección Utensilios.
	La temperatura del horno debe ser ajustada.	Consulte la sección Funciones Especiales.
	Sustitución de ingredientes	Sustituir ingredientes puede modificar el resultado de la receta.
La comida no asa de forma apropiada	**Controles del horno configurados de forma incorrecta.**	Asegúrese de seleccionar el modo correcto para asar.
	Se usó una posición incorrecta del estante.	Para acceder a sugerencias de ubicación de estantes, consulte la Guía de Cocción.
	Se cocinó comida en una olla caliente.	Asegúrese de que el utensilio esté frío
	Utensilio de cocina inadecuado para asar.	Use una olla específicamente diseñada para asar
	El papel de aluminio usado para la olla y la rejilla para asar no se ajustó ni cortó de forma apropiada, según lo recomendado.	Si usará papel de aluminio, deberá usarse conforme con las aberturas de la olla.
	En algunas áreas, es posible que el nivel de corriente (voltaje) sea bajo.	Precaliente el elemento para asar durante 10 minutos.
La temperatura del horno es demasiado caliente o demasiado fría	**La temperatura del horno debe ser ajustada.**	Consulte la sección Funciones Especiales.
El horno no funciona o parece no funcionar	**Es posible que un fusible de su hogar se haya quemado o que el disyuntor se haya desconectado.**	Reemplace el fusible o reinicie el disyuntor.
	Controles del horno configurados de forma incorrecta.	Consulte la sección Uso del Horno.
	El horno se encuentra en Sabbath Mode (Modo Sabático)	Verifique que el horno no esté en Sabbath Mode (Modo Sabático). Consulte la sección Funciones Especiales.
Sonido de “chisporroteo” o “traqueo”	**Éste es el sonido de metal calentándose o enfriándose durante las funciones de cocción y limpieza..**	Esto es normal.
¿Por qué la estufa hace un sonido de “clic” cuando uso el horno?	**Su estufa fue diseñada para mantener un control más ajustado sobre la temperatura del horno. Es posible que escuche que los elementos de calentamiento del horno hagan sonidos de “clic” con mayor frecuencia que con hornos más antiguos para lograr mejores resultados durante los ciclos de horneado, asado, convección y limpieza automática.**	Esto es normal.
El reloj y el temporizador no funcionan	**Es posible que un fusible de su hogar se haya quemado o que el disyuntor se haya desconectado.**	Reemplace el fusible o reinicie el disyuntor.

Consejos para la Solución de Problemas... Antes de solicitar el servicio técnico

Problema	Causa Posible	Qué Hacer
La luz del horno no funciona	**La lámpara está floja o presenta defectos.**	Ajuste o reemplace la lámpara.
	La luz de funcionamiento del interruptor está rota.	Llame al servicio técnico.
El modo de limpieza automática del horno no funciona	**La temperatura del horno es demasiado caliente como para configurar la limpieza automática.**	Espere a que el horno se enfríe y reinicie los controles.
	Los controles del horno están configurados de forma incorrecta.	Consulte la sección de Limpieza del Horno.
Exceso de humo durante un ciclo de limpieza	**Suciedad o grasa excesiva.**	Presione la tecla **Cancel/Off (Cancelar/ Apagar)** Abra las ventanas para liberar el humo en la habitación. Espere hasta que la luz de la función **LOCKED (Bloqueado)** desaparezca. Limpie el exceso de suciedad y reinicie el ciclo de limpieza.
Humo excesivo al asar	**La comida está demasiado cerca del quemador.**	Baje la posición del estante con comida.
La puerta del horno no se abrirá luego de un ciclo de limpieza	**El horno está demasiado caliente.**	Espere a que el horno se enfríe por debajo de la temperatura de bloqueo.
El horno no limpia luego de un ciclo de limpieza	**Los controles del horno están configurados de forma incorrecta.**	Consulte la sección de Limpieza del Horno.
	El horno estaba demasiado sucio.	Limpie derrames excesivos antes de iniciar el ciclo de limpieza. Es posible que, en hornos con mucha suciedad, sea necesario usar la limpieza automática nuevamente o usarla durante un período de tiempo más prolongado.
"LOCK DOOR" (Puerta Trabada) titila en la pantalla	**El ciclo de limpieza automática fue seleccionado pero la puerta no está cerrada.**	Cierre la puerta del horno.
La luz de LOCKED (Bloqueado) está encendida cuando desea cocinar	**La puerta del horno está bloqueada debido a que la temperatura interior del horno no descendió por debajo de la temperatura de bloqueo.**	Presione la tecla **Cancel/Off (Cancelar/ Apagar)** Deje que el horno se enfríe.
"F – y un número o letra" titila en la pantalla	**Tiene un código de error de función.**	Presione la tecla **Cancel/Off (Cancelar/ Apagar)** Permita que el horno se enfríe durante una hora. Vuelva a poner el horno en funcionamiento.
	Si el código de función se repite.	Desconecte totalmente la corriente de la cocina durante por lo menos 30 minutos y vuelva a conectar la misma. Si el código de error de función se repite, llame al servicio técnico.
La pantalla queda en blanco	**Es posible que un fusible de su hogar se haya quemado o que el disyuntor se haya desconectado.**	Reemplace el fusible o reinicie el disyuntor.
	El reloj está apagado.	Consulte la sección Funciones Especiales.
	El horno se encuentra en Sabbath Mode (Modo Sabático)..	Verifique que el horno no esté en Sabbath Mode (Modo Sabático). Consulte la sección Funciones Especiales.
Corte de corriente, el reloj titila	**Corte o exceso de corriente**	Reinicie el reloj. Si el horno estuvo en uso, deberá reiniciar el mismo presionando la tecla **Cancel/ Off (Cancelar/ Apagar)** configurando el reloj y reiniciando cualquier función de cocción.
Olor a "quemado" o "aceite" desde la ventilación	**Esto es normal en un horno nuevo y desaparecerá con el tiempo.**	Para acelerar el proceso, configure un ciclo de limpieza automática por un mínimo de 3 horas. Consulte la sección de Limpieza del Horno.
Olor fuerte	**Un olor en la aislación alrededor del interior del horno es normal desde las primeras veces en que el horno es usado.**	Esto es temporario y desaparecerá luego de varios usos o de un ciclo de limpieza automática.
Ruido del ventilador	**Es posible que un ventilador de enfriamiento se active automáticamente.**	Esto es normal. El ventilador de enfriamiento se encenderá para enfriar las partes internas. Es posible que funcione hasta durante una hora y media, una vez que el horno se haya apagado.
La puerta de vidrio del horno parece estar "teñida" o tener un color "arcoíris". ¿Es esto un defecto?	**No. El vidrio del horno interno está cubierto con una barrera de calor que refleja este último nuevamente hacia el horno, a fin de evitar la pérdida de calor y de mantener fría la puerta externa mientras se hornea.**	Esto es normal. Bajo ciertas luces y ángulos, es posible que visualice esta tinta o arcoíris.

Consejos para la Solución de Problemas... Antes de solicitar el servicio técnico

Problema	Causa Posible	Qué Hacer
A veces el horno tarda más en precalentarse a la misma temperatura	**Utensilio o comida en el horno**	El utensilio o la comida en el horno hará que éste tarde más en precalentarse. Retire estos artículos para reducir el tiempo de precalentamiento.
	Número de estantes en el horno	Agregar más estantes al horno hará que éste tarde más en precalentarse. Retire algunos estantes.
	Diferentes modos de cocción	Los diferentes modos de cocción utilizan diferentes métodos de precalentamiento para calentar el horno en un modo de cocción específico. Algunos modos tardarán más que otros (tales como: horneado por convección múltiple).

INSTRUCTION MANUAL

Issued: 7-25-2013

⚠ WARNING

Only qualified service technicians should install and service the appliance. To obtain the name and phone number of your local Hoshizaki Certified Service Representative, visit www.hoshizaki.com. No installation or service should be undertaken until the technician has thoroughly read this Instruction Manual. Likewise, the owner/manager should not proceed to operate the appliance until the installer has instructed them on its proper operation. Failure to install, operate, and maintain the appliance in accordance with this manual will adversely affect safety, performance, component life, and warranty coverage and may result in costly water damage. Proper installation is the responsibility of the installer. Product failure or property damage due to improper installation is not covered under warranty.

Hoshizaki provides this manual primarily to assist qualified service technicians in the installation, maintenance, and service of the appliance.

Should the reader have any questions or concerns which have not been satisfactorily addressed, please call, send an e-mail message, or write to the Hoshizaki Technical Support Department for assistance.

Phone: 1-800-233-1940; (770) 487-2331
Fax: 1-800-843-1056; (770) 487-3360

E-mail: techsupport@hoshizaki.com

HOSHIZAKI AMERICA, INC.
618 Highway 74 South
Peachtree City, GA 30269
Attn: Hoshizaki Technical Support Department

NOTE: To expedite assistance, all correspondence/communication MUST include the following information:

- Model Number _____
- Serial Number _____
- Complete and detailed explanation of the problem.

IMPORTANT

This manual should be read carefully before the appliance is installed and operated. Read the warnings and guidelines contained in this manual carefully as they provide essential information for the continued safe use and maintenance of the appliance. Retain this manual for any further reference that may be necessary.

Important Safety Information

Throughout this manual, notices appear to bring your attention to situations which could result in death, serious injury, damage to the appliance, or damage to property.

⚠ WARNING **Indicates a hazardous situation which could result in death or serious injury.**

NOTICE **Indicates a situation which could result in damage to the appliance or property.**

IMPORTANT **Indicates important information about the installation, use, and care of the appliance.**

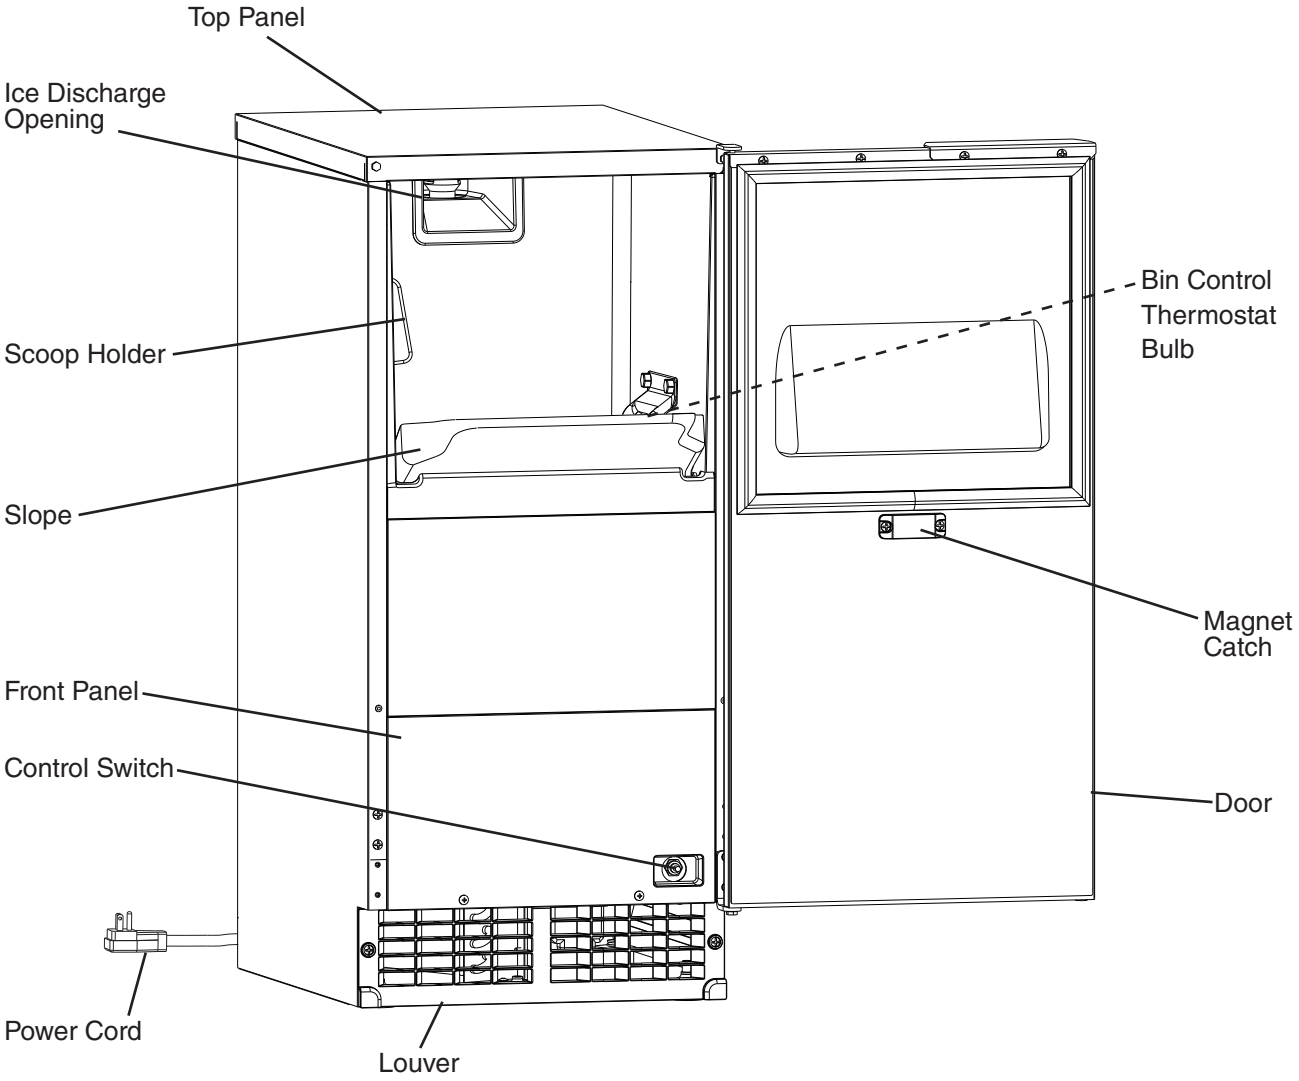
⚠ WARNING

The appliance should be destined only to the use for which it has been expressly conceived. Any other use should be considered improper and therefore dangerous. The manufacturer cannot be held responsible for injury or damage resulting from improper, incorrect, and unreasonable use. Failure to install, operate, and maintain the appliance in accordance with this manual will adversely affect safety, performance, component life, and warranty coverage and may result in costly water damage.

To reduce the risk of death, electric shock, serious injury, or fire, follow basic precautions including the following:

- Only qualified service technicians should install and service the appliance.
- The appliance must be installed in accordance with applicable national, state, and local codes and regulations.
- The appliance requires an independent power supply of proper capacity. See the nameplate for electrical specifications. Failure to use an independent power supply of proper capacity can result in a tripped breaker, blown fuse, damage to existing wiring, or component failure. This could lead to heat generation or fire.
- **THE APPLIANCE MUST BE GROUNDED:** The appliance is equipped with a NEMA 5-15 three-prong grounding plug to reduce the risk of potential shock hazards. It must be plugged into a properly grounded, independent 3-prong wall outlet. If the outlet is a 2-prong outlet, it is your personal responsibility to have a qualified electrician replace it with a properly grounded, independent 3-prong wall outlet. Do not remove the ground prong from the power cord and do not use an adapter plug. Failure to properly ground the appliance could result in death or serious injury.
- Do not use an extension cord.
- To reduce the risk of electric shock, do not touch the control switch or plug with damp hands. Make sure the control switch is in the "OFF" position before plugging in or unplugging the appliance.
- Do not use an appliance with a damaged power cord. The power cord should not be altered, jerked, bundled, weighed down, pinched, or tangled. Such actions could result in electric shock or fire. To unplug the appliance, be sure to pull the plug, not the cord, and do not jerk the cord.
- Do not make any alterations to the appliance. Alterations could result in electric shock, injury, fire, or damage to the appliance.
- Do not place fingers or any other objects into the ice discharge opening.

⚠ WARNING, continued



- The appliance is not intended for use by persons (including children) with reduced physical, sensory, or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.
- Young children should be properly supervised around the appliance.
- Do not climb, stand, or hang on the appliance or appliance door or allow children or animals to do so. Serious injury could occur or the appliance could be damaged.
- Be careful not to pinch fingers when opening and closing the door. Be careful when opening and closing the door when children are in the area.
- Do not use combustible spray or place volatile or flammable substances near the appliance. They might catch fire.
- Keep the area around the appliance clean. Dirt, dust, or insects in the appliance could cause harm to individuals or damage to the appliance.

NOTICE

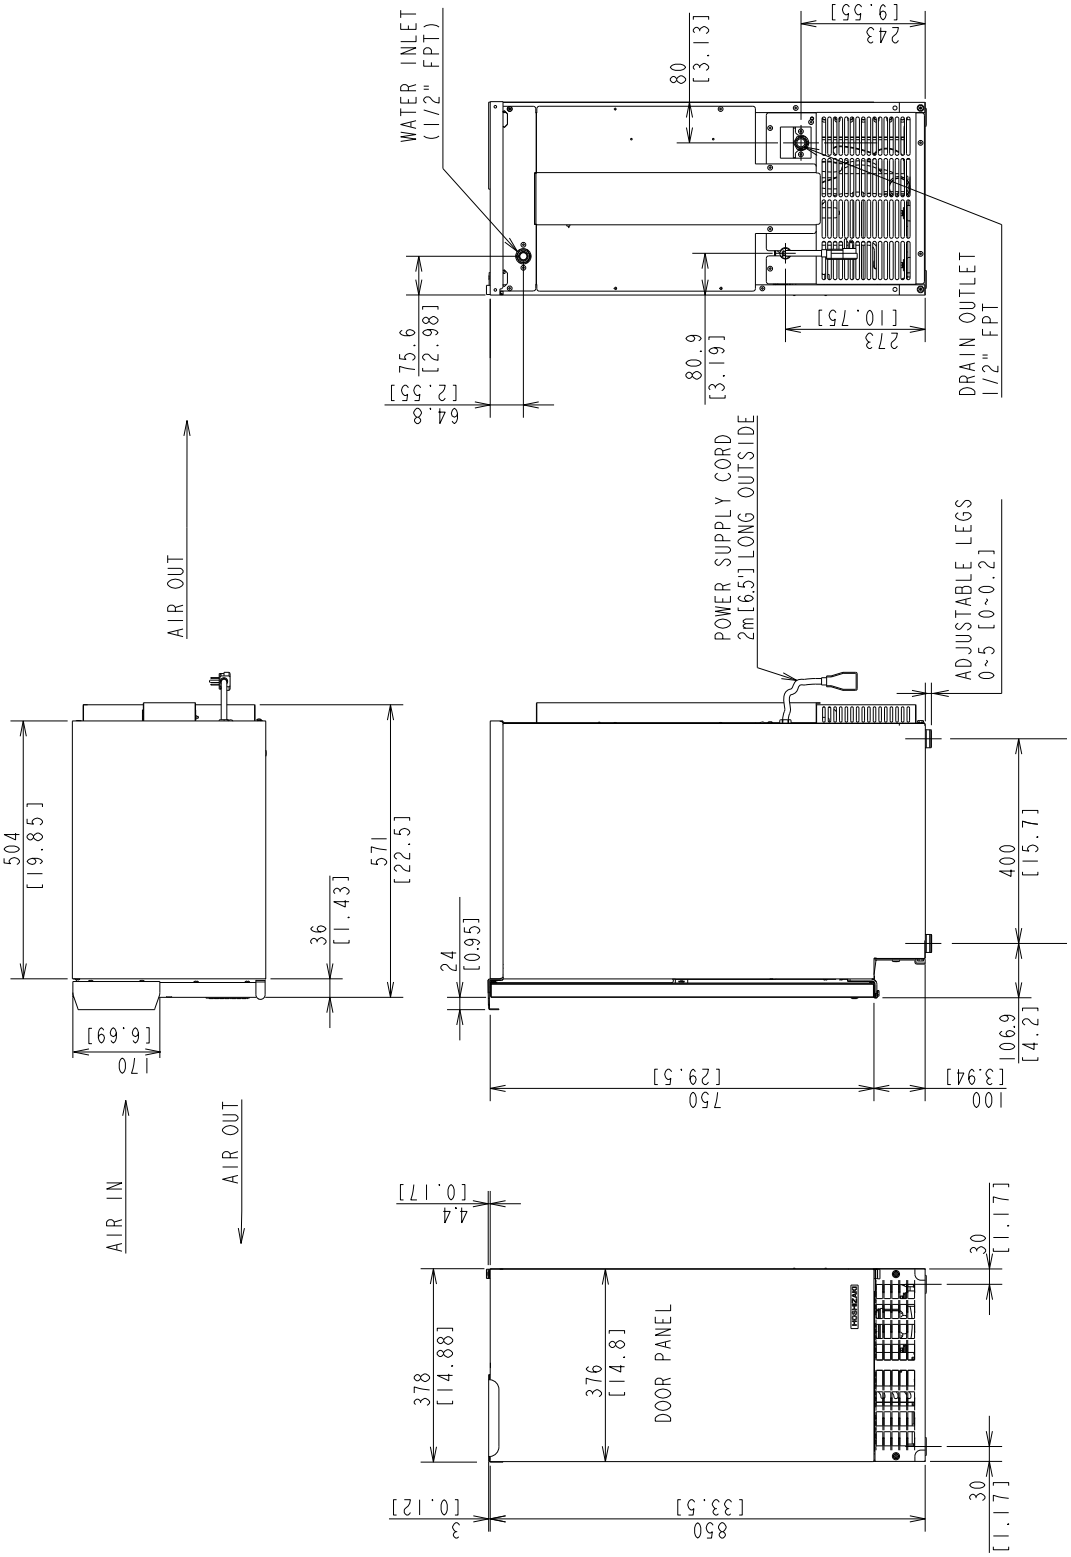
- Protect the floor when moving the appliance to prevent damage to the floor.
- Follow the water supply, drain connection, and maintenance instructions carefully to reduce the risk of costly water damage.
- In areas where water damage is a concern, install in a contained area with a floor drain.
- Install the appliance in a location that stays above freezing. Normal operating ambient temperature must be within 45°F to 100°F (7°C to 38°C).
- If using the optional drain pump (HS-5061), test its operation every time the appliance is cleaned and sanitized. See "IV.E. Optional Drain Pump HS-5061" for details. If the optional drain pump is not operating properly, water could back up and overflow, leading to costly water damage.
- To help ensure the storage bin drain remains clear, follow the instructions in "IV.C. Storage Bin Drain" once every 3 months or as often as necessary for conditions. If the storage bin drain becomes clogged, water could build up in the bin and overflow, leading to costly water damage.
- If water collects in the bin and will not drain, turn off the appliance and close the water supply line shut-off valve. Call for service.
- If water seeps from the base of the appliance, turn off the appliance and close the water supply line shut-off valve. Call for service. Failure to do so could lead to costly water damage.
- Do not leave the appliance on during extended periods of non-use, extended absences, or in sub-freezing temperatures. To properly prepare the appliance for these occasions, follow the instructions in "V. Preparing the Appliance for Periods of Non-Use."
- Keep ventilation openings, in the appliance enclosure or in the built-in structure, clear of obstruction.
- Do not place objects on top of the appliance.
- The storage bin is for ice use only. Do not store anything else in the storage bin.

I. Specifications

A. Construction

B. Electrical and Refrigerant Data

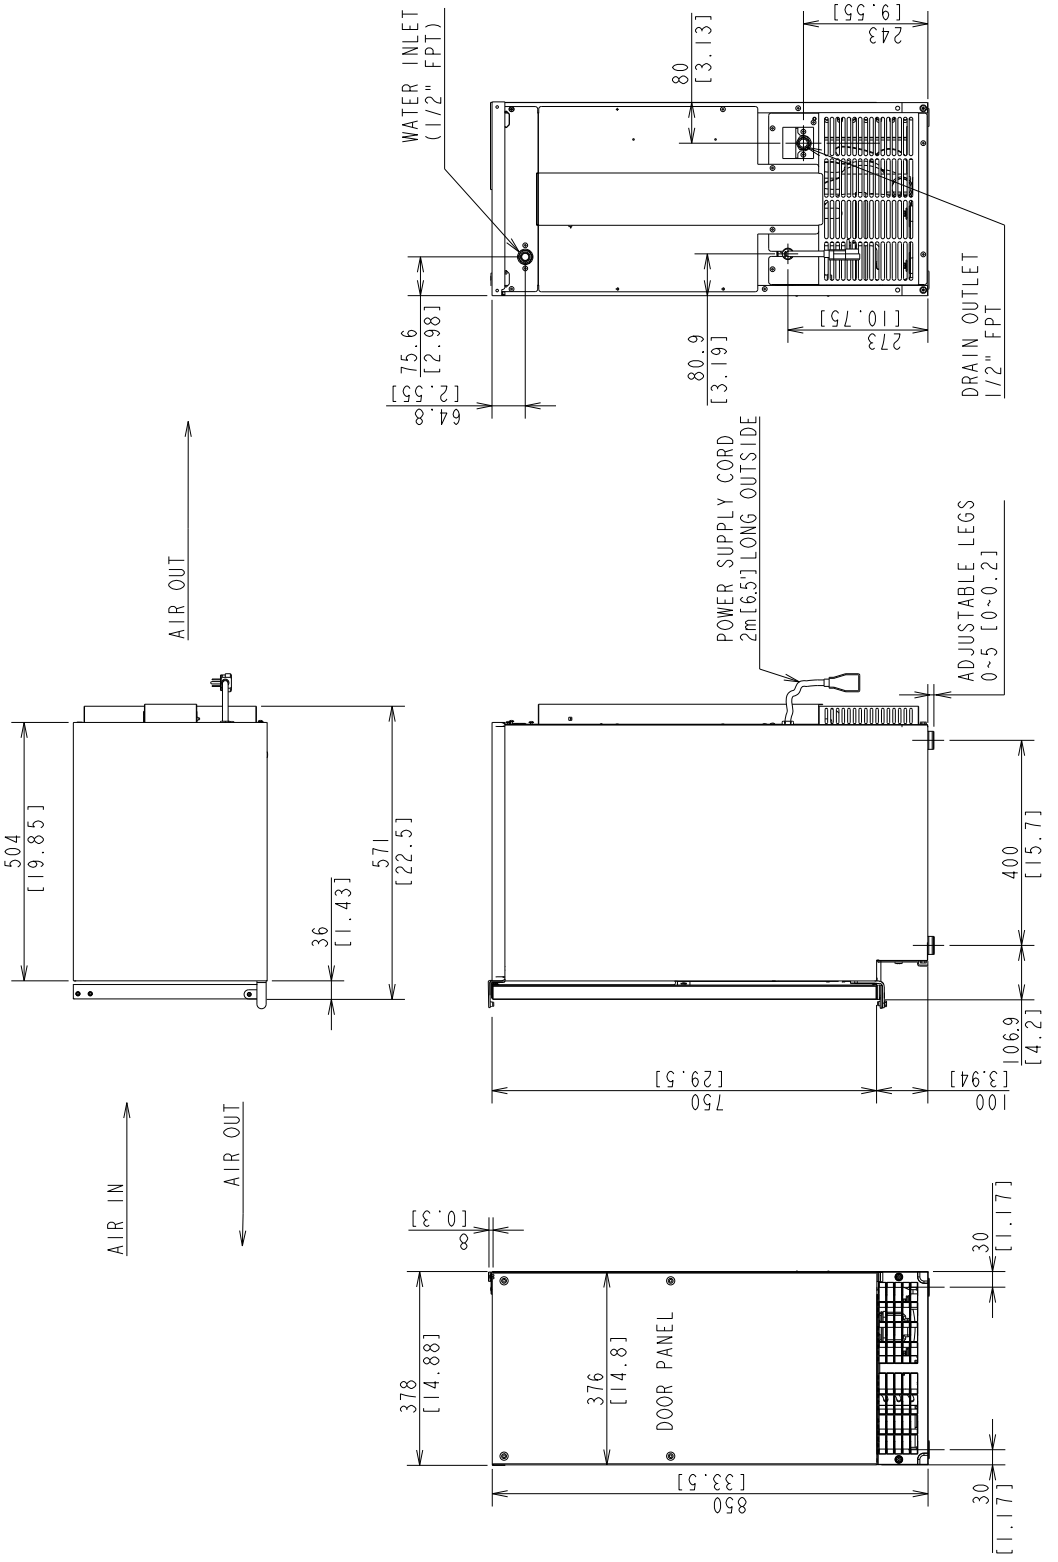
The nameplate provides electrical and refrigerant data. The nameplate is located inside the storage bin. For certification marks, see the nameplate.



We reserve the right to make changes in specifications and design without prior notice.

Model Number	**C-101BAH** **C-101BAH-DS** **C-101BAH-AD** **C-101BAH-ADDS**
AC Supply Voltage	115-120/60/1
Amperes	4.0 AMPS
Design Pressure	HI-240PSI LO-120PSI
Refrigerant	134a 3.17 OZ.

C. Dimensions/Connections



1. C-101BAH

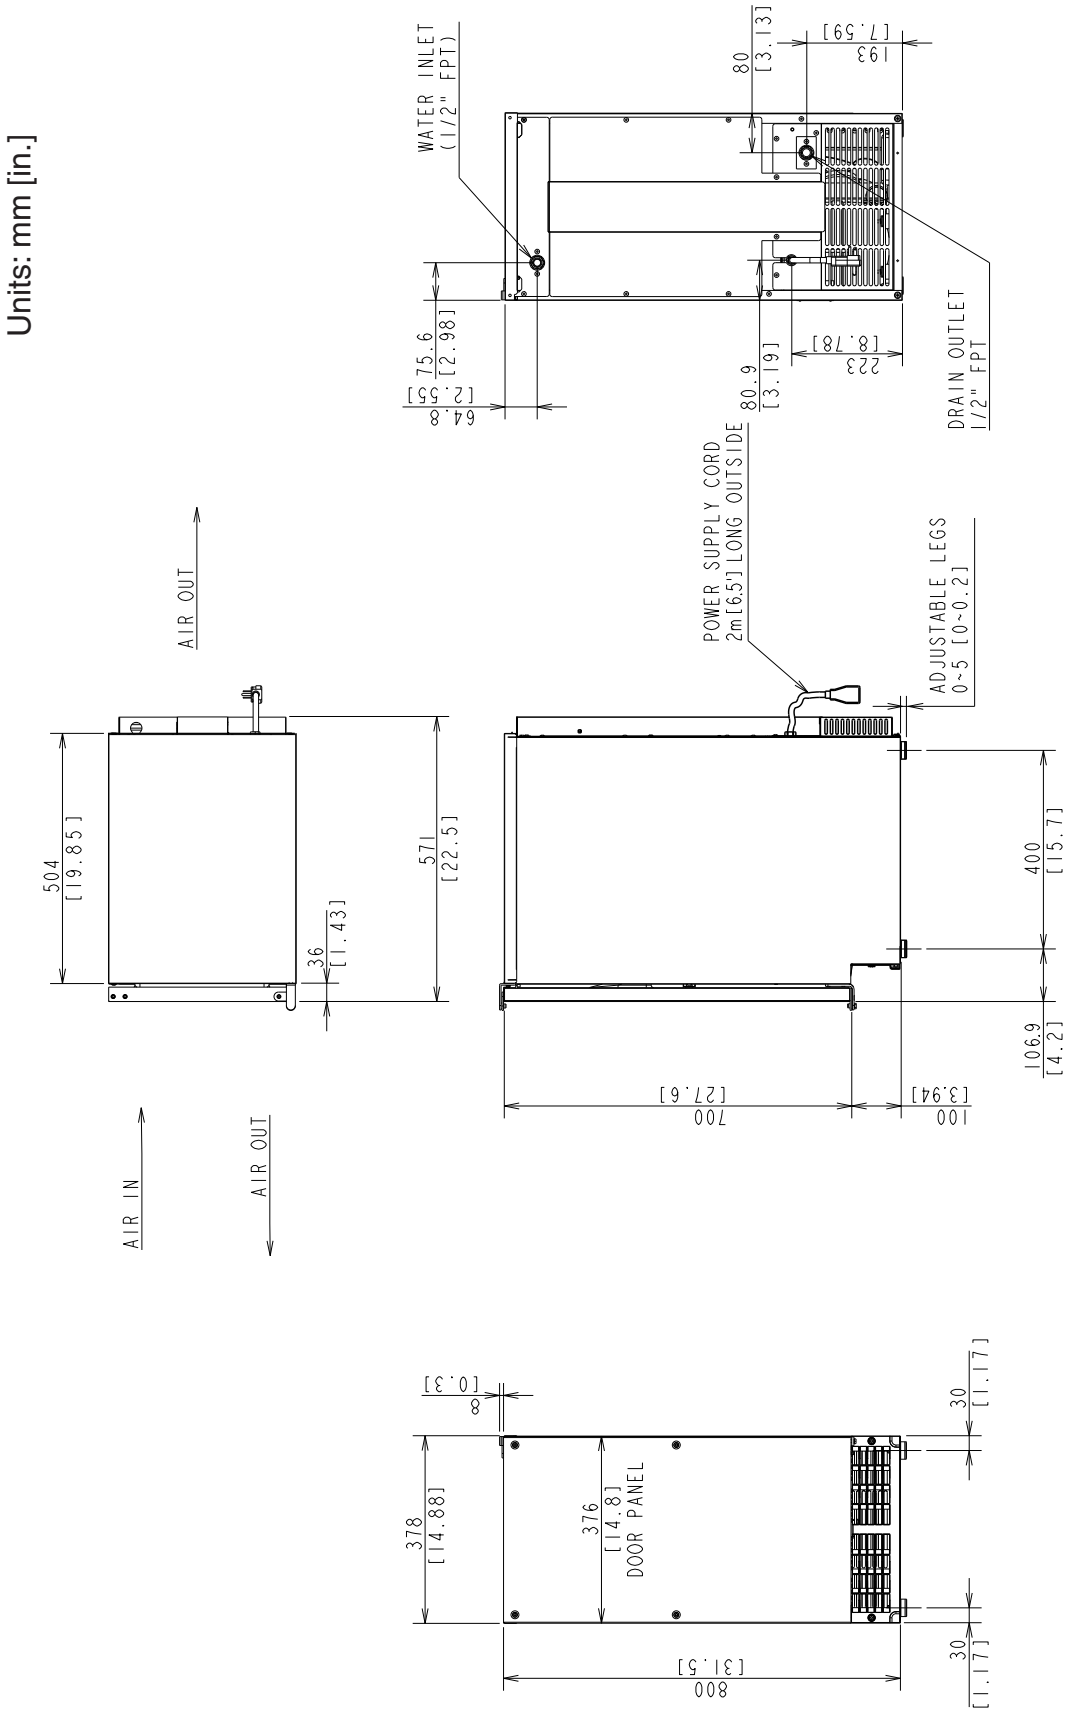
2. C-101BAH-DS

Units: mm [in.]



3. C-101BAH-AD

Units: mm [in.]

4. C-101BAH-ADDS

II. Installation Instructions

⚠ WARNING

- The appliance must be installed in accordance with applicable national, state, and local codes and regulations.
- **CHOKING HAZARD:** Ensure all components, fasteners, and thumbscrews are securely in place after installation. Make sure that none have fallen into the storage bin.

A. Checks Before Installation

- Visually inspect the exterior of the shipping container and immediately report any damage to the carrier. Upon opening the container, any concealed damage should also be immediately reported to the carrier.
- Remove the shipping carton, tape, and packing material. If any are left in the appliance, it will not work properly.
- Remove the package containing the accessories.
- Remove the protective plastic film from the panels. If the appliance is exposed to the sun or to heat, remove the film after the appliance cools.
- See the nameplate inside the storage bin, and check that your voltage supplied corresponds with the voltage specified on the nameplate.

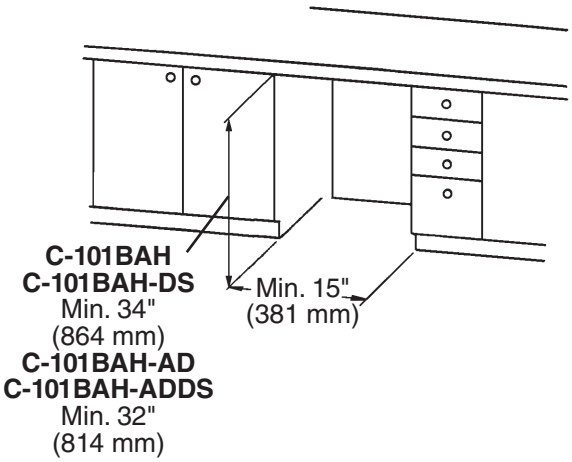
B. Location

1. General

The appliance is approved for indoor or outdoor use.

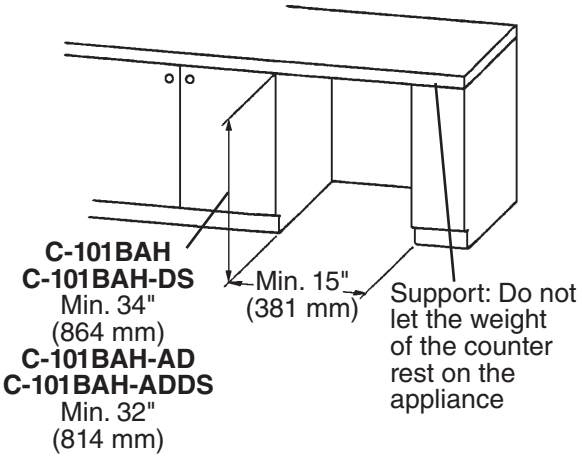
NOTICE

- Normal operating ambient temperature must be within 45°F to 100°F (7°C to 38°C); Normal operating water temperature must be within 45°F to 90°F (7°C to 32°C). Operation of the appliance, for extended periods, outside of these normal temperature ranges may affect appliance performance.
- The appliance will not work at sub-freezing temperatures. To prevent damage to the water supply line, drain the appliance if the air temperature is going to go below 32°F (0°C). See "V. Preparing the Appliance for Periods of Non-Use."



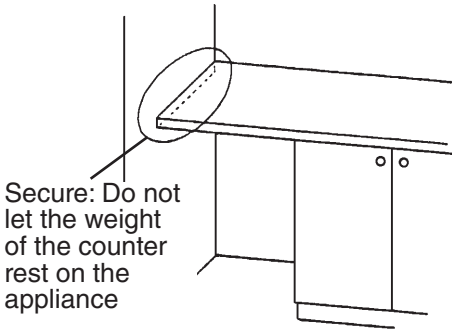
- The appliance should not be located next to ovens, grills, or other high heat producing equipment.
- The location must provide a firm and level foundation for the appliance.
- The appliance requires no side or top clearance. But allow enough space at rear for water supply and drain connections and at least 15" (38 cm) clearance at front.
- The appliance must be at floor level on a finished floor even if under a cabinet. In areas where water damage is a concern, install in a contained area with a floor drain.

2. Built-In Installation Site

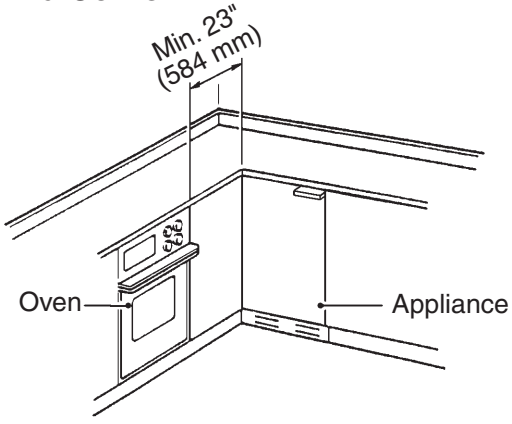


NOTICE
• Do not let the weight of the counter rest on the appliance. • Do not install the appliance in a corner where the door will interfere with other equipment or where the appliance cannot be pulled out for service.

Installation Space			
Model	**Height**	**Width**	**Depth**
C-101BAH C-101BAH-DS	34" (864 mm) minimum	15" (381 mm) minimum	24" (610 mm) minimum
C-101BAH-AD C-101BAH-ADDS	32" (814 mm) minimum		



Between Two Cabinets



Between a Cabinet and the End of a Counter

Between a Cabinet and a Wall or Tall Cabinet

In a Corner

C. Door

1. C-101BAH, C-101BAH-AD

a) Door Reversal

If you would like to reverse the door swing, follow the steps below. Otherwise, skip to section "II.D. Setup."

1) While maintaining a hold on the door, remove the hinge stop pin from hinge (B). Pull out the bottom of the door slightly and gently remove the door from hinge (A). See Fig. 1.

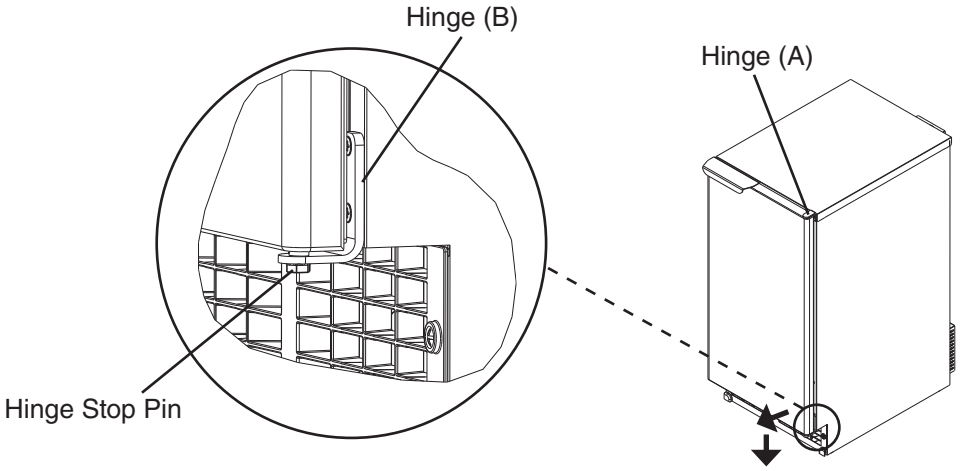


Fig. 1

2) Remove the 2 bolts securing the top panel, then lift it off. See Fig. 2.

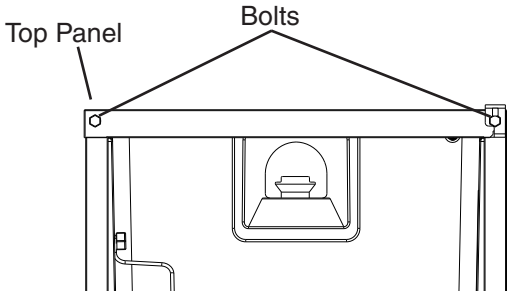

Fig. 2

3) Remove hinge (A) and the bracket from the right side of the appliance and the top brace from the left side. Rotate hinge (A) to position the gasket notch to the inside, then fasten hinge (A) and the bracket to the left side and the top brace to the right side. See Fig. 3.

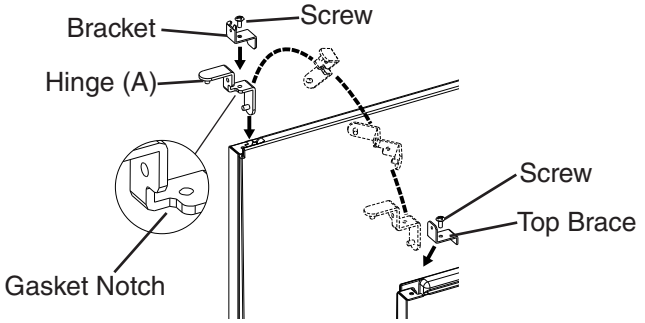

Fig. 3

4) Remove hinge (B) from the right side of the appliance and the 2 filler screws from the left side. Attach the 2 filler screws to the right side and attach hinge (B) to the left side. See Fig. 4.

5) Rotate the top panel 180° from its previous position. This brings the notch that was previously in the right rear to the left front. See Fig. 5. Hook the rear part of the panel on the body, then secure the front with the 2 bolts removed in step 2.

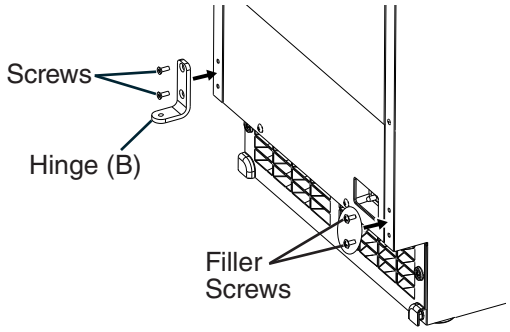

Fig. 4

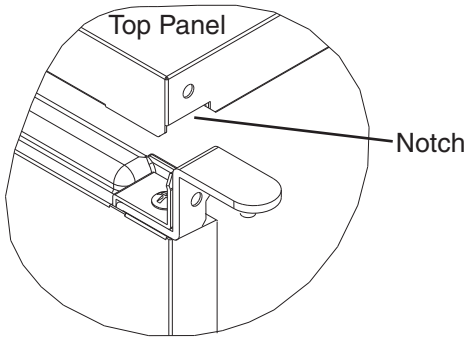

Fig. 5

6) Remove the 2 screws attaching the door handle and also remove the other 2 screws indicated in the illustration. Use 2 of the screws to attach the handle to the other side of the door and attach the other 2 screws in the remaining 2 holes. See Fig. 6.

7) Attach the door to hinge (A), then continue to maintain a hold on the door. Screw the hinge stop pin into hinge (B) until it is tight. See Fig. 7.

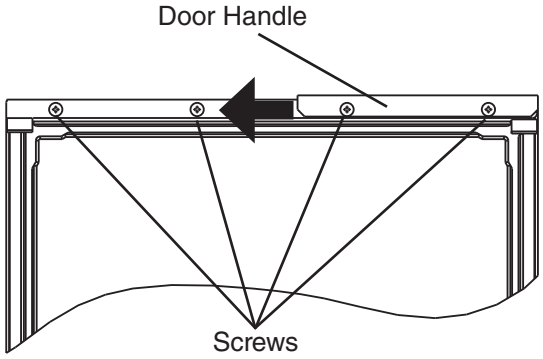

Fig. 6

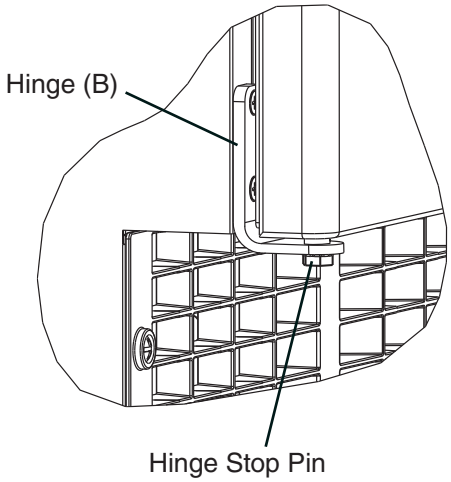

Fig. 7

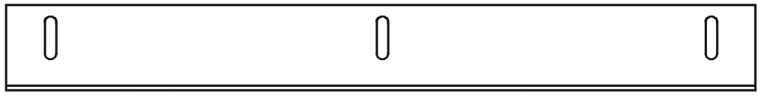
2. C-101BAH-DS, C-101BAH-ADDS

a) Overlay Panel Fabrication and Attachment

IMPORTANT
The overlay panel must be crafted by a professional cabinet maker to ensure quality results.

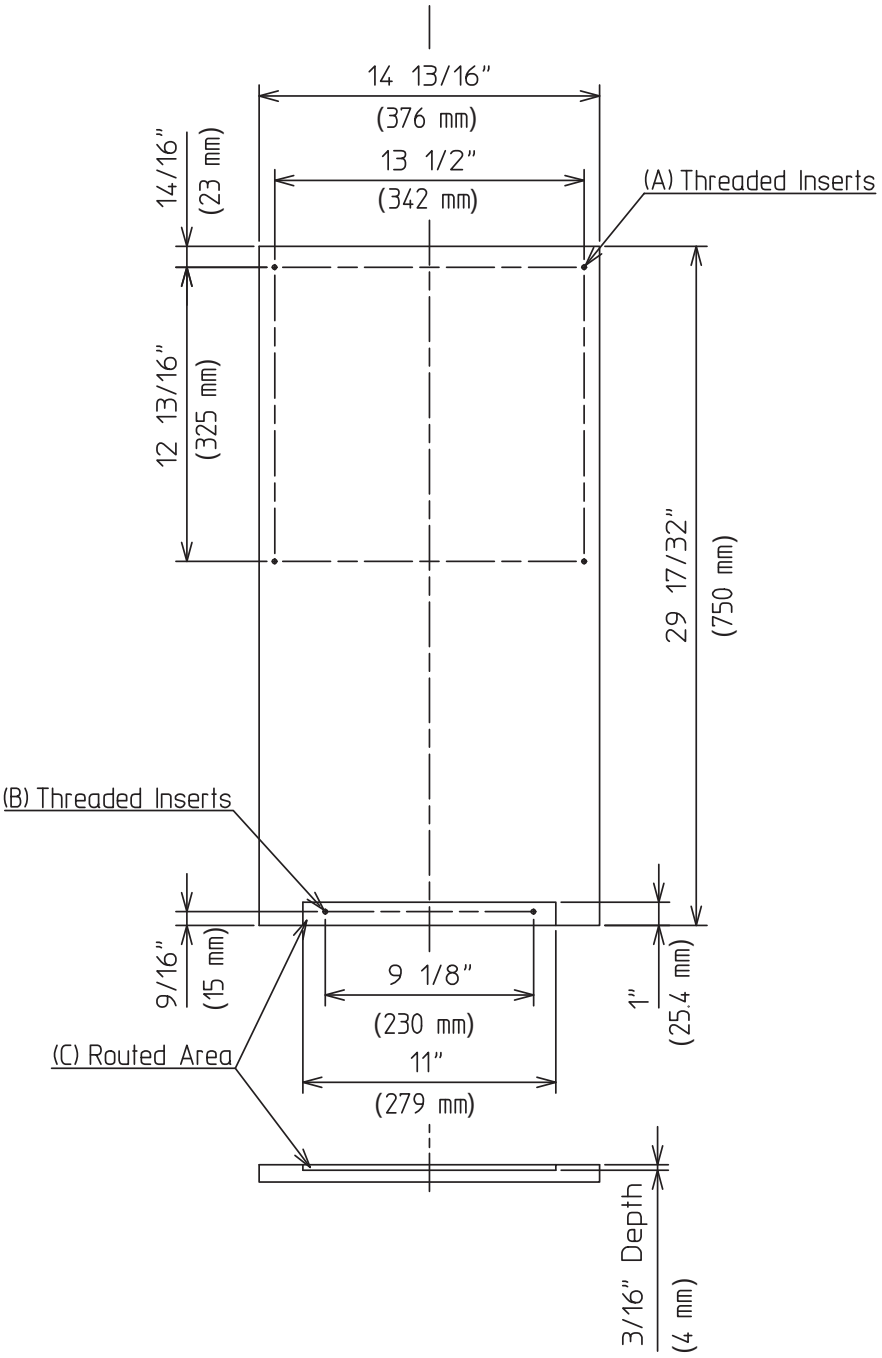


(1) Parts

Ensure that all parts required for the overlay panel assembly are contained in the accessories bag.

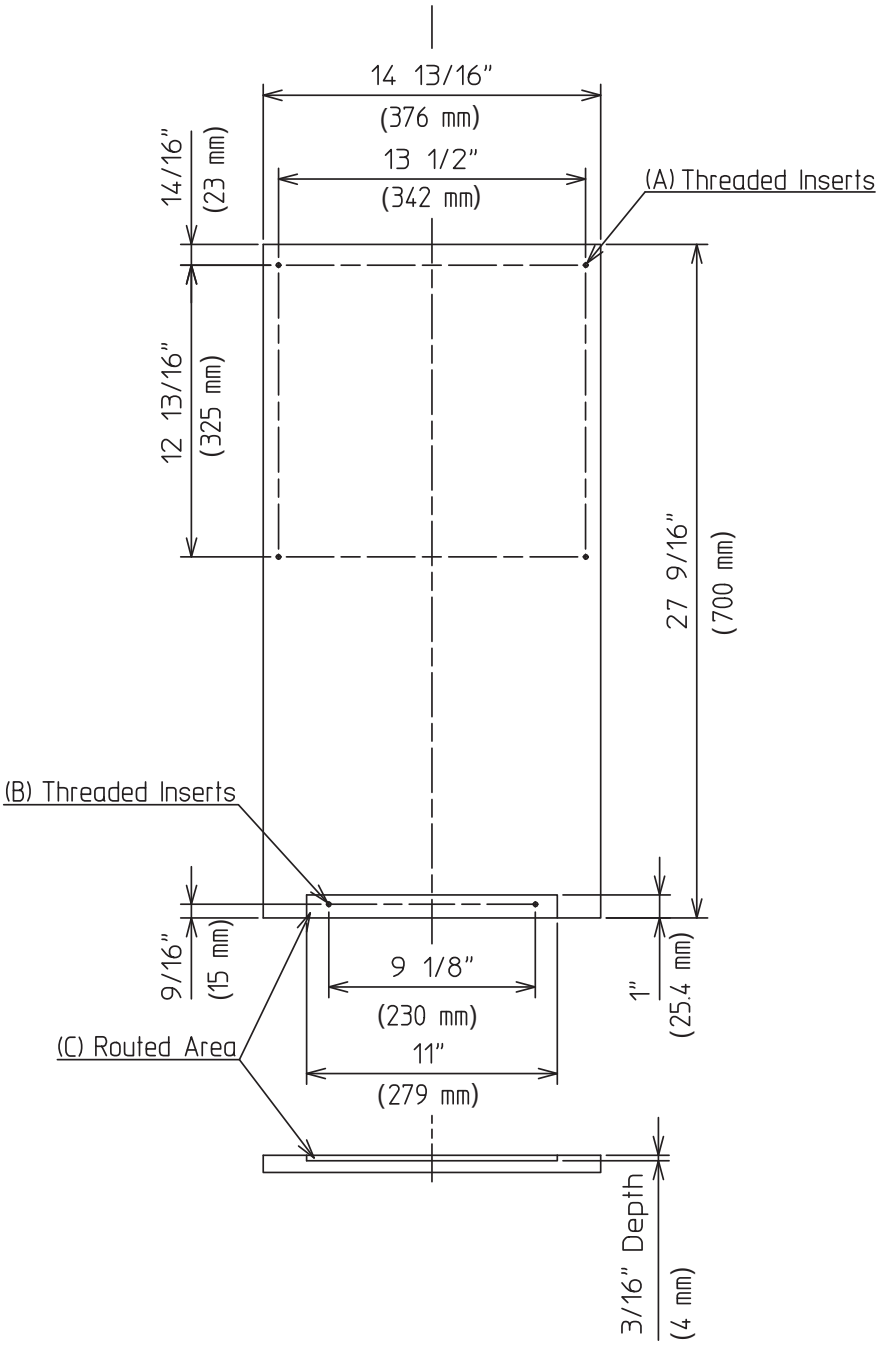
Overlay Panel Parts			
No.	**Description**	**Part Number**	**Qty.**
1	Threaded Wood Insert	4A4004-01	6
2	T2 Screw 4×8 SS	7P32-0408	3
3	Pan Head Screw M4×25 SS	7C12-0425	4
4	Truss Head Screw M4×8 SS	7C32-0408	2
5	Canoe Clip	4A0629-02	2
6	Sheet Metal Bracket	4A3998-01	1

1 2 3 4 5



6

(2) Overlay Panel Specification



Use the specification that applies to your appliance (C-101BAH-***DS*** or C-101BAH-***ADDS***) and the directions that follow to prepare your overlay panel.

(a) C-101BAH-DS

C-101BAH-DS Overlay Panel Specification	
Overlay Panel Height	29 17/32" (750 mm)
Overlay Panel Width	14 13/16" (376 mm)
Overlay Panel Thickness	5/8" (16 mm) minimum; 3/4" (19 mm) maximum
Overlay Panel and Door Weight (total)	20 lb. (9 kg) maximum

(b) C-101BAH-ADDS

C-101BAH-ADDS Overlay Panel Specification	
Overlay Panel Height	27 9/16" (700 mm)
Overlay Panel Width	14 13/16" (376 mm)
Overlay Panel Thickness	5/8" (16 mm) minimum; 3/4" (19 mm) maximum
Overlay Panel and Door Weight (total)	20 lb. (9 kg) maximum

(3) Fabrication of Overlay Panel

Fabricate the overlay panel as outlined in the specification on the previous page and the instructions below.

1) Rout a channel at the bottom of the overlay panel to the proper dimensions. See "(C) Routed Area" in the specification diagram and Fig. 8.

2) Drill six 1/4" diameter (hardwood may require slightly larger diameter) holes 3/8" (10 mm) deep in the locations designated. ***NOTICE!*** **Use care when drilling holes for mounting hardware. All drilled holes must be straight and drilled to the correct diameter and depth.** See "(A) Threaded Inserts" and "(B) Threaded Inserts" in the specification diagram and Fig. 9.

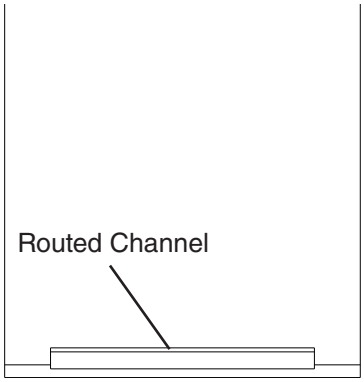


Fig. 8

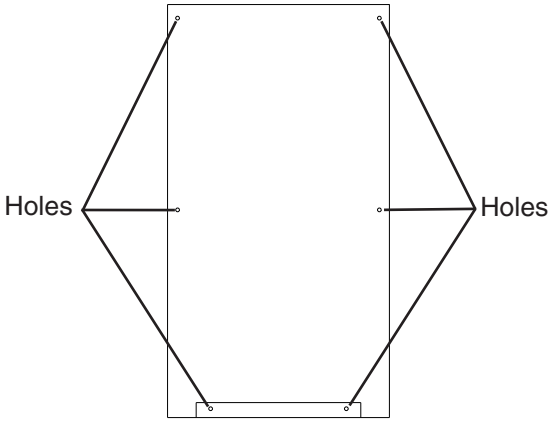

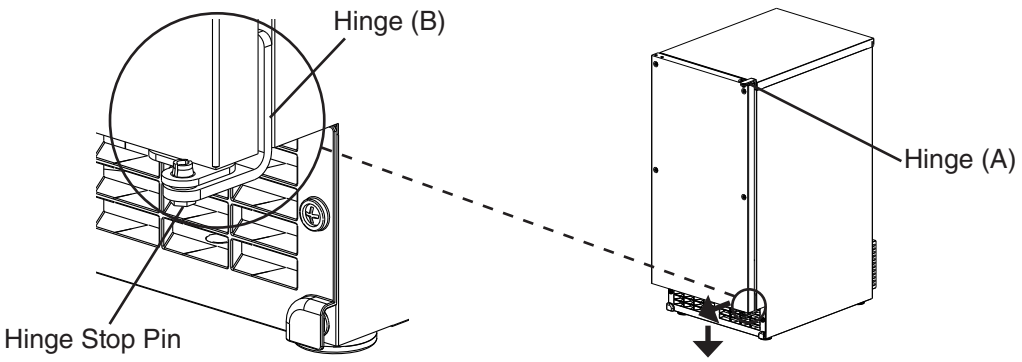

Fig. 9

3) Screw the 6 threaded wood inserts into the 1/4" holes drilled in the previous step. Make sure that the inserts are threaded straight and that the tops of the inserts are flush to the overlay panel surface. Otherwise, the overlay panel cannot be properly fastened to the door.

4) Mount the door handle hardware. Hoshizaki recommends that the door handle hardware be mounted on the edge opposite of the door hinge side (optional hinge reversal is covered in step 6. Countersunk screw heads are required to ensure that the hardware fasteners do not interfere with the overlay panel fitting flush with the door.

5) While maintaining a hold on the door, remove the hinge stop pin from hinge (B). Pull out the bottom of the door slightly and gently remove the door from hinge (A). See Fig. 10. If you are leaving the door right-hinged, skip to step 7. If you would like to reverse the door hinges, proceed to step 6.

Fig. 10

6) If you would like to reverse the door hinges, do the following:

a) Contact your local distributor to purchase Hoshizaki Kit HS-0229. The kit contains "hinge (A)-left."

b) Remove the 2 bolts securing the top panel, then lift it off. See Fig. 11.

c) Remove hinge (A)-right and the bracket from the right side of the appliance. Set aside hinge (A)-right; it is not needed. Remove the top brace from the left side. Fasten hinge (A)-left and the bracket to the left side and the top brace to the right side. See Fig. 12.

Note: When on the proper side, the gasket notch for hinge (A) is to the inside.

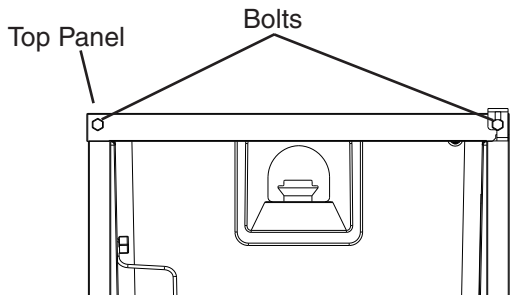

Fig. 11

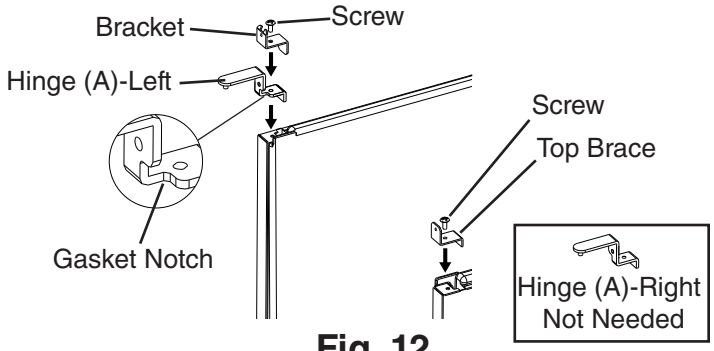

Fig. 12

d) Remove hinge (B) from the right side of the appliance and the 2 filler screws from the left side. Attach the 2 filler screws to the right side and attach hinge (B) to the left side. See Fig. 13.

e) Rotate the top panel 180° from its previous position. This brings the notch that was previously in the right rear to the left front. See Fig. 14. Hook the rear part of the panel on the body, then secure the front with the 2 bolts removed in step 6a.

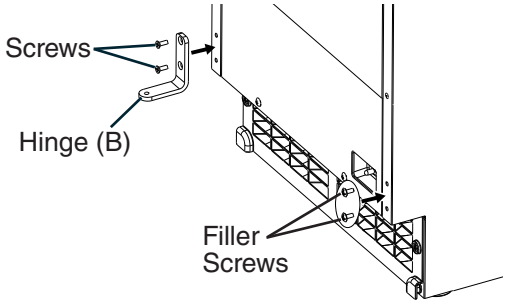

Fig. 13

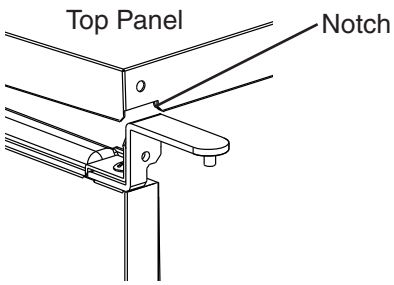

Fig. 14

f) Remove hinge (C1) from the top right part of the door, flip it and reattach to the bottom left. Remove hinge (C2) from the bottom right part of the door, flip it and reattach to the top left. See Fig. 15. Proceed to step 7.

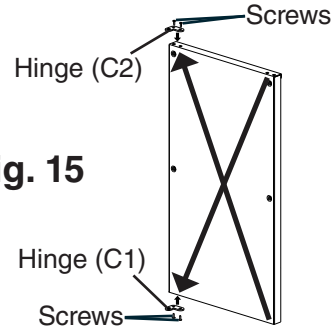

Fig. 15

7) Remove the bushings from hinge (C1) and hinge (C2) (the hinges attached to the door). See Fig. 16.

8) Remove the gasket from the door. See Fig. 17.

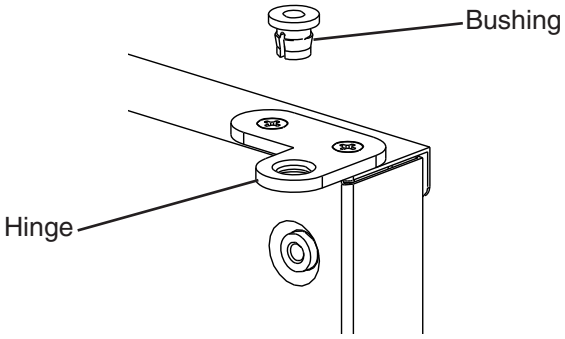

Fig. 16

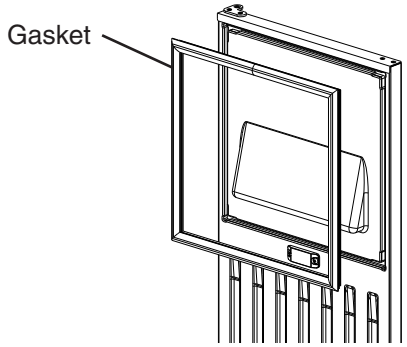

Fig. 17

9) Temporarily fasten the overlay panel to the door using 2 of the M4×25 pan head screws provided. ***NOTICE!*** **Ensure that the back surface of overlay panel is flat before attaching.** See Fig. 18.

10) Mark the centerpoint of the hinge (C1) and hinge (C2) holes that extend over the overlay panel. See Fig. 19.

11) Remove the overlay panel from the door.

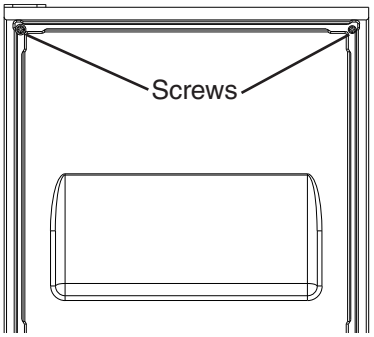

Fig. 18

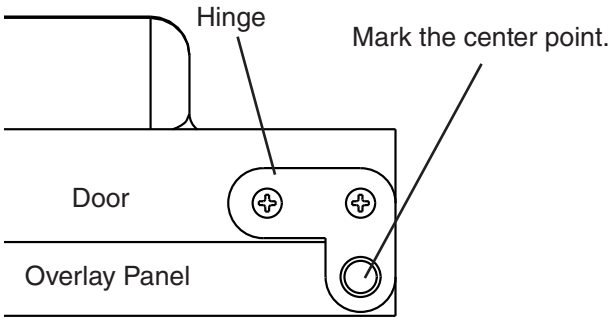

Fig. 19

12) Drill 3/8" diameter holes 1/4" (7 mm) deep where you marked on the overlay panel to accommodate the hinge (C1) and hinge (C2) bushings.

(4) Attachment of Overlay Panel to Door

1) Fasten the sheet metal bracket to the overlay panel using the two M4×8 truss head screws provided. ***Snug the screws, but do not tighten.*** See Fig. 20.

2) Temporarily fasten the overlay panel to the door using 2 of the M4×25 pan head screws provided. See Fig. 21.

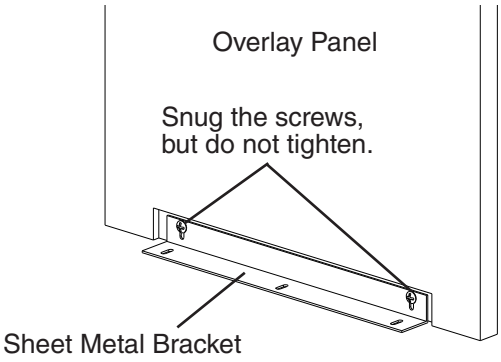

Fig. 20

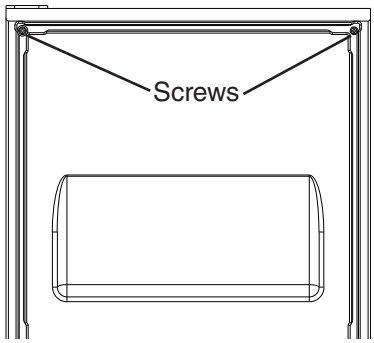

Fig. 21

3) Adjust the sheet metal bracket so that it is flush with the bottom of the door. See Fig. 22.

4) Remove the overlay panel from the door and tighten the two M4×8 truss head screws securing the sheet metal bracket to the overlay panel. See Fig. 23.

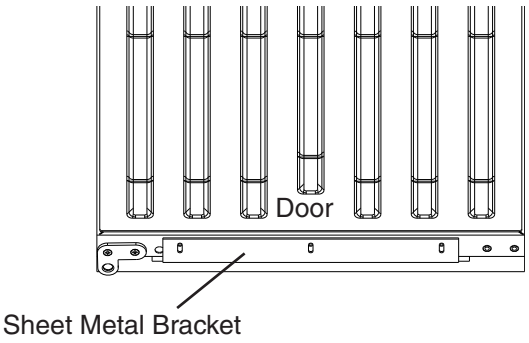

Fig. 22

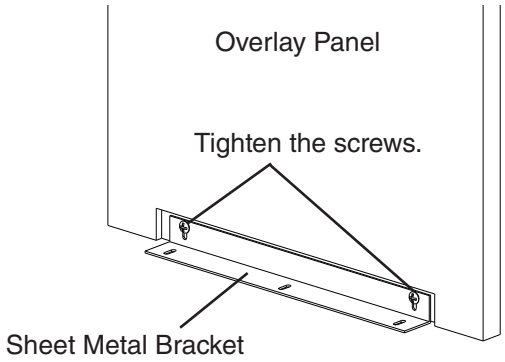

Fig. 23

5) Fasten the overlay panel to the door using the four M4×25 pan head screws provided. ***Snug the screws, but do not tighten.*** See Fig. 24.

6) Fasten the sheet metal bracket to the bottom of the door with the three T2 screws provided. Tighten the screws to the door. See Fig. 25.

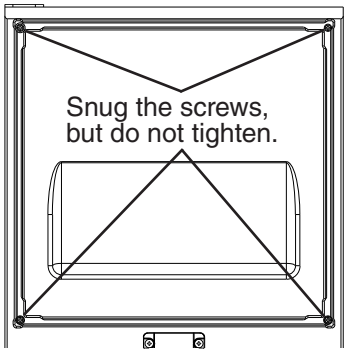

Fig. 24

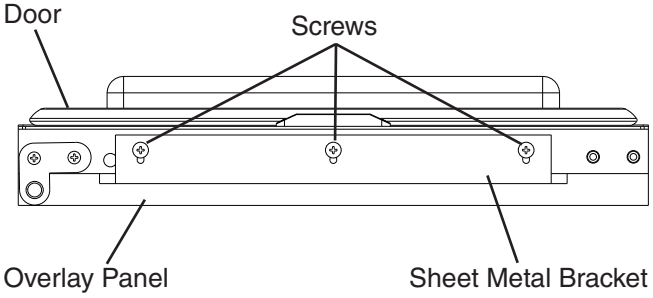

Fig. 25

7) Tighten the four M4×25 pan head screws installed in step 5. See Fig. 26.

8) Replace the door gasket in its proper orientation. Reinsert the bushings into hinge (C1) and hinge (C2) (the hinges attached to the door). See Fig. 27.

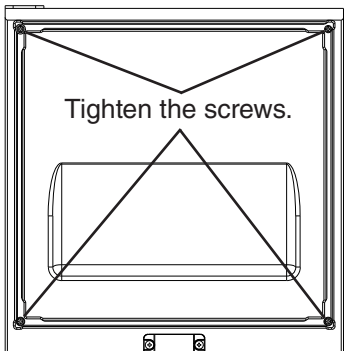

Fig. 26

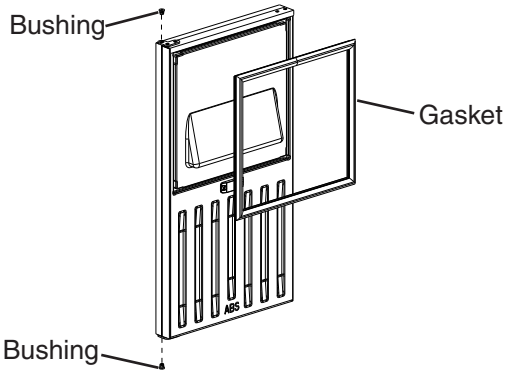

Fig. 27

9) Attach the door to hinge (A), then continue to maintain a hold on the door. Screw the hinge stop pin into hinge (B) until it is tight. See Fig. 28.

10) Insert the 2 canoe clips included in the accessory bag into the holes on top of the door. See Fig. 29.

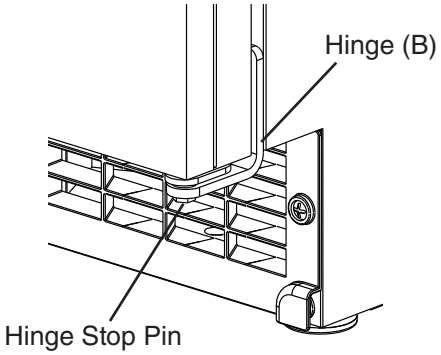

Fig. 28

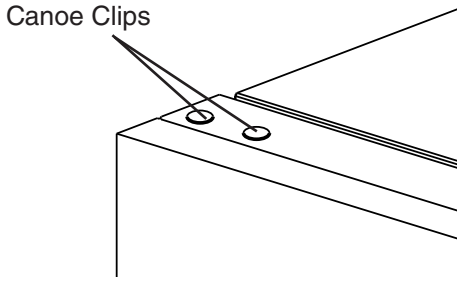

Fig. 29

D. Setup

1) Position the appliance in the selected permanent location.

2) Level the appliance from side-to-side and front-to-rear by adjusting the feet.

E. Electrical Connection

⚠ WARNING

- Electrical connection must meet national, state, and local electrical code requirements. Failure to meet these code requirements could result in death, electric shock, serious injury, fire, or damage.
- The appliance requires an independent power supply of proper capacity. See the nameplate for electrical specifications. Failure to use an independent power supply of proper capacity can result in a tripped breaker, blown fuse, damage to existing wiring, or component failure. This could lead to heat generation or fire.
- **THE APPLIANCE MUST BE GROUNDED:** The appliance is equipped with a NEMA 5-15 three-prong grounding plug to reduce the risk of potential shock hazards. It must be plugged into a properly grounded, independent 3-prong wall outlet. If the outlet is a 2-prong outlet, it is your personal responsibility to have a qualified electrician replace it with a properly grounded, independent 3-prong wall outlet. Do not remove the ground prong from the power cord and do not use an adapter plug. Failure to properly ground the appliance could result in death or serious injury.
- Do not use an extension cord.
- To reduce the risk of electric shock, do not touch the control switch or plug with damp hands. Make sure the control switch is in the "OFF" position before plugging in or unplugging the appliance.
- Do not use an appliance with a damaged power cord. The power cord should not be altered, jerked, bundled, weighed down, pinched, or tangled. Such actions could result in electric shock or fire. To unplug the appliance, be sure to pull the plug, not the cord, and do not jerk the cord.
- The GREEN ground wire in the factory-installed power cord is connected to the appliance. If it becomes necessary to remove or replace the power cord, be sure to connect the power cord's ground wire to this screw upon reattachment.

- Usually an electrical permit and services of a licensed electrician are required.
- The maximum allowable voltage variation is ±10 percent of the nameplate rating.
- For optional drain pump (HS-5061) installation, refer to the instructions included with the pump.

F. Water Supply and Drain Connections

⚠ WARNING

Water supply and drain connections must be installed in accordance with applicable national, state, and local regulations.

NOTICE

- Normal operating water temperature must be within 45°F to 90°F (7°C to 32°C). Operation of the appliance, for extended periods, outside of this normal temperature range may affect appliance performance.
- Water supply pressure must be a minimum of 7 PSIG and a maximum of 113 PSIG. If the pressure exceeds 113 PSIG, the use of a pressure reducing valve is required.
- External filters, strainers, or softeners may be required depending on water quality. Contact your local Hoshizaki Certified Service Representative or local Hoshizaki distributor for recommendations.
- Connect to potable water supply only. Do not connect to a hot-water supply.
- In areas where water damage is a concern, install in a contained area with a floor drain.
- Water line installation to the appliance is not warranted by Hoshizaki.
- Water-hammer issues must be resolved by a qualified plumber before installing the appliance. Water hammer can cause appliance damage that may lead to water leakage or flooding.
- A minimum of 1/2" nominal ID hard pipe or equivalent is required for the drain line. Installing a smaller diameter drain line will reduce water flow and may lead to water leakage or flooding.
- If using the optional drain pump (HS-5061), test its operation every time the appliance is cleaned and sanitized. See "IV.E. Optional Drain Pump HS-5061" for details. If the optional drain pump is not operating properly, water could back up and overflow, leading to costly water damage.

Water Supply Inlet	Minimum Water Supply Line Size	Drain Outlet	Minimum Drain Line Size
1/2" Female Pipe Thread (FPT)	1/4" Nominal ID Copper Water Tubing or Equivalent	1/2" Female Pipe Thread (FPT)	1/2" Nominal ID Hard Pipe or Equivalent

- A plumbing permit and services of a licensed plumber may be required in some areas.
- A water supply line shut-off valve and drain valve must be installed.
- Be sure there is sufficient extra water supply line and drain line for the appliance to be pulled out for service.
- Drain line should not be piped directly to the sewer system. An air gap of a minimum of 2 vertical inches (5 cm) must be between the end of the drain pipe from the appliance and the floor drain.

- For gravity drain installation, drain must have 1/4" fall per foot (2 cm per 1 m) on horizontal runs to get good flow. A vented tee connection is also required for proper flow. Extend the vent at least 12" (30 cm) above the drain outlet.
- For optional drain pump installation, refer to the instructions included with the pump.

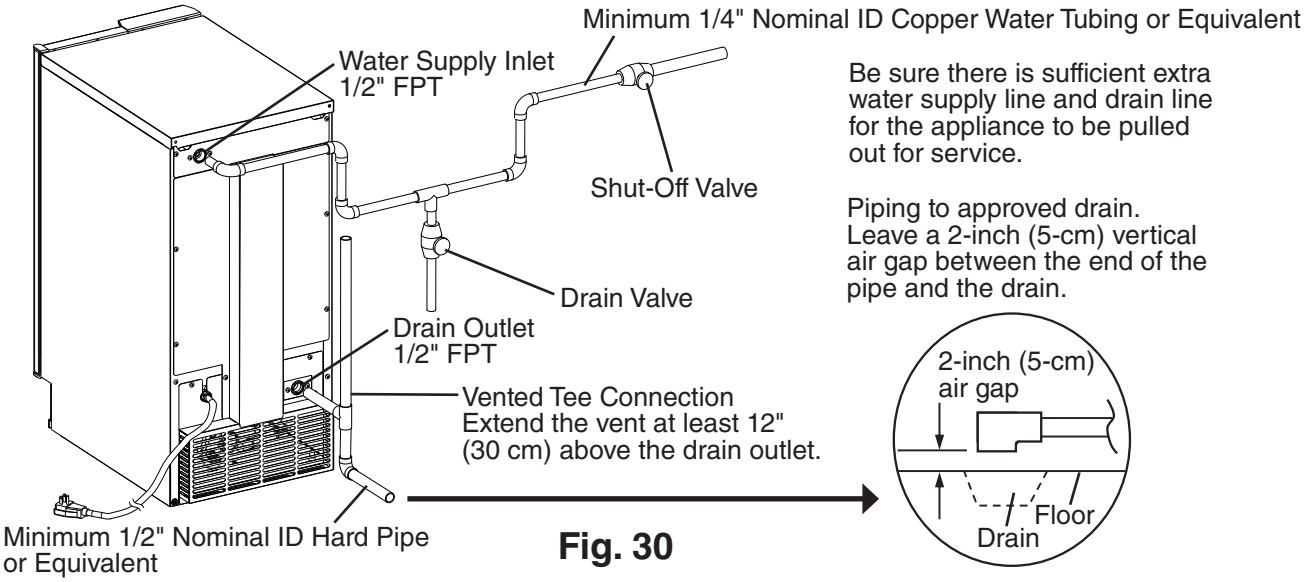

Fig. 30

G. Final Checklist

⚠ WARNING

CHOKING HAZARD: Ensure all components, fasteners, and thumbscrews are securely in place after installation. Make sure that none have fallen into the storage bin.

1) Is the appliance level?
2) Is the appliance in a site where the ambient temperature is within 45°F to 100°F (7°C to 38°C) and the water temperature within 45°F to 90°F (7°C to 32°C) all year around?
3) Have the shipping carton, tape, and packing material been removed from the appliance? Has the protective plastic film been removed from the panels?
4) Have all electrical and water connections been made? Do electrical and water connections meet all national, state, and local code and regulation requirements?
5) Has the power supply voltage been checked or tested against the nameplate rating? Is the power supply a properly grounded, independent 3-prong wall outlet?
6) Are the water supply and drain lines sized as specified? Are the water supply line shut-off valve and drain valve installed? Has the water supply pressure been checked to ensure a minimum of 7 PSIG and a maximum of 113 PSIG?
7) Are all components, fasteners, and thumbscrews securely in place?
8) Has the end user been given this instruction manual, and instructed on how to operate the appliance and the importance of the recommended periodic maintenance?
9) Has the end user been given the name and telephone number of an authorized service agent?
10) Has the warranty tag been filled out and forwarded to the factory for warranty registration?

III. Operating Instructions

A. Important Notes About Usage

⚠ WARNING

- Only qualified service technicians should install and service the appliance.
- Failure to install, operate, and maintain the equipment in accordance with this manual will adversely affect safety, performance, component life, and warranty coverage.
- To reduce the risk of electric shock, do not touch the control switch or plug with damp hands. Make sure the control switch is in the "OFF" position before plugging in or unplugging the appliance.
- The appliance must be maintained in accordance with the instruction manual and labels provided with the appliance. Consult with your local Hoshizaki Certified Service Representative about maintenance service.
- The appliance must be cleaned and sanitized at least twice a year. More frequent cleaning and sanitizing may be required in some water conditions.
- Wash your hands before removing ice. Use the plastic scoop provided.
- Do not place fingers or any other objects into the ice discharge opening.
- The appliance is not intended for use by persons (including children) with reduced physical, sensory, or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.
- Young children should be properly supervised around the appliance.
- Do not climb, stand, or hang on the appliance or appliance door or allow children or animals to do so. Serious injury could occur or the appliance could be damaged.
- Be careful not to pinch fingers when opening and closing the door. Be careful when opening and closing the door when children are in the area.
- Do not use combustible spray or place volatile or flammable substances near the appliance. They might catch fire.
- Keep the area around the appliance clean. Dirt, dust, or insects in the appliance could cause harm to individuals or damage to the appliance.

NOTICE

- Protect the floor when moving the appliance to prevent damage to the floor.
- If using the optional drain pump (HS-5061), test its operation every time the appliance is cleaned and sanitized. See "IV.E. Optional Drain Pump HS-5061" for details. If the optional drain pump is not operating properly, water could back up and overflow, leading to costly water damage.
- To help ensure the storage bin drain remains clear, follow the instructions in "IV.C. Storage Bin Drain" once every 3 months or as often as necessary for conditions. If the storage bin drain becomes clogged, water could build up in the bin and overflow, leading to costly water damage.
- If water collects in the bin and will not drain, turn off the appliance and close the water supply line shut-off valve. Call for service.
- If water seeps from the base of the appliance, turn off the appliance and close the water supply line shut-off valve. Call for service. Failure to do so could lead to costly water damage.
- Do not leave the appliance on during extended periods of non-use, extended absences, or in sub-freezing temperatures. To properly prepare the appliance for these occasions, follow the instructions in "V. Preparing the Appliance for Periods of Non-Use."
- Keep ventilation openings, in the appliance enclosure or in the built-in structure, clear of obstruction.
- Do not place objects on top of the appliance.
- The storage bin is for ice use only. Do not store anything else in the storage bin.

If ice is not used on a regular basis, it may bond together in the storage bin. In this case, discard the bonded ice and allow the appliance to make fresh ice.

B. Startup

⚠ WARNING

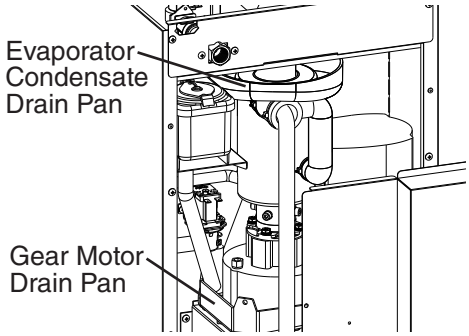
All parts are factory-adjusted. Improper adjustments may adversely affect safety, performance, component life, and warranty coverage.

NOTICE

- If the appliance is turned off, wait for at least 3 minutes before restarting the appliance to prevent damage to the compressor.
- At startup, confirm that all internal and external connections are free of leaks.

1) Open the water supply line shut-off valve.
2) Make sure the control switch is in the "OFF" position. Plug the appliance into the electrical outlet. **WARNING! To reduce the risk of electric shock, do not touch the control switch or plug with damp hands. If you have to slide the appliance back for a built-in installation, make sure you do not damage or pinch the water supply line, drain line, or power cord.**
3) If required by sanitation code in your area, seal the perimeter where the appliance touches the floor with approved caulk compound in a smooth and easily cleanable manner.
4) Move the control switch to the "ICE" position to start the automatic icemaking process.
5) Once the appliance starts to produce ice, allow it to run for another 30 minutes.
6) Move the control switch to the "OFF" position.
7) Remove the ice produced, then clean the storage bin liner, door liner, and door gasket using a neutral cleaner. Rinse thoroughly after cleaning.
8) Move the control switch to the "ICE" position to start the automatic icemaking process.
9) To confirm bin control operation, hold ice in contact with the bin control thermostat bulb. If the icemaker does not stop within 10 seconds, the bin control thermostat must be adjusted. Installations at higher altitude locations are more likely to require adjustment.

IV. Maintenance



The appliance must be maintained in accordance with the instruction manual and labels provided with the appliance. Consult with your local Hoshizaki Certified Service Representative about maintenance service. To obtain the name and phone number of your local Hoshizaki Certified Service Representative, visit www.hoshizaki.com.

⚠ WARNING

- Only qualified service technicians should service the appliance.
- Failure to install, operate, and maintain the equipment in accordance with this manual will adversely affect safety, performance, component life, and warranty coverage.
- To reduce the risk of electric shock, do not touch the control switch or plug with damp hands. Make sure the control switch is in the "OFF" position before plugging in or unplugging the appliance.
- Move the control switch to the "OFF" position and unplug the appliance from the electrical outlet before servicing.
- **CHOKING HAZARD:** Ensure all components, fasteners, and thumbscrews are securely in place after any maintenance is done to the appliance. Make sure that none have fallen into the storage bin.
- Do not place fingers or any other objects into the ice discharge opening.
- After service, make sure that there are no wires pinched between the panels and appliance. Make sure you do not damage or pinch the water supply line, drain line, or power cord.

A. Maintenance Schedule

The maintenance schedule below is a guideline. More frequent maintenance may be required depending on water quality, the appliance's environment, and local sanitation regulations.

Maintenance Schedule		
Frequency	**Area**	**Task**
Weekly	Scoop	Clean the scoop using a neutral cleaner. Rinse thoroughly after cleaning.
Monthly	Drain the Appliance	Move the control switch to the "DRAIN" position. Allow the water system to drain for 1 minute. Clear ice away from the thermostatic bin control bulb. Move the control switch to the "ICE" position. After the gear motor starts, move the control switch to the "DRAIN" position. Allow the water system to drain for 1 minute. Move the control switch to the "ICE" position to start the automatic icemaking process.
	Appliance Exterior	Wipe down with clean, soft cloth. Use a damp cloth containing a neutral cleaner to wipe off oil or dirt build up. Clean any chlorine staining (rust colored spots) using a non-abrasive cleanser.
Every 3 Months	Storage Bin Drain	Maintain as outlined in "IV.C. Storage Bin Drain."
Every 6 Months	Icemaker and Storage Bin	Clean and sanitize per the cleaning and sanitizing instructions provided in this manual. See "IV.B. Cleaning and Sanitizing Instructions."
	Evaporator Condensate Drain Pan and Gear Motor Drain Pan	Wipe down with clean cloth and warm water. 
	Optional Drain Pump (HS-5061)	Test as outlined in "IV.E. Optional Drain Pump HS-5061."
	External Water Filters	Check for proper pressure and change if necessary.
Yearly	Water Supply Inlet	Close the water supply line shut-off valve and drain the water system. Clean the water supply inlet screen.
	Condenser	Inspect. Clean if necessary. See "IV.D. Condenser."
	Water Hoses	Inspect the water hoses and clean/replace if necessary.
	Upper Bearing (extruding head)	Check for wear using .02" round stock or pin gauge. Replace both upper bearing and lower bearing if wear exceeds factory recommendations. See the Service Manual for details.
After 3 Years, then Yearly	Upper Bearing (extruding head); Lower Bearing and O-Ring (lower housing); Mechanical Seal; Evaporator Cylinder; Auger	Inspect. Replace both upper bearing and lower bearing if wear exceeds factory recommendations. Replace the mechanical seal if the seal's contact surfaces are worn, cracked, or scratched.

B. Cleaning and Sanitizing Instructions

The appliance must be cleaned and sanitized at least twice a year. More frequent cleaning and sanitizing may be required in some conditions.

⚠ WARNING

- To prevent injury to individuals and damage to the appliance, do not use ammonia type cleaners.
- Carefully follow any instructions provided with the cleaning and sanitizing solutions.
- Always wear liquid-proof gloves and goggles to prevent the cleaning and sanitizing solutions from coming into contact with skin or eyes.
- Do not use ice made from the cleaning and sanitizing solutions. After cleaning and sanitizing, be careful not to leave any solution in the appliance.
- Do not place fingers or any other objects into the ice discharge opening (extruding head).

1. Cleaning Solution

Dilute 1.6 fl. oz. (47 ml or 3.2 tbs) of Hoshizaki "Scale Away" or Nu-Calgon "Liquid Ice Machine Cleaner" with 1 qt (1 l) of warm water. This is a minimum amount. Make more solution if necessary. ***IMPORTANT!*** **For safety and maximum effectiveness, use the solution immediately after dilution.**

2. Cleaning Procedure

1) Move the control switch to the "OFF" position.
2) Remove all ice from the storage bin.
3) Move the control switch to the "DRAIN" position.
4) Allow the water system to drain for 1 minute.
5) Move the control switch to the "OFF" position.
6) Using a clean funnel and hose (not included), pour 1 qt (1 l) of cleaning solution over the extruding head. See Fig. 31. Allow the appliance to sit for 10 minutes before operation.

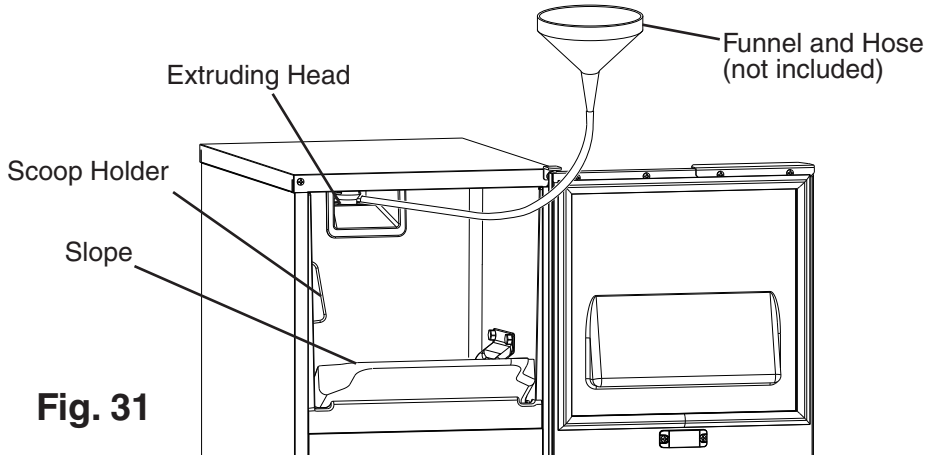


Fig. 31

7) Make sure at least 10 minutes have elapsed since you poured the cleaning solution over the extruding head, then move the control switch to the "ICE" position.

8) Allow the appliance to make ice for 20 minutes, then move the control switch to the "DRAIN" position.

9) Allow the water system to drain for 1 minute.

10) Move the control switch to the "ICE" position.

11) After the gear motor starts, move the control switch to the "DRAIN" position.

12) Allow the water system to drain for 1 minute.

13) Move the control switch to the "OFF" position. In severe water conditions, repeat the cleaning procedure.
Note: If you do not sanitize the appliance, go to step 8 in "IV.B.5. Sanitizing Procedure - Final."

3. Sanitizing Solution

Dilute 1.25 fl. oz. (37 ml or 2.5 tbs) of a 5.25% sodium hypochlorite solution (chlorine bleach) with 2.5 gallons (9.5 l) of warm water. This is a minimum amount. Make more solution if necessary. Using a chlorine test strip or other method, confirm that you have a concentration of about 200 ppm. ***IMPORTANT!*** **For safety and maximum effectiveness, use the solution immediately after dilution.**

4. Sanitizing Procedure - Initial

1) Using a clean funnel and hose, pour 1 qt (1 l) of sanitizing solution over the extruding head. Allow the appliance to sit for 10 minutes before operation.

2) Remove the slope from the storage bin by carefully bending it in the center and releasing it from the 2 slope shafts.

3) Remove the scoop. Remove the 2 thumbscrews securing the scoop holder, then remove it.

4) Pour some of the sanitizing solution into a separate, clean container. Using this sanitizing solution and a clean cloth, wipe down the slope, scoop, scoop holder, inside of the spout, and bin liner.

5) Rinse the parts and areas sanitized in step 4 thoroughly with clean water.

6) Replace all removed parts in their original and correct positions. **WARNING! CHOKING HAZARD: Ensure all components, fasteners, and thumbscrews are securely in place. Make sure that none have fallen into the storage bin.**

7) Make sure at least 10 minutes have elapsed since you poured the sanitizing solution over the extruding head, then move the control switch to the "ICE" position.

8) Allow the appliance to make ice for 20 minutes, then move the control switch to the "DRAIN" position.

9) Allow the water system to drain for 1 minute.

10) Move the control switch to the "ICE" position.

11) After the gear motor starts, move the control switch to the "DRAIN" position.

12) Allow the water system to drain for 1 minute.

13) Move the control switch to the "OFF" position.

5. Sanitizing Procedure - Final

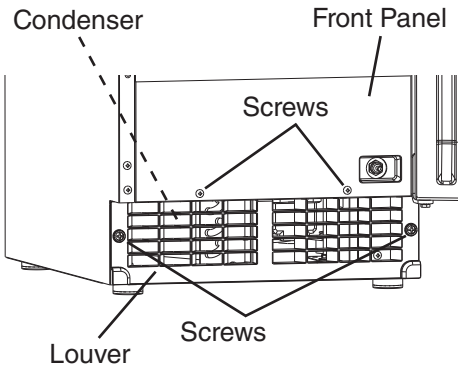
1) Using a clean funnel and hose, pour 1 qt (1 l) of sanitizing solution over the extruding head. Allow the appliance to sit for 10 minutes before operation.
2) Move the control switch to the "ICE" position.
3) Allow the appliance to make ice for 20 minutes, then move the control switch to the "DRAIN" position.
4) Allow the water system to drain for 1 minute.
5) Move the control switch to the "ICE" position.
6) After the gear motor starts, move the control switch to the "DRAIN" position.
7) Allow the water system to drain for 1 minute.
8) Move the control switch to the "ICE" position and allow the appliance to run. Check for leaks.
9) After 30 minutes, move the control switch to the "OFF" position.
10) Pour warm water into the storage bin to melt all of the ice, then clean the storage bin liner, door liner, and door gasket with a neutral cleaner. Rinse thoroughly after cleaning.
11) Move the control switch to the "ICE" position to start the automatic icemaking process.

C. Storage Bin Drain

In some conditions, slime may build up inside the storage bin drain and prevent water from draining properly. To prevent this buildup, perform the following procedure once every 3 months or as often as necessary for conditions.

NOTICE
If the storage bin drain becomes clogged, water could build up in the bin and overflow, leading to costly water damage.

1) Move the control switch to the "OFF" position. **WARNING! To reduce the risk of electric shock, do not touch the control switch with damp hands.**
2) Remove all ice from the storage bin.
3) Mix a batch of sanitizing solution by diluting 1.25 fl. oz. (37 ml or 2.5 tbs) of a 5.25% sodium hypochlorite solution (chlorine bleach) with 2.5 gallons (9.5 l) of warm water. Using a chlorine test strip or other method, confirm that you have a concentration of about 200 ppm. ***IMPORTANT!*** **For safety and maximum effectiveness, use the solution immediately after dilution.**
4) Slowly pour the sanitizing solution into the storage bin.
5) After all of the solution has drained, clean the storage bin liner with a neutral cleaner. Rinse thoroughly with clean water.
6) Move the control switch to the "ICE" position to start the automatic icemaking process.



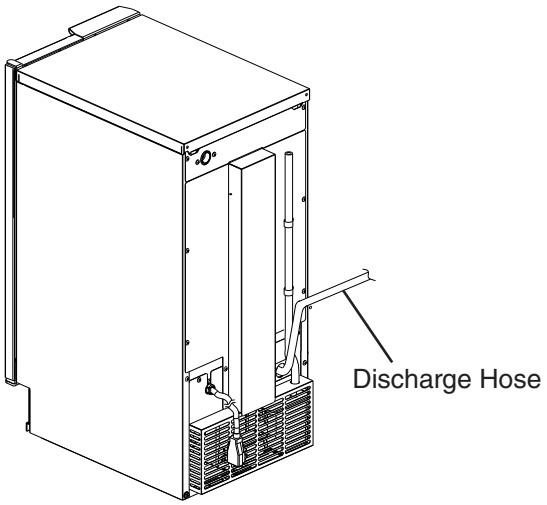
D. Condenser

Check the condenser once a year, and clean if required by following the steps below. More frequent cleaning may be required depending on location.

⚠ WARNING
Condenser fins are sharp. Use care when cleaning.

1) Move the control switch to the "OFF" position, then unplug the appliance from the electrical outlet. **WARNING! To reduce the risk of electric shock, do not touch the control switch or plug with damp hands.**
2) Remove the screws securing the front panel, then remove it. See Fig. 32.
3) Remove the screws securing the louver, then remove it.
4) Use a brush attachment on a vacuum cleaner to gently clean the condenser fins. Do not use too much force, otherwise the fins could be damaged.
5) Replace the louver and front panel in their correct positions. Ensure that the screws are securely in place.
6) Plug the appliance back in. Move the control switch to the "ICE" position to start the automatic icemaking process.

Fig. 32



E. Optional Drain Pump HS-5061

If the optional drain pump (HS-5061) is installed, test its operation at least twice a year as outlined below. Note that the pump has power even when the control switch is in the "OFF" position.

NOTICE
If the optional drain pump is not operating properly, it will adversely affect performance, component life, and warranty coverage and may result in costly water damage.

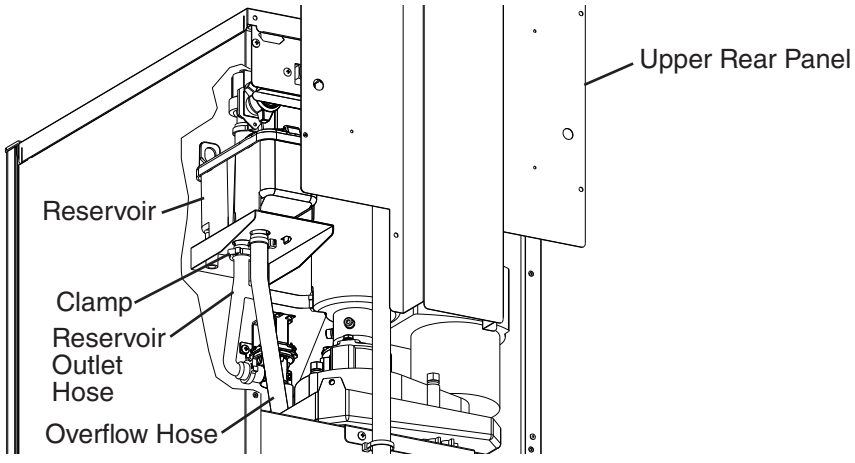
1) Move the control switch to the "OFF" position, then unplug the appliance from the electrical outlet. **WARNING! To reduce the risk of electric shock, do not touch the control switch or plug with damp hands.**
2) Remove all ice from the storage bin.
3) Plug the appliance back in.
4) Slowly pour 24 to 30 oz. (710 to 890 ml) of water over the storage bin drain hole in the storage bin.
5) If water pumps out properly and the drain pump then de-energizes, proceed to step 6. If water does not pump out properly and/or the drain pump does not de-energize, the appliance must be serviced by a qualified service technician before proceeding.
6) Move the control switch to the "ICE" position.
7) Pour another 24 to 30 oz. (710 to 890 ml) of water into the appliance's ice storage bin, then completely restrict the discharge hose while the drain pump is operating. See Fig. 33. Pour more water into the appliance's ice storage bin until the appliance turns off. The drain pump will continue to operate. Check for leaks.
8) Remove the discharge hose restriction and allow the water to be pumped out normally. Power to the appliance will be restored when the water in the drain pump returns to a normal level.
9) If the appliance fails to turn off with the discharge hose restricted or the pump fails to pump out the water, the appliance must be serviced by a qualified service technician.

Fig. 33

V. Preparing the Appliance for Periods of Non-Use

During extended periods of non-use, extended absences, or in sub-freezing temperatures, follow the instructions below. When the appliance is not used for two or three days under normal conditions, it is sufficient to move the control switch to the "OFF" position.

⚠ WARNING



Only qualified service technicians should service the appliance.

NOTICE

During extended periods of non-use, extended absences, or in sub-freezing temperatures, follow the instructions below to reduce the risk of costly water damage.

1) Move the control switch to the "OFF" position. **WARNING! To reduce the risk of electric shock, do not touch the control switch or plug with damp hands.**
2) Close the water supply line shut-off valve, then open the water supply line drain valve.
3) Allow the line to drain by gravity.
4) Move the control switch to the "DRAIN" position.
5) Allow the water system to drain for 1 minute.
6) Attach a compressed air or carbon dioxide supply to the water supply line drain valve.
7) Move the control switch to the "ICE" position.
8) Blow the water supply line out using the compressed air or carbon dioxide supply.
9) Close the water supply line drain valve.
10) Move the control switch to the "OFF" position, then unplug the appliance from the electrical outlet.
11) Remove the screws securing the upper rear panel, then remove it. See Fig. 34.
12) Remove the clamp securing the reservoir outlet hose to the reservoir. Disconnect the reservoir outlet hose from the reservoir.
13) Attach a compressed air or carbon dioxide supply to the reservoir outlet hose.

Fig. 34

14) Plug the appliance back in, then move the control switch to the "DRAIN" position.

15) Blow out the reservoir outlet hose using the compressed air or carbon dioxide supply.

16) Move the control switch to the "OFF" position, then unplug the appliance from the electrical outlet.

17) Reconnect the reservoir outlet hose to the reservoir, then secure with the clamp. Make sure all hoses are connected and secure.

18) Replace the rear panel in its correct position.

19) Clean the storage bin by using a neutral cleaner. Rinse thoroughly after cleaning.

VI. Disposal

The appliance contains refrigerant and must be disposed of in accordance with applicable national, state, and local codes and regulations. Refrigerant must be recovered by properly certified service personnel.

SAFETY INFORMATION

Your safety and the safety of others are very important.

We have provided many important safety messages in this manual and on your appliance. Always read and obey all safety messages.

This is the safety alert symbol.

This symbol alerts you to potential hazards that can kill or hurt you and others.

All safety messages will follow the safety alert symbol and either the word “DANGER” or “WARNING.” These words mean:

⚠ DANGER — **You can be killed or seriously injured if you don't immediately follow instructions.**

⚠ WARNING — **You can be killed or seriously injured if you don't follow instructions.**

All safety messages will tell you what the potential hazard is, tell you how to reduce the chance of injury, and tell you what can happen if the instructions are not followed.

WARNING: If the information in this manual is not followed exactly, a fire or explosion may result causing property damage, personal injury or death.

– Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

– WHAT TO DO IF YOU SMELL GAS:

- **Do not try to light any appliance.**
- **Do not touch any electrical switch.**
- **Do not use any phone in your building.**
- **Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.**
- **If you cannot reach your gas supplier, call the fire department.**

– Installation and service must be performed by a qualified installer, service agency or the gas supplier.

WARNING: Gas leaks cannot always be detected by smell.

Gas suppliers recommend that you use a gas detector approved by UL or CSA.

For more information, contact your gas supplier.

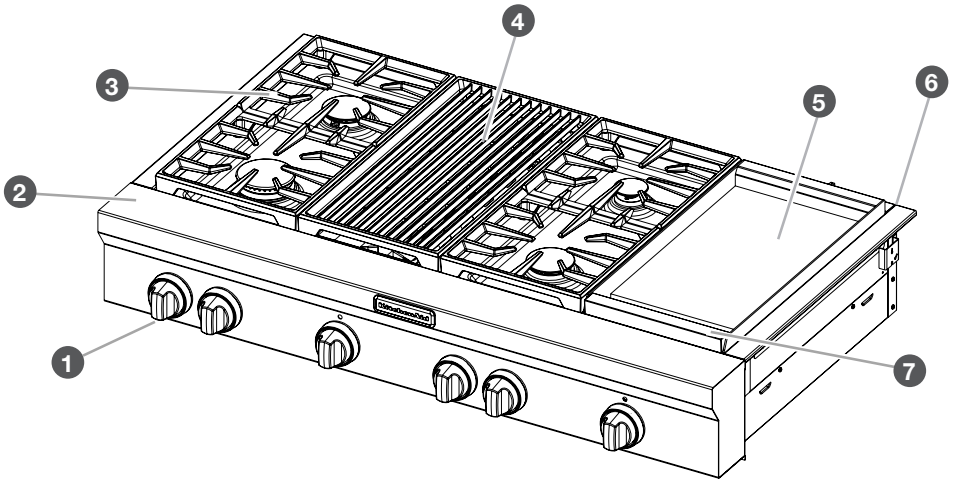
If a gas leak is detected, follow the “What to do if you smell gas” instructions.

State of California Proposition 65 Warnings:

WARNING: This product contains one or more chemicals known to the State of California to cause cancer.

WARNING: This product contains one or more chemicals known to the State of California to cause birth defects or other reproductive harm.

IMPORTANT SAFETY INSTRUCTIONS



WARNING: To reduce the risk of fire, electrical shock, injury to persons, or damage when using the cooktop, follow basic precautions, including the following:

- **WARNING:** NEVER use this appliance as a space heater to heat or warm the room. Doing so may result in carbon monoxide poisoning and overheating of the cooktop.
- **CAUTION:** Do not store items of interest to children in cabinets above the cooktop – children climbing on the cooktop to reach items could be seriously injured.
- Proper Installation – The cooktop, when installed, must be electrically grounded in accordance with local codes or, in the absence of local codes, with the *National Electrical Code, ANSI/NFPA70 or the Canadian Electrical Code, Part 1*. Be sure the cooktop is properly installed and grounded by a qualified technician.
- This cooktop is equipped with a three-prong grounding plug for your protection against shock hazard and should be plugged directly into a properly grounded receptacle. Do not cut or remove the grounding prong from this plug.
- Disconnect the electrical supply before servicing the cooktop.
- Injuries may result from the misuse of the cooktop such as stepping, leaning, or sitting on the top surface.
- Maintenance – Keep cooktop area clear and free from combustible materials, gasoline, and other flammable vapors and liquids.
- Storage on the cooktop – Flammable materials should not be stored on or near surface units.
- Top burner flame size should be adjusted so it does not extend beyond the edge of the cooking utensil.

SAVE THESE INSTRUCTIONS

PARTS AND FEATURES

This manual covers several different models. The cooktop you have purchased may have some or all of the items listed. The locations and appearances of the features shown here may not match those of your model. Refer to this manual or the Frequently Asked Questions (FAQs) section of our website at **www.kitchenaid.com** for more detailed instructions. In Canada, refer to the Customer Service Section at **www.kitchenaid.ca**.

1. **Commercial-style die cast metal control knobs**
2. **Culinary ledge**
3. **Heavy duty single grate design**
4. **Grill (on some models)**
5. **Electric chrome griddle (on some models)**
6. **Island trim**
7. **Drip tray (on griddle models)**

Not shown:

Optional 9" (22.9 cm), 22" (55.9 cm), and adjustable backguards

Optional griddle cover

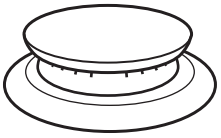
Optional grill cover

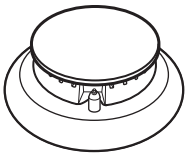
Optional wok ring

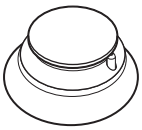
Optional stainless steel knobs

BURNERS

⚠WARNING







Fire Hazard

Do not let the burner flame extend beyond the edge of the pan.

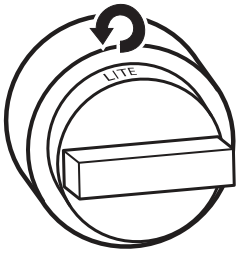
Turn off all controls when not cooking.

Failure to follow these instructions can result in death or fire.

BTU/Hr	BURNER APPEARANCE	FEATURES
Ultra-Power™ dual-flame burner		This burner has an upper and lower level of flame. The Power HI setting uses both flame levels at full power to provide the highest heat. It is ideal for cooking large quantities of food or liquid and using large pots and pans. The Simmer HI and LO settings use the upper flame only.
Medium burner		This burner is ideal for cooking smaller quantities of food and melting chocolate or butter.
Simmer burner		This burner reaches a low of 500 BTU/Hr. It provides the gentle, low temperatures required for simmering soups, stewing, and melting delicate ingredients like butter, cheese, and chocolate.

Igniting Burners:

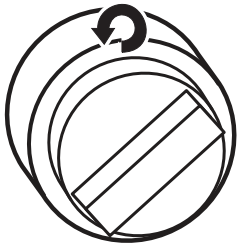
- Electric igniters automatically light the surface burners when control knobs are turned to LITE.
- Before setting a control knob, place filled cookware on the grate. Do not operate a burner using empty cookware or without any cookware on the grate.
- Visually check that the burner has lit. If the burner does not ignite, listen for the clicking sound. If you do not hear the igniter click, turn off the burner. Check for a tripped circuit breaker or blown fuse.
- Check that the control knob is pressed completely down on the valve shaft. If the spark igniter still does not operate, call a trained repair specialist.
- When the control knobs for any small or medium burner are turned to the LITE position, all small and medium burners will click. When the control knob for the large burner is turned to the LITE position, these burners will click independently of the other burners. In both cases, only the burner with the control knob turned to LITE will produce a flame.



REMEMBER: When cooktop is in use or during the Self-Cleaning cycle, the entire cooktop area may become hot.

Reignition Feature

During cooktop use, if one or more burners are extinguished due to external causes (such as a water spill, wind, or ventilation draft), the ignition system will turn on to reignite the flame. When the flame comes back on, the system will stop sparking. If the draft in the room is not removed, occasional sparking may continue. Sparking may also occasionally occur when using the low setting on a burner.

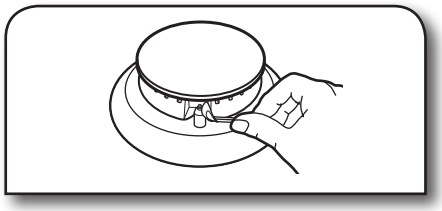


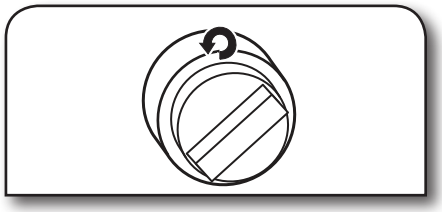
To Set a Burner:

1.

Push in and turn counterclockwise to LITE.

2.



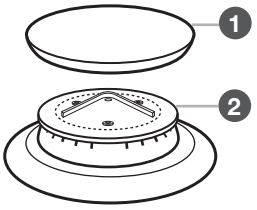


Turn knob counterclockwise between HI and LO.

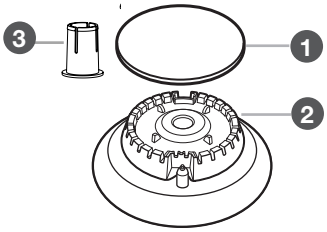
Push in one more time to get from LO to HI.

In Case of Power Failure

Hold a lit match near a burner and turn knob counterclockwise to HI. After burner lights, turn knob to the desired setting.

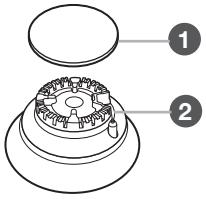


Sealed Surface Burners



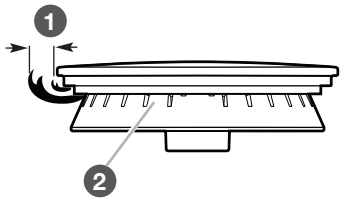
Sealed surface burners are designed to minimize gaps and seams that can allow liquids and spills to get under the cooktop. This design makes cleanup quick and easy.

Stacked Power Burner



1. **Burner cap**
2. **Burner base**
3. **Choke (for use with medium burner, LP gas only)**

Medium Burner

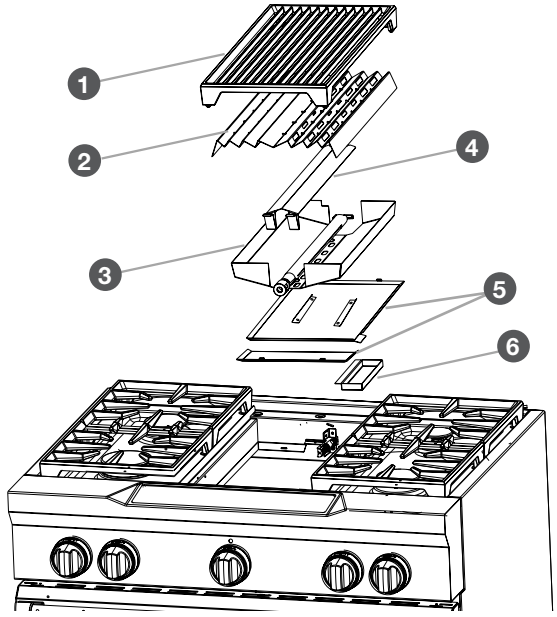


Simmer/Melt Burner

IMPORTANT: Do not obstruct the flow of combustion and ventilation air around the burner grate edges.

Burner cap: Always keep the burner cap in place when using a surface burner. A clean burner cap will help avoid poor ignition and uneven flames. Always clean the burner cap after a spillover and routinely remove and clean the caps according to the "Care and Cleaning" section.

Gas opening: Gas must flow freely throughout the gas opening for the burner to light properly. Keep this area free of soil and do not allow spills, food, cleaning agents, or any other material to enter the gas opening. Keep spillovers out of the gas opening by always using a burner cap.



1. **1-1½" (25-38 mm)**
2. **Burner ports**

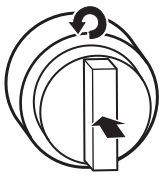
Burner ports: Check burner flames occasionally for proper size and shape as shown above. A good flame is blue in color, not yellow. Keep this area free of soil and do not allow spills, food, cleaning agents, or any other material to enter the burner ports.

GRILL (ON SOME MODELS)

The grill module consists of a cast-iron grill grate, a wave tray, a flame spreader, a burner assembly, 2 grease trays and a drip tray.

1. **Grill grate**
2. **Wave tray**
3. **Burner assembly**
4. **Flame spreader**
5. **Grease trays**
6. **Drip tray**

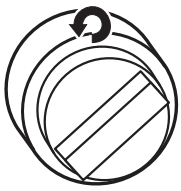
When using the grill, follow the guidelines below:



- Trim excess fat to reduce spattering. Slit the remaining fat on the edges to avoid curling.
- Allow space between food on the grill. Crowding food will result in uneven cooking.
- Use a metal spatula or tongs to turn food.
- Steaks, chops, and hamburgers should be turned only once to avoid loss of juices.
- For even cooking, foods such as chicken quarters should be turned several times.
- To check for doneness of meats and poultry, use an instant read thermometer or make a small cut in the center of the food. This will avoid loss of juices.
- Do not leave the grill unattended while cooking.
- To avoid damage to the grill, do not use aluminum foil, charcoal, or wood chips.
- To avoid damage to cookware, do not place cookware on the grill when in use. Food should be cooked directly on the grill grate.

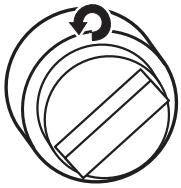
To Use:

1.
Turn on overhead range hood.



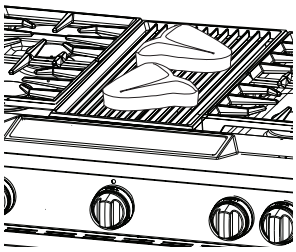
2.
Apply vegetable oil, if desired. Apply a light coating of vegetable oil or nonstick cooking spray to grill grate.

3.



Push in and turn knob to LITE/HI. The flame will ignite in 1-4 seconds.

4.



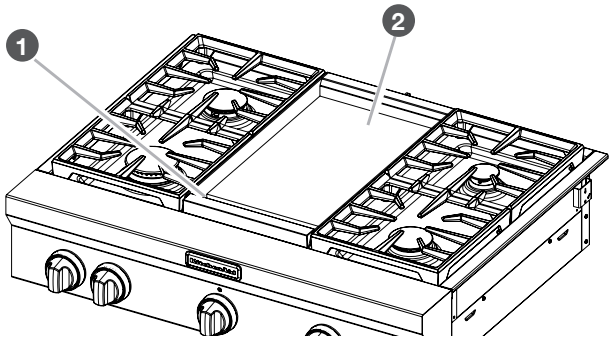
Turn knob to MED and allow grill to preheat for 15 minutes.

5.

Turn knob to desired cook setting.

6.

Place food on grill.



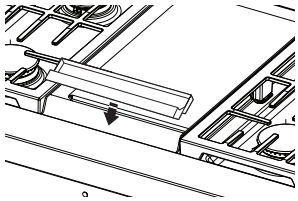
Grill Chart

The settings and times are guidelines only and may need to be adjusted for individual tastes.

FOOD	SETTING	COOK TIME TOTAL MINUTES
Steak		
1" (2.5 cm)		
medium	MED	16-20
well-done	MED	20-30
Ground Meat Patties		
½ - ¾" (1.3-1.9 cm)	MED	20-25
Pork Chops		
1" (2.5 cm)	MED	35-55
Ham Slices		
½" (1.3 cm)	MED	8-12
Frankfurters and Precooked Sausages	MED	8-15
Chicken		
Quarters	MED-LO	50-80
Breasts, boneless	MED	20-40
Fish Steaks		
¾ - 1" (1.9-2.5 cm)	MED	10-15

CHROME ELECTRIC GRIDDLE (ON SOME MODELS)

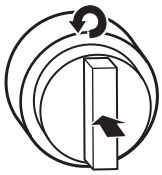
The chrome electric griddle provides the perfect cooking surface for grilled sandwiches, pancakes, eggs, burgers, sautéed vegetables, and many more family favorites. The attractive low-stick surface is designed to make cleanup easy.



1. **Drip tray**
2. **Griddle**

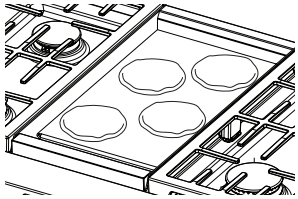
The chrome electric griddle system provides an evenly heated cooking surface.

- Be sure plastic film has been removed and wash with hot water before first use.
- To avoid scratching the griddle, do not place any pots or pans on the griddle. Use only heat-resistant plastic or wooden utensils.
- The griddle surface is ready to use and does not need to be seasoned.
- Pouring cold water on a hot griddle may warp the griddle, resulting in an uneven cooking surface.



To Use:

1.



Position drip tray.

2.

Push in and turn knob.

3.

Place food on griddle and cook to desired doneness.

The griddle light will turn off when the griddle has finished preheating. The griddle light will turn on and off during use to indicate that the griddle element is maintaining the selected surface temperature.

Cooking Chart

The settings and times are guidelines only and may need to be adjusted for individual tastes.

FOOD	SETTING	COOK TIME TOTAL MINUTES
Sausage patties and links	325°F (163°C)	12-18
Bacon slices	350°F (177°C)	7-11
Ham steak (fully cooked)	325°F (163°C)	5-7
Frankfurters and precooked Sausages	325°F (163°C)	8-15
Ground meat patties	350°F (177°C)	10-15
Grilled sandwiches	325°F (163°C)	3-5
Fish steaks, fillets	325°F (163°C)	8-15
Eggs	300°F (149°C)	3-5
Hash brown potatoes	400°F to 425°F (204°C to 218°C)	8-12
French toast	350°F (177°C)	5-7
Pancakes	350°F (177°C)	2-4

COOKWARE

IMPORTANT: Do not leave empty cookware on a hot surface cooking area, element, or surface burner.

Ideal cookware should have a flat bottom, straight sides, and a well-fitting lid and the material should be of medium-to-heavy thickness.

Rough finishes may scratch the cooktop or grates. Aluminum and copper may be used as a core or base in cookware. However, when used as a base, they can leave permanent marks on the cooktop or grates.

Cookware material is a factor in how quickly and evenly heat is transferred which affects cooking results. A nonstick finish has the same characteristics as its base material. For example, aluminum cookware with a nonstick finish will take on the properties of aluminum.

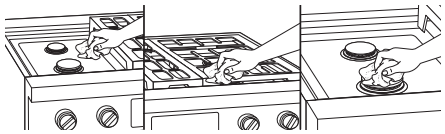
Cookware with nonstick surfaces should not be used under the broiler.

Use the following chart as a guide for cookware material characteristics.

COOKWARE	CHARACTERISTICS
Aluminum	■ Heats quickly and evenly. ■ Suitable for all types of cooking ■ Medium or heavy thickness is best for most cooking tasks.
Cast iron	■ Heats slowly and evenly. ■ Good for browning and frying ■ Maintains heat for slow cooking.
Ceramic or ceramic glass	■ Follow manufacturer's instructions. ■ Heats slowly, but unevenly. ■ Ideal results on low-to-medium heat settings
Copper	■ Heats very quickly and evenly.
Earthenware	■ Follow manufacturer's instructions. ■ Use on low heat settings.
Porcelain enamel-on-steel or cast iron	■ See stainless steel or cast iron.
Stainless steel	■ Heats quickly, but unevenly. ■ A core or base of aluminum or copper on stainless steel provides even heating.

HOME CANNING

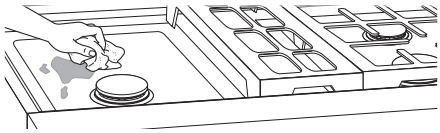
When canning for long periods, alternate the use of surface burners between batches. This allows time for the most recently used areas to cool.



- Center the canner on the grate.
- Do not place canner on 2 surface burners at the same time.
- For more information, contact your local agricultural department. Companies that manufacture home canning products can also offer assistance.

COOKTOP SURFACE

IMPORTANT: Before cleaning, make sure all controls are OFF and the cooktop is cool. Always follow label instructions on cleaning products.

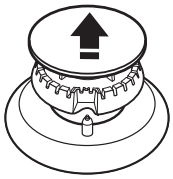


After Each Use:

1.

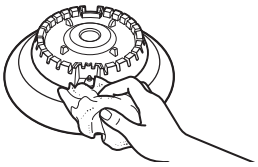
Wipe off cooktop, grates, and caps.

2.



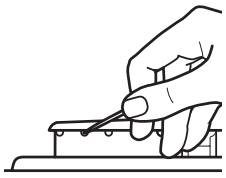
Clean food spills.

To preserve the finish, clean food spills containing acids, such as vinegar and tomato, as soon as the entire appliance is cool.



SEALED SURFACE BURNERS

1.

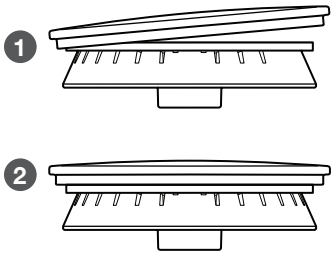


Remove burner cap and base.

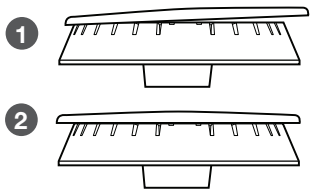
2.

Wipe off cooktop, grates, and caps.

3.

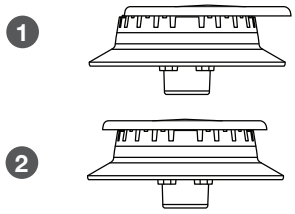


Clean clogged burner ports.



Use a straight pin. Do not enlarge or distort the port. Do not use a wooden toothpick. If the burner needs to be adjusted, contact a trained repair specialist.

4. Replace burner cap.

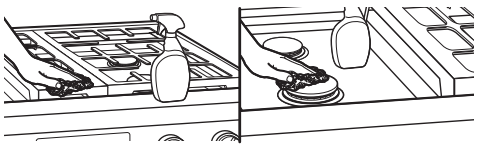


Dual-Flame Burner

Medium Burner

Simmer/Melt Burner

Make sure alignment pins are properly aligned with burner cap.



5.

Turn on burner.

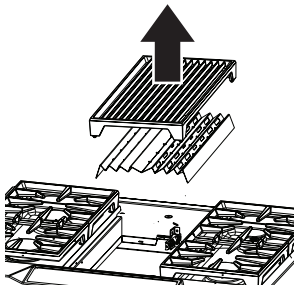
If the burner does not light, check cap alignment. If the burner still does not light, do not service the sealed burner yourself. Contact a trained repair specialist.

PORCELAIN-COATED GRATES AND CAPS

Use scrub and cleanser.

Clean with a nonabrasive nylon scrub pad and mildly abrasive cleanser.

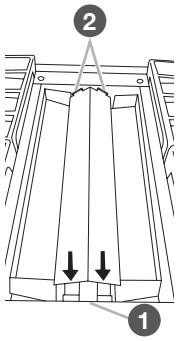
Know Your Grates and Caps



- Food spills containing acids, such as vinegar and tomato, should be cleaned as soon as the cooktop, grates, and caps are cool. These spills may affect the finish.
- To avoid chipping, do not bang grates and caps against each other or hard surfaces such as cast iron cookware.
- Do not reassemble caps on burners while wet.
- Do not clean in the Self-Cleaning cycle.
- Do not clean in dishwasher.

GRILL

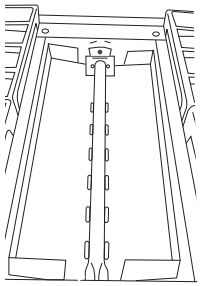
To Remove:



Before removing or replacing grill, make sure the control knobs are turned to OFF. Allow the grill to cool completely before handling.

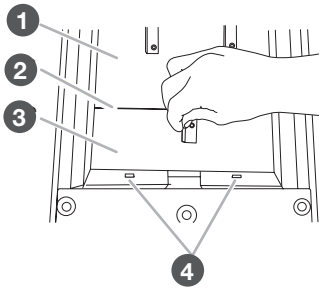
1.

Remove grill grate and wave tray.



2.

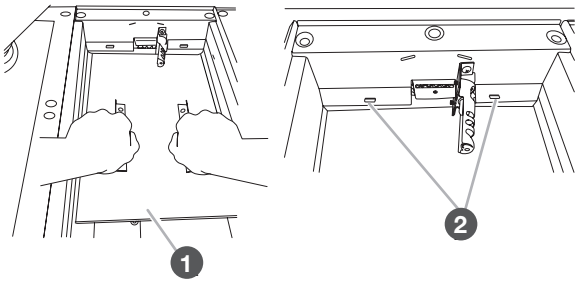
1 Grill front
2 Rear tabs and slots



Remove flame spreader. Pull forward slightly on the flame spreader to release the tabs from the rear slots and lift out.

3.

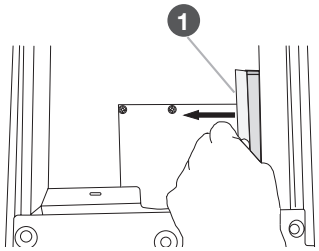
Remove burner assembly. Lift up and out.



4.

1 Large grease tray
2 Grease tray connection
3 Small grease tray
4 Slots

Remove small grease tray. Unhook tabs from slots and lift slightly to disengage from the large grease tray.



5.

1 Large grease tray
2 Slots

Remove large grease tray. Unhook slots and lift out.

6.

1 Drip tray

Remove and clean drip tray.

CARE AND CLEANING

To Clean:

Do not use oven cleaners, metal brushes, abrasive scouring pads, or other scrubbers made to clean outdoor grills.

Grate:

- Do not clean grill grate in dishwasher.
- Do not clean in a self-cleaning oven.

1.	2.
Scrub with brush while grate is still warm. Use a soft-bristle brush. Oven mitts may be worn while cleaning.	Soak in warm, soapy water for 30 minutes. After soaking, scrub with nonabrasive pad.

Wave Tray and Wave Plate:

1.

Soak in warm, soapy water to loosen soil. After soaking, scrub with non-abrasive pad. Oven cleaner may be used.

Burner Assembly:

- Do not soak in water.

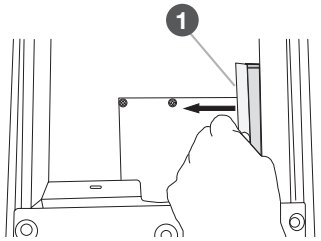
1.

Wipe with warm, soapy water or non-abrasive cleanser. Use damp cloth or non-abrasive pad.

Grease Trays and Drip Tray:

- Allow cooktop to cool before cleaning.

1.

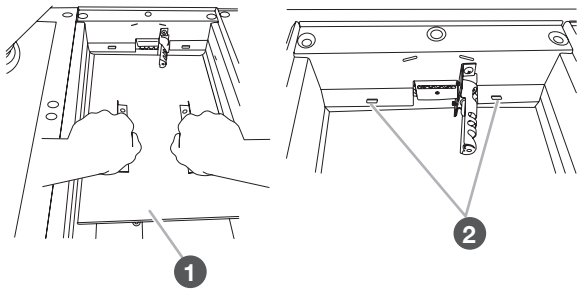


Wipe with warm, soapy water or non-abrasive cleanser. Use damp cloth or non-abrasive pad.

Module Basin:

1.	2.
Wipe with warm, soapy water or non-abrasive cleanser. Use damp cloth or non-abrasive pad.	For heavy soil, soak paper towels in household cleanser and lay them on the soil for at least 30 minutes. After soaking, scrub with a nonabrasive pad.

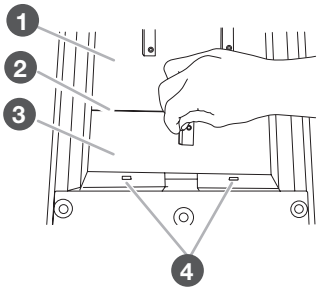
To Replace



1.

1 **Drip tray**

Replace drip tray. Slide drip tray into opening on the right front side of the grill basin. Follow the guides to ensure correct placement.



2.

1 **Large grease tray**
2 **Slots**

Replace large grease tray. Insert the large grease tray all the way under the back edge of the grill basin and hook it into the slots.

3.

1 **Large grease tray**
2 **Grease tray connection**
3 **Small grease tray**
4 **Slots**

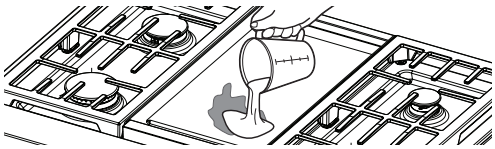
Replace small grease tray. Insert the small grease tray all the way under the front of the grill basin and hook it into the slots.

When the 2 grease trays are installed properly, the small grease tray will hook over the large grease tray.

GRIDDLE

Tips:

- Prior to cleaning the griddle, make sure that all cooktop burners have been turned off and the oven controls have been locked.
- For best results, clean the griddle shortly after removing the food.

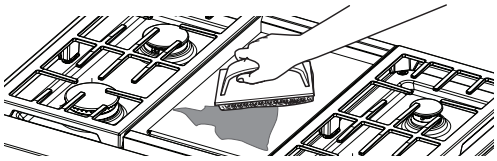


Do Not Use:

- Soap
- Abrasive materials
- Cleaning materials, including stainless steel cleaner

After Each Use:

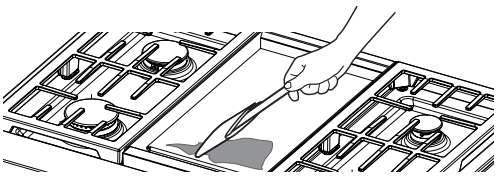
1. Heat for 10 to 15 minutes at 300°F.



2.

Pour water on soiled area.

Using a measuring cup, pour up to 1 cup tap water over the soiled area, starting at the back, allowing the water to run toward the drip tray in the front. Allow the water to bubble on the griddle for 3–4 seconds.

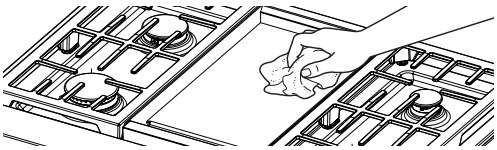


3.

Scrape residue into drip tray.

Use a pad holder or wooden spoon with non-scratch pad. Use pressure on soiled areas. Repeat if needed for heavy soils.

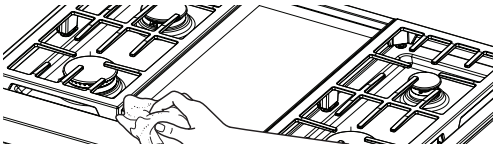
4.



Remove remaining residue.

Fold a damp towel and, with the pad holder or wooden spoon, go over the griddle to remove remaining residue.

5. Turn off griddle and let cool.

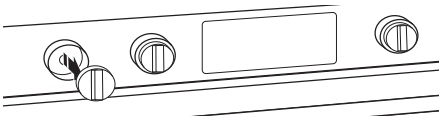


6.

Wipe off griddle.

Once cool, wipe the griddle with a clean, damp terry cloth towel. Then buff with a microfiber cloth. If streaking, rainbowing, or ghosting occurs, use a mixture of 1 part white vinegar to 2 parts water on a towel to wipe the griddle.

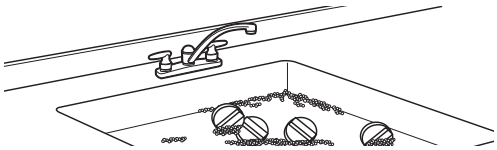
7.



Remove, empty, and clean drip tray.

Clean the drip tray with warm soapy water. Wipe the area under the drip tray clean. Once dry, put the drip tray back in position.

COOKTOP CONTROLS

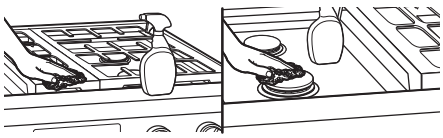


1.

Remove knobs.

Pull the knobs straight away from the control panel to remove.

2.



Clean with warm, soapy water.

Know Your Cooktop Controls

- To avoid damage to the cooktop controls, do not use steel wool, abrasive cleansers, or oven cleaner.
- To avoid damage, do not soak knobs.
- When replacing knobs, make sure knobs are in the OFF position.
- Do not remove seals under knobs.
- When replacing knobs after cleaning either the surface burner controls or the griddle module control, make sure the knobs are replaced to the correct location. The power burner knobs have power settings and the griddle knob has temperature settings. All other knobs have Hi, Med, Lo settings only.

STAINLESS STEEL (ON SOME MODELS)

Use cleaner or wipes.

Use affresh® Stainless Steel Cleaner or affresh® Stainless Steel Cleaning Wipes (not included). Rub in direction of grain to avoid possible damage to the steel surface.

Do not use:

- Soap-filled scouring pads
- Abrasive cleaners
- Cooktop polishing creme
- Steel-wool pads
- Gritty washcloths
- Abrasive paper towels

TROUBLESHOOTING

First try the solutions suggested here. If you need further assistance or more recommendations that may help you avoid a service call, refer to the warranty page in this manual and scan the code there with your mobile device, or visit **https://kitchenaid.com**. In Canada, visit **http://www.kitchenaid.ca**.

If you experience	Possible causes	Solution
Nothing will operate	A household fuse has blown or a circuit breaker has tripped.	Replace the fuse or reset the circuit breaker. If the problem continues, call an electrician.
Surface burners will not operate	This is the first time the surface burners have been used.	Turn on any one of the surface burner knobs to release air from the gas lines.
	The control knob is not set correctly.	Push in knob before turning to a setting.
	The burner ports are clogged.	Clean clogged burner ports with a straight pin.
Surface burner flames are uneven, yellow, and/or noisy	The burner ports are clogged.	Clean clogged burner ports with a straight pin.
	On models with caps, the burner caps are not positioned properly.	Make sure alignment pins are properly aligned with the burner cap.
	Propane gas is being used.	The cooktop may have been converted improperly. Contact a trained repair specialist.
Surface burner makes popping noises	The burner is wet.	Let it dry.
Burner sparks but does not light	There is continuous sparking, but the burner does not light.	Discontinue use of the surface burner and contact a service technician.
Excessive heat around cookware on cooktop	The cookware is not the proper size.	Use cookware about the same size as the surface cooking area, element, or surface burner. Cookware should not extend more than ½" (1.3 cm) outside the cooking area.
Cooktop cooking results not what expected	The proper cookware is not being used.	Use medium-to-heavy cookware made of the material that cooks food the way you want. The best cookware should have a flat bottom, straight sides, and a well-fitting lid.
	The control knob is not set to the proper heat level.	Set the Cooktop Control to HI, MED, or LO, depending upon the type of cooking you want to do.
	The cooktop is not level.	The cooktop must be level for the griddle to operate properly. See the Installation Instructions for leveling instructions.

ASSISTANCE OR SERVICE

Before calling for assistance or service, please check the "Troubleshooting" section. It may save you the cost of a service call. If you still need help, follow the instructions below. When calling, please know the purchase date and the complete model and serial number of your appliance. This information will help us to better respond to your request.

If you need replacement parts

If you need to order replacement parts, we recommend that you use only factory specified parts. These factory specified parts will fit right and work right because they are made with the same precision used to build every new KitchenAid® appliance.

To locate factory specified parts in your area, call us or your nearest KitchenAid designated service center.

IN THE U.S.A.

Call the KitchenAid Customer eXperience Center toll free: **1-800-422-1230**.

Our consultants provide assistance with:

- Features and specifications on our full line of appliances.
- Installation information.
- Use and maintenance procedures.
- Accessory and repair parts sales.
- Specialized customer assistance (Spanish speaking, hearing impaired, limited vision, etc.).
- Referrals to local dealers, repair parts distributors and service companies. KitchenAid designated service technicians are trained to fulfill the product warranty and provide after-warranty service anywhere in the United States.

  To locate the KitchenAid designated service company in your area, you can also look in your telephone directory Yellow Pages.

For further assistance

If you need further assistance, you can write to KitchenAid with any questions or concerns at:

KitchenAid Brand Home Appliances
Customer eXperience Center
553 Benson Road
Benton Harbor, MI 49022-2692

Please include a daytime phone number in your correspondence.

IN CANADA

Call the KitchenAid Customer eXperience Centre toll free: **1-800-807-6777**.

Our consultants provide assistance with:

- Features and specifications on our full line of appliances.
- Use and maintenance procedures.
- Accessory and repair parts sales.
- Referrals to local dealers, repair parts distributors and service companies. KitchenAid Canada designated service technicians are trained to fulfill the product warranty and provide after-warranty service anywhere in Canada.

For further assistance

If you need further assistance, you can write to KitchenAid Canada with any questions or concerns at:

Customer eXperience Centre

KITCHENAID® COOKTOP LIMITED WARRANTY

ATTACH YOUR RECEIPT HERE. PROOF OF PURCHASE IS REQUIRED TO OBTAIN WARRANTY SERVICE.

Please have the following information available when you call the Customer eXperience Center:

- Name, address and telephone number
- Model number and serial number
- A clear, detailed description of the problem
- Proof of purchase including dealer or retailer name and address

IF YOU NEED SERVICE:

1. Before contacting us to arrange service, please determine whether your product requires repair. Some questions can be addressed without service. Please take a few minutes to review the Troubleshooting or Problem Solver section of the Use and Care Guide, scan the QR code on the right to access additional resources, or visit http://kitchenaid.custhelp.com.
2. All warranty service is provided exclusively by our authorized KitchenAid Service Providers. In the U.S. and Canada, direct all requests for warranty service to:

KitchenAid Customer eXperience Center

In the U.S.A., call 1-800-422-1230. In Canada, call 1-800-807-6777.

http://kitchenaid.custhelp.com

If outside the 50 United States or Canada, contact your authorized KitchenAid dealer to determine whether another warranty applies.

FIVE YEAR LIMITED WARRANTY

WHAT IS COVERED

FIRST YEAR LIMITED WARRANTY (PARTS AND LABOR)

For one year from the date of purchase, when this major appliance is installed, operated and maintained according to instructions attached to or furnished with the product, KitchenAid brand of Whirlpool Corporation or Whirlpool Canada, LP (hereafter "KitchenAid") will pay for factory specified replacement parts and repair labor to correct defects in materials or workmanship that existed when this major appliance was purchased or, at its sole discretion replace the product. In the event of product replacement, your appliance will be warranted for the remaining term of the original unit's warranty period.

SECOND THROUGH FIFTH YEAR LIMITED WARRANTY (CERTAIN COMPONENT PARTS ONLY - LABOR NOT INCLUDED)

In the second through fifth years from the date of original purchase, when this major appliance is installed, operated and maintained according to instructions attached to or furnished with the product, KitchenAid will pay for factory specified parts for the following components to correct non-cosmetic defects in materials or workmanship in these parts that prevent function of this major appliance and that existed when this major appliance was purchased. This is a limited 5-year warranty on the below named parts only and does not include repair labor.

- Electric element
- Gas burners
- Solid state touch control system parts
- Any cracking of the rubber seal between the ceramic glass cooktop and porcelain edge
- Any cracking due to thermal shock of the ceramic glass cooktop
- Surface unit elements

YOUR SOLE AND EXCLUSIVE REMEDY UNDER THIS LIMITED WARRANTY SHALL BE PRODUCT REPAIR AS PROVIDED HEREIN. Service must be provided by a KitchenAid designated service company. This limited warranty is valid only in the United States or Canada and applies only when the major appliance is used in the country in which it was purchased. This limited warranty is effective from the date of original consumer purchase. Proof of original purchase date is required to obtain service under this limited warranty.

WHAT IS NOT COVERED

1. Commercial, non-residential or multiple-family use, or use inconsistent with published user, operator or installation instructions.
2. In-home Instruction on how to use your product.
3. Service to correct improper product maintenance or installation, installation not in accordance with electrical or plumbing codes or correction of household electrical or plumbing (i.e. house wiring, fuses or water inlet hoses).
4. Consumable parts (i.e. light bulbs, batteries, air or water filters, etc.).
5. Defects or damage caused by the use of non-genuine KitchenAid parts or accessories.
6. Conversion of your product from natural gas or L.P. gas.
7. Damage from accident, misuse, abuse, fire, floods, acts of God or use with products not approved by KitchenAid.
8. Repairs to parts or systems to correct product damage or defects caused by unauthorized service, alteration or modification of the appliance.
9. Cosmetic damage including scratches, dents, chips, and other damage to appliance finishes unless such damage results from defects in materials and workmanship and is reported to KitchenAid within 30 days.
10. Discoloration, rust or oxidation of surfaces resulting from caustic or corrosive environments including but not limited to high salt concentrations, high moisture or humidity or exposure to chemicals.
11. Food loss due to product failure.
12. Pick-up or delivery. This product is intended for in-home repair.
13. Travel or transportation expenses for service in remote locations where an authorized KitchenAid servicer is not available.
14. Removal or reinstallation of inaccessible appliances or built-in fixtures (i.e. trim, decorative panels, flooring, cabinetry, islands, countertops, drywall, etc.) that interfere with servicing, removal or replacement of the product.
15. Service or parts for appliances with original model/serial numbers removed, altered or not easily determined.

The cost of repair or replacement under these excluded circumstances shall be borne by the customer.

DISCLAIMER OF IMPLIED WARRANTIES

IMPLIED WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR IMPLIED WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED TO ONE YEAR OR THE SHORTEST PERIOD ALLOWED BY LAW. Some states and provinces do not allow limitations on the duration of implied warranties of merchantability or fitness, so this limitation may not apply to you. This warranty gives you specific legal rights, and you also may have other rights that vary from state to state or province to province.

DISCLAIMER OF REPRESENTATIONS OUTSIDE OF WARRANTY

KitchenAid makes no representations about the quality, durability, or need for service or repair of this major appliance other than the representations contained in this warranty. If you want a longer or more comprehensive warranty than the limited warranty that comes with this major appliance, you should ask KitchenAid or your retailer about buying an extended warranty.

LIMITATION OF REMEDIES; EXCLUSION OF INCIDENTAL AND CONSEQUENTIAL DAMAGES

YOUR SOLE AND EXCLUSIVE REMEDY UNDER THIS LIMITED WARRANTY SHALL BE PRODUCT REPAIR AS PROVIDED HEREIN. KITCHENAID SHALL NOT BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES. Some states and provinces do not allow the exclusion or limitation of incidental or consequential damages, so these limitations and exclusions may not apply to you. This warranty gives you specific legal rights, and you also may have other rights that vary from state to state or province to province.

11/14

INFORMATIONS DE SÉCURITÉ

Votre sécurité et celle des autres est très importante.

Nous donnons de nombreux messages de sécurité importants dans ce manuel et sur votre appareil ménager. Assurez-vous de toujours lire tous les messages de sécurité et de vous y conformer.

Voici le symbole d'alerte de sécurité.

Ce symbole d'alerte de sécurité vous signale les dangers potentiels de décès et de blessures graves à vous et à d'autres.

Tous les messages de sécurité suivront le symbole d'alerte de sécurité et le mot "DANGER" ou "AVERTISSEMENT". Ces mots signifient :

⚠ DANGER — **Risque possible de décès ou de blessure grave si vous ne suivez pas immédiatement les instructions.**

⚠ AVERTISSEMENT — **Risque possible de décès ou de blessure grave si vous ne suivez pas les instructions.**

Tous les messages de sécurité vous diront quel est le danger potentiel et vous disent comment réduire le risque de blessure et ce qui peut se produire en cas de non-respect des instructions.

AVERTISSEMENT : Si les renseignements dans ce manuel ne sont pas exactement observés, un incendie ou une explosion peut survenir, causant des dommages au produit, des blessures ou un décès.

– Ne pas entreposer ni utiliser de l'essence ou d'autres vapeurs ou liquides inflammables à proximité de cet appareil ou de tout autre appareil électroménager.

– QUE FAIRE DANS LE CAS D'UNE ODEUR DE GAZ :

- **Ne pas tenter d'allumer un appareil.**
- **Ne pas toucher à un commutateur électrique.**
- **Ne pas utiliser le téléphone se trouvant sur les lieux.**
- **Appeler immédiatement le fournisseur de gaz à partir du téléphone d'un voisin. Suivre ses instructions.**
- **À défaut de joindre votre fournisseur de gaz, appeler les pompiers.**

– L'installation et l'entretien doivent être effectués par un installateur qualifié, une agence de service ou le fournisseur de gaz.

AVERTISSEMENT : L'odorat ne permet pas toujours la détection d'une fuite de gaz.

Les distributeurs de gaz recommandent l'emploi d'un détecteur de gaz (homologation UL ou CSA).

Pour d'autre information, contacter le fournisseur de gaz local.

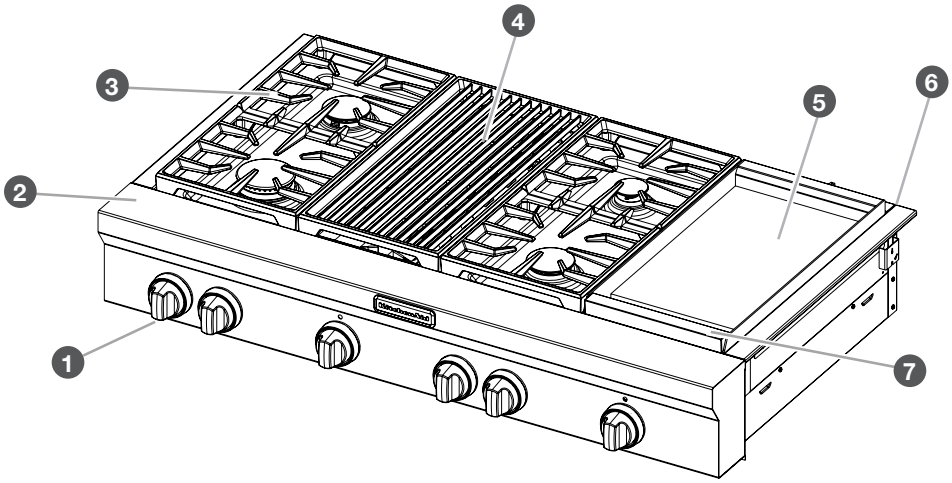
En cas de détection d'une fuite de gaz, exécuter les instructions "Que faire dans le cas d'une odeur de gaz".

Avertissements de la proposition 65 de l'État de Californie :

AVERTISSEMENT : Ce produit contient au moins un produit chimique connu par l'État de Californie pour être à l'origine de cancers.

AVERTISSEMENT : Ce produit contient au moins un produit chimique connu par l'État de Californie pour être à l'origine de malformations et autres déficiences de naissance.

IMPORTANTES INSTRUCTIONS DE SÉCURITÉ



AVERTISSEMENT : Pour réduire le risque d'incendie, de choc électrique, de blessures ou de dommages lors de l'utilisation de la table de cuisson, il convient d'observer certaines précautions élémentaires dont les suivantes :

- **AVERTISSEMENT :** NE JAMAIS utiliser cet appareil comme dispositif de chauffage de la pièce. Le non-respect de cette instruction peut entraîner une intoxication au monoxyde de carbone et une surchauffe de la table de cuisson.
- **MISE EN GARDE –** Ne pas remiser dans des armoires au-dessus de la table de cuisson, des objets que des enfants pourraient vouloir atteindre. Les enfants pourraient se blesser gravement en grimpant sur la table de cuisson.
- Installation appropriée – La table de cuisson lorsqu'elle est correctement installée doit être reliée à la terre conformément aux codes locaux ou, en l'absence de codes locaux, selon le *Code national électrique, ANSI/NFPA70 ou le Code canadien des installations électriques, Partie 1*. S'assurer que la table de cuisson est correctement installée et reliée à la terre par un technicien qualifié.
- La table de cuisson est munie d'une fiche de liaison à la terre à trois broches pour votre protection contre les risques de choc électrique et doit être branchée directement dans une prise de courant bien reliée à la terre. Ne pas couper ni enlever la broche de liaison à la terre de cette fiche.
- Débrancher l'alimentation électrique avant d'exécuter des réparations à la table de cuisson.
- Des blessures peuvent survenir du mauvais usage de la table de cuisson tel que se tenir debout sur la surface, se pencher ou s'asseoir sur le dessus de la surface.
- Entretien – Garder l'espace autour de la table de cuisson dégagé et exempt de matériaux combustibles, d'essence et d'autres vapeurs et liquides inflammables.
- Remisage sur la table de cuisson – Des produits inflammables ne doivent pas être remisés sur ou près des éléments de surface.
- La taille de la flamme des brûleurs de surface devrait être ajustée de sorte qu'elle ne dépasse pas le bord d'un ustensile de cuisson.

CONSERVEZ CES INSTRUCTIONS

PIÈCES ET CARACTÉRISTIQUES

Ce manuel couvre plusieurs modèles différents. La table de cuisson que vous avez achetée peut comporter l'ensemble des articles énumérés ou seulement certains d'entre eux. L'emplacement et l'apparence des caractéristiques illustrées peuvent ne pas correspondre à ceux de votre modèle. Se reporter à ce manuel ou à la section Foire Aux Questions (FAQ) de notre site Web sur **www.kitchenaid.com** pour des instructions plus détaillées. Au Canada, consulter la section Service à la clientèle sur **www.kitchenaid.ca**.

1. **Boutons de commande métalliques coulés sous pression de style commercial**
2. **Rebord de protection**
3. **Conception pour service intense de grille simple**
4. **Gril (sur certains modèles)**
5. **Grille chromée électrique (sur certains modèles)**
6. **Garniture périphérique**
7. **Plateau d'égouttement (sur modèles avec plaque à frire)**

Non illustré :

Dosserets réglables facultatifs de 9" (22,9 cm) et 22" (55,9 cm)

Couvercle de plaque à frire facultatif

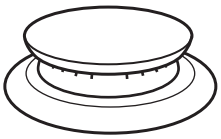
Couvercle de gril facultatif

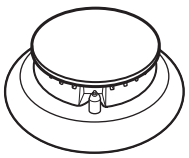
Cerclage de wok facultatif

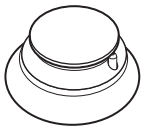
Boutons en acier inoxydable facultatifs

BRÛLEURS

⚠ AVERTISSEMENT







Risque d'incendie

La flamme d'un brûleur ne devrait pas dépasser le bord du récipient de cuisson.

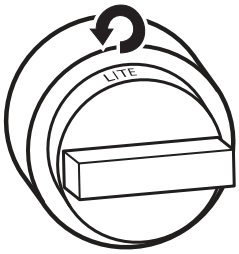
Fermer tous les réglages lorsque la cuisson est terminée.

Le non-respect de ces instructions peut causer un décès ou un incendie.

BTU/H	ILLUSTRATION DU BRÛLEUR	CARACTÉRISTIQUES
Brûleur à double flamme Ultra-Power™		Ce brûleur comporte un débit thermique minimal et un débit thermique maximal. Le réglage Power Hi (puissance élevée) utilise les deux niveaux de flamme à pleine puissance pour fournir le niveau thermique maximal. Il est idéal pour la cuisson de grandes quantités d'aliments liquides ou solides à l'aide de grandes casseroles et poêles. Les réglages Simmer HI et LO (mijotage à grand et petit feu) utilisent uniquement la petite flamme.
Brûleur moyen		Ce brûleur est idéal pour cuire de petites quantités d'aliments et fondre du chocolat ou du beurre.
Brûleur de mijotage		Ce brûleur atteint 500 BTU/h au réglage minimum. Il fournit des températures basses nécessaires pour faire mijoter des soupes, des ragoûts et pour faire fondre des ingrédients délicats comme le beurre, le fromage et le chocolat.

Allumage des brûleurs :

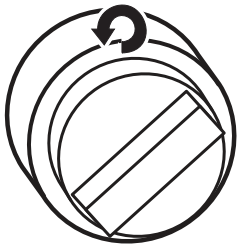
- Des allumeurs électriques allument automatiquement les brûleurs de surface lorsque les boutons de commande sont tournés à LITE (allumage).
- Avant de régler un bouton de commande, placer l'ustensile de cuisson rempli sur la grille. Ne pas faire fonctionner un brûleur avec un ustensile de cuisson vide ou sans ustensile de cuisson sur la grille.
- Vérifier visuellement que le brûleur est allumé. Si le brûleur ne s'allume pas, guetter un déclic. Si l'allumeur n'émet aucun déclic, éteindre le brûleur. Vérifier si le disjoncteur ne s'est pas déclenché ou si un fusible n'est pas grillé.
- Vérifier que le bouton de commande est complètement enfoncé sur la tige de la soupape. Si l'allumeur ne fonctionne toujours pas, appeler un technicien de réparation qualifié.
- Lorsque les boutons de commande d'un brûleur de petite ou moyenne puissance sont tournés à la position LITE (allumage), tous les brûleurs de petite ou moyenne puissance émettent un déclic. Lorsque le bouton de commande commandant le gros brûleur est tourné à la position LITE (allumage), ces brûleurs émettent des déclics indépendamment des autres brûleurs. Dans les deux cas, seul le brûleur dont le bouton de commande est placé sur LITE (allumage) produira une flamme.



NE PAS OUBLIER : Lors de l'utilisation de la cuisson ou durant le programme d'autonettoyage, toute la surface de cuisson peut devenir chaude.

Caractéristique de rallumage

Durant l'utilisation de la table de cuisson, si un ou plusieurs brûleurs s'éteint/s'éteignent en raison de causes extérieures (tel qu'un renversement de liquide, un courant d'air ou un mouvement d'air lié à l'aspiration), le système d'allumage s'active pour rallumer la flamme. Lorsque la flamme réapparaît, la production d'étincelles cesse. Si l'on n'élimine pas le courant d'air dans la pièce, la production épisodique d'étincelles peut se poursuivre. Une production d'étincelles peut aussi se produire occasionnellement lorsqu'on utilise le débit thermique minimal sur l'un des brûleurs.

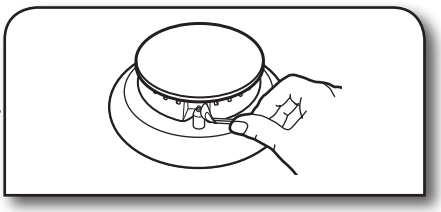


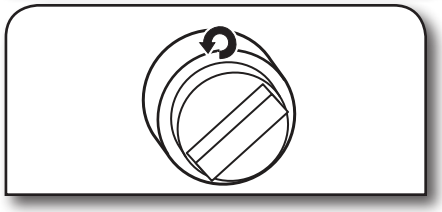
Pour régler un brûleur :

1.

Enfoncer et tourner le bouton dans le sens antihoraire à LITE (allumage).

2.



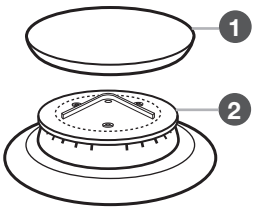


Tourner le bouton dans le sens antihoraire entre HI (élevé) et LO (bas).

Enfoncer une fois de plus pour passer de LO (bas) à HI (élevé).

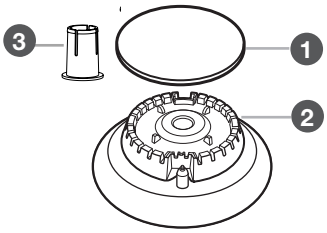
En cas de panne de courant

Tenir une allumette allumée près d'un brûleur et tourner le bouton dans le sens antihoraire à HI (élevé). Une fois le brûleur allumé, tourner le bouton au réglage souhaité.



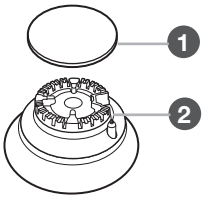
CARACTÉRISTIQUES DE LA TABLE DE CUISSON

Brûleurs de surface scellés



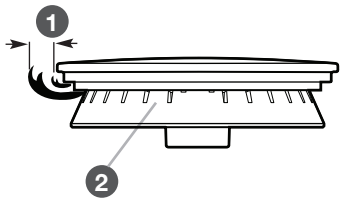
Les brûleurs de surface scellés sont conçus pour minimiser les espaces et joints d'où les liquides et les renversements peuvent pénétrer sous la table de cuisson. Cette conception rend possible un nettoyage rapide et facile.

Brûleur haute puissance superposé



1. **Chapeau de brûleur**
2. **Base du brûleur**
3. **Douille de réduction (pour utilisation avec le brûleur de moyenne puissance, uniquement pour l'alimentation au propane)**

Brûleur moyen

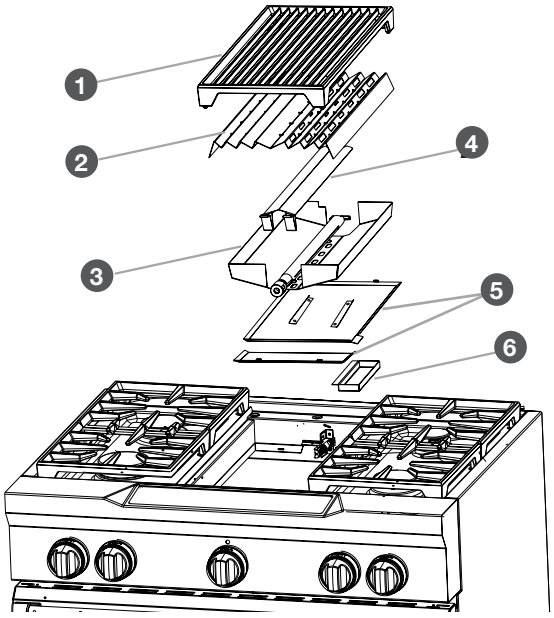


Brûleur de mijotage/pour faire fondre

IMPORTANT : Ne pas entraver l'évacuation de l'air de combustion et de ventilation autour des bords des grilles de brûleur.

Chapeau de brûleur : Toujours garder le chapeau de brûleur en place lorsqu'un brûleur de surface est utilisé. Un chapeau de brûleur propre aide à empêcher le mauvais allumage et les flammes irrégulières. Toujours nettoyer le chapeau du brûleur après un renversement; enlever et nettoyer régulièrement les chapeaux tel qu'indiqué à la section "Entretien et nettoyage".

Ouverture de gaz : Pour que le brûleur s'allume convenablement, le gaz doit pouvoir circuler librement à travers l'orifice de gaz. Garder cette zone propre et ne pas laisser de renversements, d'aliments, d'agents de nettoyage ou tout autre produit pénétrer dans l'ouverture de gaz. Toujours utiliser un chapeau de brûleur pour protéger l'ouverture de gaz contre tout renversement.



1. **1-1½" (25-38 mm)**
2. **Orifices de brûleur**

Orifices de brûleur : Examiner occasionnellement les flammes des brûleurs pour en vérifier la taille et la forme tel qu'indiqué ci-dessus. Une bonne flamme est bleue plutôt que jaune. Garder cette zone exempte de souillures et ne pas laisser les produits renversés, les aliments, les agents de nettoyage ou autre produit pénétrer dans les orifices de brûleur.

GRIL (SUR CERTAINS MODÈLES)

Le module du gril consiste en une grille en fonte, un plateau ondulé, un répartiteur de flammes, un brûleur, 2 plateaux à graisse et un plateau d'égouttement.

1. **Grille du gril**
2. **Plateau ondulé**
3. **Ensemble de brûleur**
4. **Répartiteur de flammes**
5. **Plateau à graisse**
6. **Plateau d'égouttement**

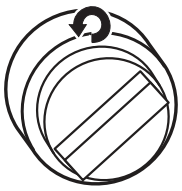
Lors de l'utilisation du gril, suivre les directives ci-dessous.

- Enlever l'excès de graisse pour réduire les éclaboussures. Entailler le gras résiduel sur les côtés pour éviter que la viande ne se recroqueville.
- Laisser de la place entre les aliments sur le gril. Placer les aliments trop près les uns des autres entraînera une cuisson irrégulière.
- Utiliser une spatule métallique ou des pinces pour retourner les aliments.
- Les steaks, les côtelettes et les hamburgers ne doivent être retournés qu'une fois afin d'éviter la perte des jus de cuisson.
- Pour une cuisson plus uniforme, les aliments tels que les quarts de poulet doivent être retournés plusieurs fois.
- Pour vérifier le degré de cuisson des viandes et de la volaille, utiliser un thermomètre à lecture instantanée ou faire une petite entaille au centre de l'aliment. Ceci préviendra la perte des jus de cuisson.
- Ne pas laisser le gril sans surveillance pendant la cuisson.
- Afin d'éviter d'endommager le gril, ne pas utiliser de papier aluminium, de charbon ou de copeaux de bois.
- Afin d'éviter d'endommager les ustensiles de cuisson, ne pas les placer sur le gril lorsque celui-ci n'est pas utilisé. Les aliments doivent être cuits directement sur la grille du gril.

CARACTÉRISTIQUES DE LA TABLE DE CUISSON

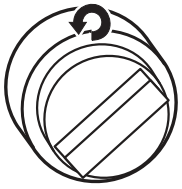
Utilisation :

1.
Mettre la hotte d'évacuation au-dessus de la cuisinière en marche.



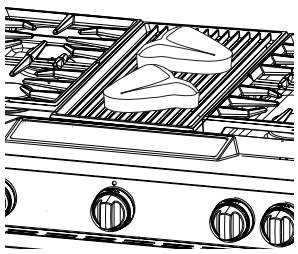
2.
Ajouter de l'huile végétale, au besoin. Appliquer une mince couche d'huile végétale ou d'aérosol de cuisine antiadhésif sur la grille du gril.

3.



Enfoncer et tourner le bouton à LITE/HI (allumage/élevé). La flamme s'allume en 1 à 4 secondes.

4.



Tourner le bouton à MED (moyen) et laisser la grille se réchauffer pendant 15 minutes.

5.

Tourner le bouton au réglage de cuisson désiré.

6.

Placer les aliments sur le gril.

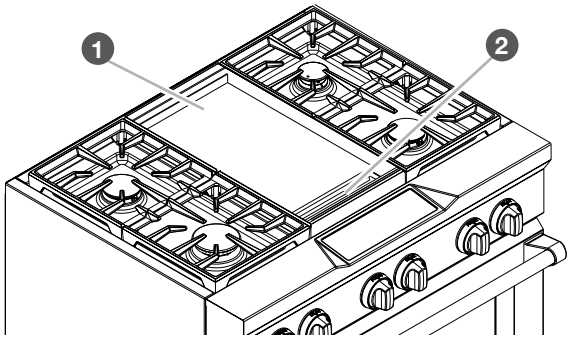


Tableau de cuisson au gril

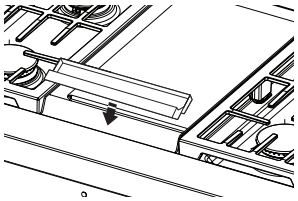
Les réglages et durées de cuisson sont cités à titre indicatif seulement et peuvent être modifiés en fonction des goûts personnels.

ALIMENT	RÉGLAGE	DURÉE DE CUISSON TOTAL MINUTES
Steak		
1" (2,5 cm)		
à point	MED	16-20
bien cuit	MED	20-30
Galettes de viande hachée		
½ - ¾" (1,3 à 1,9 cm)	MED	20-25
Côtelettes de porc		
1" (2,5 cm)	MED	35-55
Tranches de jambon		
½" (1,3 cm)	MED	8-12
Saucisses de Francfort et Saucisses précuites	MED	8-15
Poulet		
Quarts	MED-LO	50-80
Poitrine, désossée	MED	20-40
Darnes de poisson		
¾ - 1" (1,9 à 2,5 cm) d'épaisseur	MED	10-15

PLAQUE À FRIRE ÉLECTRIQUE CHROMÉE (SUR CERTAINS MODÈLES)

La surface de cuisson de la plaque à frire électrique chromée est idéale pour faire cuire des sandwiches, des crêpes, des œufs, des hamburgers, des légumes sautés et de nombreux autres favoris de la famille. La surface attrayante à faible adhésion est conçue pour rendre le nettoyage facile.

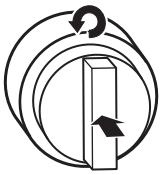
1 Plaque à frire



2 Plateau d'égouttement

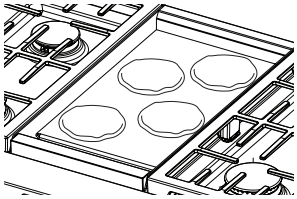
Le système de plaque à frire électrique chromée fournit une surface de cuisson à répartition de chaleur uniforme.

- S'assurer que la pellicule a été retirée et laver avec de l'eau chaude avant la première utilisation.
- Afin d'éviter d'égratigner la plaque à frire, ne pas placer de casseroles ou de poêles sur la plaque à frire. Utiliser uniquement des ustensiles en plastique ou en bois résistants à la chaleur.
- La surface de la plaque à frire est prête à l'emploi et ne nécessite pas de préparation.
- Le fait de verser de l'eau froide sur une plaque à frire chaude peut déformer la plaque à frire et entraîner une surface de cuisson irrégulière.



Utilisation :

1.



Positionner le plateau d'égouttement.

2.

Pousser et tourner le bouton.

3.

Placer l'aliment sur la plaque et cuire au degré de cuisson désiré.

Le témoin lumineux de la plaque à frire s'éteint lorsque le préchauffage de la plaque à frire est terminé. Le témoin lumineux de la plaque à frire s'allume et s'éteint durant l'utilisation pour indiquer que l'élément de la plaque à frire maintient la température de surface sélectionnée.

Tableau de cuisson

Les réglages et durées de cuisson sont cités à titre indicatif seulement et peuvent être modifiés en fonction des goûts personnels.

ALIMENT	RÉGLAGE	DURÉE DE CUISSON TOTAL MINUTES
Galettes et chapelets de saucisses	325°F (163°C)	12-18
Tranches de bacon	350°F (177°C)	7-11
Tranches de jambon (entièrement cuit)	325°F (163°C)	5-7
Saucisses de Francfort et saucisses précuites	325°F (163°C)	8-15
Galettes de viande hachée	350°F (177°C)	10-15
Sandwiches grillés	325°F (163°C)	3-5
Darnes et filets de poisson	325°F (163°C)	8-15
Œufs	300°F (149°C)	3-5
Pommes de terre rissolées	400°F à 425°F (204°C à 218°C)	8-12
Pain doré	350°F (177°C)	5-7
Crêpes	350°F (177°C)	2-4

USTENSILES DE CUISSON

IMPORTANT : Ne pas laisser un ustensile de cuisson vide sur la surface d'une table de cuisson, d'un élément ou d'un brûleur de surface chauds.

Les ustensiles de cuisson idéals doivent avoir un fond plat, des parois droites, un couvercle qui ferme bien et le matériau doit être d'épaisseur moyenne à forte.

Les surfaces rêches peuvent érafler la table de cuisson ou les grilles. L'aluminium et le cuivre peuvent être employés comme fond ou base dans un ustensile de cuisson. Cependant, utilisés comme base, ils peuvent laisser des marques permanentes sur la table de cuisson ou les grilles.

Le matériau d'un ustensile de cuisson affecte la rapidité et l'uniformité de la transmission de la chaleur, ce qui affecte les résultats de cuisson. Un fini antiadhésif a les mêmes caractéristiques que son matériau de base. Par exemple, un ustensile de cuisson en aluminium avec un fini antiadhésif aura les propriétés de l'aluminium.

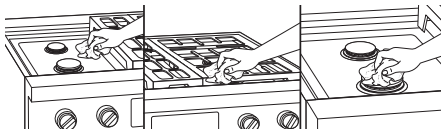
Les ustensiles de cuisson avec surface antiadhésive ne doivent pas être utilisés sous l'élément de cuisson au gril.

Utiliser le tableau suivant comme guide pour les caractéristiques du matériau de l'ustensile de cuisson.

USTENSILE	CARACTÉRISTIQUES
Aluminium	■ Chauffe rapidement et uniformément. ■ Convient à tous les genres de cuisson ■ L'épaisseur moyenne ou forte convient le mieux pour la plupart des tâches de cuisson.
Fonte	■ Chauffe lentement et uniformément. ■ Convient pour le brunissage et la friture. ■ Maintient la chaleur pour une cuisson lente.
Céramique ou vitrocéramique	■ Suivre les instructions du fabricant. ■ Chauffe lentement mais inégalement ■ Les meilleurs résultats sont obtenus sur les réglages de chaleur basse à moyenne.
Cuivre	■ Chauffe très rapidement et de façon uniforme
Terre cuite	■ Suivre les instructions du fabricant. ■ Utiliser des réglages de température basse.
Acier émaillé (porcelaine) ou fonte émaillée	■ Voir acier inoxydable ou fonte.
Acier inoxydable	■ Chauffe rapidement, mais inégalement. ■ Un fond ou une base d'aluminium ou de cuivre sur l'acier inoxydable procure un chauffage uniforme.

PRÉPARATION DE CONSERVES À LA MAISON

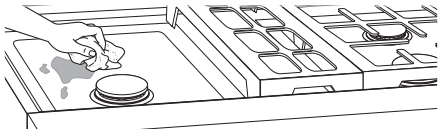
Lors de la préparation de conserves pendant de longues périodes, alterner l'utilisation des brûleurs de surface entre les quantités préparées. Cette alternance permet aux dernières surfaces utilisées de refroidir.



- Centrer l'autoclave sur la grille.
- Ne pas placer l'autoclave sur deux brûleurs de surface à la fois.
- Pour plus de renseignements, communiquez avec votre service local d'agriculture. Les compagnies qui fabriquent des produits pour la préparation de conserves peuvent aussi offrir de l'aide.

SURFACE DE LA TABLE DE CUISSON

IMPORTANT : Avant le nettoyage, s'assurer que toutes les commandes sont éteintes et que la table de cuisson a refroidi. Toujours suivre les instructions figurant sur les étiquettes des produits de nettoyage.

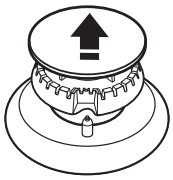


Après chaque utilisation :

1.

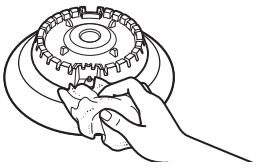
Essuyer la table de cuisson, les grilles et les chapeaux.

2.



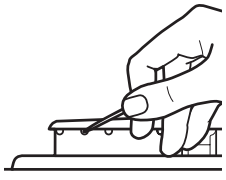
Nettoyer le déversement des aliments.

Afin préserver le revêtement, nettoyer les renversements d'aliments contenant des produits acides, tels que vinaigre et tomates, dès que tout l'appareil est froid.



BRÛLEURS DE SURFACE SCELLÉS

1.

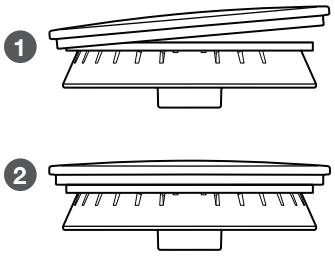


Retirer le chapeau et la base.

2.

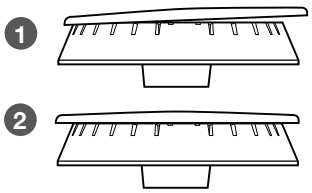
Essuyer la table de cuisson, les grilles et les chapeaux.

3.



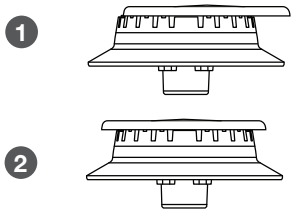
Nettoyer les orifices de brûleur obstrués.

Utiliser une épingle droite. Ne pas agrandir ni déformer l'orifice. Ne pas utiliser un cure-dents en bois. Si le brûleur a besoin d'être ajusté, contacter un technicien de réparation qualifié.



4. Réinstaller le chapeau de brûleur.

Brûleur à double flamme



1 **Incorrect**
2 **Correct**

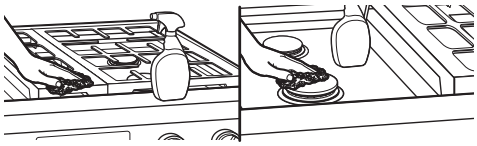
Brûleur moyen

1 **Incorrect**
2 **Correct**

Brûleur de mijotage/pour faire fondre

1 **Incorrect**
2 **Correct**

S'assurer que les broches d'alignement sont bien alignées avec le chapeau du brûleur.



5.

Allumer le brûleur.

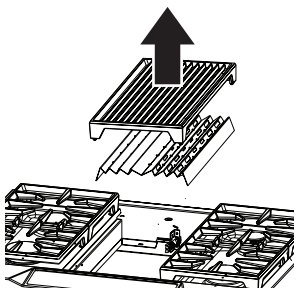
Si le brûleur ne s'allume pas, vérifier l'alignement du chapeau. Si le brûleur ne s'allume toujours pas, ne pas réparer vous-même le brûleur scellé. Contacter un technicien de réparation qualifié.

GRILLES ET CHAPEAUX ÉMAILLÉS

Utiliser un tampon à récurer et un détergent.

Nettoyer à l'aide d'outils de récurage en nylon non abrasif et nettoyant légèrement abrasif :

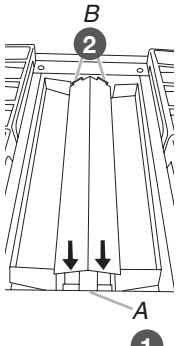
Connaître vos grilles et chapeaux.



- Les renversements d'aliments contenant des produits acides, tels que vinaigre et tomates, doivent être nettoyés dès que la table de cuisson, les grilles et les chapeaux ont refroidi. Ces salissures peuvent endommager le fini.
- Pour éviter l'écaillement, ne pas entrechoquer les grilles et les chapeaux ni les frapper contre des surfaces dures telles que les ustensiles en fonte.
- Ne pas réinstaller les chapeaux sur les brûleurs lorsqu'ils sont mouillés.
- Ne pas utiliser le programme d'autonettoyage pour les nettoyer.
- Ne pas nettoyer au lave-vaisselle.

GRIL

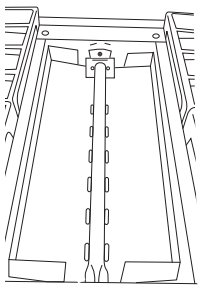
Démontage :



Avant de retirer ou de remettre en place le gril, s'assurer que les boutons de commande sont placés à ARRÊT. Laisser le gril refroidir complètement avant de le manipuler.

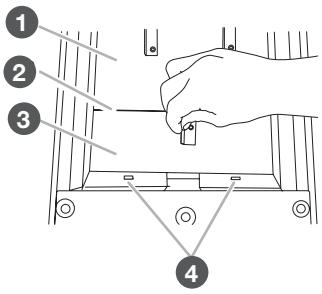
1.

Ôter la grille du gril et le plateau ondulé.



2.

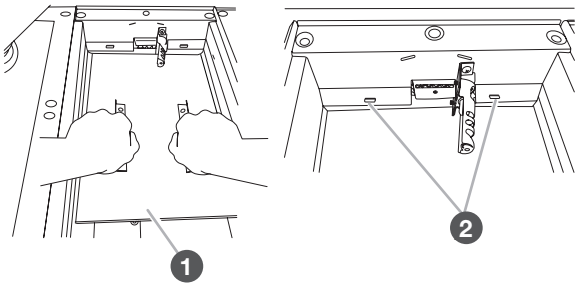
1 **Avant du gril**
2 **Onglets et encoches arrière**



Ôter le répartiteur de flammes. Tirer le répartiteur de flammes légèrement vers l'avant pour libérer les onglets des encoches arrière et le soulever.

3.

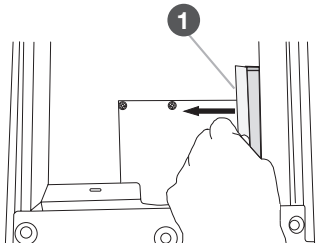
Enlever l'ensemble du brûleur. Soulever et sortir.



4.

1 **Grand plateau à graisse**
2 **Connexion du plateau à graisse**
3 **Petit plateau à graisse**
4 **Réceptacles d'emboîtement**

Enlever le petit plateau à graisse, en décrochant les onglets des encoches et en soulevant légèrement pour le dégager du grand plateau à graisse.



5.

1 **Grand plateau à graisse**
2 **Réceptacles d'emboîtement**

Enlever le grand plateau à graisse. Décrocher les onglets et soulever.

6.

1 **Plateau d'égouttement**

Enlever et nettoyer le plateau d'égouttement.

ENTRETIEN ET NETTOYAGE

Nettoyage :

Ne pas utiliser de nettoyants à four, brosses métalliques, tampons à récurer abrasifs ou autres accessoires de récurage pour nettoyer les grils d'extérieur.

Grille :

- Ne pas laver la grille du gril au lave-vaisselle.
- Ne pas la nettoyer dans un four autonettoyant.

1.	2.
Frotter à l'aide d'une brosse pendant que la grille est encore chaude. Utiliser une brosse à poils doux. On peut porter des mitaines de four pendant le nettoyage.	Laisser tremper dans une eau chaude et savonneuse pendant 30 minutes. Après le trempage, frotter avec un tampon non abrasif.

Plateau et plaque ondulés

1.

Faire tremper dans de l'eau tiède et savonneuse pour désincruster la saleté. Après le trempage, frotter avec un tampon non abrasif. Du nettoyant à four peut être utilisé.

Ensemble de brûleur :

- Ne pas tremper dans l'eau.

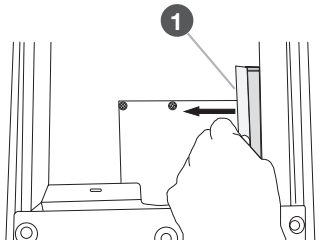
1.

Nettoyer à l'aide d'eau chaude savonneuse ou d'un nettoyant non abrasif. Utiliser un chiffon humide ou un tampon non abrasif.

Plateaux à graisse et plateau d'égouttement :

- Laisser la table de cuisson refroidir avant le nettoyage.

1.

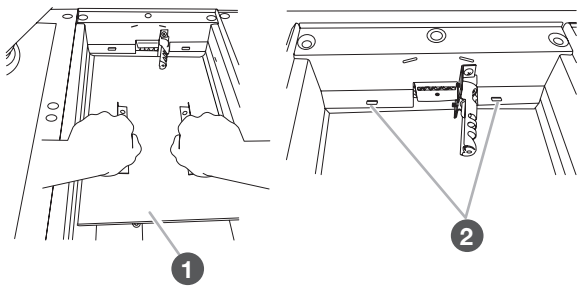


Nettoyer à l'aide d'eau chaude savonneuse ou d'un nettoyant non abrasif. Utiliser un chiffon humide ou un tampon non abrasif.

Bac du module :

1.	2.
Nettoyer à l'aide d'eau chaude savonneuse ou d'un nettoyant non abrasif. Utiliser un chiffon humide ou un tampon non abrasif.	Pour les zones très sales, laisser tremper en utilisant des essuie-tout. Faire tremper des essuie-tout dans du nettoyant ménager et les placer sur les saletés pendant au moins une demi-heure. Après le trempage, frotter avec un tampon non abrasif.

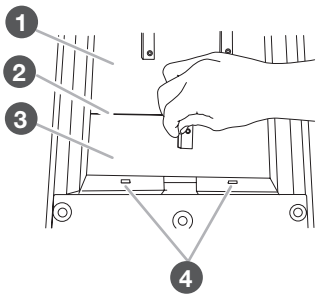
Pour replacer :



1.

1 **Plateau d'égoutte**

Réinstaller le plateau d'égouttement. Faire glisser le plateau d'égouttement dans l'ouverture du côté droit du bac du gril. Suivre les guides pour assurer un bon positionnement.



2.

1 **Grand plateau à graisse**
2 **Réceptacles d'emboîtement**

Replacer le grand plateau à graisse. Insérer complètement le grand plateau à graisse sous le rebord arrière du bac du gril et l'engager dans les encoches.

3.

1 **Grand plateau à graisse**
2 **Connexion du plateau à graisse**
3 **Petit plateau à graisse**
4 **Réceptacles d'emboîtement**

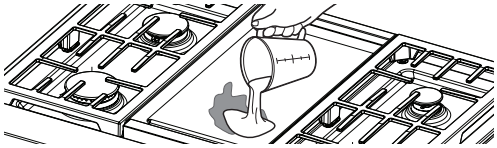
Replacer le petit plateau à graisse. Insérer complètement le petit plateau à graisse sous le rebord avant du bac du gril et l'engager dans les encoches.

Lorsque les 2 plateaux à graisse sont correctement installés, le petit plateau à graisse s'emboîte sur le grand plateau à graisse.

PLAQUE À FRIRE

Astuces :

- Avant de nettoyer la plaque à frire, vérifier que les brûleurs de la table de cuisson sont éteints et que les commandes du four ont été verrouillées.
- Pour obtenir de bons résultats, nettoyer la plaque à frire peu de temps après avoir retiré les aliments.



Ne pas utiliser :

- Savon
- Matériaux abrasifs
- Matériaux de nettoyage, incluant les tampons en acier inoxydable

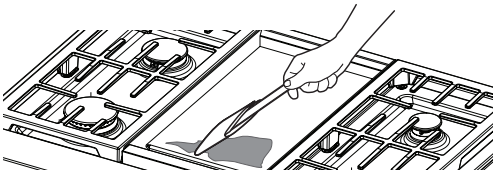
Après chaque utilisation :

1. Faire chauffer pendant 10 à 15 minutes à 300°F.

2.

Mouiller la zone sale.

À l'aide d'une tasse à mesurer, ajouter 1 tasse d'eau du robinet sur la zone souillée. Commercer par l'arrière pour permettre à l'eau de couler vers le plateau d'égouttement situé à l'avant. Permettre à l'eau de faire des bulles sur la plaque pendant 3 à 4 secondes.

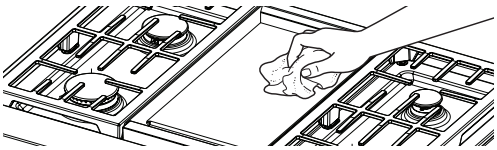


3.

Gratter les résidus dans le plateau d'égouttement.

Utiliser un porte-tampon à récurer ou une cuillère en bois et un tampon à récurer antiégratignures. Appliquer une pression sur les zones souillées. Répéter au besoin pour les zones très sales.

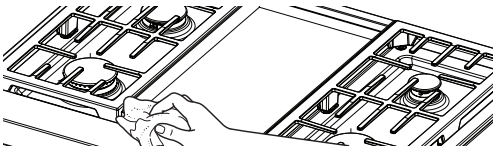
4.



Retirer les résidus restants.

Plier un chiffon humide, et à l'aide du porte-tampon à récurer ou de la cuillère de bois, passer sur la plaque à frire pour enlever les résidus restants.

5. Éteindre la plaque et la laisser refroidir.

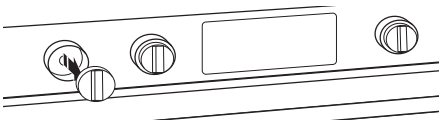


6.

Essuyer la plaque.

Une fois refroidie, essuyer la plaque à frire avec un linge en ratine humide et propre. Polir ensuite avec un tissu en microfibres. Si des rayures, un effet arc-en-ciel ou un effet flou apparaît, utiliser un mélange comportant une part de vinaigre pour 2 parts d'eau et essuyer la plaque à l'aide d'un tissu.

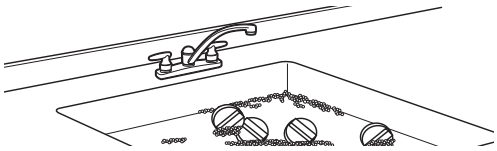
7.



Enlever, vider et nettoyer le plateau d'égouttement.

Nettoyer le plateau d'égouttement avec de l'eau tiède savonneuse. Essuyer la zone sous le plateau d'égouttement. Une fois sèche, replacer le plateau d'égouttement.

COMMANDES DE LA TABLE DE CUISSON

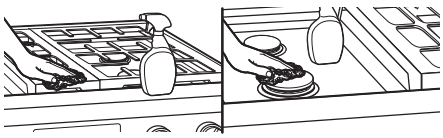


1.

Enlever les boutons.

Tirer les boutons directement hors du tableau de commande pour les enlever.

2.



Nettoyer les boutons à l'eau chaude savonneuse.

Se familiariser avec les commandes de la table de cuisson

- Afin d'éviter d'endommager les commandes de la table de cuisson, ne pas utiliser de laine d'acier, de nettoyants abrasifs ou de nettoyant pour four.
- Afin d'éviter toute détérioration, ne pas laisser tremper les boutons de commande.
- Lors de la réinstallation des boutons, s'assurer que chaque bouton est à la position Off (arrêt).
- Ne pas retirer les joints sous les boutons.
- Lors de la réinstallation des boutons après le nettoyage des commandes des brûleurs de surface ou de la commande du module de la plaque à frire, vérifier que les boutons sont réinstallés à leur emplacement correct. Les boutons de brûleur possèdent des réglages de puissance et le bouton de la plaque à frire des réglages de température. Tous les autres boutons possèdent uniquement des réglages Hi (élevé), Med (moyen), Lo (bas).

ACIER INOXYDABLE (SUR CERTAINS MODÈLES)

Utiliser un nettoyant ou des lingettes.

Utiliser le nettoyant affresh® pour acier inoxydable ou les lingettes nettoyantes affresh® pour acier inoxydable (non compris). Frotter dans la direction du grain pour éviter des dommages possibles à la surface en acier inoxydable.

Ne pas utiliser :

- Tampons à récurer savonneux
- Nettoyants abrasifs
- Crème à polir pour table de cuisson
- Tampons en laine d'acier
- Lingettes de texture rugueuse
- Essuie-tout abrasifs

DÉPANNAGE

Essayez d'abord les solutions suggérées ici. Pour obtenir de l'aide ou des conseils qui permettront peut-être d'éviter une intervention de dépannage, consultez la page de garantie de ce manuel et balayez le code QR avec votre appareil mobile, ou visitez le site Internet **https://kitchenaid.com**. Au Canada, visitez le site Internet **https://kitchenaid.ca**.

Si vous rencontrez les problèmes suivants	Causes possibles	Solution
Rien ne fonctionne	Un fusible est grillé ou un disjoncteur s'est déclenché.	Remplacer le fusible ou réenclencher le disjoncteur. Si le problème persiste, appeler un électricien.
Les brûleurs de surface ne fonctionnent pas	C'est la première fois que les brûleurs de surface sont utilisés.	Allumer n'importe quel brûleur de surface pour libérer l'air des canalisations de gaz.
	Le bouton de commande n'est pas réglé correctement.	Enfoncer le bouton avant de le tourner à un réglage.
	Les orifices du brûleur sont obstrués.	Nettoyer les orifices de brûleur obstrués avec une épingle droite.
Les flammes des brûleurs de surface ne sont pas uniformes, sont de teinte jaune et/ou sont bruyantes	Les orifices du brûleur sont obstrués.	Nettoyer les orifices de brûleur obstrués avec une épingle droite.
	Sur les modèles avec chapeaux, les chapeaux de brûleur ne sont pas correctement positionnés	S'assurer que les broches d'alignement sont bien alignées avec le chapeau du brûleur.
	Du gaz propane est utilisé.	La table de cuisson a peut-être été mal convertie. Contacter un technicien de réparation qualifié.
Le brûleur de surface émet des bruits d'éclatement	Le brûleur est humide.	Laisser sécher.
Le brûleur émet des étincelles, mais ne s'allume pas	Il y a une production continue d'étincelles, mais le brûleur ne s'allume pas.	Discontinuer l'utilisation du brûleur de surface et contacter un technicien de service.
Chaleur excessive autour des ustensiles de cuisson sur la table de cuisson	Les ustensiles de cuisson n'ont pas la bonne taille.	Utiliser un ustensile de cuisson à peu près de la même dimension que la surface de cuisson, l'élément ou le brûleur de surface. L'ustensile de cuisson ne doit pas dépasser de plus de ½" (1,3 cm) à l'extérieur de la zone de cuisson.
La cuisson ne produit pas les résultats escomptés	L'ustensile de cuisson approprié n'est pas utilisé.	Utiliser des ustensiles de cuisine d'épaisseur moyenne à forte fabriqués de matière qui cuit les aliments comme l'on souhaite. Les meilleurs ustensiles de cuisson doivent avoir un fond plat, des parois droites et un couvercle qui ferme hermétiquement.
	Le bouton de commande n'est pas réglé au niveau approprié de chaleur.	Régler la commande de la table de cuisson à HI (élevée), MED (moyenne) ou LO (basse) selon le type de cuisson souhaité.
	La table de cuisson n'est pas d'aplomb.	La table de cuisson doit être d'aplomb pour que la plaque à frire puisse fonctionner correctement. Voir les Instructions d'installation pour des instructions de nivellement.

ASSISTANCE OU SERVICE

Avant de faire un appel pour assistance ou service, veuillez consulter la section “Dépannage”. Cette vérification peut vous faire économiser le coût d’une intervention de dépannage. Si vous avez encore besoin d’aide, suivez les instructions ci-dessous. Avant d’appeler, vous devez connaître la date d’achat et les numéros de modèle et de série complets de votre appareil. Ces renseignements nous aideront à mieux répondre à votre demande.

Si vous avez besoin de pièces de rechange

Si vous avez besoin de commander des pièces de rechange, nous vous recommandons d’utiliser seulement des pièces spécifiées par l’usine. Ces pièces spécifiées par l'usine conviendront et fonctionneront bien parce qu’elles sont fabriquées selon les mêmes spécifications précises utilisées pour fabriquer chaque nouvel appareil KitchenAid® .

Pour savoir où trouver des pièces spécifiées par l’usine dans votre région, appelez-nous ou contactez le centre de service désigné par KitchenAid le plus proche.

AUX É.-U.

Appelez sans frais au Centre pour l’eXpérience de la clientèle au : **1-800-422-1230**

Nos consultants peuvent vous aider sur les points suivants :

- Caractéristiques et spécifications de notre gamme complète d’appareils ménagers.
- Renseignements sur l’installation.
- Procédures d’utilisation et d’entretien.
- Vente d’accessoires et de pièces de rechange.
- Assistance spécialisée au client (langue espagnole, malentendants, malvoyants, etc.).
- Orientation vers des concessionnaires, compagnies de service de réparation et distributeurs de pièces de rechange locaux. Les techniciens de service désignés par KitchenAid sont formés pour remplir la garantie des produits et fournir un service après garantie partout aux États-Unis.

  Pour localiser la compagnie de service désignée par Kitchen Aid dans votre région, vous pouvez également consulter les Pages jaunes.

Pour de l’aide supplémentaire

Si vous avez besoin de plus d’assistance, vous pouvez écrire à KitchenAid en soumettant tout question ou problème à :

KitchenAid Brand Home Appliances
Customer eXperience Center
553 Benson Road
Benton Harbor, MI 49022-2692

Veuillez indiquer dans votre correspondance un numéro de téléphone où l'on peut vous joindre dans la journée.

AU CANADA

Appelez sans frais au Centre pour l’eXpérience de la clientèle au : **1-800-807-6777**.

Nos consultants peuvent vous aider sur les points suivants :

GARANTIE LIMITÉE DE TABLE DE CUISSON KITCHENAID®

ATTACHEZ ICI VOTRE REÇU DE VENTE. UNE PREUVE D'ACHAT EST OBLIGATOIRE POUR OBTENIR L'APPLICATION DE LA GARANTIE.

Lorsque vous appelez le centre d'eXpérience de la clientèle, veuillez garder à disposition les renseignements suivants :

- Nom, adresse et numéro de téléphone
- Numéros de modèle et de série
- Une description claire et détaillée du problème rencontré
- Une preuve d'achat incluant le nom et l'adresse du marchand ou du détaillant

SI VOUS AVEZ BESOIN DE SERVICE :

1. Avant de nous contacter pour obtenir un dépannage, veuillez déterminer si des réparations sont nécessaires pour votre produit. Certains problèmes peuvent être résolus sans intervention de dépannage. Prenez quelques minutes pour parcourir la section Dépannage ou Résolution de problèmes du guide d'utilisation et d'entretien, scannez le code QR ci-contre avec votre téléphone intelligent pour accéder à des ressources supplémentaires, ou rendez-vous sur le site http://www.kitchenaid.ca.
2. Tout service sous garantie doit être effectué exclusivement par nos fournisseurs de dépannage autorisés KitchenAid. Aux É.-U. et au Canada, dirigez toutes vos demandes de service sous garantie au

http://www.kitchenaid.ca

Centre d'eXpérience de la clientèle KitchenAid

Aux É.-U., composer le 1-800-422-1230. Au Canada, composer le 1-800-807-6777.

Si vous résidez à l'extérieur du Canada et des 50 États des États-Unis, contactez votre marchand KitchenAid autorisé pour déterminer si une autre garantie s'applique.

GARANTIE LIMITÉE DE CINQ ANS

CE QUI EST COUVERT

GARANTIE LIMITÉE DURANT LA PREMIÈRE ANNÉE (PIÈCES ET MAIN-D'ŒUVRE)

Pendant un an à compter de la date d'achat, lorsque ce gros appareil ménager est installé, utilisé et entretenu conformément aux instructions jointes au produit ou fournies avec, la marque KitchenAid de Whirlpool Corporation ou Whirlpool Canada, LP (ci-après désignées "KitchenAid") paiera pour les pièces de rechange spécifiées par l'usine et pour la main-d'œuvre pour corriger les vices de matériaux ou de fabrication qui existaient déjà lorsque ce gros appareil ménager a été acheté. S'il est remplacé, l'appareil sera couvert pour la période restant à courir de la garantie limitée d'un an du produit d'origine.

GARANTIE LIMITÉE DE LA DEUXIÈME À LA CINQUIÈME ANNÉE (CERTAINS COMPOSANTS UNIQUEMENT - MAIN-D'ŒUVRE NON COMPRISE)

De la deuxième à la cinquième année inclusivement à compter de la date d'achat initiale, lorsque ce gros appareil ménager est installé, utilisé et entretenu conformément aux instructions jointes au produit ou fournies avec, KitchenAid paiera pour les pièces de rechange spécifiées par l'usine concernant les composants suivants pour corriger les défauts non esthétiques de matériau ou de fabrication desdites pièces qui empêchent le gros appareil de fonctionner et qui étaient déjà présentes lorsque ce gros appareil ménager a été acheté. La présente garantie est une garantie limitée de 5 ans sur les pièces énumérées ci-dessous et elle ne comprend pas la main-d'œuvre de réparation.

- Éléments électriques
- Brûleurs à gaz
- Pièces du système de commande à semi-conducteurs
- Toute fissuration du joint d'étanchéité en caoutchouc entre la table de cuisson en vitrocéramique et le bord en porcelaine
- Toute fissuration de la table de cuisson en vitrocéramique due à un choc thermique
- Éléments de l'unité de surface

LE SEUL ET EXCLUSIF RECOURS DU CLIENT DANS LE CADRE DE LA PRÉSENTE GARANTIE LIMITÉE CONSISTE EN LA RÉPARATION PRÉVUE PAR LA PRÉSENTE. Le service doit être fourni par une compagnie de service désignée par KitchenAid. Cette garantie limitée est valide uniquement aux États-Unis ou au Canada et s'applique exclusivement lorsque le gros appareil ménager est utilisé dans le pays où il a été acheté. La présente garantie limitée est valable à compter de la date d'achat initial par le consommateur. Une preuve de la date d'achat initial est exigée pour obtenir un dépannage dans le cadre de la présente garantie limitée.

CE QUI N'EST PAS COUVERT

1. Usage commercial, non résidentiel ou par plusieurs familles, ou non-respect des instructions de l'utilisateur, de l'opérateur ou des instructions d'installation.
2. Visite d'instruction à domicile pour montrer à l'utilisateur comment utiliser l'appareil.
3. Visites de service pour rectifier une installation ou un entretien fautifs du produit, une installation non conforme aux codes d'électricité ou de plomberie, ou la rectification de l'installation électrique ou de la plomberie du domicile (ex : câblage électrique, fusibles ou tuyaux d'arrivée d'eau du domicile).
4. Pièces consomptibles (ex : ampoules, batteries, filtres à air ou à eau, etc.).
5. Défauts ou dommage résultant de l'utilisation de pièces ou accessoires KitchenAid non authentiques.
6. Conversion de votre produit du gaz naturel ou du gaz de pétrole liquéfié.
7. Dommages causés par : accident, mésusage, abus, incendie, inondations, catastrophe naturelle ou l'utilisation de produits non approuvés par KitchenAid.
8. Réparations aux pièces ou systèmes dans le but de rectifier un dommage ou des défauts résultant d'une réparation, altération ou modification non autorisée faite à l'appareil.
9. Défauts d'apparence, notamment les éraflures, traces de choc, fissures ou tout autre dommage subi par le fini de l'appareil ménager, à moins que ces dommages ne résultent de vices de matériaux ou de fabrication et ne soient signalés à KitchenAid dans les 30 jours suivant la date d'achat.
10. Décoloration, rouille ou oxydation des surfaces résultant d'environnements caustiques ou corrosifs incluant des concentrations élevées de sel, un haut degré d'humidité ou une exposition à des produits chimiques (exemples non exhaustifs).
11. Perte d'aliments due à la défaillance du produit.
12. Enlèvement ou livraison. Ce produit est conçu pour être réparé à l'intérieur du domicile.
13. Frais de déplacement et de transport pour le dépannage/la réparation dans une région éloignée où une compagnie de service KitchenAid autorisée n'est pas disponible.
14. Retrait ou réinstallation d'appareils inaccessibles ou de dispositifs préinstallés (ex : garnitures, panneaux décoratifs, plancher, meubles, îlots de cuisine, plans de travail, panneaux de gypse, etc.) qui entravent le dépannage, le retrait ou le remplacement du produit.
15. Service et pièces pour des appareils dont les numéros de série et de modèle originaux ont été enlevés, modifiés ou ne peuvent pas être facilement identifiés.

Le coût d'une réparation ou d'un remplacement dans le cadre de ces circonstances exclues est à la charge du client.

CLAUSE D'EXONÉRATION DE RESPONSABILITÉ AU TITRE DES GARANTIES IMPLICITES

LES GARANTIES IMPLICITES, Y COMPRIS LES GARANTIES APPLICABLES DE QUALITÉ MARCHANDE OU D'APTITUDE À UN USAGE PARTICULIER, SONT LIMITÉES À UN AN OU À LA PLUS COURTE PÉRIODE AUTORISÉE PAR LA LOI. Certains États et provinces ne permettent pas de limitation sur la durée des garanties implicites de qualité marchande ou d'aptitude à un usage particulier, de sorte que la limitation ci-dessus peut ne pas être applicable dans votre cas. Cette garantie vous confère des droits juridiques spécifiques et vous pouvez également jouir d'autres droits qui peuvent varier d'une juridiction à l'autre.

EXONÉRATION DE RESPONSABILITÉ DANS LES DOMAINES NON COUVERTS PAR LA GARANTIE

KitchenAid décline toute responsabilité au titre de la qualité, de la durabilité ou en cas de dépannage ou de réparation nécessaire sur ce gros appareil ménager autre que les responsabilités énoncées dans la présente garantie. Si vous souhaitez une garantie plus étendue ou plus complète que la garantie limitée fournie avec ce gros appareil ménager, adressez-vous à KitchenAid ou à votre détaillant pour obtenir les modalités d'achat d'une garantie étendue.

LIMITATION DES RECOURS; EXCLUSION DES DOMMAGES FORTUITS OU INDIRECTS

LE SEUL ET EXCLUSIF RECOURS DU CLIENT DANS LE CADRE DE LA PRÉSENTE GARANTIE LIMITÉE CONSISTE EN LA RÉPARATION PRÉVUE PAR LA PRÉSENTE. KITCHENAID N'ASSUME AUCUNE RESPONSABILITÉ POUR LES DOMMAGES FORTUITS OU INDIRECTS. Certains États et certaines provinces ne permettent pas l'exclusion ou la limitation des dommages fortuits ou indirects de sorte que ces limitations et exclusions peuvent ne pas être applicables dans votre cas. Cette garantie vous confère des droits juridiques spécifiques et vous pouvez également jouir d'autres droits qui peuvent varier d'une juridiction à l'autre.

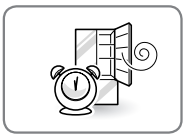
AjMadison Your Appliance Authority™ 800-570-2255



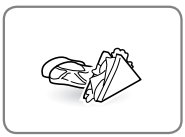
PRODUCT FEATURES

* Depending on the model, some of the following functions may not be available.

FILTERED WATER AND ICE DISPENSER

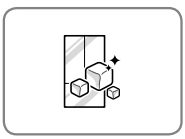
The water dispenser dispenses fresh, chilled water.
The ice dispenser dispenses cubed and crushed ice.

DOOR ALARM



The Door Alarm function is designed to prevent refrigerator malfunctioning that could occur if a refrigerator door or freezer drawer remains open. If a refrigerator door or freezer drawer is left open for more than 60 seconds, a warning alarm sounds in 30 second intervals.

HUMIDITY CONTROLLED CRISPER



The Humidity Controlled Crisper is designed to help keep your fruits and vegetables fresh and crisp. You can control the amount of humidity in the crisper by adjusting the setting between Low and High.

AiMadison
Your Appliance Authority
800-570-3355

GLIDE'N'SERVE

Glide'N'Serve provides storage space that keeps the compartment colder than the refrigerator.
It is a convenient place to store sandwiches or meat to be cooked.

ICE PLUS

Ice production can be increased by approximately 20 percent when the freezer section is maintained at the coldest temperature for a 24-hour period.

IMPORTANT SAFETY INSTRUCTIONS

READ ALL INSTRUCTIONS BEFORE USING THE APPLIANCE.

This guide contains many important safety messages. Always **read and obey** all safety messages.

This is the safety alert symbol. It alerts you to safety messages that inform you of hazards that can kill or hurt you or others, or cause damage to the product.

All safety messages will be preceded by the safety alert symbol and the hazard signal word WARNING or CAUTION. These words mean:

WARNING You can be killed or seriously injured if you do not follow instructions.

CAUTION Indicates an imminently hazardous situation which, if not avoided, may result in minor or moderate injury, or product damage.

WARNING

To reduce the risk of fire, electric shock, or personal injury when using your product, basic safety precautions should be followed, including the following.

Power

- NEVER unplug your refrigerator by pulling on the power cord. Always grip the plug firmly and pull it straight out from the outlet.
- Immediately repair or replace all power cords that have become frayed or otherwise damaged. Do not use a cord that shows cracks or abrasion damage along its length or at either the plug or connector end.
- Do not use an uncertified power outlet.
- Unplug the power plug immediately in the event of a blackout or thunderstorm.
- Plug in the power plug with the power cord facing downward.

Madison Your Appliance Authority™ 800-570-3355

Installation

- Contact an authorized service center when you install or relocate the refrigerator.
- When moving your refrigerator away from the wall, be careful not to roll over or damage the power cord.
- Connect this product to a dedicated grounded electric outlet conforming with the rating prior to use. It is the user's responsibility to replace a standard 2-prong wall outlet with a standard 3-prong wall outlet.
- Do not install the refrigerator where there may be a danger of falling.

Use

- DO NOT allow children to climb, stand, or hang on the refrigerator doors or shelves in the refrigerator. They could damage the refrigerator and seriously injure themselves.
- Do not place heavy objects on the dispenser of the refrigerator or hang onto it.
- Do not place heavy or dangerous objects (bottles with liquid) on the refrigerator.
- Do not put live animals inside of the refrigerator.
- Do not allow children to climb into the product when it is in use.
- In the event of a gas leak (propane/LPG), ventilate sufficiently and contact an authorized service center before use. Do not touch or disassemble the electric outlet of the refrigerator.
- In the event of a refrigerant leak, move flammable objects away from the refrigerator. Ventilate sufficiently and contact an authorized service center.
- Do not use or place flammable substances (chemicals, medicine, cosmetics, etc) near the refrigerator or store them inside the refrigerator. Do not place the refrigerator in the vicinity of flammable gas.

READ ALL INSTRUCTIONS BEFORE USING THE APPLIANCE.

To reduce the risk of fire, electric shock, or personal injury when using your product, basic safety precautions should be followed, including the following.

- Do not use this product for special purposes (storage of medicine or test materials or for ships, etc).
- Unplug the power plug before cleaning or repairing the refrigerator.
- When you replace the light bulb in the refrigerator, unplug the refrigerator or turn off the power.
- Do not modify or extend the power cord.
- Do not use a dryer to dry the interior. Do not light a candle to remove the interior odor.
- For your safety, this appliance must be properly grounded. Have the wall outlet and the circuit checked by a qualified electrician to make sure the outlet is properly grounded.
- Do not use an outlet that can be turned off with a switch. Do not use an extension cord. It is the user's responsibility to replace a standard 2-prong wall outlet with a standard 3-prong wall outlet.
- Do not, under any circumstances, cut or remove the third (ground) prong from the power cord.
- Do not use an adapter plug and plug the power plug into a multi-outlet extension cord.
- Disconnect the power cord immediately if you hear a noise, smell a strange odor or detect smoke.
- Turn the power off if water or dust penetrates into the refrigerator. Call a service agent.
- Do not disassemble or modify the refrigerator.
- Do not put hands, feet, or metal objects below or behind the refrigerator.
- Do not operate the refrigerator or touch the power cord with wet hands.
- In refrigerators with automatic icemakers, avoid contact with the moving parts of the ejector mechanism or with the heating element that releases the cubes. Do not place fingers or hands on the automatic ice-making mechanism while the refrigerator is plugged in.
- When dispensing ice from the dispenser, do not use crystal ceramics.
- Do not touch the cold surfaces in the freezer compartment with wet or damp hands, when your refrigerator is in operation.
- Do not put glass containers, glass bottles or soda in the freezer.
- This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning the use of the appliance by a person responsible for their safety.
- Do not refreeze frozen food that have thawed completely. It may result in a serious health issue.
- If you are throwing away your old refrigerator, make sure the CFC coolant is removed for proper disposal by a qualified servicer. If you release CFC coolant, you may be fined or imprisoned in accordance with the relevant environmental law.
- Junked or abandoned refrigerators are dangerous, even if they are sitting for only a few days. When disposing the refrigerator, remove the packing materials from the door or take off the doors but leave the shelves in place so that children may not easily climb inside.

Madison Your Appliance Authority 800-570-3355

READ ALL INSTRUCTIONS BEFORE USING THE APPLIANCE.

To reduce the risk of fire, electric shock, or personal injury when using your product, basic safety precautions should be followed, including the following.

⚠ CAUTION

Installation

- The refrigerator must be properly installed in accordance with the Installer Instructions that were taped to the front of the refrigerator.
- Be careful when you unpack and install the refrigerator. Immediately dispose of packing materials (plastic) out of reach of children.

Use

- Close the door carefully when children are around.
- Keep fingers out of pinch point areas; clearances between the doors and cabinets are necessarily small. Be careful closing doors when children are in the area.
- If you store food properly, beware that it may fall and cause injury.

Maintenance

- Do not use strong detergents like wax or thinners for cleaning. Clean with a soft fabric.
- Wipe foreign objects (dust, water, etc) off the prongs of the power plug and contact areas regularly.

Unpacking Your Refrigerator

WARNING

- Use two or more people to move and install the refrigerator. Failure to do so can result in back or other injury.
- Your refrigerator is heavy. When moving the refrigerator for cleaning or service, be sure to protect the floor. Always pull the refrigerator straight out when moving it. Do not wiggle or walk the refrigerator when trying to move it, as floor damage could occur.
- Keep flammable materials and vapors, such as gasoline, away from the refrigerator. Failure to do so can result in fire, explosion, or death.

Remove tape and any temporary labels from your refrigerator before using. Do not remove any warning-type labels, the model and serial number label, or the Tech Sheet that is located under the front of the refrigerator.

To remove any remaining tape or glue, rub the area briskly with your thumb. Tape or glue residue can also be easily removed by rubbing a small amount of liquid dish soap over the adhesive with your fingers. Wipe with warm water and dry.

Do not use sharp instruments, rubbing alcohol, flammable fluids, or abrasive cleaners to remove tape or glue. These products can damage the surface of your refrigerator.

Refrigerator shelves are installed in the shipping position. Please reinstall shelves according to your individual storage needs.

Choosing the Proper Location

- Select a place where a water supply can be easily connected for the automatic icemaker.

NOTE

The water pressure must be between 20 and 120 psi on models without a water filter and between 40 and 120 psi on models with a water filter.

- The refrigerator should always be plugged into its own individual properly grounded electrical outlet rated for 115 Volts, 60 Hz, AC only, and fused at 15 or 20 amperes. This provides the best performance and also prevents overloading house wiring circuits which could cause a fire hazard from overheated wires. It is recommended that a separate circuit serving only this appliance be provided.

WARNING

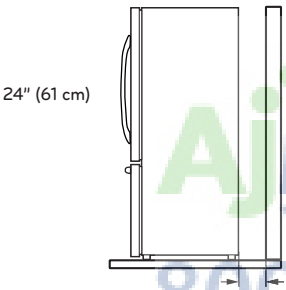
To reduce the risk of electric shock, do not install the refrigerator in a wet or damp area.

AiMadison Your Appliance Authority™ 800-570-3355

Flooring

To avoid noise and vibration, the unit must be leveled and installed on a solidly constructed floor. If required, adjust the leveling legs to compensate for unevenness of the floor. The front should be slightly higher than the rear to aid in door closing. Leveling legs can be turned easily by tipping the cabinet slightly. Turn the leveling legs to the left to raise the unit or to the right to lower it. (See Leveling and door Allgnment.)

NOTE



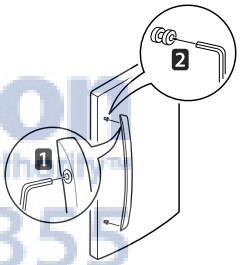
Installing on carpeting, soft tile surfaces, a platform or weakly supported structure is not recommended.

Ambient Temperature

Install this appliance in an area where the temperature is between 55°F (13°C) and 110°F (43°C). If the temperature around the appliance is too low or high, cooling ability may be adversely affected.

Measuring the Clearances

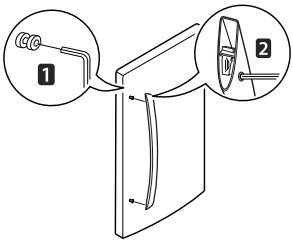
Too small of a distance from adjacent items may result in lowered freezing capability and increased electricity consumption charges. Allow at least 24 inches (61 cm) in front of the refrigerator to open the doors, and at least 2 inches (5 cm) between the back of the refrigerator and the wall.



Removing/Assembling the Refrigerator Door Handles

> **NOTE**
>
> Removing the doors is always recommended when it is necessary to move the refrigerator through a narrow opening. If it is necessary to remove the handles, follow the directions below.

Removing the Handles

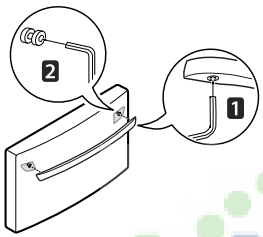


1. Loosen the set screws **1** with a $^{3}/_{32}$ in. Allen wrench and remove the handle.
2. Loosen the mounting fasteners **2** that connect to the refrigerator door and handle using a $^{1}/_{4}$ in. Allen wrench, remove the mounting fasteners.

AjMadison
Your Appliance Authority
800-570-3355

Assembling the Handles

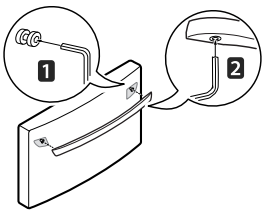
1. Assemble the mounting fasteners **1** at both ends of the handle using a $^{1}/_{4}$ in. Allen wrench.
2. Place the handle on the door by fitting the handle footprints over the mounting fasteners and tightening the set screws **2** with a $^{3}/_{32}$ in. Allen wrench.



Removing/Assembling the Freezer Drawer Handle

Removing the Handles

1 Loosen the set screws 1 located on the lower side of the handle with a 1/8 in. Allen wrench and remove the handle.



2 Loosen the mounting fasteners 2 that connect to the freezer drawer and handle using a 1/4 in. Allen wrench, and remove the mounting fasteners.

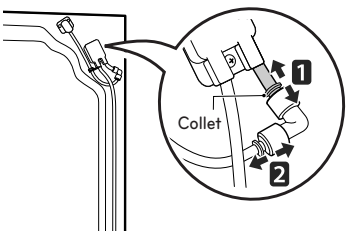
Assembling the Handles

1 Assemble the mounting fasteners 1 at both ends of the handle using a 1/4 in. Allen wrench.

2 Place the handle on the door by fitting the handle footprints over the mounting fasteners and tightening the set screws 2 with a 1/8 in. Allen wrench.

Removing/Assembling the Doors and Drawers

Removing the doors is always recommended when it is necessary to move the refrigerator through a narrow opening.



WARNING

- If your entrance door is too narrow for the refrigerator to pass through, remove the refrigerator doors and move the refrigerator sideways through the doorway.
- Use two or more people to remove and install the refrigerator doors. Failure to do so can result in back or other injury.
- Disconnect the electrical supply to the refrigerator before installing. Failure to do so could result in serious injury or death.
- Do not put hands, feet or other objects into the air vents or bottom of the refrigerator. You may be injured or receive an electrical shock.
- Be careful when handling the hinge and stopper. It may result in injury.
- Remove food and bins from the doors and drawers before detaching.

AjMadison
Your Appliance Authority™

Removing the Left Refrigerator Door

1 The water supply is connected to the upper right part of the rear surface of the refrigerator. Remove the ring in the joint area. Hold the water supply connection and gently push the Collet to detach the water supply line as shown in 1 and 2.

NOTE

Detachment of the water supply line is applicable only when detaching the left refrigerator door.

2 Open the left door. Remove the top hinge cover screw (1). Lift up the cover (2).

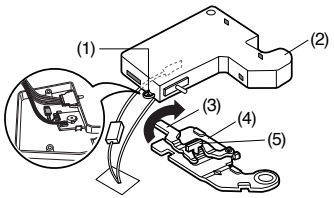
3 Remove the cover.

4 Pull out the tube (3).

5 Disconnect all wire harnesses (4).

6 Remove the grounding screw (5).

7 Rotate the hinge lever (6) counterclockwise. Lift the top hinge (7) free of the hinge lever latch (8).



8 Lift the door from the middle hinge pin and remove the door.

9 Place the door, inside facing up, on a non-scratching surface.

CAUTION

When lifting the hinge free of the latch, be careful that the door does not fall forward.

Removing the Right Refrigerator Door

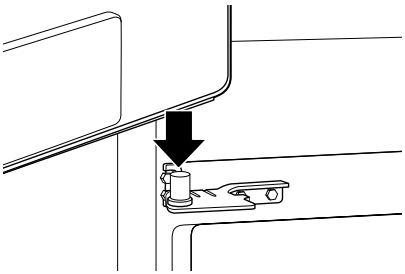
1 Open the door. Remove the top hinge cover screw (1). Lift up the cover (2).

2 Remove the cover.

3 Rotate the hinge lever (3) clockwise. Lift the top hinge (4) free of the hinge lever latch (5).

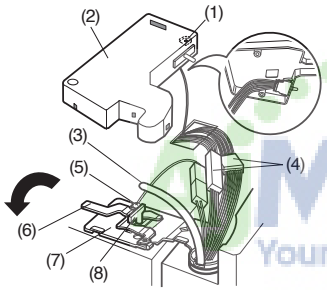
4 Lift the door from the middle hinge pin and remove the door.

5 Place the door, inside facing up, on a non-scratching surface.



CAUTION

When lifting the hinge free of the latch, be careful that the door does not fall forward.



AjMadison
Your Appliance Authority™
800-570-3355

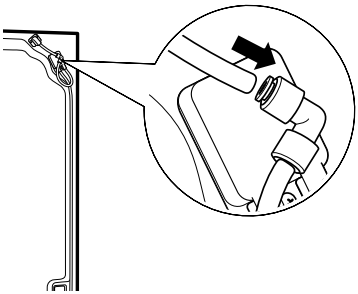
Assembling the Left Refrigerator Door

Install the left refrigerator door after the right door is installed.

1 Lower the door onto the middle hinge pin.

2 Fit the top hinge (7) over the hinge lever latch (8) and into place.

3 Rotate the lever (6) clockwise to secure the hinge.



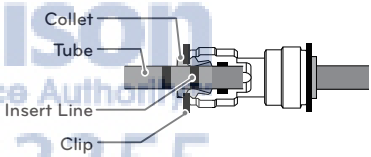
4 Install the grounding screws (5) and connect the two wire harnesses (4).

5 Push the water tube (3) located at the top of the left door into the hole beside the left hinge on the top of the cabinet until it exits through the back.

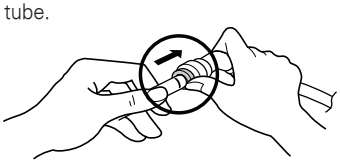
6 Insert the water supply tube (3) into the connector until you see only one scale mark. Fully insert the tub cover (15 mm).

7 Hook the tabs on the left side of the hinge cover (1) under the edge of the top hinge (7) and position the cover in place.

8 Insert and tighten the cover screw (1).

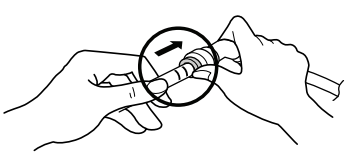


9 Insert the water supply tube at least 5/8 in. (15 mm) into the connector.



10 Hook the tab on the door switch side of the cover under the edge of the wire opening in the cabinet top.

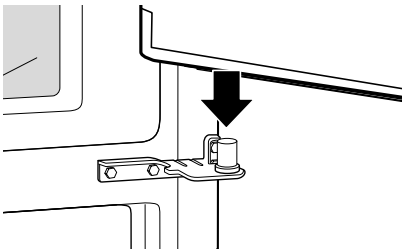
11 Position the cover into place. Insert and tighten the cover screw.



NOTE

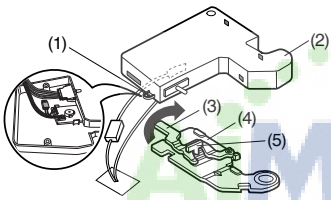
1) Gently press the Collet and insert the tube until only one line shows on the tube.

(Correct)



(Incorrect)

2) Pull the tube to make sure that the tube is tightly fastened and then insert the clip.



Madison Your Appliance Authority 800-570-3355

Assembling the Right Refrigerator Door

Install the right-side door first.

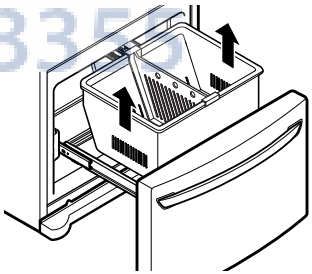
1 Lower the door onto the middle hinge pin. Make sure that the plastic sleeve is inserted into the bottom of the door.

2 Fit the top hinge (4) over the hinge lever latch (5) and into place.

3 Rotate the lever (3) counterclockwise to secure the hinge.

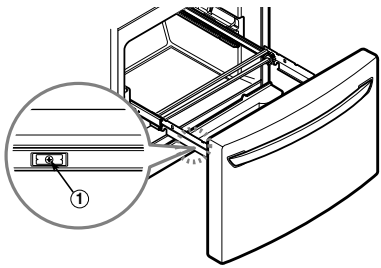
4 Hook the tabs on the right side of the hinge cover (2) under the edge of the top hinge (4) and position the cover in place.

5 Insert and tighten the cover screw (1).



Removing the Freezer Drawers

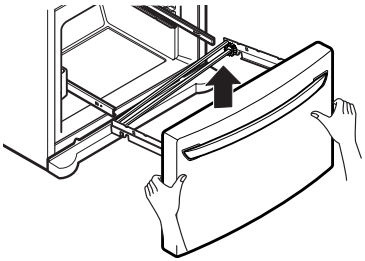
The top, middle and bottom drawers are all removed in the same way. In the following figures, the Pullout Drawer located above the freezer drawer is not shown for clarity.



⚠ CAUTION

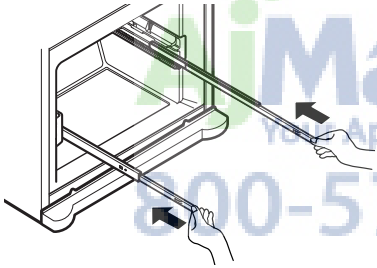
- Use two or more people to remove and install the freezer drawer. Failure to do so can result in back or other injury.
- Do not hold the handle when removing or replacing the drawer. The handle may come off and it could cause personal injury.
- Be careful of sharp hinges on both sides of the drawer.
- When you lay the drawer down, be careful not to damage the floor.
- Do not sit or stand on the freezer drawer.
- To prevent accidents, keep children and pets away from the drawer. Do not leave the drawer open.

1 Fully extend the freezer drawer. Lifting up and out to remove the Dura Base basket making sure to clear the rail system.



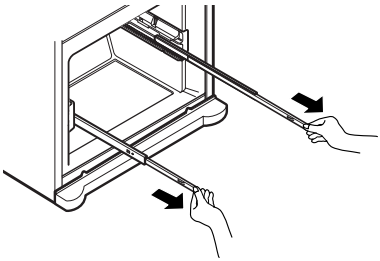
2 Remove one white screw ① on each side of the rails.

AJ Madison Your Appliance Authority 800-570-3356



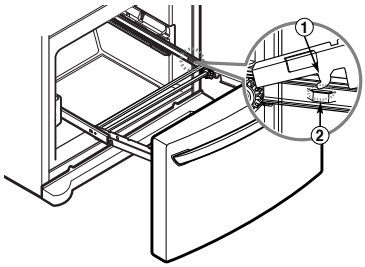
3 Holding both sides of the door pull up to separate the door from the rails.

4 With both hands, hold each rail and push it in to allow both rails to slide in simultaneously.

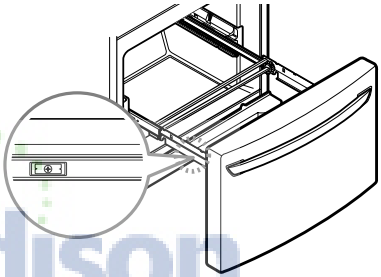


CAUTION

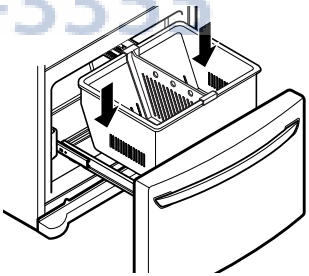
Do not hold the handle when removing or replacing the drawer. The handle may come off and it could cause personal injury.



Assembling the Freezer Drawer



1 With both hands, pull out each rail simultaneously until both rails are fully extended.



2 Hook door supports ① into rail tabs ②.

3 Lower door into final position and tighten the screws.

4 With the drawer pulled out to full extension, insert the lower basket in the rail assembly.

WARNING

- If the Durabase divider is removed, there is enough open space for children or pets to crawl inside. To prevent accidental child and pet entrapment or suffocation risk, DO NOT allow them to touch or go near the freezer drawer.
- DO NOT step or sit down on freezer drawer.

AjMadison Your Appliance Authority™ 800-570-3355

Connecting the Water Line

Before You Begin

This water line installation is not covered by the refrigerator warranty. Follow these instructions carefully to minimize the risk of expensive water damage.

Water hammer (water banging in the pipes) in house plumbing can cause damage to refrigerator parts and can lead to water leakage or flooding. Call a qualified plumber to correct water hammer before installing the water supply line to the refrigerator.

⚠ CAUTION

To prevent burns and product damange, only connect the refrigerator water line to a cold water supply.

If you use your refrigerator before connecting the water line, make sure the icemaker power switch is in the OFF (O) position.

⚠ CAUTION

Do not install the icemaker tubing in areas where temperatures fall below freezing.

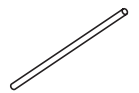
Water Pressure

A cold water supply. The water pressure must be between 20 and 120 psi on models without a water filter and between 40 and 120 psi on models with a water filter.

If a reverse osmosis water filtration system is connected to your cold water supply, this water line installation is not covered by the refrigerator warranty. Follow the following instructions carefully to minimize the risk of expensive water damage.

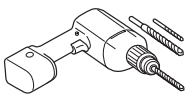
If a reverse osmosis water filtration system is connected to your cold water supply, the water pressure to the reverse osmosis system needs to be a minimum of 40 to 60 psi (2.8 kgf/cm^2 ~ 4.2 kgf/cm^2, less than 2.0~3.0 sec. to fill a cup of 7 oz capacity).

⚠ CAUTION



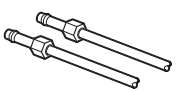
Wear eye protection during installation to prevent injury.

If the water pressure from the reverse osmosis system is less than 21 psi or 1.5 kgf/cm^2 (takes more than 4.0 sec to fill a cup of 7 oz capacity):



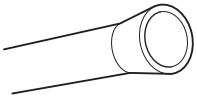
- Check to see if the sediment filter in the reverse osmosis system is blocked. Replace the filter if necessary.
- Allow the storage tank on the reverse usage.
- If the issue concerning water pressure from reverse osmosis remains, call a licensed, qualified plumber.
- All installations must be in accordance with local plumbing code requirements.

What You Will Need

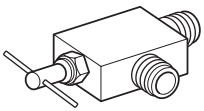


- **Copper Tubing,** ¼ in. outer diameter, to connect the refrigerator to the water supply. Be sure both ends of the tubing are cut square.
- To determine how much tubing you need: measure the distance from the water valve on the back of the refrigerator to the water supply pipe. Then, add 8 feet (2.4 m). Be sure there is sufficient extra tubing (about 8 feet [2.4 m] coiled into 3 turns of about 10 in. [25 cm] diameter) to allow the refrigerator to move out from the wall after installation.

- **Power drill.**
- **½ in. or adjustable wrench.**



- **Flat blade and Phillips head screwdrivers.**
- **Two ¼ in. outer diameter compression nuts and 2 ferrules (sleeves)** to connect the copper tubing to the shutoff valve and the refrigerator water valve.



AMadison Your Appliance Authority™ 800-570-3565

- If your existing copper water line has a flared fitting at the end, you will need an **adapter** (available at plumbing supply stores) to connect the water line to the refrigerator OR you can cut off the flared fitting with a tube cutter and then use a compression fitting.

- **Shutoff valve to connect to the cold water line.** The shutoff valve should have a water inlet with a minimum inside diameter of 5/32 in. at the point of connection to the COLD WATER LINE. Saddle-type shutoff valves are included in many water supply kits. Before purchasing, make sure a saddle-type valve complies with your local plumbing codes.

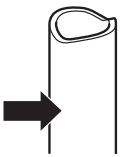
NOTE

A self piercing saddle type water valve should not be used.

Water Line Installation Instructions

WARNING

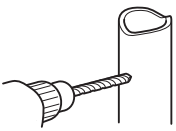
When using any electrical device (such as a power drill) during installation, be sure the device is battery powered, double insulated or grounded in a manner that will prevent the hazard of electric shock.



Install the shutoff valve on the nearest frequently used drinking water line.

1 SHUT OFF THE MAIN WATER SUPPLY

Turn on the nearest faucet to relieve the pressure on the line.

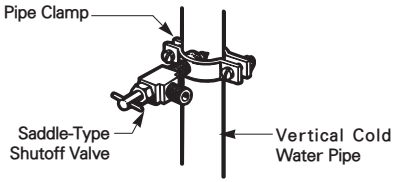


2 CHOOSE THE VALVE LOCATION

Choose a location for the valve that is easily accessible. It is best to connect into the side of a vertical water pipe. When it is necessary to connect into a horizontal water pipe, make the connection to the top or side, rather than at the bottom, to avoid drawing off any sediment from the water pipe.

3 DRILL THE HOLE FOR THE VALVE

Drill a ¼ in. hole in the water pipe using a sharp bit. Remove any burrs resulting from drilling the hole in the pipe. Be careful not to allow water to drain into the drill. Failure to drill a ¼ in. hole may result in reduced ice production or smaller cubes.



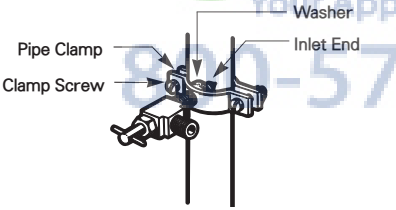
NOTE

The hookup line cannot be white, plastic tubing. Licensed plumbers must use only copper tubing NDA tubing #49595 or 49599 or Cross Link Polyethylene (PEX) tubing.

AjMadison Your Appliance Partner 800-570-3355

4 FASTEN THE SHUTOFF VALVE

Fasten the shutoff valve to the cold water pipe with the pipe clamp.



NOTE

Commonwealth of Massachusetts Plumbing Codes 248CMR shall be adhered to. Saddle valves are illegal and use is not permitted in Massachusetts. Consult with your licensed plumber.

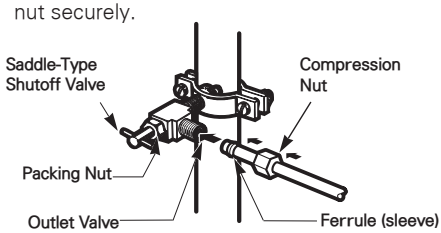
5 TIGHTEN THE PIPE CLAMP

Tighten the clamp screws until the sealing washer begins to swell.

NOTE: Do not overtighten clamp or you may crush the tubing.

6 ROUTE THE TUBING

Route the tubing between the cold water line and the refrigerator.



Route the tubing through a hole drilled in the wall or floor (behind the refrigerator or adjacent base cabinet) as close to the wall as possible.

NOTE

Be sure there is sufficient extra tubing (about 8 feet coiled into 3 turns of about 10 in. diameter) to allow the refrigerator to move out from the wall after installation.

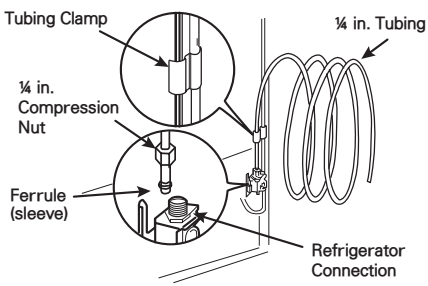
7 CONNECT THE TUBING TO THE VALVE

Place the compression nut and ferrule (sleeve) for copper tubing onto the end of the tubing and connect it to the shutoff valve. Make sure the tubing is fully inserted into the valve. Tighten the compression nut securely.

8 FLUSH OUT THE TUBING

Turn the main water supply on and flush out the tubing until the water is clear.

Shut the water off at the water valve after about one quart of water has been flushed through the tubing.

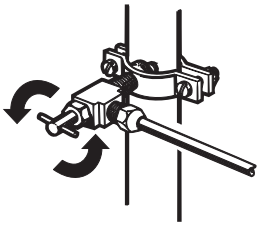


9 CONNECT THE TUBING TO THE REFRIGERATOR

NOTE: Before making the connection to the refrigerator, be sure that the refrigerator power cord is not plugged into the wall outlet.

a. Remove the plastic flexible cap from the water valve.

b. Place the compression nut and ferrule (sleeve) onto the end of the tubing as shown.



c. Insert the end of the copper tubing into the connection as far as possible. While holding the tubing, tighten the fitting.

AjMadison Your Appliance Authority 800-570-3355

10 TURN THE WATER ON AT THE SHUTOFF VALVE

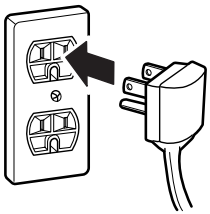
Tighten any connections that leak.

CAUTION

Check to see if leaks occur at the water line connections.

11 PLUG IN THE REFRIGERATOR

Arrange the coil of tubing so that it does not vibrate against the back of the refrigerator or against the wall. Push the refrigerator back to the wall.



12 START THE ICEMAKER

Set the icemaker power switch to the **ON** position.

The icemaker will not begin to operate until it reaches its operating temperature of 15°F (–9°C) or below. It will then begin operation automatically if the icemaker power switch is in the **ON (I)** position.

Turning On The Power

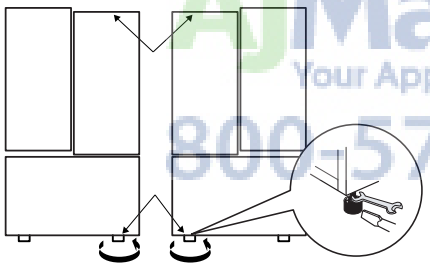
1 Plug in the refrigerator.

CAUTION

- Connect to a rated power outlet.
- Have a certified electrician check the wall outlet and wiring for proper grounding.
- Do not damage or cut off the ground terminal of the power plug.

AjMadison Your Appliance Authority™ 800-570-3355

Leveling and Door Alignment



Leveling

After installing, plug the refrigerator's power cord into a 3-prong grounded outlet and push the refrigerator into the final position.

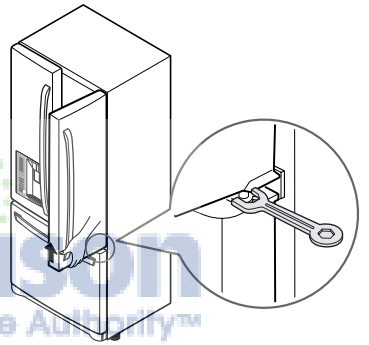
Your refrigerator has two front leveling legs—one on the right and one on the left. Adjust the legs to alter the tilt from front-to-back or side-to-side. If your refrigerator seems unsteady, or you want the doors to close more easily, adjust the refrigerator's tilt using the instructions below:

1 Remove the base grille. Refer to the Base Grille Installation section.

2 Turn the leveling leg to the left to raise that side of the refrigerator or to the right to lower it. It may take several turns of the leveling leg to adjust the tilt of the refrigerator.

NOTE

A flare nut wrench works best, but an open-end wrench will suffice.
Do not over-tighten.



3 Open both doors again and check to make sure that they close easily. If the doors do not close easily, tilt the refrigerator slightly more to the rear by turning both leveling legs to the left. It may take several more turns, and you should turn both leveling legs the same mount.

4 Replace the base grille.

Door Alignment

Both the left and right refrigerator doors have an adjustable nut, located on the bottom hinge, to raise and lower them to align properly.
If the space between your doors is uneven, follow the instructions below to align the doors evenly:

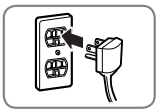
Use the wrench (included with the Owner's Manual) to turn the nut in the door hinge to adjust the height. To the right to raise or to the left to lower the height.

AjMadison
Your Appliance Authority™
800-570-3355

HOW TO USE

Before use

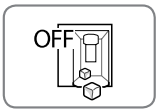
Clean the refrigerator.



Clean your refrigerator thoroughly and wipe off all dust that accumulated during shipping.

CAUTION

- Do not scratch the refrigerator with a sharp object or use a detergent that contains alcohol, a flammable liquid or an abrasive when removing any tape or adhesive from the refrigerator,.
- Do not peel off the model or serial number label or the technical information on the rear surface of the refrigerator.

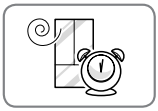


NOTE

Remove adhesive residue by wiping it off with your thumb or dish detergent.

Connect the power supply.

Check if the power supply is connected before use.
Read the "Turning On The Power" section.

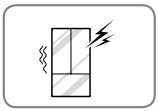


Turn off the icemaker if the refrigerator is not yet connected to the water supply.

Turn off the automatic icemaker and then plug the power plug of the refrigerator into the grounded electric outlet.
* This is applicable only to certain models.

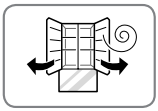
CAUTION

Running the automatic icemaker before connecting it to the water supply may cause the refrigerator to malfunction.



Wait for the refrigerator to cool.

Allow your refrigerator to run for at least two to three hours before putting food in it. Check the flow of cold air in the freezer compartment to ensure proper cooling.



CAUTION

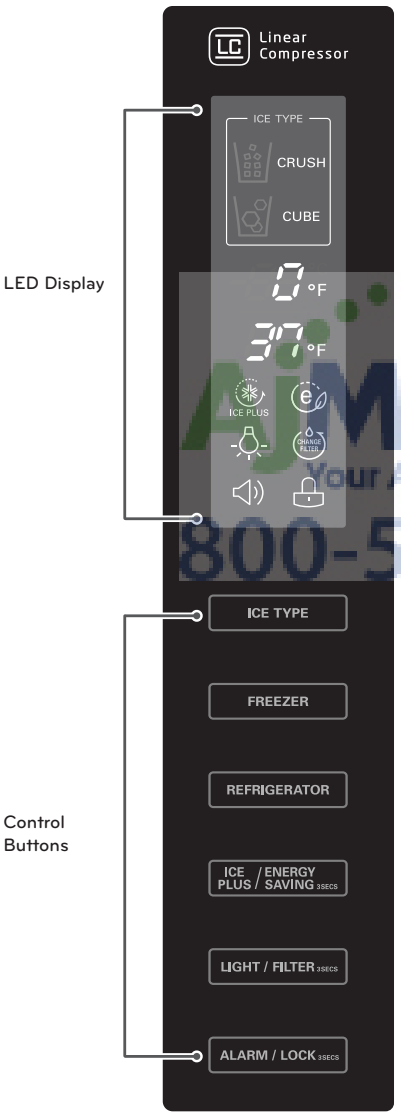
Putting food in the refrigerator before it has cooled could cause the food to spoil, or a bad odor could remain inside the refrigerator.

The refrigerator makes a loud noise after initial operation.

This is normal. The loudness will decrease as the temperature lowers.

Open refrigerator doors and freezer drawers to ventilate the interior.

The inside of the refrigerator may smell like plastic at first. Remove any adhesive tape from inside the refrigerator and open the refrigerator doors and the freezer drawers for ventilation.



AiMadison
800-570-3355

Control Panel

* Depending on the model, some of the following functions may not be available.

Control Panel Features

The LED Display shows the temperature settings, dispenser options, water filter, door alarm, and locking status messages.

Ice Type

CRUSH CUBE

Press the ICE TYPE button to select either Crushed or Cubed Ice. The selected option will illuminate on the LED display.

Freezer

0 °F

Press the FREEZER button to adjust the temperature in the freezer compartment.

NOTE

To change the display from Fahrenheit to Celsius, press and hold the FREEZER and REFRIGERATOR button for five seconds.

Refrigerator

37 °F

Press the REFRIGERATOR button to adjust the temperature in the freezer compartment.

Ice Plus

ICE PLUS

This function increases both ice making and freezing capabilities.

- When you touch the Ice Plus button, the graphic will illuminate in the display and will continue for 24 hours. The function will automatically shut off after 24 hours.
- You can stop this function manually by touching the button one more time.

AJMadison Your Appliance Authority™ 800-570-3355

Control Panel Features (continued)

Energy Saving

The Energy Saving function disables the mullion heater located on the refrigerator door in order to conserve electricity. Press and hold the Energy Saving button for three seconds to activate or deactivate this function.

NOTE

Discontinue using the Energy Saving function if excessive moisture begins to collect on the door mullion.

Light

Press the LIGHT button, to turn on the dispenser light. The indicator will appear on the LED display.

Change Filter

When the water filter indicator turns on, you have to change the water filter. After changing the water filter, press and hold the FILTER button for three seconds to turn the indicator light off. You need to change the water filter approximately every six months.

Alarm

- When power is connected to the refrigerator, the door alarm is initially set to ON. When you press the ALARM button, the display will change to OFF and the Alarm function will deactivate.
- When either the refrigerator or the freezer door is left open for more than 60 seconds, the alarm tone will sound to let you know that the door is open.
- When you close the door, the door alarm will stop.

Control Lock

The Control Lock function disables every other button on the display.

- When power is initially connected to the refrigerator, the Lock function is off.
- If you want to activate the Lock function to lock other buttons, press and hold the Lock button for three seconds or more. The Lock icon will display and the Lock function is now enabled.
- To disable the Lock function, press and hold the Lock button for approximately three seconds.

CAUTION

Display Mode (For Store Use Only)

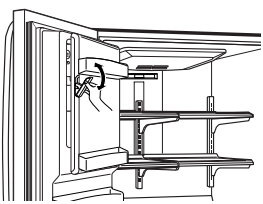
The Display Mode disables all cooling in the refrigerator and freezer sections to conserve energy while on display in a retail store. When activated, OFF will display on the control panel.

To deactivate:

With either refrigerator door opened, press and hold the Refrigerator and Ice Plus buttons at the same time for five seconds. The control panel will beep and the temperature settings will display to confirm that Display Mode is deactivated. Use the same procedure to activate the Display Mode.

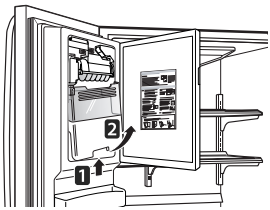
AjMadison Your Appliance Authority™ 800-570-3355

In-Door Ice Bin



* Depending on the model, some of the following functions may not be available.

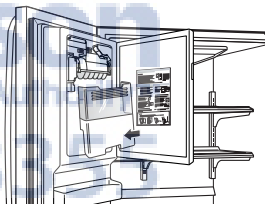
CAUTION



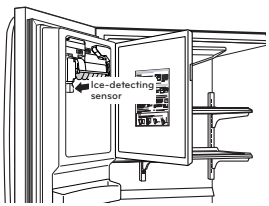
- Keep hands and tools out of the ice compartment door and dispenser chute. Failure to do so may result in damage or personal injury.
- The icemaker will stop producing ice when the in-door ice bin is full. If you need more ice, empty the ice bin into the extra ice bin in the freezer compartment. During use, the ice can become uneven causing the icemaker to misread the amount of ice cubes and stop producing ice. Shaking the ice bin to level the ice within it can reduce this problem.
- Storing cans or other items in the ice bin will damage the icemaker.
- Keep the ice compartment door closed tightly. If the ice compartment door is not closed tightly, the cold air in the ice bin will freeze food in the refrigerator compartment. This could also cause the icemaker to stop producing ice.
- If the ON/OFF switch on the icemaker is set to OFF for an extended period of time, the ice compartment will gradually warm up to the temperature of the refrigerator compartment. To prevent ice cubes from melting and leaking from the dispenser, ALWAYS empty the ice bin when the icemaker is set to OFF for more than a few hours.

Detaching the In-Door Ice Bin

1 Gently pull the handle to open the ice compartment.



2 To remove the in-door ice bin, grip the front handle, slightly lift the lower part, and slowly pull out the bin as shown.



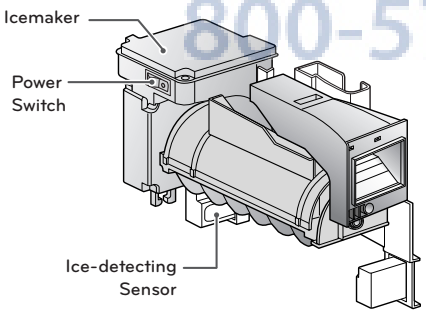
Assembling the In-Door Ice Bin

1 Carefully insert the in-door ice bin while slightly slanting it to avoid contact with the icemaker.

2 Avoid touching the ice-detecting sensor when replacing the ice bin. See the label on the ice compartment door for details.

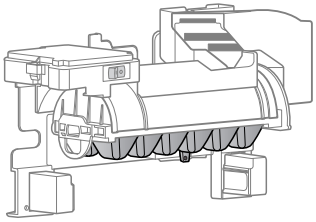
CAUTION

When handling the ice bin, keep hands away from the icemaker tray area to avoid personal injury.



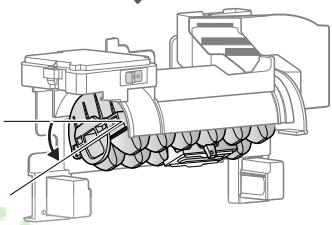
Sylvadison Your Appliance Authority 800-570-3355

Automatic Icemaker

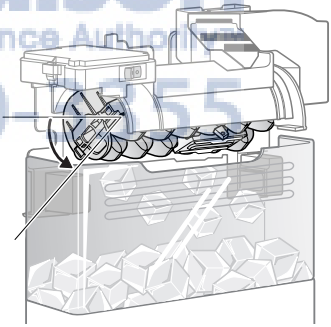


* Depending on the model, some of the following functions may not be available.

Ice is made in the automatic icemaker and sent to the dispenser. The icemaker will produce 12 cubes per cycle—approximately 120 cubes in a 24-hour period, depending on freezer compartment temperature, room temperature, number of door openings and other operating conditions.



- It takes about 12 to 24 hours for a newly installed refrigerator to begin making ice. Wait 72 hours for full ice production to occur.
- Ice making stops when the in-door ice bin is full. When full, the in-door ice bin holds approximately 6 to 8 (12-16 oz) glasses of ice.
- The water pressure must be between 20 and 120 psi on models without a water filter and between 40 and 120 psi on models with a water filter to produce the normal amount and size of ice cubes.
- Foreign substances or frost on the ice-detecting sensor can interrupt ice production. Make sure the sensor area is clean at all times for proper operation.



Water fills the ice tray.

1 hour later from supplying water

- 60 minutes after water has been added to the ice tray, the ice tray will sit slightly tilted to help the cold air reach the ice.

- The ice-detecting sensors will sense when the ice is ready to be dumped into the ice bin.

AjMadison Your Appliance Authority 800-570-1865

Turning the Automatic Icekamer On or Off

To turn off the automatic icemaker, set the icemaker switch to **OFF (O)**. To turn on the automatic icemaker, set the switch to **ON (I)**.

Automatic Icemaker (continued)

CAUTION

- The first ice and water dispensed may include particles or odor from the water supply line or the water tank.
- Throw away the first few batches of ice (about 24 cubes). This is also necessary if the refrigerator has not been used for a long time.
- Never store beverage cans or other items in the ice bin for the purpose of rapid cooling. Doing so may damage the icemaker or the containers may burst.
- If discolored ice is dispensed, check the water filter and water supply. If the problem continues, contact a Sears or other qualified service center. Do not use the ice or water until the problem is corrected.
- Keep children away from the dispenser. Children may play with or damage the controls.
- The ice passage may become blocked with frost if only crushed ice is used. Remove the frost that accumulates by removing the ice bin and clearing the passage with a rubber spatula. Dispensing cubed ice can also help prevent frost buildup.
- Never use thin crystal glass or crockery to collect ice. Such containers may chip or break resulting in glass fragments in the ice.
- Dispense ice into a glass before filling it with water or other beverages. Splashing may occur if ice is dispensed into a glass that already contains liquid.
- Never use a glass that is exceptionally narrow or deep. Ice may jam in the ice passage and refrigerator performance may be affected.
- Keep the glass at a proper distance from the ice outlet. A glass held too close to the outlet may prevent ice from dispensing.
- To avoid personal injury, keep hands out of the ice door and passage.
- Never remove the dispenser cover.
- If ice or water dispenses unexpectedly, turn off the water supply and contact a qualified service center.

When You Should Turn the Icemaker Off

- When the water supply will be shut off for several hours.
- When the ice bin is removed for more than one or two minutes.
- When the refrigerator will not be used for several days.

NOTE

The ice bin should be emptied when the icemaker on/off switch is turned to the **OFF** position.

Normal Sounds You May Hear

- The icemaker water valve will buzz as the icemaker fills with water. If the power switch is in the ON (I) position, it will buzz even if it has not yet been hooked up to water. To stop the buzzing, move the power switch to OFF (O).

NOTE

Keeping the power switch in the ON (I) position before the water line is connected can damage the icemaker.

- You will hear the sound of cubes dropping into the bin and water running in the pipes as the icemaker refills.

Preparing for Vacation

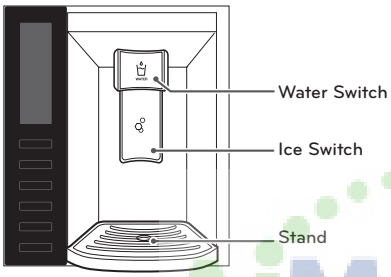
Set the icemaker power switch to OFF (O) and shut off the water supply to the refrigerator.

NOTE

The ice bin should be emptied anytime the icemaker on/off switch is turned to the OFF (O) position.

If the ambient temperature will drop below freezing, have a qualified technician drain the water supply system to prevent serious property damage due to flooding caused by ruptured water lines or connections.

AiMadison Your Appliance Authority 800-570-3355



Ice and Water Dispenser

* Depending on the model, some of the following functions may not be available.

CAUTION

Keep children away from the dispenser. Children may play with or damage the controls.

Dispenser

Using the Dispenser

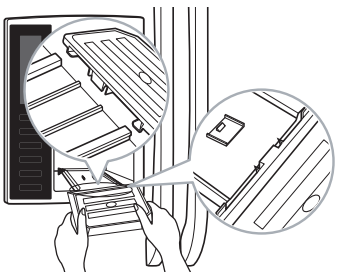
- To dispense **cold water**, push on the water switch with a glass.
- To dispense **ice**, push on the ice switch with a glass.

NOTE

- If discolored ice is dispensed, check the water filter and water supply. If the problem continues, contact a qualified service center. Do not use the ice or water until the problem is corrected.
- The dispenser will not operate when either of the refrigerator doors are open.
- If dispensing water or ice into a container with a small opening, place it as close to the dispenser as possible.
- Some dripping may occur after dispensing. Hold your cup beneath the dispenser for a few seconds after dispensing to catch all of the drops.

	Incorrect Way	Correct Way
Water		
Ice		

CAUTION



Throw away the first few batches of ice (about 24 cubes). This is also necessary if the refrigerator has not been used for a long time.

Locking the Dispenser

Press and hold the Alarm and Lock button simultainously for 3 seconds to lock the dispenser and all the control panel functions. Follow the same instructions to unlock.

Cleaning the Dispenser Stand

1 Grip the stand with both hands and pull it out.

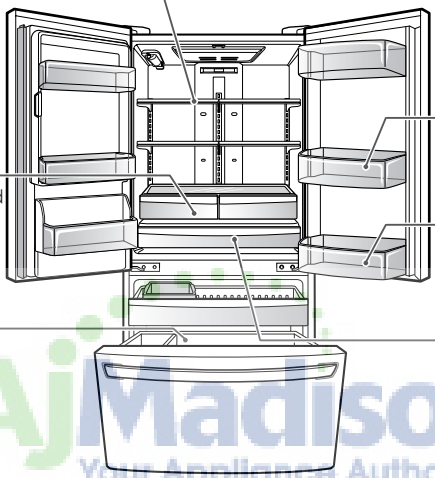
2 Wipe out dirty areas with a clean cloth.

AjMadison
Your Appliance Authority
800-570-3355

Storing Food

Food Preservation Location

Each compartment inside the refrigerator is designed to store different types of food.
Store your food in the optimal space to enjoy the freshest taste.



Adjustable refrigerator shelf
Adjustable shelves to meet your individual storage needs.

Vegetable storage (Crisper)
Preserves vegetables and fruit.

Durabase®
Largest storage space in the freezer.

Gallon Storage Bin
Store drinks such as juice and soda, as well as seasonings, salad dressings and other food items.

Glide'N'Serve
Provides storage space that keeps the compartment at a different temperature than the refrigerator. It is a convenient place to store sandwiches or meat to be cooked.

AjMadison
Your Appliance Authority
800-570-3355

CAUTION

- Do not store food with high moisture content towards the top of the refrigerator. The moisture could come in direct contact with the cold air and freeze.
- Wash food before storing it in the refrigerator. Vegetables and fruit should be washed, and food packaging should be wiped down to prevent adjacent foods from being contaminated.
- If the refrigerator is kept in a hot and humid place, frequent opening of the door or storing a lot of vegetables in the refrigerator may cause condensation to form. Wipe off the condensation with a clean cloth or a paper towel.
- If the refrigerator door or freezer drawer is opened or closed too often, warm air may penetrate the refrigerator and raise its temperature. It can also increase the cost of electricity.

NOTE

- If you are leaving home for a short period of time, like a short vacation, the refrigerator should be left on. Refrigerated foods that are able to be frozen will stay preserved longer if stored in the freezer.
- If you are leaving the refrigerator turned off for an extended period of time, remove all food and unplug the power cord. Clean the interior, and leave the door open to prevent fungi from growing in the refrigerator.

Food Storage Tips

* The following tips may not be applicable depending on the model.

Wrap or store food in the refrigerator in airtight and moisture-proof material unless otherwise noted. This prevents food odor and taste transfer throughout the refrigerator. For dated products, check date code to ensure freshness.

Food	How to
Butter or Margarine	Keep opened butter in a covered dish or closed compartment. When storing an extra supply, wrap in freezer packaging and freeze.
Cheese	Store in the original wrapping until you are ready to use it. Once opened, rewrap tightly in plastic wrap or aluminum foil.
Milk	Wipe milk cartons. For best storage, place milk on interior shelf, not on door shelf.
Eggs	Store in original carton on interior shelf, not on door shelf.
Fruit	Do not wash or hull the fruit until it is ready to be used. Sort and keep fruit in its original container, in a crisper, or store in a completely closed paper bag on a refrigerator shelf.
Leafy Vegetables	Remove store wrapping and trim or tear off bruised and discolored areas. Wash in cold water and drain. Place in plastic bag or plastic container and store in crisper.
Vegetables with skins (carrots, peppers)	Place in plastic bags or plastic container and store in crisper.
Fish	Store fresh fish and shellfish in the freezer section if they are not being consumed the same day of purchase. It is recommended to consume fresh fish and shellfish the same day purchased.
Leftovers	Cover leftovers with plastic wrap, aluminum foil, or plastic containers with tight lids.

Storing Frozen Food

NOTE

Check a freezer guide or a reliable cookbook for further information about preparing food for freezing or food storage times.

Freezing

Your freezer will not quick-freeze a large quantity of food. Do not put more unfrozen food into the freezer than will freeze within 24 hours (no more than 2 to 3 lbs. of food per cubic foot of freezer space). Leave enough space in the freezer for air to circulate around packages. Be careful to leave enough room at the front so the door can close tightly.

Storage times will vary according to the quality and type of food, the type of packaging or wrap used (how airtight and moisture-proof) and the storage temperature. Ice crystals inside a sealed package are normal. This simply means that moisture in the food and air inside the package have condensed, creating ice crystals.

NOTE

Allow hot foods to cool at room temperature for 30 minutes, then package and freeze. Cooling hot foods before freezing saves energy.

AbMadison Your Appliance Authority 800-570-3333

Storing Frozen Food (continued)

Packaging

Successful freezing depends on correct packaging. When you close and seal the package, it must not allow air or moisture in or out. If it does, you could have food odor and taste transfer throughout the refrigerator and could also dry out frozen food.

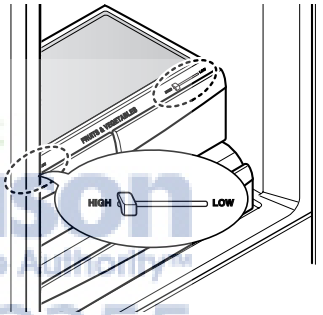
Packaging recommendations:

- Rigid plastic containers with tight-fitting lids
- Straight-sided canning/freezing jars
- Heavy-duty aluminum foil
- Plastic-coated paper
- Non-permeable plastic wraps
- Specified freezer-grade self-sealing plastic bags

Follow package or container instructions for proper freezing methods.

Do not use

- Bread wrappers
- Non-polyethylene plastic containers
- Containers without tight lids
- Wax paper or wax-coated freezer wrap
- Thin, semi-permeable wrap



Humidity Controlled Crisper

* Depending on the model, some of the following functions may not be available.

The crispers provide fresher tasting fruit and vegetables by letting you easily control humidity inside the drawer.

You can control the amount of humidity in the moisture-sealed crispers by adjusting the control to any setting between **HIGH** and **LOW.**

- **HIGH** keeps moist air in the crisper for best storage of fresh, leafy vegetables.
- **LOW** lets moist air out of the crisper for best storage of fruit.

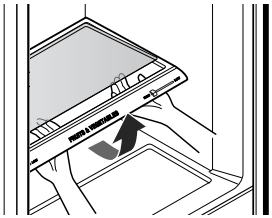
Detaching and Assembling the Storage Bins

Glide'N'Serve and Humidity Controlled Crisper

To remove the Humidity Controlled Crisper and the Glide'N'Server, pull out the Crisper 1 and Glide'N'Server 2 to full extension, lift the front up, and pull straight out.

To install, slightly tilt up the front, insert the drawer into the frame and push it back into place.



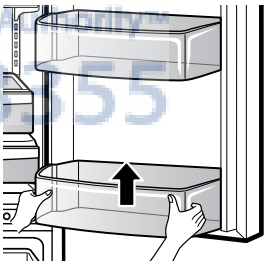
NOTE

Storage Bins may vary in appearance, depending on your model.

To Remove the Glass

(Pantry drawer not shown for clarity)

Lift up the glass under the crisper cover, and pull up and out.



Door Bins

The door bins are removable for easy cleaning and adjustment.

1 To remove the bin, simply lift the bin up and pull straight out.

2 To replace the bin, slide it in above the desired support and push down until it snaps into place.

NOTE

Some bins may vary in appearance and will only fit in one location.

CAUTION

- Do not apply excessive force while detatching or assembling the storage bins.
- Do not use the dishwasher to clean the storage bins and shelves.
- Regularly detach and wash the storage bins and shelves; they can become easily contaminated by the food.

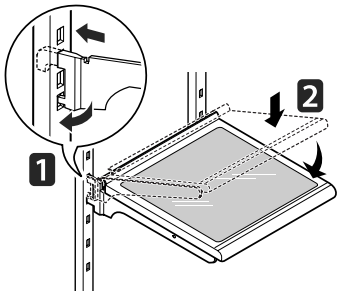
Adjusting the Refrigerator Shelves

The shelves in your refrigerator are adjustable to meet your individual storage needs. Your model may have glass or wire shelves.

Adjusting the shelves to fit different heights of items will make finding the exact item you want easier. Doing so will also reduce the amount of time the refrigerator door is open which will save energy.



Detaching the Shelf

Tilt up the front of the shelf and lift it straight up. Pull the shelf out.

Assembling the Shelf

Tilt the front of the shelf up and guide the shelf hooks into the slots at a desired height. Then, lower the front of the shelf so that the hooks drop into the slots.

CAUTION

Make sure that shelves are level from one side to the other. Failure to do so may result in the shelf falling or spilling food.

AjMadison
Your Appliance Authority™
800-570-3355

MAINTENANCE

Cleaning

- Both the refrigerator and freezer sections defrost automatically; however, clean both sections about once a month to prevent odors.
- Wipe up spills immediately.
- Always unplug the refrigeration before cleaning.

General Cleaning Tips

- Unplug refrigerator or disconnect power.
- Remove all removable parts, such as shelves, crispers, etc.
- Use a clean sponge or soft cloth and a mild detergent in warm water. Do not use abrasive or harsh cleaners.
- Hand wash, rinse and dry all surfaces thoroughly.

Exterior

Waxing external painted metal surfaces helps provide rust protection. Do not wax plastic parts. Wax painted metal surfaces at least twice a year using appliance wax (or auto paste wax). Apply wax with a clean, soft cloth.

For products with a stainless steel exterior, use a clean sponge or soft cloth and a mild detergent in warm water. Do not use abrasive or harsh cleaners. Dry thoroughly with a soft cloth.

CAUTION

- Do not use a rough cloth or sponge when cleaning the interior and exterior of the refrigerator.
- Do not place your hand on the bottom surface of the refrigerator when opening and closing.

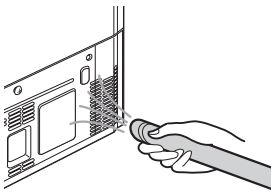
WARNING

Use non-flammable cleaner. Failure to do so can result in fire, explosion, or death.

Inside Walls (allow freezer to warm up so the cloth will not stick)

To help remove odors, you can wash the inside of the refrigerator with a mixture of baking soda and warm water. Mix 2 tablespoons of baking soda to 1 quart of water (26 g soda to 1 liter water.) Be sure the baking soda is completely dissolved so it does not scratch the surfaces of the refrigerator.

Door Liners and Gaskets



Use a clean sponge or soft cloth and a mild detergent in warm water. Do not use cleaning waxes, concentrated detergents, bleaches, or cleaners containing petroleum on plastic refrigerator parts.

Plastic Parts (covers and panels)

Use a clean sponge or soft cloth and a mild detergent in warm water. Do not use window sprays, abrasive cleansers, or flammable fluids. These can scratch or damage the material.

Condenser Coils

Use a vacuum cleaner with an attachment to clean the condenser cover and vents. Do not remove the panel covering the condenser coil area.

AiMadison Appliance Authority™ 800-570-3355

Light bulb replacement

WARNING

Electrical Shock Hazard

Before replacing a burned-out light bulb, either unplug the refrigerator or turn off power at the circuit breaker or fuse box.

NOTE

The refrigerator compartment has LED interior lighting and service should only be performed by a qualified technician.

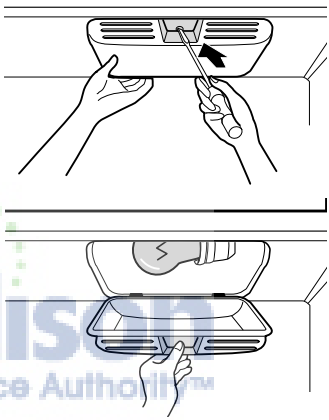
Change Freezer Compartment Light Bulb

1 Unplug refrigerator power cord form outlet.

2 Remove the screw using a Phillips screwdriver.

3 Grasp the light cover, pull the cover downward.

CAUTION



- Make sure the bulb is cool to the touch.

4 Rotate the bulb counterclockwise to remove.

5 Replace with a new 60-watt appliance bulb.

6 Insert tabs on back of cover into slots in freezer ceiling. Push cover up to snap front into place.

7 Tighten the screw using a Phillips screwdriver.

AjMadison

General Information

Power interruptions

1 If the power will be out for 24 hours or less, keep all refrigerator doors closed to help foods stay cold and frozen.

2 If the power will be out for more than 24 hours, remove all food and store it in a different refrigerator or frozen food locker.

When you go on vacation

If you choose to leave the refrigerator on while you are away, follow these steps to prepare your refrigerator before you leave.

1 Use up any perishables and freeze other items.

2 Turn off the icemaker and empty the ice bin.

If you choose to turn the refrigerator off before you leave, follow these steps.

1 Remove all food from the refrigerator.

2 Clean the refrigerator, wipe it and dry well.

3 Tape rubber or wood blocks to the tops of both doors to prop them open far enough for air to get in. This stops odor and mold from building up.

When you move

When you are moving your refrigerator to a new home, follow these steps to prepare it for the move.

1 Remove all food from the refrigerator and pack all frozen food in dry ice.

2 Unplug the refrigerator.

3 Clean, wipe and dry thoroughly.

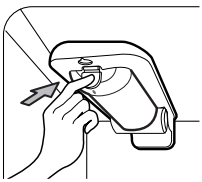
4 Take out all removable parts, wrap them well and tape them together so they do not shift and rattle during the move. Refer to the Using your Refrigerator section for removable instructions.

5 Depending on the model, raise the front of the refrigerator so it rolls easier OR screw in the leveling legs all the way so they do not scrape the floor. See the Door Closing section.

6 Tape the doors shut and tape the power cord to the refrigerator cabinet.

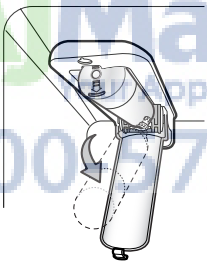
When you get to your new home, put everything back and refer to the Refrigerator Installation section for preparation instructions.

AjMadison Your Appliance Authority 800-470-3355



Replacing the Water Filter

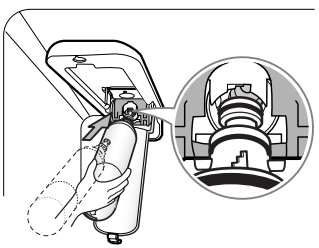
It is recommended that you replace the water filter:



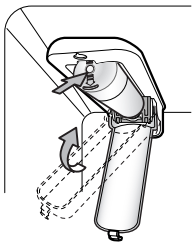
- Approximately every six months.
- When the water filter indicator turns on.
- When the water dispenser output decreases.
- When the ice cubes are smaller than normal.

1 Remove the old water filter.

- Lower or remove the top left shelf to allow the water filter to rotate all the way down.
- Press the push button to open the water filter cover.



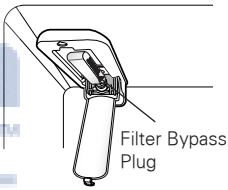
NOTE: Replacing the water filter causes a small amount of water (around 1 oz. or 25 cc) to drain. Place a cup under the front end of the water filter cover to collect any leaking water. Hold the water filter upright, once it is removed, to prevent any remaining water from spilling out of the water filter.



- Pull the water filter downward and pull out. Make sure to rotate the filter down completely before pulling it out of the manifold hole.

2 Replace with a new water filter.

- Take the new water filter out of its packing and remove the protective cover from the o-rings. With water filter tabs in the horizontal position, push the new water filter into the manifold hole until it stops.



- Rotate the water filter up into position and close the cover. The cover will click when closed correctly.

3 After the water filter is replaced, dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminates from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.

4 Water Filter Bypass Plug

Keep the water filter bypass plug. You MUST use the water filter bypass plug when a replacement water filter cartridge is not available.

AjMadison
Your Appliance Superstore™
800-670-3355

CAUTION

DO NOT operate refrigerator without water filter or water filter plug installed.

NOTE

- To purchase a replacement water filter:
  - Visit your local dealer or distributor
  - Web: Find Parts & Accessories from Support section of lg.com
  - Call : 1-800-243-0000 (USA)
    1-888-542-2623 (Canada)
- Part number of the replacement water filter: ADQ36006101

Performance Data Sheet

Model: LG ADQ36006101-S Use Replacement Cartridge: ADQ36006101

The concentration of the indicated substances in water entering the system was reduced to a concentration less than or equal to the permissible limit for water leaving the system as specified in NSF/ANSI Standard 42 and Standard 53.

System tested and certified by NSF International against NSF/ANSI Standard 42 and Standard 53 for the reduction of substances listed below.

Contaminant Reduction	Average Influent	NSF specified Challenge Concentration	Avg % Reduction	Average Product Water Concentration	Max Permissible Product Water Concentration	NSF Reduction Requirements	NSF Test Report
Chlorine Taste and Odor	2.1 mg/L	2.0 mg/L ± 10%	97.2%	0.06 mg/L	N/A	≥ 50%	J-00049247

AMadison Your Appliance Authority™ 800-570-3355

Application Guidelines/Water Supply Parameters	
Service Flow	0.5 gpm (1.9 lpm)
Water Supply	Potable Water
Water Pressure	20 -120 psi (138 - 827 kPa)
Water Temperature	33°F - 100°F (0.6°C - 38°C)

It is essential that the manufacturer's recommended installation, maintenance and filter replacement requirements be carried out for the product to perform as advertised.

NOTE

- While the testing was performed under standard laboratory conditions, actual performance may vary.

Replacement Cartridge: ADQ36006101
For estimated costs of replacement elements please call USA 1-800-243-0000
CANADA 1-888-LGCANADA (24 hours per day/7 days per week) or visit our website at www.lg.com

NSF is a trademark of NSF International.
© 2009 3M Company. All rights reserved.

WARNING

To reduce the risk associated with choking:

- Do not allow children under 3 years of age to have access to small parts during the installation of this product.

To reduce the risk associated with the ingestion of contaminants:

- Do not use with water that is microbiologically unsafe or of unknown quality without adequate disinfection before or after the system. Systems certified for cyst reduction may be used on disinfected water that may contain filterable cysts. EPA Establishment # 070595-MEX-001

CAUTION

To reduce the risk associated with property damage due to water leakage:

- Read and follow. Use Instructions before installation and use of this system.
- Installation and use MUST comply with all state and local plumbing codes.
- Do not install if water pressure exceeds 120 psi (827 kPa). If your water pressure exceeds 80 psi, you must install a pressure limiting valve. Contact a plumbing professional if you are uncertain how to check your water pressure.
- Do not install where water hammer conditions may occur. If water hammer conditions exist you must install a water hammer arrester. Contact a plumbing professional if you uncertain how to check for this condition.
- Do not install on hot water supply lines. The maximum operating water temperature of this filter system is 100°F (37.8°C).
- Protect filter from freezing. Drain filter when temperatures drop below 40°F (4.4°C).
- The disposable filter cartridge MUST be replaced every 6 months, at the rated capacity or if a noticeable reduction in flow rate occurs.
- Protect from freezing, remove filter cartridge when temperatures are expected to drop below 33° F.
- Do not install systems in areas where ambient temperatures may go above 110° F (43.3° C).
- Where a backflow prevention device is installed on a water system, a device for controlling pressure due to thermal expansion must be installed.
- Ensure all tubing and fittings are secure and free of leaks.

Conditions of Certification:

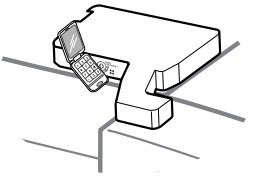
SMART DIAGNOSIS

Should you experience any problems with your refrigerator, it has the capability of transmitting data via your telephone to the LG service center. This gives you the capability of speaking directly to our trained specialists. The specialist records the data transmitted from your machine and uses it to analyze the issue, providing a fast and effective diagnosis.

If you experience problems with your refrigerator, call 1-800-243-0000. Only use the Smart Diagnosis feature when instructed to do so by the LG call center agent. The transmission sounds that you will hear are normal and sound similar to a fax machine.

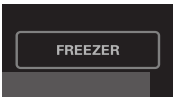
Smart Diagnosis cannot be activated unless your refrigerator is connected to power. If your refrigerator is unable to turn on, then troubleshooting must be done without using Smart Diagnosis.

Using Smart Diagnosis



First, call 1-800-243-0000. Only use the Smart Diagnosis feature when instructed to do so by the LG call center agent.

1 Lock the display. To lock the display, press and hold the Lock button for three seconds. (If the display has been locked for over five minutes, you must deactivate the lock and then reactivate it.)



2 Open the right refrigerator door.

3 Hold the mouthpiece of your phone in front of the speaker that is located on the right hinge of the refrigerator door, when instructed to do so by the call center.

4 Press and hold the Freezer Temperature button for three seconds while continuing to hold your phone to the speaker.

5 After you hear three beeps, release the Freezer Temperature button.

6 Keep the phone in place until the tone transmission has finished. This takes about 15 seconds, and the display will count down the time. Once the countdown is over and the tones have stopped, resume your conversation with the specialist, who will then be able to assist you in using the information transmitted for analysis.

NOTE

- For best results, do not move the phone while the tones are being transmitted.
- If the call center agent is not able to get an accurate recording of the data, you may be asked to try again.

NOTE

- Call quality differences by region may affect the function.
- Use the home telephone for better communication performance, resulting in better service.
- Bad call quality may result in poor data transmission from your phone to the machine, which could cause Smart Diagnosis to not work properly.

AjMadison Your Appliance Source 800-570-3365

TROUBLESHOOTING

Review the Troubleshooting section before calling for service; doing so will save you both time and money.

Problem	Possible Causes	Solutions
Refrigerator and Freezer section are not cooling.	The refrigerator control is set to OFF (some models).	Turn the control ON. Refer to the Setting the Controls section for proper temperature settings.
	Refrigerator is in the defrost cycle.	During the defrost cycle, the temperature of each compartment may raise slightly. Wait 30 minutes and confirm the proper temperature has been restored once the defrost cycle has completed.
	Refrigerator was recently installed.	It may take up to 24 hours for each compartment to reach the desired temperature.
	Refrigerator was recently relocated.	If the refrigerator was stored for a long period of time or moved on its side, it is necessary for the refrigerator to stand upright for 24 hours before connecting it to power.
Cooling System runs too much.	Refrigerator is replacing an older model.	Modern refrigerators require more operating time but use less energy due to more efficient technology.
	Refrigerator was recently plugged in or power restored.	The refrigerator will take up to 24 hours to cool completely.
	Door opened often or a large amount of food / hot food was added.	Adding food and opening the door warms the refrigerator, requiring the compressor to run longer in order to cool the refrigerator back down. In order to conserve energy, try to get everything you need out of the refrigerator at once, keep food organized so it is easy to find, and close the door as soon as the food is removed. (Refer to the Food Storage Guide.)
	Doors are not closed completely.	Firmly push the doors shut. If they will not shut all the way, see the Doors will not close completely or pop open section in Parts & Features Troubleshooting.
	Refrigerator is installed in a hot location.	The compressor will run longer under warm conditions. At normal room temperatures (70°F) expect your compressor to run about 40% to 80% of the time. Under warmer conditions, expect it to run even more often. The refrigerator should not be operated above 110°F.
	Condenser / back cover is clogged.	Use a vacuum cleaner with an attachment to clean the condenser cover and vents. Do not remove the panel covering the condenser coil area.

AiMadison Appliance Technician 800-570-3339

Problem	Possible Causes	Solutions
Refrigerator or Freezer section is too warm.	Refrigerator was recently installed.	It may take up to 24 hours for each compartment to reach the desired temperature.
	Air vents are blocked.	Rearrange items to allow air to flow throughout the compartment. Refer to the Airflow diagram in the Using Your Refrigerator section.
	Doors are opened often or for long periods of time.	When the doors are opened often or for long periods of time, warm, humid air enters the compartment. This raises the temperature and moisture level within the compartment. To lessen the effect, reduce the frequency and duration of door openings.
	Unit is installed in a hot location.	The refrigerator should not be operated in temperatures above 110°F.
	A large amount of food or hot food was added to either compartment.	Adding food warms the compartment requiring the cooling system to run. Allowing hot food to cool to room temperature before putting it in the refrigerator will reduce this effect.
	Doors not closed correctly.	See the Doors will not close correctly or pop open section in Parts & Features Troubleshooting.
	Temperature control is not set correctly.	If the temperature is too warm, adjust the control one increment at a time and wait for the temperature to stabilize. Refer to the Setting the Controls section for more information.
	Defrost cycle has recently completed.	During the defrost cycle, the temperature of each compartment may raise slightly and condensation may form on the back wall. Wait 30 minutes and confirm the proper temperature has been restored once the defrost cycle has completed.

AjMadison Your Appliance Superstore 800-570-2255

Problem	Possible Causes	Solutions
Interior moisture buildup.	Doors are opened often or for long periods of time.	When the doors are opened often or for long periods of time, warm, humid air enters the compartment. This raises the temperature and moisture level within the compartment. To lessen the effect, reduce the frequency and duration of door openings.
	Doors not closed correctly.	See the Doors will not close correctly section in the Troubleshooting section.
	Weather is humid.	Humid weather allows additional moisture to enter the compartments when the doors are opened leading to condensation or frost. Maintaining a reasonable level of humidity in the home will help to control the amount of moisture that can enter the compartments.
	Defrost cycle recently completed.	During the defrost cycle, the temperature of each compartment may raise slightly and condensation may form on the back wall. Wait 30 minutes and confirm that the proper temperature has been restored once the defrost cycle has completed.
	Food is not packaged correctly.	Food stored uncovered or unwrapped, and damp containers can lead to moisture accumulation within each compartment. Wipe all containers dry and store food in sealed packaging to prevent condensation and frost.
Food is freezing in the refrigerator compartment.	Food with high water content was placed near an air vent.	Rearrange items with high water content away from air vents.
	Refrigerator temperature control is set incorrectly.	If the temperature is too cold, adjust the control one increment at a time and wait for the temperature to stabilize. Refer to the Setting the Controls section for more information.
	Refrigerator is installed in a cold location.	When the refrigerator is operated in temperature below 41°F (5°C), food can freeze in the refrigerator compartment. The refrigerator should not be operated in temperature below 55°F (13°C).
Frost or ice crystals form on frozen food (outside of package).	Door is opened frequently or for long periods of time.	When the doors are opened often or for long periods of time, warm, humid air enters the compartment. This raises the temperature and moisture level within the compartment. Increased moisture will lead to frost and condensation. To lessen the effect, reduce the frequency and duration of door openings.
	Door is not closing properly.	Refer to the Doors will not close correctly or pop open section in the Troubleshooting section.
Refrigerator or Freezer section is too cold.	Incorrect temperature control settings.	If the temperature is too cold, adjust the control one increment at a time and wait for the temperature to stabilize. Refer to the Setting the Controls section for more information.

AiMadison Your Appliance Authority™ 800-578-5555

Problem	Possible Causes	Solutions
Frost or ice crystals on frozen food (inside of sealed package).	Condensation from food with a high water content has frozen inside of the food package.	This is normal for food items with a high water content.
	Food has been left in the freezer for a long period of time.	Do not store food items with high water content in the freezer for a long period of time.
Icemaker is not making enough ice.	Demand exceeds ice storage capacity.	The icemaker will produce approximately 100 cubes in a 24 hour period.
	House water supply is not connected, valve is not turned on fully, or valve is clogged.	Connect the refrigerator to a cold water supply with adequate pressure and turn the water shutoff valve fully open. If the problem persists, it may be necessary to contact a plumber.
	Water filter has been exhausted.	It is recommended that you replace the water filter: • Approximately every six months. • When the water filter indicator turns on. • When the water dispenser output decreases. • When the ice cubes are smaller than normal.
	Low house water supply pressure.	The water pressure must be between 20 and 120 psi on models without a water filter and between 40 and 120 psi on models with a water filter. If the problem persists, it may be necessary to contact a plumber.
	Reverse Osmosis filtration system is used.	Reverse osmosis filtration systems can reduce the water pressure below the minimum amount and result in icemaker issues. (Refer to Water Pressure section.)
	Tubing connecting refrigerator to house supply valve is kinked.	The tubing can kink when the refrigerator is moved during installation or cleaning resulting in reduced water flow. Straighten or repair the water supply line and arrange it to prevent future kinks.

AJMadison Your Appliance Authority™ 800-570-3333

Problem	Possible Causes	Solutions
Icemaker is not making enough ice (continued).	Doors are opened often or for long periods of time.	If the doors of the unit are opened often, ambient air will warm the refrigerator which will prevent the unit from maintaining the set temperature. Lowering the refrigerator temperature can help, as well as not opening the doors as frequently.
	Doors are not closed completely.	If the doors are not properly closed, ice production will be affected. See the Doors will not close completely or pop open section in Parts & Features Troubleshooting for more information.
	The temperature setting for the freezer is too warm.	The recommended temperature for the freezer compartment for normal ice production is 0°F. If the freezer temperature is warmer, ice production will be affected.
Dispensing water slowly.	Water filter has been exhausted.	It is recommended that you replace the water filter: • Approximately every six months. • When the water filter indicator turns on. • When the water dispenser output decreases. • When the ice cubes are smaller than normal.
	Reverse osmosis filtration system is used.	Reverse osmosis filtration systems can reduce the water pressure below the minimum amount and result in icemaker issues. If the problem persists, it may be necessary to contact a plumber.
	Low house water supply pressure.	The water pressure must be between 20 and 120 psi on models without a water filter and between 40 and 120 psi on models with a water filter. If the problem persists, it may be necessary to contact a plumber.

AjMadison Your Appliance Authority™ 800-570-3355

Problem	Possible Causes	Solutions
Not dispensing ice.	Doors are not closed completely.	Ice will not dispense if any of the refrigerator doors are left open.
	Infrequent use of the dispenser.	Infrequent use of the ice dispenser will cause the cubes to stick together over time, which will prevent them from properly dispensing. Check the ice bin for ice cubes clumping/sticking together. If they are, break up the ice cubes to allow for proper operation.
	The delivery chute is clogged with frost or ice fragments.	Eliminate the frost or ice fragments by removing the ice bin and clearing the chute with a plastic utensil. Dispensing cubed ice can also help prevent frost or ice fragment buildup.
	The dispenser display is locked.	Press and hold the Lock button for three seconds to unlock the control panel and dispenser.
	Ice bin is empty.	It may take up to 24 hours for each compartment to reach the desired temperature and for the icemaker to begin making ice. Make sure that the shutoff (arm/sensor) is not obstructed. Once the ice supply in the bin has been completely exhausted, it my take up to 90 minutes before additional ice is available, and approximately 24 hours to completely refill the bin.
Icemaker is not making ice.	Refrigerator was recently installed or icemaker recently connected.	It may take up to 24 hours for each compartment to reach the desired temperature and for the icemaker to begin making ice.
	Icemaker not turned on.	Locate the icemaker ON/OFF switch and confirm that it is in the ON (I) position.
	The ice detecting sensor is obstructed.	Foreign substances or frost on the ice-detecting sensor can interrupt ice production. Make sure that the sensor area is clean at all times for proper operation.
	The refrigerator is not connected to a water supply or the supply shutoff valve is not turned on.	Connect refrigerator to the water supply and turn the water shutoff valve fully open.
	Icemaker shutoff (arm or sensor) obstructed.	If your icemaker is equipped with an ice shutoff arm, make sure that the arm moves freely. If your icemaker is equipped with the electronic ice shutoff sensor, make sure that there is a clear path between the two sensors.
	Reverse osmosis water filtration system is connected to your cold water supply.	Reverse osmosis filtration systems can reduce the water pressure below the minimum amount and result in icemaker issues. (Refer to the Water Pressure section.)

AjMachine Your Appliance Authority™

Problem	Possible Causes	Solutions
Not dispensing water.	New installation or water line recently connected.	Dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminates from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.
	The dispenser panel is locked.	Press and hold the Lock button for three seconds to unlock the control panel and dispenser.
	The dispenser is not set for water dispensing.	The dispenser can be set for ice or water. Make certain that the control panel is set for the proper operation. Press the Water button on the control panel to dispense water.
	Refrigerator or freezer doors are not closed properly.	Water will not dispense if any of the refrigerator doors are left open.
	Water filter has been recently removed or replaced.	After the water filter is replaced, dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminates from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.
	Tubing connecting refrigerator to house supply valve is kinked.	The tubing can kink when the refrigerator is moved during installation or cleaning resulting in reduced water flow. Straighten or repair the water supply line and arrange it to prevent future kinks.
	The house water supply is not connected, the valve is not turned on fully, or the valve is clogged.	Connect refrigerator to the water supply and turn the water shutoff valve fully open. If the problem persists, it may be necessary to contact a plumber.

Appliance Solutions
800-570-5555

Problem	Possible Causes	Solutions
Ice has bad taste or odor.	Water supply contains minerals such as sulfur.	A water filter may need to be installed to eliminate taste and odor problems. NOTE: In some cases, a filter may not help. It may not be possible to remove all minerals / odor / taste in all water supplies.
	Icemaker was recently installed.	Discard the first few batches of ice to avoid discolored or bad tasting ice.
	Ice has been stored for too long.	Ice that has been stored for too long will shrink, become cloudy, and may develop a stale taste. Throw away old ice and make a new supply.
	The food has not been stored properly in either compartment.	Rewrap the food. Odors may migrate to the ice if food is not wrapped properly.
	The interior of the refrigerator needs to be cleaned.	See the Care and Cleaning section for more information.
	The ice storage bin needs to be cleaned.	Empty and wash the bin (discard old cubes). Make sure that the bin is completely dry before reinstalling it.
Dispensing warm water.	Refrigerator was recently installed.	Allow 24 hours after installation for the water storage tank to cool completely.
	The water dispenser has been used recently and the storage tank was exhausted.	Depending on your specific model, the water storage capacity will range from approximately 20 to 30 oz.
	Dispenser has not been used for several hours.	If the dispenser has not been used for several hours, the first glass dispensed may be warm. Discard the first 10 oz.
	Refrigerator is connected to the hot water supply.	Make sure that the refrigerator is connected to a cold water pipe. ⚠ WARNING: Connecting the refrigerator to a hot water line may damage the icemaker.
Water has bad taste or odor.	Water supply contains minerals such as sulfur.	A water filter may need to be installed to eliminate taste and odor problems.
	Water filter has been exhausted.	It is recommended that you replace the water filter: • Approximately every 6 months. • When the water filter indicator turns on. • When the water dispenser output decreases. • When the ice cubes are smaller than normal.
	Refrigerator was recently installed.	Dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminates from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.

iMadison Your Appliance Authority 800-570-5555

Problem	Possible Causes	Solutions
Icemaker is making too much ice.	Icemaker shutoff (arm/sensor) is obstructed.	Empty the ice bin. If your icemaker is equipped with an ice shutoff arm, make sure that the arm moves freely. If your icemaker is equipped with the electronic ice shutoff sensor, make sure that there is a clear path between the two sensors. Reinstall the ice bin and wait 24 hours to confirm proper operation.
Clicking	The defrost control will click when the automatic defrost cycle begins and ends. The thermostat control (or refrigerator control on some models) will also click when cycling on and off.	Normal Operation
Rattling	Rattling noises may come from the flow of refrigerant, the water line on the back of the unit, or items stored on top of or around the refrigerator.	Normal Operation
	Refrigerator is not resting solidly on the floor.	Floor is weak or uneven or leveling legs need to be adjusted. See the Door Alignment section.
	Refrigerator with linear compressor was jarred while running.	Normal Operation
Whooshing	Evaporator fan motor is circulating air through the refrigerator and freezer compartments.	Normal Operation
	Air is being forced over the condenser by the condenser fan.	Normal Operation
Gurgling	Refrigerant flowing through the cooling system.	Normal Operation
Popping	Contraction and expansion of the inside walls due to changes in temperature.	Normal Operation
Sizzling	Water dripping on the defrost heater during a defrost cycle.	Normal Operation
Vibrating	If the side or back of the refrigerator is touching a cabinet or wall, some of the normal vibrations may make an audible sound.	To eliminate the noise, make sure that the sides and back cannot vibrate against any wall or cabinet.
Dripping	Water running into the drain pan during the defrost cycle.	Normal Operation

Madison Appliance Authority™ 866-570-3355

Problem	Possible Causes	Solutions
Pulsating or High-Pitched Sound	Your refrigerator is designed to run more efficiently to keep your food items at the desired temperature. The high efficiency compressor may cause your new refrigerator to run longer than your old one, but it is still more energy efficient than previous models. While the refrigerator is running, it is normal to hear a pulsating or high-pitched sound.	Normal Operation
Doors will not close correctly or pop open.	Food packages are blocking the door open.	Rearrange food containers to clear the door and door shelves.
	Ice bin, crisper cover, pans, shelves, door bins, or baskets are out of position.	Push bins all the way in and put crisper cover, pans, shelves and baskets into their correct positions. See the Using Your Refrigerator section for more information.
	The doors were removed during product installation and not properly replaced.	Remove and replace the doors according to the Removing and Replacing Refrigerator Handles and Doors section.
	Refrigerator is not leveled properly.	See Door Alignment in the Refrigeration Installation section to level refrigerator.
Doors are difficult to open.	The gaskets are dirty or sticky.	Clean the gaskets and the surfaces that they touch. Rub a thin coat of appliance polish or kitchen wax on the gaskets after cleaning.
	Door was recently closed.	When you open the door, warmer air enters the refrigerator. As the warm air cools, it can create a vacuum. If the door is hard to open, wait one minute to allow the air pressure to equalize, then see if it opens more easily.
Refrigerator wobbles or seems unstable.	Leveling legs are not adjusted properly.	Refer to the Leveling and Door Alignment section.
	Floor is not level.	It may be necessary to add shims under the leveling legs or rollers to complete installation.
Lights do not work.	LED interior lighting failure.	The refrigerator compartment lamp is LED interior lighting, and service should be performed by a qualified technician.
Refrigerator has an unusual odor.	The Air Filter may need to be set to the MAX setting or replaced.	Set the Air Filter to the MAX setting. If the odor does not go away within 24 hours, the filter may need to be replaced. See the Replacing the Air Filter section for replacement instructions.
The interior of the refrigerator is covered with dust or soot.	The refrigerator is located near a fire source, such as a fireplace, chimney or candle.	Make sure that the refrigerator is not located near a fire source, such as a fireplace, chimney or candle.

AJ Madison Your Appliance Expert 800-570-3355

WARRANTY (USA)

Should your LG Refrigerator ("Product") fail due to a defect in materials or workmanship under normal home use, during the warranty period set forth below, LG will at its option repair or replace the product. This limited warranty is valid only to the original retail purchaser of the product and applies only when purchased and used within the United States including U.S. Territories. Proof of original retail purchase is required to obtain warranty service under this limited warranty.

WARRANTY PERIOD			
Refrigerator	Sealed System (Condenser, Dryer, Connecting Tube, Refrigerant and Evaporator)		Linear Compressor
One (1) year from the date of original retail purchase	One (1) year from the date of original retail purchase	Seven (7) years from the date of original retail purchase	Ten (10) years from the date of original retail purchase
Parts and Labor (internal/functional parts only)	Parts and Labor	Parts only (Consumer will be charged for labor)	Part only (Consumer will be charged for labor)

Noises associated with normal operation and failure to follow instructions found in the use and care and installation guides or operating the unit in an unsuitable environment will not be covered under this warranty.

- Replacement products and parts are warranted for the remaining portion of the original warranty period or ninety (90) days, whichever is greater.
- Replacement products and parts may be new or remanufactured.

THIS WARRANTY IS IN LIEU OF ANY OTHER WARRANTY, EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TO THE EXTENT ANY IMPLIED WARRANTY IS REQUIRED BY LAW, IT IS LIMITED IN DURATION TO THE EXPRESS WARRANTY PERIOD ABOVE. NEITHER THE MANUFACTURER NOR ITS U.S. DISTRIBUTOR SHALL BE LIABLE FOR ANY INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL, OR PUNITIVE DAMAGES OF ANY NATURE, INCLUDING WITHOUT LIMITATION, LOST REVENUES OR PROFITS, OR ANY OTHER DAMAGE WHETHER BASED IN CONTRACT, TORT, OR OTHERWISE. Some states do not allow the exclusion or limitation of incidental or consequential damages or limitations on how long an implied warranty lasts, so the above exclusion or limitation may not apply to you. This warranty gives you specific legal rights and you may also have other rights that vary from state to state.

AjMadison Your Appliance Authority™

THIS LIMITED WARRANTY DOES NOT COVER:

1. Service trips to deliver, pick up, install, or repair the product; instruct the customer on operation of the product; repair or replace fuses or correct wiring or plumbing, or correction of unauthorized repairs/installation.
2. Failure of product to perform during power failures and interruptions or inadequate electrical service.
3. Damage caused by leaky or broken water pipes, frozen water pipes, restricted drain lines, inadequate or interrupted water supply or inadequate supply of air.
4. Damage resulting from operating the product in a corrosive atmosphere or contrary to the instructions outlined in the product owner's manual.
5. Damage to the product caused by accidents, pests and vermin, lightning, wind, fire, floods, or acts of God.
6. Damage resulting from misuse, abuse, improper installation, repair, or maintenance. Improper repair includes use of parts not approved or specified by LG.
7. Damage or failure caused by unauthorized modification or alteration, or if it is used for other than the intended purpose, or any water leakage where the unit was not properly installed.
8. Damage or failure caused by incorrect electrical current, voltage, or plumbing codes, commercial or industrial use, or use of accessories, components, or consumable cleaning products that are not approved by LG.
9. Damage caused by transportation and handling, including scratches, dents, chips, and/or other damage to the finish of your product, unless such damage results from defects in materials or workmanship and is reported within one (1) week of delivery (Call: 1-800-243-0000).
10. Damage or missing items to any display, open box, discounted, or refurbished product.
11. Products with original serial numbers that have been removed, altered, or can not be readily determined. Model and Serial numbers, along with original retail sales receipt, are required for warranty validation.
12. Increases in utility costs and additional utility expenses.
13. Replacement of light bulbs, filters, or any consumable parts.
14. Repairs when your product is used in other than normal and usual household use (e.g. commercial use, offices, and recreational facilities) or contrary to the instructions outlined in the product owner's manual.
15. Costs associated with removal of your product from your home for repairs.
16. The removal and reinstallation of the product if it is installed in an inaccessible location or is not installed in accordance with published installation instructions, including LG's owner's and installation manuals.
17. Shelves, door bins, drawers, handles, accessories, and other parts besides those that were originally included with this particular model.

The cost of repair or replacement under these excluded circumstances shall be borne by the consumer.

To Our Valued Customer:

Congratulations on your purchase of the very latest in Dacor® products! Our unique combination of features, style and performance make us The Life of the Kitchen™, and a great addition to your home.

In order to familiarize yourself with the controls, functions and full potential of your new Distinctive Appliance, read this use and care manual thoroughly, beginning with the ***Important Safety Instructions*** section.

All Dacor appliances are designed and manufactured with quality and pride, while working within the framework of our company value. Should you ever experience a problem with your product, please first check the ***Before You Call for Service*** section of this manual for guidance. It provides useful suggestions and remedies prior to calling for service.

Valuable customer input helps us to continuously improve our products and services, so please feel free to contact our Customer Service Team for assistance with any of your product support needs.

Dacor Customer Service Team
600 Anton Blvd. Suite 1000
Costa Mesa, CA 92626

Telephone: (800) 793-0093
Fax: (626) 403-3130
Hours of Operation: Monday through Friday
6:00 A.M. to 5:00 P.M. Pacific Time

Web Site: www.Dacor.com

Thank you for choosing Dacor for your home. We are a company built by families for families and we are dedicated to serving yours. We are confident that your new Dacor product will deliver a high level of performance and enjoyment for many years to come.

Sincerely,

The Dacor Customer Service Team

Have complete model and serial number identification of your appliance ready.

For models MMDV30S and MMD30: The name plate, including model and serial number, is located on the faceplate behind the microwave drawer front.

For model MMD24: The name plate includes the model and serial number. Open the microwave drawer fully. The label is located slightly beyond the back wall of the microwave cavity facing up from the flat surface.

Record these numbers below for easy access.

Model Number _____

Serial Number _____

Date of Purchase_____

For service and warranty information, see page 19.

At Dacor, we continuously improve the quality and performance of all our products. We may need to make changes to this appliance without updating these instructions.

IMPORTANT INFORMATION ABOUT SAFETY INSTRUCTIONS

The Important Safety Instructions and warnings in this manual are not meant to cover all possible conditions and situations that can occur. Use common sense and caution when installing, maintaining or operating this or any other appliance.

Always contact the Dacor Customer Service Team about problems or situations that you do not understand.

SAFETY SYMBOLS AND LABELS

⚠ DANGER

Immediate hazards that **WILL** result in severe personal injury or death.

⚠ WARNING

Hazards or unsafe practices that **COULD** result in severe personal injury or death.

⚠ CAUTION

Hazards or unsafe practices that **COULD** result in minor personal injury or property damage.

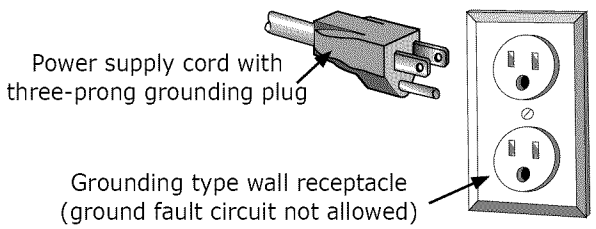
⚠ WARNING

PRECAUTIONS TO AVOID POSSIBLE EXPOSURE TO EXCESSIVE MICROWAVE ENERGY

(a) Do not attempt to operate this oven with the door open since open-door operation can result in harmful exposure to microwave energy. It is important not to defeat or tamper with the safety interlocks.

(b) Do not place any object between the oven front face and the door or allow soil or cleaner residue to accumulate on sealing surfaces.

(c) Do not operate the oven if it is damaged. It is particularly important that the oven door close properly and that there is no damage to the: (1) drawer front (bent), (2) glides and latches (broken or loosened), (3) drawer seals and sealing surfaces.



(d) The oven should not be adjusted or repaired by anyone except properly qualified service personnel.

GROUNDING INSTRUCTIONS

⚠ WARNING

Improper use of the grounding plug can result in a risk of electric shock.

This appliance is equipped with a three-prong grounding plug for your protection against possible electric shock hazards. It must be plugged into a grounded wall receptacle. If only a two-prong wall receptacle is available, it is the responsibility of the customer to have it replaced with a properly grounded three-prong wall receptacle. **Do not under any circumstances, cut or remove the third (ground) prong from the power cord.** Do not use an adapter plug. Do not use an extension cord. If the power supply cord is too short, have a qualified electrician or serviceman install an outlet near the appliance. **Do not use a Ground Fault Circuit Interrupter.**

IMPORTANT SAFETY INSTRUCTIONS

⚠ WARNING

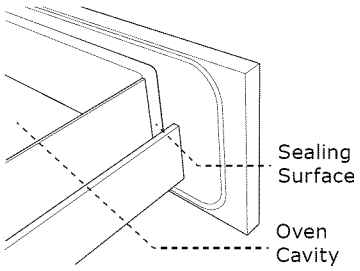
When using the appliance, basic safety precautions should be followed, including the following:

⚠ WARNING To reduce the risk of burns, electric shock, fire, injury to persons or exposure to excessive microwave energy:

1. Read all instructions before using the appliance.
2. Read and follow the specific "PRECAUTIONS TO AVOID POSSIBLE EXPOSURE TO EXCESSIVE MICROWAVE ENERGY" on page 1.
3. This appliance must be properly grounded. See page 1 and the separate installation instructions for grounding instructions .
4. Install or locate this appliance only in accordance with the provided installation instructions.
5. Some products such as whole eggs and sealed containers - for example, closed glass jars—can explode and should not be heated in the drawer.
6. Use this appliance only for its intended use as described in this manual. Do not use corrosive chemicals or vapors in this appliance. This microwave is specifically designed to heat and cook food. It is not designed for industrial or laboratory use.
7. As with any appliance, close supervision is necessary when used by children.
8. Do not operate this appliance if it has a damaged cord or plug, if it is not working properly or if it has been damaged or dropped.
9. This appliance should be serviced only by qualified service personnel. Contact nearest Dacor Authorized Servicer for examination, repair or adjustment.
10. Do not cover or block any openings on the appliance.
11. Do not store or use this appliance outdoors. Do not use this product near water—for example, near a kitchen sink, in a wet basement, near a swimming pool or similar locations.
12. Do not immerse the power cord or plug in water.
13. Keep the power cord away from heated surfaces.
14. Do not climb or sit on the drawer.
15. Be sure that fingers or other objects or materials are not around the drawer opening when the appliance is closed.
16. Do not put fingers or clothes around the drawer guides when the appliance is opened or closed. They could be caught in the guides when the drawer is closed.
17. Be sure that the food and it's container can fit inside the drawer completely before closing it.
18. When cleaning drawer sealing surfaces that come together on closing the drawer, use only mild, non-abrasive soaps or detergents applied with a sponge or soft cloth. See cleaning instructions on page 15.
19. To reduce the risk of fire in the appliance cavity:
    a. Do not overcook food. Carefully attend appliance when paper, plastic or other combustible materials are placed inside the drawer to facilitate cooking.
    b. Remove wire twist-ties from paper or plastic bags before placing bag in drawer.
    c. If materials inside the appliance ignite, keep drawer door closed, turn microwave off and shut off power at the fuse or circuit breaker panel.
    d. Do not use the drawer for storage purposes. Do not leave paper products, cooking utensils, or food in the drawer when not in use.
20. Liquids, such as water, coffee or tea are able to be overheated beyond the boiling point without appearing to be boiling due to surface tension of the liquid. Visible bubbling or boiling when the container is removed from the appliance is not always present. THIS COULD RESULT IN VERY HOT LIQUIDS SUDDENLY BOILING OVER WHEN A SPOON OR OTHER UTENSIL IS INSERTED INTO THE LIQUID.

    To reduce the risk of injury to persons:
    a. Do not overheat the liquid.
    b. Stir the liquid both before and halfway through heating.
    c. Do not use straight-sided containers with narrow necks. Use a wide-mouthed container.
    d. After heating, allow the container to stand in the drawer for at least 20 seconds before removing the container.
    e. Use extreme care when inserting a spoon or other utensil into the container.
21. If the appliance light fails, consult a DACOR AUTHORIZED SERVICER.

READ AND SAVE THESE INSTRUCTIONS



Information You Need To Know

About Unpacking And Examining Your Microwave In-A-Drawer™

1. Remove all packing materials from inside the Microwave In-A-Drawer™. DO NOT REMOVE THE WAVE-GUIDE COVER, which is located inside, on the ceiling of the Microwave In-A-Drawer™.

2. Remove the feature sticker, if there is one. Check the drawer for any damage, such as misaligned or bent drawer, damaged drawer seals and sealing surfaces, broken or loose drawer guides and dents inside the cavity or on the front side of the drawer. If there is any damage, do not operate the Microwave In-A-Drawer™ and contact your dealer or a DACOR AUTHORIZED SERVICER.

RADIO OR TV INTERFERENCE

Should there be any interference caused by the Microwave In-A-Drawer™ to your radio or TV, check to make sure that the appliance is on a different electrical circuit, relocate the radio or TV as far away from the drawer as feasible or check the position and signal of receiving antenna.

About Your Microwave In-A-Drawer™

ALWAYS have food in the drawer when it is on to absorb the microwave energy.

The vent under the Microwave In-A-Drawer™ must not be blocked. During microwaving, steam may come from the right side of the vent.

When using the Microwave In-A-Drawer™ at power levels below 100%, you may hear the magnetron cycling on and off. It is normal for the exterior of the drawer to be warm to the touch when cooking or reheating.

Condensation is a normal part of microwave cooking. Room humidity and the moisture in food will influence the amount of moisture that condenses in the drawer. Generally, covered foods will not cause as much condensation as uncovered ones.

The Microwave In-A-Drawer™ is for food preparation only. It should not be used to dry clothes or newspapers.

Your Microwave In-A-Drawer™ is rated 950 watts by using the IEC Test Procedure. In using recipes or package directions, check food one or two minutes before the minimum time and add time accordingly.

When opening or closing the Microwave In-A-Drawer™ quickly, food in the drawer may be spilled. To clean, please refer to the Cleaning and Care section on page 15.

About Microwave Cooking

- Arrange food carefully. Place thickest areas towards outside of dish.
- Watch the cooking time. Cook for the shortest amount of time indicated and add more as needed. Food severely overcooked can smoke or ignite.
- Cover foods while cooking. Check a recipe or cookbook for suggestions like: paper towels, wax paper, microwave plastic wrap or a lid. Covers prevent spattering and help foods to cook evenly.
- Shield with small flat pieces of aluminum foil any thin areas of meat or poultry to prevent overcooking before dense, thick areas are cooked thoroughly.
- Stir foods from outside to center of dish once or twice during cooking, if possible.
- Turn foods over once during microwaving to speed cooking of such foods as chicken and hamburgers. Large items like roasts must be turned over at least once.
- Rearrange foods such as meatballs halfway through cooking both from top to bottom and from right to left.
- Add standing time. Remove food from drawer and stir, if possible. Cover during standing time, allowing the food to finish cooking without overcooking.
- Check for doneness. Look for signs indicating that cooking temperatures have been reached.

  Signs of doneness include:

  - Food steams throughout, not just at edge.
  - Poultry thigh joints move easily.
  - Meat and poultry show no pinkness.
  - Fish is opaque and flakes easily with a fork.

About Utensils And Coverings

It is not necessary to buy all new cookware. Many pieces already in your kitchen can be used successfully in your new microwave. Make sure the utensil does not touch the interior walls during cooking.

Use these utensils for safe microwave cooking and reheating:

- Glass ceramic (Pyroceram®), such as Corningware®
- Heat-resistant glass (Pyrex®)
- Microwave-safe plastics
- Microwave-safe paper plates
- Microwave-safe pottery, stoneware and porcelain
- Browning dish (Do not exceed recommended preheating time. Follow manufacturer's directions.)

These items can be used for short time reheating of foods that have little fat or sugar in them:

- Wood, Straw, Wicker

DO NOT USE

- Metal pans and Bakeware
- Dishes with metallic trim
- Non-heat-resistant glass
- Non-microwave-safe plastics (margarine tubs)
- Recycled paper products
- Brown paper bags
- Food storage bags
- Metal twist-ties

Should you wish to check if a dish is safe for microwaving, place the empty dish in the microwave on HIGH for 30 seconds. A dish which becomes very hot should not be used.

THE FOLLOWING COVERINGS ARE IDEAL:

- Paper towels are good for covering foods for reheating and absorbing fat while cooking bacon.
- Wax paper can be used for cooking and reheating.
- Plastic wrap that is specially marked for microwave use can be used for cooking and reheating. DO NOT allow plastic wrap to touch food. Vent so steam can escape.
- Lids that are microwave-safe are a good choice because heat is kept near the food to hasten cooking.
- Oven cooking bags are good for large meats or foods that need tenderizing. DO NOT use metal twist ties. Remember to slit the bag so steam can escape.

HOW TO USE ALUMINUM FOIL IN YOUR DRAWER:

- Small flat pieces of aluminum foil placed smoothly on the food can be used to shield areas that are either defrosting or cooking too quickly.
- Foil should not come closer than one inch to any surface of the Microwave In-A-Drawer™.

Should you have questions about utensils or coverings, check a good microwave cookbook or follow recipe suggestions.

ACCESSORIES:

There are many microwave accessories available for purchase. Evaluate carefully before you purchase to make sure that they meet your needs. A microwave-safe thermometer will assist you in determining correct doneness and assure you that foods have been cooked to safe temperatures. Dacor is not responsible for any damage to the appliance when accessories are used.

Open Or Close Drawer

Always press the OPEN or CLOSE key on the control panel to open or close the drawer.

Do not push or pull the drawer by hand, except in case of emergency, such as a power failure. If necessary, push or pull slowly.

About Children And The Microwave

Children below the age of 7 should use the Microwave In-A-Drawer™ with a supervising person very near to them. Between the ages of 7 and 12, the supervising person should be in the same room. The child must be able to reach the drawer comfortably.

At no time should anyone be allowed to lean or sit on the Microwave In-A-Drawer™.

Children should be taught all safety precautions: how to use potholders, remove coverings carefully and pay special attention to packages that crisp food because they may be extra hot.

Do not assume because a child has mastered one cooking skill that he/she can cook everything.

Children need to learn that the Microwave In-A-Drawer™ is not a toy. See page 14 for Control Lock feature.

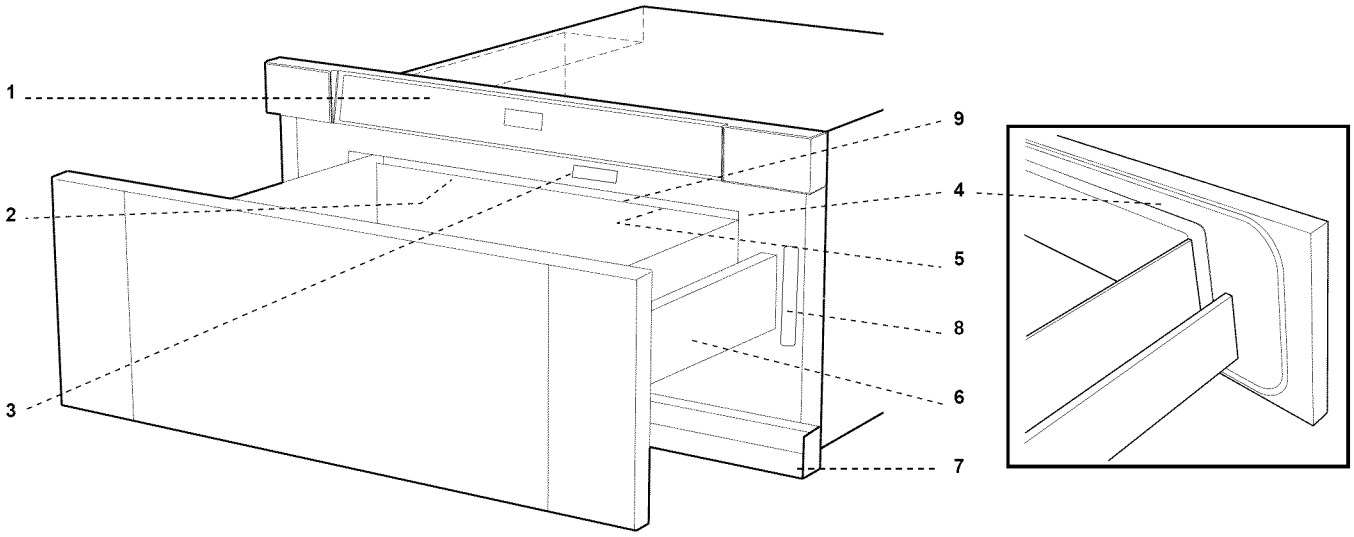
Information You Need To Know

About Safety

Check foods to see that they are cooked to the United States Department of Agriculture's recommended temperatures.

160°F	- For fresh pork, ground meat, boneless white poultry, fish, seafood, egg dishes and frozen prepared food.
165°F	- For leftovers, ready-to-reheat refrigerated; deli and carry-out "fresh" food.
170°F	- White meat of poultry.
180°F	- Dark meat of poultry.

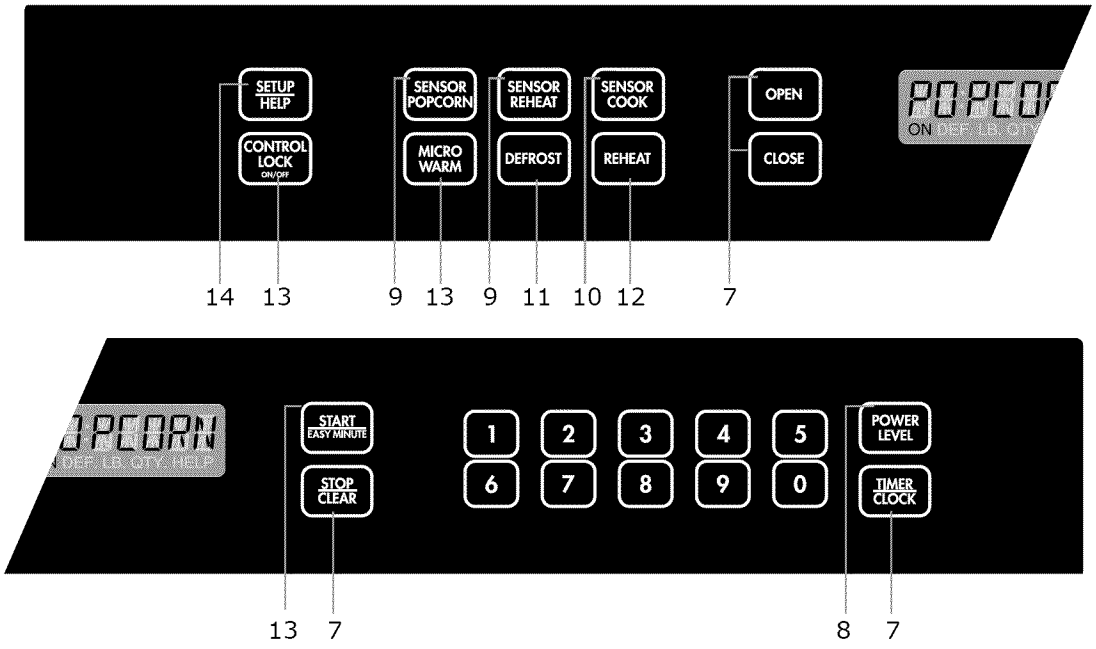
To test for doneness, insert a meat thermometer in a thick or dense area away from fat or bone. NEVER leave the thermometer in the food during cooking, unless it is approved for microwave use.



- ALWAYS use potholders to prevent burns when handling utensils that are in contact with hot food. Enough heat from the food can transfer through utensils to cause skin burns.
- Avoid steam burns by directing steam away from the face and hands. Slowly lift the farthest edge of a dish's covering and carefully open popcorn and oven cooking bags away from the face.
- Stay near the Microwave In-A-Drawer™ while it's in use and check cooking progress frequently so that there is no chance of overcooking food.
- NEVER use the Microwave In-A-Drawer™ for storing cookbooks or other items.
- Select, store and handle food carefully to preserve its high quality and minimize the spread of foodborne bacteria.
- Keep waveguide cover clean. Food residue can cause arcing and/or fires. See page 15.

About Foods

FOOD	DO	DON'T
Eggs, sausages, fruits & vegetables	• Puncture egg yolks before cooking to prevent "explosion". • Pierce skins of potatoes, apples, squash, hot dogs and sausages so that steam escapes.	• Cook eggs in shells. • Reheat whole eggs. • Dry nuts or seeds in shells.
Popcorn	• Use specially bagged popcorn for the microwave. • Listen while popping corn for the popping to slow to 1 or 2 seconds or use the special **SENSOR POPCORN** key.	• Pop popcorn in regular brown bags or glass bowls. • Exceed maximum time on popcorn package.
Baby food	• Transfer baby food to small dish and heat carefully, stirring often. Check temperature before serving. • Put nipples on bottles after heating and shake thoroughly. "Wrist" test before feeding.	• Heat disposable bottles. • Heat bottles with nipples on. • Heat baby food in original jars.
General	• Cut baked goods with filling after heating to release steam and avoid burns. • Stir liquids briskly before and after heating to avoid "eruption". • Use deep bowl, when cooking liquids or cereals, to prevent boilovers. • Food should be shorter than the drawer. Please refer to the height of side walls of the drawer.	• Heat or cook in closed glass jars or airtight containers. • Heat cans in the microwave as harmful bacteria may not be destroyed. • Deep fat fry. • Dry wood, gourds, herbs or wet papers.



Part Names

Microwave In-A-Drawer™

1. Control Panel
2. Waveguide Cover DO NOT REMOVE
3. Menu Label
4. Drawer Sealing Surfaces
5. Drawer Light
6. Drawer Guides
7. Vent
8. Rating Label for models MMDV30 and MMD30
9. Rating Label for model MMD24: Open the Microwave Drawer fully. The label is slightly beyond the back wall of the microwave cavity, facing up from the flat surface.

KEYSHEET

Numbers next to the keysheet illustration indicate page numbers where feature descriptions and usage information is located.

Before Operating

Before operating your new Microwave In-A-Drawer™ make sure you read and understand this manual completely.

- Before the Microwave In-A-Drawer™ can be used, follow these steps:

1. Plug in the Microwave In-A-Drawer™. ENJOY YOUR MICRO- WAVE TOUCH CLEAR AND TOUCH CLOCK will appear.
2. Touch the **STOP/CLEAR** key. : will appear.
3. Set the clock.

To Set The Clock

1. Touch the **TIMER/CLOCK** key and number 2.
2. Touch the number keys for correct time of day and touch the **TIMER/CLOCK** key again.

This is a 12 hour clock. If you attempt to enter an incorrect clock time, ERROR will appear in the display. Touch the **STOP/CLEAR** key and re-enter the time.

- If the electrical power supply to your Microwave In-A-Drawer™ should be interrupted, the display will intermittently show ENJOY YOUR MICRO- WAVE TOUCH CLEAR AND TOUCH CLOCK after the power is restored. If power is interrupted during cooking, the program will be erased. The time of day will also be erased. Simply touch the **STOP/CLEAR** key and reset the clock for the correct time of day.

NOTE:

- The Microwave In-A-Drawer™ can be programmed with the drawer open except for the **START/EASY MINUTE** feature.

Timer

1. Touch the **TIMER/CLOCK** key and number 1.
2. Enter time.
3. Touch the **TIMER/CLOCK** key again.
4. To cancel timer, touch the **STOP/CLEAR**.

Stop/Clear

Touch the **STOP/CLEAR** key to:

1. Clear a mistake made during programming.
2. Cancel the timer.
3. Stop the Microwave In-A-Drawer™ temporarily during timed cooking.
4. Return the time of day to the display.
5. Cancel a program during cooking, touch twice for timed cooking.

Open Or Close Drawer

Always press the **OPEN** or **CLOSE** key on the control panel to open or close the drawer.

Do not push or pull the drawer by hand, except in case of emergency, such as during a power failure. If necessary, push or pull slowly.

Microwave In-A-Drawer™ Cooking

Time Cooking

Your Microwave In-A-Drawer™ can be programmed for 99 minutes 99 seconds (99.99). Always enter the seconds after the minutes, even if they are both zeros.

- For example: Cook for 5 minutes at 100%.

1. Enter cooking time 5 0 0. 5.00 TOUCH START OR TOUCH POWER LEVEL
2. To cook at 100% power (High), touch the **START/ EASY MINUTE** key.

To Set Power Level

There are eleven preset power levels.

Using lower power levels increases the cooking time, which is recommended for foods such as cheese, milk and long slow cooked meats. Consult a microwave cookbook or recipes for specific recommendations.

- For example: Defrost for 5 minutes at 30%.

1. Enter defrost time 5 0 0. 5.00
2. Touch the **POWER LEVEL** key 8 times.
3. Touch the **START/EASY MINUTE** key.

TOUCH POWER LEVEL PAD NUMBER OF TIMES FOR DESIRED POWER	APPROXIMATE PERCENTAGE OF POWER	COMMON WORDS FOR POWER LEVELS
Power Level x 1	100%	High
Power Level x 2	90%	
Power Level x 3	80%	
Power Level x 4	70%	Medium High
Power Level x 5	60%	
Power Level x 6	50%	Medium
Power Level x 7	40%	
Power Level x 8	30%	Med Low/Defrost
Power Level x 9	20%	
Power Level x 10	10%	Low
Power Level x 11	0%	

Sensor Settings

Dacor's Sensor is a semi-conductor device that detects the vapor (moisture and humidity) emitted from the food as it heats. The sensor adjusts the cooking times and power levels for various foods and quantities.

USING SENSOR SETTINGS:

1. After the Microwave In-A-Drawer™ is plugged in, wait 2 minutes before using any sensor setting.
2. Be sure the exterior of the cooking container and the interior of the Microwave In-A-Drawer™ are dry. Wipe off any moisture with a dry cloth or paper towel.
3. The sensor works with foods at normal storage temperature. For example, popcorn would be at room temperature.
4. Any sensor selection can be programmed with More or Less Time Adjustment. See page 13.
5. More or less food than the quantity listed in the charts should be cooked following the guidelines in any microwave cookbook.
6. During the first part of sensor use, the food name will appear on the display. Do not open the Microwave In-A-Drawer™ or touch **STOP/CLEAR** during this part of the cycle. The measurement of vapor will be interrupted. If this occurs, an error message will appear. To continue cooking, touch the **STOP/CLEAR** key and cook manually.

   When the sensor detects the vapor emitted from the food, the remainder of cooking/reheating time will appear. The Microwave In-A-Drawer™ may be opened when the remaining time appears on the display. At this time, you may stir or season food, as desired.
7. If the sensor does not detect vapor properly when popping popcorn, the Microwave In-A-Drawer™ will turn off, and the time of day will be displayed. If the sensor does not detect vapor properly when cooking other foods, ERROR will be displayed, and the microwave will turn off.
8. Check the food temperature after cooking. If additional time is needed, continue to cook manually.
9. Each food has a cooking hint. Touch the **SET UP/ HELP** key when the HELP indicator is lighted in the display.

COVERING FOODS:

Some foods cook best when covered. Use the cover recommended in the charts for these foods. You may refer to the hints by touching the **SET UP/HELP** key.

1. Casserole lid.
2. Plastic wrap: Use plastic wrap recommended for microwave cooking. Cover dish loosely; allow approximately 1/2 inch to remain uncovered to allow steam to escape. Plastic wrap should not touch food.
3. Wax paper: Cover dish completely; fold excess wrap under dish to secure. If dish is wider than paper, overlap two pieces at least one inch to cover.

Be careful when removing any covering to allow steam to escape away from you.

Sensor Popcorn / Sensor Reheat

You can pop popcorn and reheat many foods without calculating the cooking time or power level.

Touch the **SENSOR REHEAT** or **SENSOR POPCORN** and the **START/EASY MINUTE** key.

When the sensor detects the vapor emitted from the food, the remainder of cooking/reheating time will appear.

NOTE:

- The Sensor Popcorn setting has 2 choices. Follow directions on the display to choose desired option.

SENSOR POPCORN / SENSOR REHEAT CHART

FOOD	AMOUNT	PROCEDURE
Sensor Popcorn	Only 1 package at a time	Use only popcorn packaged for the microwave. Try several brands to decide your favorite. Do not try to pop unpopped kernels.
	2.85 - 3.5 oz. (Regular / Regular light)	Touch the **SENSOR POPCORN** key once.
	1.2 - 1.75 oz. (Mini / Snack)	Touch the **SENSOR POPCORN** key twice.
Sensor Reheat	4 - 36 oz.	Place food to be reheated in a dish or casserole slightly larger than the amount. Flatten, if possible. Cover with a lid, plastic wrap or wax paper. Use covers such as plastic wrap or lids, with larger quantities of more dense foods such as stews. After reheating, stir well if possible. Re-cover and allow to stand 2 to 3 minutes. Foods should be very hot. If not, continue to heat with variable power and time.

Sensor Cooking

1. Touch the **SENSOR COOK** key once.
   SEE | LABEL | SELECT | FOOD | NUMBER
2. See the Menu Label. Select desired food by touching the number key. Ex: Touch 5 for baked potatoes.
3. Touch the **START/EASY MINUTE** key.

NOTE:

- To heat or cook other foods or foods above or below the quantity allowed on the SENSOR COOK CHART, cook manually.

SENSOR COOK CHART

FOOD	AMOUNT	PROCEDURE
1. Fresh vegetables: soft Broccoli Brussel sprouts Cabbage Cauliflower (flowerets) Cauliflower (whole) Spinach Zucchini Baked apples	 .25 - 2.0 lb. .25 - 2.0 lb. .25 - 2.0 lb. .25 - 2.0 lb. 1 med. .25 - 1.0 lb. .25 - 2.0 lb. 2 - 4 med.	Wash and place in casserole. Do not add water if vegetables have just been washed. Cover with lid for tender vegetables. Use plastic wrap for tender-crisp vegetables. After cooking, stir, if possible. Let stand covered for 2 to 5 minutes.
2. Fresh vegetables: hard Carrots, sliced Corn on the cob Green beans Winter squash: diced halves	 .25 - 1.5 lb. 2 - 4 .25 - 1.5 lb. .25 - 1.5 lb. 1 - 2	Place in casserole. Add 1 - 4 tablespoons water. Cover with lid for tender vegetables. Use plastic wrap cover for tender-crisp vegetables. After cooking, stir, if possible. Let stand covered for 2 to 5 minutes.
3. Frozen vegetables	.25 - 1.25 lb.	Do not add water. Cover with lid or plastic wrap. After cooking, stir and let stand covered for 3 minutes.
4. Frozen entrees	6 - 17 oz.	Use this key for frozen convenience foods. It will give satisfactory results for most brands. You may wish to try several and choose your favorite. Remove package from outer wrapping and follow package directions for covering. After cooking, let stand covered for 1-3 minutes.
5. Baked potatoes	1 - 6 med.	Pierce. Place on paper-towel-lined drawer. After cooking, remove from microwave, wrap in aluminum foil and let stand 5 to 10 minutes.
6. Ground meat	.25 - 2.0 lb.	Use this setting to cook ground beef or turkey as patties or in a casserole to be added to other ingredients. Place patties on a microwave-safe rack and cover with wax paper. Place ground meat in a casserole and cover with wax paper or plastic wrap. When microwave stops, turn patties over or stir meat in casserole to break up large pieces. Re-cover and touch **START/ EASY MINUTE**. After cooking, let stand covered for 2 to 3 minutes.
7. Fish/seafood	.25 - 2.0 lb.	Arrange in ring around shallow glass dish (roll fillet with edges underneath). Cover with vented plastic wrap. After cooking, let stand covered for 3 minutes.
8. Rice	.5 - 2.0 cup	Place rice into a deep casserole and add a double quantity of water. Cover with lid or plastic wrap. After cooking, stir, cover and let stand 3 to 5 minutes or until all liquid has been absorbed. **Rice** / **Water** / **Size of casserole** .5 cup / 1 cup / 1.5 quart 1 cup / 2 cups / 2 quart 1.5 cups / 3 cups / 2.5 or 3 quart 2 cups / 4 cups / 3 quart or larger

Defrost

Use this feature to defrost the foods shown in the DEFROST CHART below.

1. Touch the **DEFROST** key. SEE LABEL SELECT FOOD NUMBER
2. See the Menu Label. Select desired food by touching the number key. For example: Touch 2 for steaks/chops. STEAKS CHOPS ENTER WEIGHT
3. Enter the weight by touching 1 0 0. 1.0 Lb
4. Touch the **START/EASY MINUTE** key.
5. The Microwave In-A-Drawer™ will stop so that the food can be checked.
6. After the first stage, open the drawer. Turn steak over and shield any warm portions. Close the drawer. Touch the **START/EASY MINUTE** key.
7. After the second stage, open the drawer. Shield any warm portions. Close the drawer. Touch the **START/EASY MINUTE** key.
8. After defrost cycle ends, cover and let stand as indicated in the chart below.

NOTE:

- Defrost can be programmed with More or Less Time Adjustment. See page 13.
- To defrost other foods or foods above or below the weights allowed on the DEFROST CHART, see MANUAL DEFROST below.
- Do not defrost until all ice crystals are thawed.
- Check foods when the Microwave In-A-Drawer™ signals. After the final stage, small sections may still be icy. Let stand to continue thawing.
- Shielding prevents cooking from occurring before the center of the food is defrosted. Use small smooth strips of aluminum foil to cover edges and thinner sections of the food.

DEFROST CHART

FOOD	AMOUNT	PROCEDURE
1. Ground meat	.5 - 2.0 lb	Remove any thawed pieces after each audible signal. Let stand covered for 5 to 10 minutes.
2. Steaks/chops	.5 - 3.0 lb	After each audible signal, rearrange and if there are warm or thawed portions, shield with small flat pieces of aluminum foil. Remove any meat or fish that is almost defrosted. Let stand covered for 10 to 20 minutes.
3. Boneless poultry	.5 - 2.0 lb	After each audible signal, if there are warm or thawed portions, rearrange or remove. Let stand covered for 10 to 20 minutes.
4. Bone-in poultry	.5 - 3.0 lb	After each audible signal, rearrange pieces or remove portions should they become warm or thawed. Let stand covered for 10 to 20 minutes.
5. Casserole/soup	1 - 6 cups	After each audible signal, break apart and remove any defrosted part. At end, stir well and let stand covered for 5 to 10 minutes.

Manual Defrost

If the food that you wish to defrost is not listed on the DEFROST CHART or is above or below the limits in the AMOUNT column on the DEFROST CHART, you need to defrost manually.

You can defrost any frozen food, either raw or previously cooked, by setting the Power Level to 30%. Follow the exact 3-step procedure found under TO SET POWER LEVEL on page 8. Estimate defrosting time and press POWER LEVEL key eight times for 30% power.

For either raw or previously cooked frozen food, the rule of thumb is approximately 4 minutes per pound. For example, defrost 4 minutes for 1 pound of frozen spaghetti sauce.

Always stop the Microwave In-A-Drawer™ periodically to remove or separate the portions that are defrosted. If food is not defrosted at the end of the estimated defrosting time, program the Microwave In-A-Drawer™ in 1 minute increments at a Power Level of 30% until totally defrosted.

When using plastic containers from the freezer, defrost only long enough to remove from the plastic, then place in a microwave-safe dish.

Reheat

Reheat automatically computes the correct warming time and microwave power level for foods shown in the chart below.

1. Touch the **REHEAT** key once. SEE LABEL SELECT FOOD NUMBER
2. See Menu Label. Select desired food by touching the number key. For example: Touch 2 for frozen rolls or muffins.
3. Touch the number key to select quantity. For example: Touch 2 for 2 rolls or muffins.
4. Touch the **START/EASY MINUTE** key.

NOTE:

- Reheat can be programmed with More or Less Time Adjustment. See page 13.
- To reheat other foods or foods above or below the quantity allowed on the REHEAT CHART, heat manually.

REHEAT CHART

FOOD	AMOUNT	PROCEDURE
1. Fresh rolls/ muffins	1 - 8 pcs	Use this key to warm rolls, muffins, biscuits, bagels etc. Large items should be considered as 2 or 3 regular size. Arrange on plate; cover with paper towel. For refrigerated rolls or muffins, it may be necessary to double the entered amount to ensure the proper serving temperature. For example, enter quantity of 2 for 1 refrigerated muffin.
2. Frozen rolls/ muffins	1 - 8 pcs	Use this key to warm frozen rolls, muffins, biscuits, bagels etc. Large items should be considered as 2 or 3 regular size. Arrange on plate; cover with paper towel.
3. Beverage	.5 - 2.0 cups	This setting is good for restoring cooled beverage to a better drinking temperature. Stir liquid briskly before and after heating to avoid "eruption".

Other Features

Micro Warm

Micro Warm allows you to keep food warm up to 30 minutes.

DIRECT USE

1. Touch the **MICRO WARM** key.
   ENTER | TIME | UP TO | 30 | MINUTES
2. Enter the desired time by touching the number keys. To enter 30 minutes, touch 3 0 0 0.
   30.00 | TOUCH | START
3. Touch the **START/EASY MINUTE** key.

The Microwave In-A-Drawer™ will start. The display will show 30.00 and count down. KEEP | WARM will be displayed intermittently during the count down.

WITH MANUAL COOKING

1. Enter the desired cooking time and power level.
2. Touch the **MICRO WARM** key.
3. Enter the desired warming time, up to 30 minutes.
4. Touch the **START/EASY MINUTE** key.

The operation will start. When the cooking time is complete, a long tone will sound and Micro Warm will start. The display will count down. KEEP | WARM will be displayed intermittently during the count down.

NOTE:

- If you attempt to enter more than 30 minutes for Micro Warm, an error message will appear in the display.
- Micro Warm cannot be programmed with Sensor Popcorn, Sensor Reheat, Sensor Cook, Defrost or Reheat.

Help

Each setting of Sensor Reheat, Sensor Cook, Sensor Popcorn, Micro Warm, Reheat and Defrost has a cooking hint. If you wish to check, touch **SET UP/HELP** whenever HELP is lighted in the interactive display for these and other manual operation hints.

More Or Less Time Adjustment

Should you discover that you like any of the Sensor, Reheat or Defrost settings slightly more done, touch the **POWER LEVEL** key once after touching your selection. The display will show MORE.

For slightly less done, touch the **POWER LEVEL** key twice after touching your selection.
The display will show LESS.

Multiple Sequence Cooking

Your Microwave In-A-Drawer™ can be programmed for up to 4 automatic cooking sequences, switching from one power level setting to another automatically.

Sometimes cooking directions tell you to start on one power level and then change to a different power level. Your Microwave In-A-Drawer™ can do this automatically.

1. First enter the cooking time. Then touch the **POWER LEVEL** key once for 100% cooking or repeat touching the **POWER LEVEL** key for a lower power level.
2. Enter the second cooking time. Touch the **POWER LEVEL** key repeatedly for desired level. You can follow this procedure up to 4 times. TOUCH | START
3. Touch the **START/EASY MINUTE** key.

NOTE:

- If the **POWER LEVEL** key is touched once, HIGH will be displayed.
- If 100% is selected as the final sequence, it is not necessary to touch the **POWER LEVEL** key.
- If you wish to know the power level during cooking, simply touch the **POWER LEVEL** key. As long as your finger is touching the **POWER LEVEL** key, the power level will be displayed.
- Micro Warm can be programmed even if 4 cooking sequences have been set.

Easy Minute

Easy Minute allows you to cook for a minute at 100% by simply touching the **EASY MINUTE** key. You can also extend cooking time in multiples of 1 minute by repeatedly touching the **EASY MINUTE** key during manual cooking.

NOTE:

- To use Easy Minute, touch the key within 3 minutes after cooking, closing the door or touching the **STOP/CLEAR** key.
- Easy Minute cannot be used with Sensor settings, Reheat or Defrost.

Setup/Help

If the electrical power supply to your Microwave In-A-Drawer™ should be interrupted, the display will intermittently show ENJOY | YOUR | MICRO- | WAVE | TOUCH | CLEAR | AND | TOUCH | CLOCK after the power is reinstated. If this situation occurs, the **SETUP/HELP** option you input will be erased. Simply touch the **STOP/CLEAR** key and reset.

Other Features

Audible Signal Elimination

At the end of timed cook, a series of beeps will sound. If you wish to operate the appliance with no audible signals, you can turn them off.

TO TURN SOUND OFF

1. Touch the **SETUP/HELP** key. TOUCH AGAIN
2. Touch the **SETUP/HELP** key again. SOUND OFF ? TOUCH START
3. Touch the **START/EASY MINUTE** key. The display shows SOUND OFF.

TO RESTORE SOUND

1. Touch the **SETUP/HELP** key. TOUCH AGAIN
2. Touch the **SETUP/HELP** key again. SOUND ON ? TOUCH START
3. Touch the **START/EASY MINUTE** key. The display shows SOUND ON.

End Of Cooking Reminder

At end of timed cooking, the microwave will signal every 10 seconds for the first minute; then every 3 minutes until the **STOP/CLEAR** key is touched, up to one hour.

TO TURN REMINDER OFF

1. Touch the **SETUP/HELP** key three times. The display shows REMIND SIGNAL OFF ? TOUCH START.
2. Touch the **START/EASY MINUTE** key. The display shows REMIND SIGNAL OFF.

TO TURN REMINDER SIGNAL BACK ON

1. Touch the **SETUP/HELP** key three times. The display shows REMIND SIGNAL ON ? TOUCH START.
2. Touch the **START/EASY MINUTE** key. The display shows REMIND SIGNAL ON.

Auto Start

If you wish to program the Microwave In-A-Drawer™ to begin cooking automatically at a designated time of day, follow this procedure:

1. Touch the **SETUP/HELP** key 4 times. The display shows AUTO START TOUCH START.
2. Touch the **START/EASY MINUTE** key. ENTER START TIME
3. Enter start time. 4:30 TOUCH CLOCK
4. Touch the **TIMER/CLOCK** key. ENTER COOKING TIME
5. Touch the number keys to enter cooking time. 20.00 TOUCH START OR TOUCH POWER LEVEL
   Touch the **POWER LEVEL** key repeatedly until the desired power level is reached. TOUCH START
6. Touch the **START/EASY MINUTE** key.

Demonstration Mode

TO SELECT DEMO MODE

1. Touch the **SETUP/HELP** key five times. The display shows DEMO ON? HOLD START 3 SEC.
2. Hold the **START/EASY MINUTE** key for 3 seconds. The display shows DEMO ON.

TO CANCEL DEMO MODE

1. Hold the **SETUP/HELP** key five times. The display shows DEMO OFF ? TOUCH START.
2. Touch the **START/EASY MINUTE** key. The display shows DEMO OFF.

NOTE:

- Microwave In-A-Drawer™ doesn't heat in Demo Mode.
- The display counts down quickly.

Control Lock

The Control Lock prevents unwanted Microwave In-A-Drawer™ operation such as by small children. The Microwave In-A-Drawer™ can be set so that the control panel is deactivated or locked.

TO LOCK

Touch the **CONTROL LOCK** key and hold for 3 seconds. The display shows LOCK ON.

TO UNLOCK

Touch the **CONTROL LOCK** key and hold for 3 seconds. The display shows LOCK OFF.

Cleaning and Care

Exterior

The outside surface is precoated metal and plastic. Clean the outside with mild soap and water; rinse and dry with a soft cloth. Do not use any type of household or abrasive cleaner.

Stainless Steel Surface

(Select Models)

The exterior should be wiped often with a soft damp cloth and polished with a soft dry cloth to maintain its beauty. Always wipe in the direction of the grain. There are also a variety of products designed especially for cleaning and shining the stainless exterior of the Microwave In-A-Drawer™. We recommend that the cleaner be applied to a soft cloth and then carefully used on the stainless exterior rather than sprayed directly onto it. Follow package directions carefully.

Front Side Of The Drawer

Wipe the window on both sides with a soft damp cloth to remove any spills or spatters. Metal parts will be easier to maintain if wiped frequently with a soft damp cloth. Avoid the use of spray cleaners and other harsh cleaners as they may stain, streak or dull the door surface.

Touch Control Panel

If desired, the touch keys may be deactivated before cleaning. See the Control Lock information on page 14 of this manual. Wipe the panel with a cloth dampened slightly with water only. Dry with a soft cloth. Do not scrub or use any sort of chemical cleaners. Close the door and follow directions on page 14 for turning Control Lock off. Touch **STOP/CLEAR**.

Interior

Cleaning is easy because little heat is transferred to the interior surfaces; therefore, there is no baking and setting of spills or spattering. To clean the interior surfaces, including drawer sealing surfaces, wipe with a soft damp cloth. DO NOT USE ABRASIVE OR HARSH CLEANERS OR SCOURING PADS. For heavier soil, use mild soap; wipe clean with a soft damp cloth. Do not use any chemical oven cleaners.

Drawer Guides

Remove the food crumbs from the drawer guides. Wipe them with a soft dry cloth in order to keep the drawer opening and closing smoothly.

Waveguide Cover

ATTENTION The waveguide cover, located on the inside top of the Microwave area, is made of mica, so it requires special care. Keep the waveguide cover clean to assure good microwave performance. Carefully wipe with a soft damp cloth any food spatters from the surface of the cover immediately after they occur. Soil build up may overheat and cause smoke or possibly catch fire. Do not remove the waveguide cover.

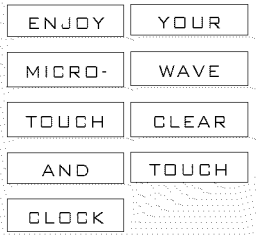
Odor Removal

Occasionally, cooking odors may remain in the drawer. To remove odors, combine 1 cup water, grated peel and juice of one lemon and several whole cloves in a 2-cup glass measuring cup. Boil for several minutes using 100% power. Allow to set in the drawer until cool. Wipe interior with a soft cloth.

Before You Call For Service

Please check the following before calling for service. It may save you time and expense.

PROBLEM	POSSIBLE CAUSE	SOLUTION
1. Part or all of Microwave In-A-Drawer™ does not operate.	• Power cord of Microwave In-A-Drawer™ is not completely connected to the electrical outlet.	• Make sure the power cord is tightly connected to the outlet.
	• Power outage.	• Check house lights to be sure. Call your local electric company for service.
	• Fuse/circuit breaker at home doesn't work.	• Replace the fuse or reset the circuit breaker.
	• Microwave In-A-Drawer™ is in Demo Mode.	• See page 14 for how to cancel Demo Mode.
2. Food in microwave is not heated.	• No power to the appliance.	• See SOLUTION for PROBLEM 1.
	• Drawer controls improperly set.	• Check if the controls have been properly set.
	• Drawer is in Demo Mode.	• See page 14.
3. Microwave In-A-Drawer™ light does not work.	• Light bulb is loose or burned out.	• Call for service.
4. Touch controls will not operate.	• Control Lock is on.	• See page 14 to unlock.
5. Display flashes.	• Power failure.	• Press the **STOP/CLEAR** key and reset the clock. If the Microwave In-A-Drawer™ was in use, you must reset the cooking function.
6. Steam from the vent.	• Normal operation. During microwaving, steam may come from the right side of the vent.	

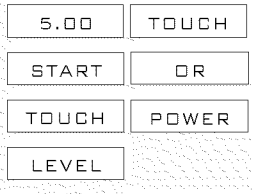


Auto-Touch Guide

Microwave In-A-Drawer™

SET CLOCK

1. Touch the **TIMER/CLOCK** key and number 2.
2. Touch number keys for correct time of day and touch the **TIMER/CLOCK** key again.



If the electrical power supply to your appliance should be interrupted, the display will intermittently show:

TIME COOKING

High Power Cooking

1. Enter cooking time by touching number keys. To enter 5 minutes, touch 5 0 0.

2. Touch the **START/EASY MINUTE** key.

Variable Power Cooking

1. After step 1 above, touch the **POWER LEVEL** key until desired power level is in the display.
2. Touch the **START/EASY MINUTE** key.

SENSOR COOK

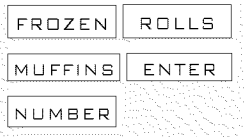
Sensor Cook automatically computes the correct time and power level to cook foods on the Menu Label perfectly.

1. Touch the **SENSOR COOK** key once.

2. See Menu Label. Select desired food by touching the number key. Ex: Touch 5 for baked potatoes.
3. Touch the **START/EASY MINUTE** key.

SENSOR POPCORN/SENSOR REHEAT

Touch **SENSOR REHEAT** or **SENSOR POPCORN** and the **START/EASY MINUTE** key.



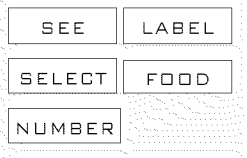
REHEAT

Reheat automatically computes the correct warming time and microwave power level for foods shown on the Menu Label.

1. Touch the **REHEAT** key once.

2. See Menu Label. Select desired food by touching the number key. Ex: Touch 2 for frozen rolls or muffins.

3. Touch the number key to select quantity. Ex: Touch 2 for 2 rolls or muffins.



4. Touch the **START/EASY MINUTE** key.

DEFROST

Use this feature to defrost the foods shown on the Menu Label.

1. Touch the **DEFROST** key.

2. See Menu Label. Select desired food by touching the number key. Ex: Touch 2 for steaks/chops.

3. Enter weight by touching number keys. To enter 1 pound, touch 1 0.

4. Touch the **START/EASY MINUTE** key.
5. Microwave will stop to allow food to be turned over, shielded and/or removed. Close the drawer. Touch the **START/EASY MINUTE** key.

Auto-Touch Guide

MICRO WARM

Micro Warm allows you to keep food warm up to 30 minutes.

Direct Use

1. Touch the **MICRO WARM** key.

2. Enter desired time by touching the number keys. To enter 30 minutes, touch 3 0 0 0.

3. Touch the **START/EASY MINUTE** key.

With Manual Cooking

1. Enter desired cooking time and power level.
2. Touch the **MICRO WARM** key.
3. Enter desired warming time up to 30 minutes.
4. Touch the **START/EASY MINUTE** key.

TIMER

1. Touch the **TIMER/CLOCK** key and number 1.
2. Enter time.
3. Touch the **TIMER/CLOCK** key again.

   To cancel timer, touch **STOP/CLEAR**.

EASY MINUTE

Touch **START/EASY MINUTE** for 1 minute at 100% microwave power or to add a minute during manual cooking. Continue to touch for additional minutes.

Other Features

CONTROL LOCK

The Control Lock prevents unwanted drawer operation such as by small children. The Microwave In-A-Drawer™ can be set so that the control panel is deactivated or locked.

To Lock

Touch **CONTROL LOCK** key and hold for 3 seconds.

To Unlock

Touch **CONTROL LOCK** key and hold for 3 seconds.

HELP

Check operation manual for specific details.

Touch the **SETUP/HELP** key.

- 2 times for Sound Off/On.
- 3 times for End of Cooking Reminder.
- 4 times for Auto Start.
- 5 times for Demonstration Mode.

Product Warranty

What Is Covered

CERTIFICATE OF WARRANTIES

DACOR Microwave In-A-Drawer™

WITHIN THE FIFTY STATES OF THE U.S.A., THE DISTRICT OF COLUMBIA AND CANADA*:

FULL ONE YEAR WARRANTY

If your DACOR product fails to function within one year of the original date of purchase, due to a defect in material or workmanship, DACOR will remedy the defect without charge to you or subsequent users. The owner must provide proof of purchase upon request and have the appliance accessible for service.

* Warranty is null and void if non-CSA approved product is transported from the U.S.

OUTSIDE THE FIFTY STATES OF THE U.S.A., THE DISTRICT OF COLUMBIA AND CANADA:

LIMITED FIRST YEAR WARRANTY

If your DACOR product fails to function within one year of the original date of purchase, due to a defect in material or workmanship, DACOR will furnish a new part, F.O.B. factory, to replace the defective part. All delivery, installation and labor costs are the responsibility of the purchaser. The owner must provide proof of purchase upon request and have the appliance accessible for service.

What Is Not Covered

- Failure of the product caused by faulty installation, improper usage, or neglect of required maintenance.
- Service calls to educate the customer in the proper use and care of the product.
- Failure of the product when used for commercial, business, rental or any application other than for residential consumer use.
- Replacement of house fuses or fuse boxes, or resetting of circuit breakers.
- Damage to the product caused by accident, fire, flood or other acts of God.
- Breakage, discoloration or damage to glass, metal surfaces, plastic components, trim, paint, porcelain or other cosmetic finish, caused by improper usage or care, abuse, or neglect.

THE REMEDIES PROVIDED FOR IN THE ABOVE EXPRESS WARRANTIES ARE THE SOLE AND EXCLUSIVE REMEDIES THEREFORE NO OTHER EXPRESS WARRANTIES ARE MADE, AND OUTSIDE THE FIFTY STATES OF THE UNITED STATES AND THE DISTRICT OF COLUMBIA, ALL IMPLIED WARRANTIES, INCLUDING BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PURCHASE. IN NO EVENT SHALL DACOR BE LIABLE FOR INCIDENTAL EXPENSE OR CONSEQUENTIAL DAMAGES. NO WARRANTIES, EXPRESS OR IMPLIED, ARE MADE TO ANY BUYER FOR RESALE.

Some states do not allow limitations on how long an implied warranty lasts or do not allow the exclusion or limitation of incidental or consequential damages, so the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights, and you may also have other rights that vary from state to state.

CE QUI VOUS DEVEZ SAVOIR CONSIGES DE SÉCURITÉ

Instructions de sûreté d'avertissement et importantes apparaître en ce livre ne sont pas censés couvrir toutes les conditions possibles et situations qui peuvent se produire. Le bon sens, l'attention et le soin doivent être employés en installant, en maintenant ou en actionnant un appareil.

Entrez en contact avec toujours le fabricant au sujet des problèmes ou des conditions que vous ne comprenez pas.

SYMBOLES DE SÛRETÉ, MOTS, ÉTIQUETTES

⚠ DANGER

Risques immédiats qui auront comme conséquence des blessures ou la mort graves.

⚠ ADVERTISSEMENT

Risques ou pratiques peu sûres qui POURRAIENT avoir comme conséquence des blessures ou la mort graves.

⚠ ATTENTION

Risques ou pratiques peu sûres qui POURRAIENT avoir comme conséquence des blessures ou des dégats matériels mineurs.

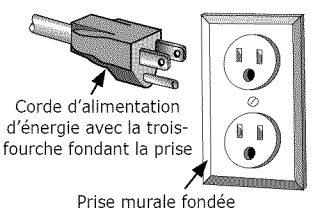
⚠ ADVERTISSEMENT

MESURES POUR ÉVITER UNE EXPOSITION POSSIBLE À UNE ÉNERGIE MICRO-ONDE EXCESSIVE

(a) Ne pas essayer de faire fonctionner ce four avec la porte ouverte puisque le fonctionnement avec la porte ouverte peut entraîner une exposition dangereuse à l'énergie micro-onde. Il est important de ne pas enlever ou modifier les verrouillages de sécurité.

(b) Ne pas placer d'objet entre l'avant du four et la porte ou laisser s'accumuler de la saleté ou des résidus de nettoyant sur les surfaces d'étanchéité.

(c) Ne pas faire fonctionner le four s'il est endommagé. Il est particulièrement important que la porte du four ferme bien et qu'il n'y ait pas de dommages: (1) à la tête du tiroir (tordue), (2) aux glissières et verrous (brisés ou avec du jeu), (3) aux joints et aux surfaces d'étanchéité du tiroir.



(d) Seul du personnel qualifié en réparations doit ajuster ou réparer ce four.

INSTRUCTIONS POUR LA MISE À LA TERRE

⚠ MISE EN GARDE

Un mauvais usage de la prise de terre peut causer des décharges électriques.

Cet appareil est équipé d'une trois-fourche fondant la prise pour votre protection contre des risques de choc électrique possibles. Il doit être branché à une prise de mise à la terre. Là où une prise murale de deux-fourche standard est produite, il est de la responsabilité personnelle et engagement du client pour le faire remplacer avec une prise murale correctement fondée de trois-fourche. **Pas dans aucune circonstance, coupe ou enlever la troisième fourche (de la terre) du cordon de secteur.** N'utilisez pas une prise d'adapteur. N'employez pas une corde de prolongation. Si le cordon d'alimentation est trop court, demander à un électricien ou un réparateur qualifié de poser une prise près de l'appareil. **N'employez pas un interrupteur moulu de circuit de défaut.**

IMPORTANTES CONSIGES DE SÉCURITÉ

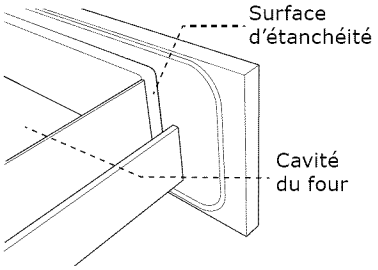
⚠ ADVERTISSEMENT

Lors de l'utilisation l'appareil, il faut prendre des mesures de sécurité élémentaires, y compris les suivantes :

⚠ ADVERTISSEMENT Pour réduire le risque de brûlures, de choc électrique, de blessures personnelles et d'exposition excessive à l'énergie micro-onde :

1. Lire toutes les directives avant d'utiliser l'appareil.
2. Lire et suivre expressément les « MESURES POUR ÉVITER UNE EXPOSITION POSSIBLE À UNE ÉNERGIE MICRO-ONDE EXCESSIVE » à la page 1.
3. Cet appareil doit être correctement mis à la terre. Voir les directives d'installation séparées pour les consignes de mise à la terre.
4. Installer cet appareil uniquement selon les directives d'installation fournies.
5. Certains produits comme les œufs entiers ou des contenants scellés —par exemple, des bocaux fermés— exploseront et ne doivent pas être chauffés au l'appareil.
6. N'utiliser cet appareil que pour l'usage prévu comme décrit dans ce manuel. Ne pas utiliser de produits chimiques ou de vapeurs corrosives dans cet appareil. Cet appareil est spécifiquement conçu pour chauffer, cuire ou sécher de la nourriture. Il n'a pas été conçu pour un usage industriel ou de laboratoire.
7. Comme tout appareil, une surveillance attentive est nécessaire quand des enfants l'utilisent.
8. Ne pas faire fonctionner cet appareil si son cordon ou sa fiche sont endommagés, s'il ne fonctionne pas correctement ou s'il a été endommagé ou est tombé.
9. Seul un personnel qualifié doit réparer cet appareil. Communiquer avec le réparateur Dacor autorisé le plus proche pour une inspection, une réparation ou in réglage.
10. Ne couvrir ou bloquer aucune ouverture de cet appareil.
11. Ne pas ranger ou utiliser cet appareil à l'extérieur. Ne pas utiliser ce produit près de l'eau —par exemple, près d'un évier de cuisine, dans un sous-sol humide, près d'une piscine ou autre endroit semblable.
12. Ne pas immerger le cordon ou la prise dans l'eau.
13. Tenir le cordon loin des surfaces chauffées.
14. Ne pas monter ou s'asseoir sur de l'appareil.
15. Assurez-vous de ne pas tenir vos doigts ou autres objets ou matériaux près de l'ouverture du tiroir quand le l'appareil est fermé.
16. Ne pas placer les doigts ou des vêtements près des glissières du tiroir lors de l'ouverture ou de la fermeture du l'appareil. Il pourrait être pris dans les glissières lors de la fermeture du tiroit.
17. Vérifier que la nourriture ou le contenant sont plus petits que du tiroir avant de le fermer. Vous pouvez vous reporter à la hauteur des parois latérales cet appareil.
18. Lors du nettoyage des surfaces d'étanchéité qui viennent en contact lors de la fermeture l'appareil, utiliser uniquement des savons ou des détergents doux non abrasifs à l'aide d'une éponge ou d'un chiffon doux. Voir les consignes de nettoyage à la page 15.
19. Pour réduire le risque d'incendie dans la cavité du l'appareil:
    a. Ne pas trop faire cuire les aliments. Rester prudemment près du four lorsqu'on utilise du papier, du plastique ou tout autre matériel combustible pour faciliter la cuisson.
    b. Retirer les attaches de métal des sacs de papier ou de plastique avant de mettre les sacs au four.
    c. Si les matériaux à l'intérieur du l'appareil prennent feu, garder la porte du four fermée, arrêter le four et couper l'électricité au fusible ou au panneau d'entrée.
    d. Ne pas utiliser la cavité comme espace de rangement. Ne laisser ni papier, ni ustensiles de cuisson, ni aliments dans l'appareil lorsque l'appareil n'est pas utilisé.
20. Des liquides comme l'eau, le café ou le thé peuvent chauffer au-delà du point d'ébullition sans qu'aucun bouillonnement n'apparaisse à cause de la tension de surface du liquide. Ainsi, quand le contenant est retiré du l'appareil, il peut ne pas y avoir d'ébullition ou de bouillonnement apparents. IL PEUT EN RÉSULTER UN DÉBORDEMENT DES LIQUIDES TRÈS CHAUDS LORSQU'UNE CUILLER OU UN AUTRE USTENSILE EST PLONGÉ DANS LE LIQUIDE.

    Pour réduire le risque de blessures personnelles :
    a. Ne pas trop chauffer le liquide.
    b. Remuer le liquide et avant de le chauffer et à mi-cuisson.
    c. Ne pas utiliser de contenants à bords droits et à goulot mince. Utiliser un bocal à large goulot.
    d. Après le chauffage, laisser reposer le contenant dans le four à l'appareil pour au moins 20 secondes avant de le retirer.
    e. Faire très attention lorsque vous mettez une cuiller ou un autre ustensile dans le contenant.
21. Si la lumière l'appareil manque, consulter un RÉPARATEUR DACOR AUTORISÉ.



LIRE ET CONSERVER CES DIRECTIVES

Ce Que Vous Devez Savoir

À Propos Du Déballage Et De L'inspection De Votre Microwave In-A-Drawer™

1. Retirer tous les matériaux d'emballage de l'intérieur du Microwave In-A-Drawer™. NE PAS RETIRER LE GUIDE D'ONDES qui est situé au plafond du Microwave In-A-Drawer™.

2. Retirer l'étiquette des caractéristiques, s'il y en à une Vérifier que le four n'a aucun dommage, comme un tiroir mal aligné ou plié, des joints ou des surfaces d'étanchéité de porte endommagés, des glissières cassés ou lâches et des bosses à l'intérieur de la cavité ou sur la façade du tiroir. En cas de dommages, ne pas faire fonctionner le Microwave In-A-Drawer™ et contacter votre détaillant ou un RÉPARATEUR AUTORISE DACOR.

INTERFÉRENCE RADIO OU TÉLÉVISION

Si le Microwave In-A-Drawer™ provoque de l'interférence avec la radio ou la télévision, vérifier qu'il est branché sur un circuit électrique indépendant, en éloigner la radio ou la télévision le plus possible et vérifier la position et le signal de l'antenne de réception.

À Propos De Votre Microwave In-A-Drawer™

Veiller à ce qu'il y ait TOUJOURS des aliments dans le tiroir lorsqu'il est allumé, de sorte qu'ils absorbent l'énergie micro-onde.

L'évent sous le four doit toujours être dégagé.

Pendant la cuisson aux micro-ondes, de la vapeur peut s'échapper par le côté droit de l'évent.

Quand on utilise le Microwave In-A-Drawer™ à des niveaux de puissance inférieurs à 100 %, on peut entendre la mise en marche et l'arrêt du magnétron. Il est normal que l'extérieur du tiroir soit chaud au toucher pendant la cuisson ou le réchauffage.

La condensation est un phénomène normal pendant la cuisson aux micro-ondes. L'humidité ambiante et la teneur en eau des aliments déterminent le degré de condensation à l'intérieur du tiroir. En règle générale, les aliments couverts produisent moins de condensation que ceux cuits à découvert.

Le Microwave In-A-Drawer™ n'est conçu que pour la préparation des aliments. Il ne doit pas servir à faire sécher des vêtements ou des journaux.

La puissance nominale de ce four est égale à 950 watts selon la méthode d'essai IEC. Vérifier la cuisson des aliments une minute ou deux avant l'expiration du temps minimum indiqué sur les recettes et les emballages et, s'il y a lieu, augmenter le temps de cuisson.

Lors d'une ouverture ou d'une fermeture rapide du Microwave In-A-Drawer™, de la nourriture peut être renversée dans le tiroir. Pour nettoyer, veuillez vous reporter au chapitre Nettoyage et entretien à la page 15.

À Propos De La Cuisson Aux Microondes

- Disposer les aliments avec soin. Placer la partie la plus épaisse des aliments vers l'extérieur du plat.
- Surveiller le temps de cuisson. Cuire les aliments pendant la plus courte période indiquée et prolonger la cuisson au besoin. Des aliments trop cuits peuvent dégager de la fumée ou prendre feu.
- Recouvrir les aliments pendant la cuisson. Selon la recette ou le livre de cuisine, utiliser un essuie-tout, du papier ciré, un film plastique allant au micro-onde ou un couvercle. Couvrir les aliments empêche les éclaboussures et leur permet de cuire de manière uniforme.
- Protéger les parties de viande ou de volaille très minces par des petits écrans en papier d'aluminium pour éviter qu'ils ne cuisent trop vite par rapport aux parties plus épaisses.
- Si possible, remuer les aliments de l'extérieur du plat vers le centre une ou deux fois pendant la cuisson.
- Retourner les aliments comme du poulet et des hamburgers une fois au cours de la cuisson afin d'accélérer le processus. Il faut retourner les grosses pièces comme les rôtis au moins une fois.
- Au milieu de la cuisson, déplacer les aliments comme les boulettes de viande du haut vers le bas et de droite à gauche.
- Ajouter du temps de repos. Retirer les aliments du four et, si possible, les remuer. Couvrir les aliments pendant ce temps pour leur permettre Vérifier que les aliments sont bien cuits. Rechercher les signes qui indiquent que les températures de cuisson ont été atteintes.
- Les signes d'une bonne cuisson sont les suivants :
  - La vapeur s'élève de toute la surface des aliments, pas seulement des bords.
  - Le fond du plat est très chaud au toucher.
  - Les cuisses de poulet se détachent facilement.
  - La viande et la volaille ne présentent plus de parties rosées.
  - Le poisson est opaque et se défait facilement à la fourchette.

À Propos Des Ustensiles Et Des Moyens De Couvrir Les Aliments

Il n'est pas nécessaire d'acheter une nouvelle batterie de cuisine. La plupart des ustensiles de votre cuisine peuvent être utilisés dans votre nouveau micro-onde. S'assurer que les ustensiles ne touchent pas les parois intérieures pendant la cuisson.

Se servir de ces ustensiles pour cuire et réchauffer sans danger aux micro-ondes :

- La vitrocéramique (Pyroceram®), comme Corningware®.
- Le verre résistant à la chaleur (Pyrex®)
- Les plastiques pour micro-ondes
- Les assiettes en papier pour micro-ondes
- La céramique, la poterie, la porcelaine pour micro-ondes
- Les plats à brunir (ne pas dépasser pas les temps de préchauffage recommandés. Suivre les directives du fabricant).

Les articles suivants peuvent être utilisés pour le réchauffage très court des aliments qui contiennent peu de sucre ou de graisses :

- Le bois, la paille et l'osier

NE PAS UTILISER

- De casseroles et de plats de cuisson métalliques
- De plats à bordure métallique
- Du verre qui ne résiste pas à la chaleur
- De plastiques ne convenant pas aux micro-ondes (contenants de margarine)
- De produits en papier recyclé
- De sacs en papier brun
- De sacs pour la conservation des aliments
- D'attaches métalliques

Pour vérifier si un plat va au four à micro-ondes, le placer dans le four et mettre le four en marche à la puissance maximale pendant 30 secondes. Si le plat devient très chaud, il ne faut pas l'employer.

LES ARTICLES SUIVANTS SONT IDÉALS POUR COUVRIR :

- Les essuie-tout conviennent bien pour recouvrir les aliments pendant le réchauffage et pour absorber la graisse de cuisson du bacon.
- Le papier ciré peut être employé pour la cuisson et le réchauffage.
- Le film plastique destiné spécialement à l'usage du micro-onde peut être utilisé pour la cuisson et le réchauffage. Le film plastique ne doit JAMAIS entrer en contact avec les aliments. Faire une ouverture pour laisser la vapeur s'échapper.
- Les couvercles pour micro-ondes sont un très bon choix, car ils concentrent la chaleur sur les aliments et accélèrent la cuisson.
- Les sacs de cuisson au four conviennent pour les grosses pièces de viande ou les aliments à attendrir. NE PAS SE SERVIR d'attaches métalliques. Ne pas oublier de percer le sac pour laisser s'échapper la vapeur.

COMMENT SE SERVIR DU PAPIER ALUMINIUM DANS VOTRE TIROIR:

- De petits morceaux non froissés de papier aluminium posés sur les aliments peuvent servir à protéger les parties qui décongèlent ou cuisent trop rapidement.
- Le papier d'aluminium doit être à au moins 2,5 cm des surfaces du Microwave In-A-Drawer™.

Pour toute question concernant les ustensiles ou la manière de couvrir les aliments, consulter un bon livre de cuisine spécialisé en micro-ondes ou suivre les conseils de la recette.

ACCESSORIES:

De nombreux accessoires pour four à micro-ondes sont offerts sur le marché. Évaluer soigneusement vos besoins avant d'en faire l'acquisition. Un thermomètre pour micro-ondes permettra de vérifier la cuisson à point et de s'assurer que les aliments ont été cuits à la bonne température Dacor n'est pas responsable des dommages au tiroir résultant de l'utilisation d'accessoires.

Ouverture Ou Fermeture Du Tiroir

Toujours appuyer sur les touches OPEN ou CLOSE du panneau de commande pour ouvrir ou fermer le tiroir.

Ne pas pousser ou tirer le tiroir à la main, sauf en cas d'urgence, comme une panne de courant. En cas de nécessité, pousser ou tirer doucement.

À Propos Des Enfants Et Du Micro-onde

Les enfants de moins de 7 ans ne devraient utiliser le Microwave In-A-Drawer™ que sous la surveillance étroite d'un adulte. Entre 7 et 12 ans, l'adulte surveillant doit se trouver dans la même pièce qu'eux. L'enfant doit pouvoir accéder facilement au tiroir.

Jamais personne ne doit être autorisé à s'appuyer ou à s'asseoir sur le Microwave In-A-Drawer™.

Il faut enseigner les mesures de sécurité aux enfants : Employer des gants isolants, enlever les couvercles avec précaution, faire très attention aux contenants d'aliments croustillants parce qu'ils peuvent devenir très chauds.

Ne pas présumer qu'un enfant qui connaît bien une fonction de l'appareil peut cuire n'importe quoi.

Les enfants doivent apprendre que le Microwave In-A-Drawer™ n'est pas un jouet. Voir à la page 13 la caractéristique du verrouillage des commandes.

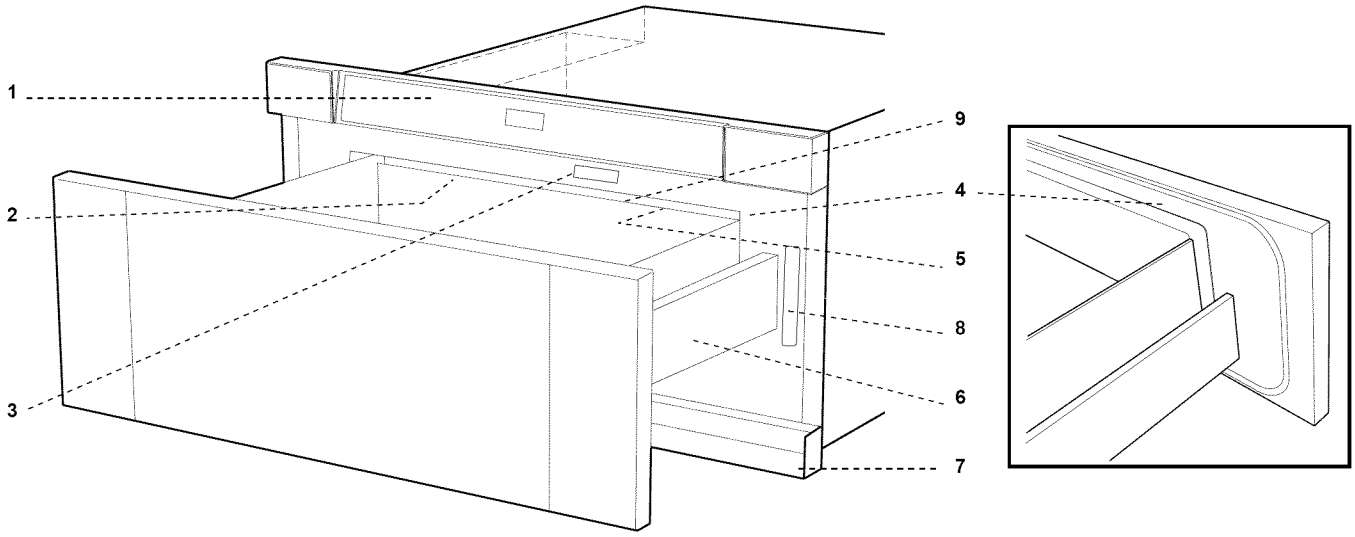
Ce Que Vous Devez Savoir

À Propos De La Sécurité

Inspecter les aliments pour voir s'ils ont été cuits aux températures recommandées par le ministère de l'agriculture des États-Unis.

71 °C (160 °F) -	Pour le porc frais, la viande hachée, le blanc de poulet désossé, le poisson, les fruits de mer, les oeufs frais et les aliments préparés surgelés.
74 °C (165 °F) -	Pour les restes, les aliments réfrigérés prêts-à-réchauffer, et les aliments frais d'un traiteur ou l'équivalent.
77 °C (170 °F) -	Les blancs de volaille.
82 °C (180 °F) -	La viande brune de volaille.

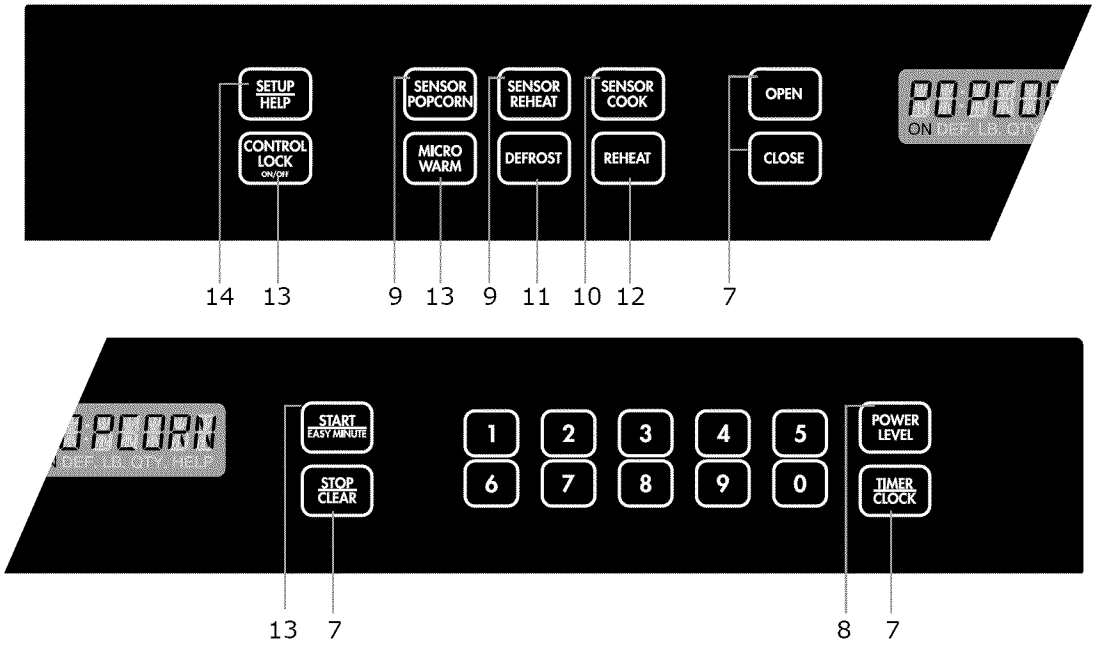
Pour vérifier si les aliments sont cuits à point, insérer un thermomètre à viande dans un endroit épais, à l'écart de la graisse et des os. Ne JAMAIS laisser le thermomètre dans les aliments qui cuisent, sauf s'il est approuvé pour emploi aux micro-ondes.



- TOUJOURS utiliser des gants isolants pour éviter des brûlures lorsque l'on se sert d'ustensiles en contact avec des aliments chauds. Assez de chaleur des aliments peut être transféré aux ustensiles pour provoquer des brûlures de la peau.
- Diriger la vapeur loin du visage et des mains afin d'éviter des brûlures. Soulever doucement la partie la plus éloignée des couvercles et des pellicules et ouvrir lentement les sacs de maïs soufflé ou de cuisson en les tenant loin du visage.
- Rester près du four quand il fonctionne et vérifier fréquemment la cuisson afin d'éviter de trop cuire les aliments.
- Ne JAMAIS entreposer des livres de cuisine ou autres objets dans le Microwave In-A-Drawer™.
- Choisir, entreposer et manipuler la nourriture de manière à préserver sa qualité et de minimiser la prolifération de bactéries alimentaires.
- Garder propre le couvercle du guide d'ondes. Les résidus d'aliments peuvent causer des étincelles ou s'enflammer. Voir page 15.

À Propos Des Aliments

ALIMENTS	À FAIRE	À NE PAS FAIRE
Oeufs, saucisses, fruits et légumes	• Percer les jaunes d'œufs avant la cuisson pour empêcher une « explosion ». • Percer la peau des pommes de terre, des pommes, des courges, des hot dogs et des saucisses pour que la vapeur s'échappe.	• Cuire les œufs dans leur coquille • Réchauffer des œufs entiers • Sécher des noix ou des graines dans leur coquille
Maïs soufflé	• Utiliser du maïs soufflé en sac pour micro-onde. • Porter attention à l'éclatement du maïs pour que celui-ci ralentisse à 1 ou 2 secondes ou utiliser la touche **SENSOR POPCORN**.	• Faire éclater du maïs soufflé dans des sacs bruns ordinaires ou des bols de verre • Dépasser le temps maximal inscrit sur le paquet de maïs soufflé.
Aliments pour bébé	• Transférer les aliments pour bébé dans un plat plus petit et chauffer prudemment en remuant souvent. Vérifier la température avant de servir • Mettre les tétines sur les bouteilles après le réchauffage et bien agiter. Essayer sur le poignet avant de nourrir.	• Chauffer les bouteilles jetables. • Chauffer les bouteilles avec les tétines. • Chauffer les aliments pour bébé dans les pots d'origine
Général	• Couper les aliments avec garniture après chauffage pour relâcher la vapeur et éviter les brûlures. • Remuer vivement les liquides avant et après chauffage pour empêcher une « éruption ». • Se servir d'un bol profond, pour cuire des liquides ou des céréales pour empêcher les débordements. • Les aliments doivent être plus petits que le micro-onde tiroir. • Vous pouvez vous reporter à la hauteur des parois latérales du tiroir.	• Chauffer ou cuire dans des pots de verre fermés ou des contenants hermétiques • Mettre en conserve dans le micro-onde car des bactéries dangereuses pourraient ne pas être détruites. • Faire frire de la graisse épaisse • Sécher du bois, des gourdes, des herbes ou des papiers humides



Nom des Pièces

9. Étiquette des caractéristiques nominales pour le modèle MMD24 : Ouvrir le tiroir à micro-ondes complètement. L'étiquette est légèrement au-delà de la paroi arrière de la cavité du four à micro-ondes, face vers le haut, sur la surface plate.

FEUILLE DES TOUCHES

Les chiffres à côté de l'illustration des touches indiquent les pages où on retrouve la description des caractéristiques et les renseignements concernant l'utilisation.

Avant L'utilisation

Avant d'utiliser votre nouveau Microwave In-A-Drawer™, prendre la peine de lire et de comprendre intégralement ce mode d'emploi.

- Avant d'utiliser le Microwave In-A-Drawer™, procéder ainsi :

1. Brancher le Microwave In-A-Drawer™.
   ENJOY YOUR MICRO- WAVE TOUCH CLEAR AND TOUCH CLOCK s'affichera.
2. Appuyer sur la touche **STOP/CLEAR**.
   : s'affiche.
3. Régler l'horloge.

Pour Régler L'horloge

1. Appuyer sur la touche **TIMER/CLOCK** et sur 2.
2. Appuyer sur les chiffres pour corriger l'heure du jour et appuyer de nouveau sur **TIMER/CLOCK**.

Cette horloge a un cycle de 12 heures..En cas d'entrée d'une heure invalide, ERROR s'affichera. Appuyer sur la touche **STOP/CLEAR** et entrer à nouveau l'heure.

- Si l'alimentation électrique du four à micro-ondes est coupée, ENJOY YOUR MICRO- WAVE TOUCH CLEAR AND TOUCH CLOCK s'affichera et clignotera dès que l'alimentation sera rétablie. Si cela se produit durant la cuisson, la programmation sera effacé. L'heure aussi sera effacée. Appuyer simplement sur la touche **STOP/CLEAR** et remettre l'horloge à l'heure.

NOTA:

- Le Microwave In-A-Drawer™ peut être programmé avec le tiroir ouvert sauf pour **START/EASY MINUTE**.

Minuterie

1. Appuyer sur la touche **TIMER/CLOCK** et sur 1.
2. Entrer l'heure.
3. Appuyer à nouveau sur la touche **TIMER/CLOCK**.
4. Pour annuler la minuterie appuyer sur **STOP/CLEAR**.

Stop/Clear (Arrêt/Remise À Zéro)

Appuyer sur la touche **STOP/CLEAR** pour:

1. Effacer une erreur durant la programmation.
2. Annuler la minuterie.
3. Arrêter le micro-onde tiroir temporairement durant la cuisson.
4. Afficher à nouveau l'heure.
5. Annuler un programme durant la cuisson, appuyer deux fois.

Ouverture Ou Fermeture Du Tiroir

Toujours appuyer sur les touches **OPEN** ou **CLOSE** du panneau de commande pour ouvrir ou fermer le tiroir.

Ne pas pousser ou tirer le tiroir à la main, sauf en cas d'urgence, comme une panne de courant. En cas de nécessité, pousser ou tirer doucement.

Temps De Cuisson

Votre Microwave In-A-Drawer™ peut être programmé pour 99 minutes 99 secondes (99.99). Toujours entrer les secondes après les minutes même si les deux sont égales à zéro.

- Supposons que l'on veuille faire cuire pendant 5 minutes à 100 %.

1. Entrer le temps de cuisson 5 0 0. 5.00 TOUCH START OR TOUCH POWER LEVEL
2. Pour cuire à la puissance 100 % (élevée), Appuyer sur la touche **START/EASY MINUTE**.

Pour Régler Le Niveau De Puissance

Onze niveaux de puissance sont prévus.

Plus le niveau de puissance est faible, plus le temps de cuisson est long, ce qui est conseillé pour les aliments tels que le fromage, le lait ou les viandes qui exigent une cuisson lente. Consulter un livre de cuisine ou de recettes pour chaque cas particulier.

- Supposons que l'on veuille décongeler pendant 5 minutes à 30 %.

1. Entrer le temps de décongélation 5 0 0. 5.00
2. Appuyer 8 fois sur la touche **POWER LEVEL**.
3. Appuyer sur **START/EASY MINUTE**.

APPUYER SUR LA TOUCHE POWER LEVEL JUSQU'À CE QUE LE NIVEAU DE PUISSANCE DÉSIRÉ S'AFFICHE	POURCENTAGE APPROXIMATIF DE LA PUISSANCE	NOMS DONNÉS AUX NIVEAUX DE PUISSANCE
Power Level x 1	100%	Fort
Power Level x 2	90%	
Power Level x 3	80%	
Power Level x 4	70%	À demi fort
Power Level x 5	60%	
Power Level x 6	50%	Moyen
Power Level x 7	40%	
Power Level x 8	30%	Moyen faible/ Décongélation
Power Level x 9	20%	
Power Level x 10	10%	Faible
Power Level x 11	0%	

Réglages Des Capteurs

Le capteur de Dacor est un dispositif à semi-conducteur qui décèle la vapeur humidité) émise par les aliments lorsqu'ils sont chauffés. Le capteur permet de régler les durées de cuisson et les niveaux de puissance selon les divers aliments et leur quantité.

UTILISATION DES RÉGLAGES DU CAPTEUR :

1. Après le branchement du Microwave In-A-Drawer™, attendre 2 minutes avant d'utiliser un réglage du capteur.
2. S'assurer que l'extérieur du récipient de cuisson et l'intérieur du Microwave In-A-Drawer™ sont secs. Essuyer toute trace d'humidité avec un chiffon sec ou un essuie-tout.
3. Le capteur fonctionne pour les aliments conservés à la température de rangement normale. Par exemple, le maïs soufflé devrait être à la température de la pièce.
4. Toute sélection du capteur peut être programmée avec réglage de durée en plus ou en moins (More or Less Time Adjustment). Voir page 14.
5. Si la quantité d'aliments est inférieure ou supérieure à celle des tableaux, il faut cuire selon les directives d'un livre de cuisine aux micro-ondes.
6. Au cours de la première période d'utilisation du capteur, le nom de l'aliment s'affichera. Ne pas ouvrir la porte du Microwave In-A-Drawer™, ni appuyer sur la touche **STOP/CLEAR** au cours de cette période, car cela provoquerait l'interruption de la mesure du degré d'humidité. Dans un tel cas, un message d'erreur s'affichera. Pour poursuivre la cuisson, appuyer sur la touche **STOP/CLEAR** et cuire en mode manuel.

   Quand le capteur détectera la vapeur émise par les aliments, le temps de cuisson/réchauffage restant s'affichera. On peut ouvrir le Microwave In-A-Drawer™ lorsque le temps de cuisson restant s'affiche à l'écran. À ce moment-là, on peut aussi remuer les aliments et les assaisonner, au goût.
7. Si pendant le soufflage du maïs, le capteur ne détecte pas correctement la vapeur émise, le four cessera de fonctionner et l'heure sera affichée. Si le capteur ne détecte pas correctement la vapeur émise lors de la cuisson d'autres aliments, l'indication ERROR s'affichera et le micro-onde cessera de fonctionner.
8. Vérifier la température des aliments après cuisson. S'il faut plus de temps, continuer à cuire en mode manuel.
9. Il existe un conseil de cuisson pour chaque aliment. Appuyer sur la touche **SET UP/HELP** quand l'indicateur HELP est allumé sur l'afficheur.

COVERING ALIMENTS:

Certains aliments cuisent mieux lorsqu'ils sont couverts. Se servir su couvercle recommandés dans les tableaux pour ces aliments. Vous pouvez vous reporter aux conseils en appuyant sur la touche **SET UP/HELP**.

1. Couvercle.
2. Film plastique : Utiliser un film plastique recommandé pour la cuisson aux micro-ondes. Couvrir le plat sans serrer et en conservant une ouverture de 1,25 cm (1/2 po) de manière à ce que la vapeur puisse s'échapper. Le film plastique ne doit pas entrer en contact avec les aliments.
3. Papier ciré : Couvrir entièrement le plat et replier le papier sous le plat de manière à ce qu'il soit maintenu. Si le plat est plus large que le papier, utiliser deux morceaux de papier se chevauchant d'au moins 2,5 cm (1 po).

Faire attention en retirant l'élément couvrant les aliments de laisser la vapeur s'échapper loin de vous.

Sensor Popcorn / Sensor Reheat (Mais Soufflé Au Capteur / Réchauffage Au Capteur)

Vous pouvez faire éclater du maïs ou réchauffer de nombreux aliments sans avoir besoin de calculer le temps de cuisson ou le niveau de puissance.

Appuyer sur **SENSOR REHEAT** ou **SENSOR POPCORN** puis sur la touche **START/EASY MINUTE**.

Quand le capteur détectera la vapeur émise par les aliments, le temps restant de cuisson/réchauffage s'affichera.

NOTA:

- Il y a 2 choix pour le réglage du maïs soufflé au capteur. Suivre les instructions sur l'afficheur pour choisir l'option désirée.

TABLEAU DE SENSOR POPCORN / SENSOR REHEAT

ALIMENTS	QUANTITÉ	MARCHE À SUIVRE
Maïs soufflé au capteur	1 paquet à la fois	N'utiliser que du maïs soufflé emballé pour le micro-onde. Essayer plusieurs marques et choisir celle qui vous plait. Ne pas tenter de souffler les grains qui n'ont pas éclaté.
	80 – 98 g (2,85 – 3,5 oz) (Régulier / Régulier léger)	Appuyer une fois sur **SENSOR POPCORN**.
	34 – 50 g (1,2 – 1,75 oz) (Mini / Collation)	Appuyer deux fois sur **SENSOR POPCORN**.
Réchauffage par capteur	112g – 1 kg (4 – 36 oz)	Mettre dans un plat ou une casserole un peu plus grande que la quantité à réchauffer. Aplatir si possible. Couvrir avec un couvercle, film plastique ou un papier ciré. Couvrir avec du film plastique ou des couvercles pour de plus grandes quantités d'aliments plus denses comme les ragoûts Si possible, bien remuer après réchauffage. Couvrir à nouveau et laisser reposer 2 à 3 minutes. Les aliments devraient être très chauds. Dans le cas contraire, continuer à chauffer avec une puissance et une durée variables.

Sensor Cook (Cuisson Au Capteur)

1. Appuyer une fois sur la touche **SENSOR COOK**.
   SEE | LABEL | SELECT | FOOD | NUMBER
2. Voir l'aide-mémoire. Choisir un aliment en appuyant sur un chiffre. Ex : Appuyer 5 fois pour des pommes terre au four.
3. Appuyer sur **START/EASY MINUTE**.

NOTA:

- Pour réchauffer d'autres aliments ou des aliments en quantités inférieure ou supérieure à celles permises sur le TABLEAU DE SENSOR COOK, cuire en mode manuel.

TABLEAU DE SENSOR COOK

ALIMENTS	QUANTITÉ	MARCHE À SUIVRE
1. Légumes frais : tendres Brocoli Choux de Bruxelles Choux Chou-fleur (en bouquet) Chou-fleur (entier) Épinards Courgettes Pommes au four	 0,25 - 2 lb. 0,25 - 2 lb. 0,25 - 2 lb. 0,25 - 2 lb. 1 moyen 0,25 - 1.0 lb. 0,25 - 2 lb. 2 - 4 moyen	Laver et mettre dans une casserole. Ne pas ajouter d'eau si les légumes viennent d'être lavé. Couvrir avec un couvercle pour obtenir des légumes tendres. Utiliser un film plastique pour obtenir des légumes tendres mais croustillants. Après la cuisson, remuer si possible, Laisser reposer, à couvert, 2 à 5 minutes.
2. Légumes frais : croquants Carottes, tranchées Maïs en épi Haricots verts Courge d'hiver : en dés en moitié	 0,25 - 1,5 lb. 2 - 4 0,25 - 1,5 lb. 0,25 - 1,5 lb. 1 - 2	Mettre dans une casserole. Ajouter 1 à 4 c. à soupe d'eau. Couvrir avec un couvercle pour obtenir des légumes tendres. Utiliser un film plastique pour obtenir des légumes tendres mais croustillants. Après la cuisson, remuer si possible, Laisser reposer, à couvert, 2 à 5 minutes.
3. Légumes congelés	0,25 - 1,25 lb.	Ne pas ajouter d'eau. Couvrir avec un couvercle ou un film plastique. Après la cuisson, remuer et laisser reposer, à couvert, 3 minutes.
4. Plats congelés	112g - 1kg (6 - 17 oz)	Utiliser cette touche pour les plats prêt-à-servir congelés. Cela donnera des résultats satisfaisants avec la plupart des marques. Peut-être voudrez-vous en essayer plusieurs et choisir votre préféré. Retirer le plat de l'emballage extérieur et suivre les indications pour le recouvrement du plat. Après la cuisson, laisser reposer, à couvert, 1 à 3 minutes.
5. Pommes terre au four	1 - 6 moyen	Les piquer. Les placer sur un essuie-tout au fond du tiroir. Après la cuisson, les retirer du four, les envelopper dans une feuille d'aluminium et les laisser reposer pendant 5 à 10 minutes.
6. Viande hachée	0,25 - 2 lb.	Utiliser ce réglage pour cuire du bœuf ou de la dinde hachés en fricadelles ou en cocotte avec d'autres ingrédients. Placer les fricadelles sur une grille transparente aux micro-ondes et couvrir de papier ciré. Placer la viande hachée dans une cocotte et couvrir avec du papier ciré ou du film plastique. Quand le four s'arrête, retourner les fricadelles ou mélanger la viande dans la cocotte pour séparer les gros morceaux. Recouvrir et appuyer sur **START/EASY MINUTE**. Après la cuisson, laisser reposer, à couvert, 2 à 3 minutes.
7. Poisson/Fruits de mer	0,25 –2 lb	Disposer en anneau autour d'un plat en verre peu profond (rouler le filet en mettant les bords en dessous). Couvrir avec du film plastique ventilé. Après la cuisson, laisser reposer, à couvert, 3 minutes
8. Riz	0,5 à 2 tasses	Placer le riz dans une cocotte profonde et ajouter le double d'eau. Couvrir avec un couvercle ou un film plastique. Après la cuisson, remuer, couvrir et laisser reposer de 3 à 5 minutes ou jusqu'à ce que tout le liquide ait été absorbé. **Riz** — **Eau** — **Taille de la casserole** 0,5 tasse — 1 tasse — 1,5 pinte 1 tasse — 2 tasses — 2 pinte 1,5 tasse — 3 tasses — 2,5 ou 3 pintes 2 tasses — 4 tasses — 3 pinte ou plus

Defrost (Décongélation)

Utiliser cette caractéristique pour décongeler les aliments indiqués dans le TABLEAU DE DEFROST.

1. Appuyer sur la touche **DEFROST**.
   SEE | LABEL | SELECT | FOOD | NUMBER
2. Voir l'aide-mémoire 2 Choisir l'aliment désirée en appuyant sur un chiffre. Ex : Appuyer sur 2 pour les biftecks ou les côtelettes.
   STEAKS | CHOPS | ENTER | WEIGHT
3. Entrer le poids en appuyant sur les chiffres.
   1 0 0. | 1.0 LB
4. Appuyer sur **START/EASY MINUTE**.
5. Le four d'arrêtera pour que vous puissiez inspecter l'aliment.
6. Après la première étape, ouvrir le Microwave In-A-Drawer™. Retourner le bifteck et masquer les parties chaudes. Fermerle tiroir. Appuyer sur **START/EASY MINUTE**.
7. Après la deuxième étape, ouvrir le Microwave In-A-Drawer™. Masquer tout les parties chaudes. Fermer le micro-onde tiroir. Appuyer sur **START/ EASY MINUTE.**
8. À la fin du cycle de décongélation, masquer et laisser reposer comme indiqué dans le tableau ci-dessous.

NOTA:

- Defrost peut être programmé avec réglage de durée en plus ou en moins. Voir page 14.
- Pour décongeler d'autres aliments dont le poids est supérieur ou inférieur à celui autorisé au TABLEAU DE DEFROST, voir la DÉCONGÉLATION MANUELLE.
- Inspecter les aliments au signal du four. Après l'étape finale, de petites sections peuvent être encore gelées. Laisser reposer pour que le dégel se poursuive. Ne pas décongeler avant que tous les cristaux de glace soient fondus.
- Le masquage empêche que la cuisson ait lieu avant que le centre de l'aliment ne soit dégelé. Utiliser de petites bandes souples de papier d'aluminium pour couvrir les bords et les parties les moins épaisses de l'aliment.

TABLEAU DE DEFROST

ALIMENTS	QUANTITÉ	MARCHE À SUIVRE
1. Viande hachée	0,5 - 2 lb	Retirer les parties dégelées après chaque signal sonore. Laisser reposer, à couvert, 5 à 10 minutes.
2. Biftecks/ Côtelettes	0,5 - 3 lb	Après chaque signal sonore, changer la disposition des aliments et masquer les parties chaudes ou dégelées au moyen de bandes de papier d'aluminium. Retirer la viande ou le poisson presque entièrement dégelés. Laisser reposer, à couvert, 10 à 20 minutes.
3. Poulet désossé	0,5 - 2 lb	Après chaque signal sonore, s'il y a des morceaux chauds ou dégelés, changer la disposition ou retirer. Laisser reposer, à couvert, 10 à 20 minutes.
4. Poulet avec les os	0,5 - 3 lb	Après chaque signal sonore, changer la disposition ou retirer les morceaux. s'il sont chauds ou dégelés Laisser reposer, à couvert, 10 à 20 minutes.
5. Casserole/soupe	1 - 6 tasses	Après chaque signal sonore, briser en morceaux et retirer ce qui est dégelé. À la fin, bien remuer et laisser reposer, couvert, pendant 5 à 10 minutes.

Décongélation Manuelle

Si les aliments que vous voulez décongeler ne sont pas dans le TABLEAU DE DÉCONGÉLATION, ou sont en quantité supérieure ou inférieure à celle de la colonne QUANTITÉ du TABLEAU DE DÉCONGÉLATION, vous devrez décongeler en mode manuel.

Vous pouvez décongeler tout aliment, cru ou déjà cuit, à l'aide du niveau de puissance de 30 %. Suivre exactement la marche suivre en 3 étapes sous LE RÉGLAGE DU NIVEAU DE PUISSANCE à la page 11. Estimer la durée de décongélation et appuyer sur la touche POWER LEVEL huit fois pour une puissance de 30%.

Pour des aliments crus ou déjà cuits, la règle d'or est d'environ 4 minutes par livre. Par exemple, 1 livre de spaghetti dégèlera en 4 minutes.

Toujours arrêter le four périodiquement pour séparer et retirer les portions dégelées. Si les aliments ne sont pas complètement dégelés à a fin du temps de décongélation estimé, programmer le four en incréments d'1 minute, au niveau de puissance de 30 % jusqu'à décongélation complète.

Quand vous utilisez des contenants plastique sortant du congélateur, décongeler seulement assez longtemps pour retirer les aliments du plastique et les mettre dans un plat pour micro-onde.

Reheat (Réchauffage)

Reheat calculera automatiquement le temps de réchauffage approprié et la puissance du four à micro-ondes pour les aliments énumérés dans le tableau suivant.

1. Appuyer une fois sur la touche **REHEAT**. SEE LABEL SELECT FOOD NUMBER
2. Voir l'aide-mémoire Choisir un aliment en appuyant sur un chiffre. Ex : Appuyer sur 2 pour des petits pains ou des muffins congelés.
3. Appuyer sur un chiffre pour choisir la quantité. Ex : Appuyer sur 2 pour 2 pains ou muffins.
4. Appuyer sur **START/EASY MINUTE**.

NOTA:

- Reheat peut être programmé avec réglage de durée en plus ou en moins. Voir page 14.
- Pour réchauffer d'autres aliments ou des aliments en quantités inférieure ou supérieure à celle permise sur le TABLEAU DE REHEAT, réchauffer en mode manuel.

TABLEAU DE REHEAT

ALIMENTS	QUANTITÉ	MARCHE À SUIVRE
1. Petits pains frais/muffins	1 - 8	Utiliser cette touche pour décongeler petits pains, muffins, biscuits, baguels, etc. il faut compter les grosses pièces comme 2 ou 3 de taille régulière. Disposer sur une assiette; couvrir avec un essuie-tout. Pour des petits pains et des muffins réfrigérés, il peut être nécessaire de doubler la quantité pour que la portion soit à la température appropriée. Par exemple, entrer la quantité 2 pour 1 petit pain réfrigéré.
2. Pains ou muffins congelés	1 - 8	Utiliser cette touche pour décongeler petits pains, muffins, biscuits, baguels, etc. il faut compter les grosses pièces comme 2 ou 3 de taille régulière. Disposer sur une assiette; couvrir avec un essuie-tout.
3. Boisson	0,5 – 2 tasses	Ce réglage est bon pour ramener des boissons réfrigérées à une meilleure température de consommation. Remuer vivement les liquides avant et après chauffage pour empêcher une « éruption ».

Autres Caractéristiques

Micro Warm (Micro Réchaud)

Micro Warm vous permet de garder les aliments au chaud pendant 30 minutes.

USAGE DIRECT

1. Appuyer sur la touche **MICRO WARM**.
   ENTER | TIME | UP TO | 30 | MINUTES
2. Entrer la durée désirée en appuyant sur les chiffres. Pour entrer 30 minutes appuyer sur 3 0 0 0.
   30.00 | TOUCH | START
3. Appuyer sur **START/EASY MINUTE**.

Le four se mettra en marche. L'afficheur indiquera 30.00 et le compte à rebours. KEEP WARM sera affiché pendant le compte à rebours.

AVEC CUISSON EN MODE MANUEL

1. Entrer le temps de cuisson et le niveau de puissance.
2. Appuyer sur la touche **MICRO WARM**.
3. Entrer la durée de réchauffage désirée jusqu'à 30 minutes.
4. Appuyer sur **START/EASY MINUTE**.

L'opération démarrera. Quand la durée de cuisson est terminée, une longue tonalité résonnera et Micro Warm démarrera. L'afficheur indiquera le compte à rebours KEEP WARM sera affiché de manière intermittente pendant le compte à rebours.

NOTA:

- Si vous essayez d'entrer plus de 30 minutes pour Micro Warm, un message d'erreur s'affichera.
- Micro Warm ne peut pas être programmé avec Sensor Popcorn, Sensor Reheat, Sensor Cook, Defrost ou Reheat.

Cuisson À Séquences Multiples

Votre micro-onde tiroir peut être programmé pour 4 séquences automatiques de cuisson, passant d'un réglage de puissance à l'autre automatiquement.

Parfois, les conseils de cuisson suggèrent de commencer à un certain niveau de puissance et de poursuivre à un autre niveau. Votre micro-onde tiroir peut le faire automatiquement.

1. Entrer d'abord le temps de cuisson. Puis appuyer sur la touche **POWER LEVEL** pour la cuisson à 100% ou appuyer de nouveau sur **POWER LEVEL** pour un niveau plus faible.
2. Entrer le second temps de cuisson. Appuyer répétitivement sur la touche **POWER LEVEL** jusqu'au niveau de puissance désiré. Vous pouvez faire cette marche à suivre jusqu'à 4 fois. TOUCH START.
3. Appuyer sur **START/EASY MINUTE**.

NOTA:

- HIGH sera affiché si on appuie une fois sur la touche **POWER LEVEL**.
- Si le niveau 100 % doit être utilisé au cours de la dernière séquence, il n'est pas nécessaire d'appuyer sur la touche **POWER LEVEL**.
- Si vous voulez savoir le niveau de puissance, appuyer simplement sur la touche **POWER LEVEL**. Aussi long temps que votre doigt appuie sur la touche **POWER LEVEL**, le niveau de puissance sera affiché.
- Micro Warm peut être programmé même si 4 séquences de cuisson ont été réglées.

Aide

Il y a un conseil de cuisson pour chaque réglage de Sensor Reheat, Sensor Cook, Sensor Popcorn, Micro Warm, Reheat et Defrost Si vous êtes intéressé, appuyer sur **SET UP/HELP** quand HELP est allumé sur l'afficheur interactif, pour lire les conseils de cuisson et ceux de fonctionnement des autres manuels.

Easy Minute

Easy Minute vous permet de cuire pendant une minute à 100 % simplement en appuyant sur la touche **EASY MINUTE**. Vous pouvez aussi prolonger la durée de cuisson de multiples fois 1 minute en appuyant répétitivement sur **EASY MINUTE** en mode manuel de cuisson.

NOTA:

- Pour utiliser **EASY MINUTE**, appuyer sur la touche dans les trois minutes après la cuisson, en fermant la porte ou en appuyant sur la touche **STOP/CLEAR**.
- On ne peut pas utiliser Easy Minute avec Sensor, Reheat ou Defrost.

Control Lock (Verrouillage Des Commandes)

Le verrouillage des commandes vise à empêcher l'utilisation du four comme par de jeunes enfants. Le micro-onde tiroir peut être réglé de telle sorte que le tableau de commande est inopérant ou verrouillé.

POUR VERROUILLER

Appuyer sur **CONTROL LOCK** pendant 3 secondes. LOCK ON s'affichera.

POUR DÉVERROUILLER

Appuyer sur **CONTROL LOCK** pendant 3 secondes. LOCK OFF s'affichera.

Autres Caractéristiques

Réglage De Durée En Plus Ou En Moins

Si vous trouvez que vous préférez les réglages de Sensor, Reheat or Defrost un peu plus forts, appuyer une fois sur la touche **POWER LEVEL** après avoir appuyé sur les touches de votre choix. MORE s'affichera.

Pour des réglages un peu moins forts, appuyer deux fois sur la touche **POWER LEVEL** après avoir appuyé sur les touches de votre choix. LESS s'affichera.

Suppression Du Signal Sonore

À la fin d'une durée de cuisson, un bip résonnera Si vous désirez que votre appareil n'émette pas de signal sonore, vous pouvez le désactiver.

POUR DÉSACTIVER LE SIGNAL SONORE

1. Appuyer sur **SETUP/HELP**. TOUCH AGAIN
2. Appuyer à nouveau sur **SETUP/HELP**. SOUND OFF ? TOUCH START
3. Appuyer sur **START/EASY MINUTE**. SOUND OFF s'affichera.

POUR RÉACTIVER LE SON

1. Appuyer sur **SETUP/HELP**. TOUCH AGAIN
2. Appuyer à nouveau sur **SETUP/HELP**. SOUND ON ? TOUCH START
3. Appuyer sur **START/EASY MINUTE**. SOUND ON s'affichera.

Rappel De Fin De Cuisson

À la fin d'une cuisson, le micro-onde signalera toutes les 10 secondes pendant une minutes et ensuite toutes les 3 minutes pendant une heure, jusqu'à ce qu'on appuie sur **STOP/CLEAR**.

POUR DÉSACTIVER LE RAPPEL

1. Appuyer trois fois sur **SETUP/HELP**. REMIND SIGNAL OFF ? TOUCH START s'affichera.
2. Appuyer sur **START/EASY MINUTE**. REMIND SIGNAL OFF s'affichera.

POUR RÉACTIVER LE RAPPEL

1. Appuyer trois fois sur **SETUP/HELP**. REMIND SIGNAL ON ? TOUCH START s'affichera.
2. Appuyer sur **START/EASY MINUTE**. REMIND SIGNAL ON s'affichera.

Auto Démarrage

Si vous voulez programmer le micro-onde tiroir pour commencer à cuire automatiquement à une heure donnée, prendre cette marche à suivre.

1. Appuyer 4 fois sur **SETUP/HELP**. AUTO START TOUCH START s'affichera.
2. Appuyer sur **START/EASY MINUTE**. ENTER START TIME
3. Entrer l'heure de démarrage. 4:30 TOUCH CLOCK
4. Appuyer sur la touche **TIMER/CLOCK**. ENTER COOKING TIME
5. Appuyer sur les chiffres pour entrer la durée de cuisson. 20.00 TOUCH START OR TOUCH POWER LEVEL. Appuyer sur **POWER LEVEL** répétitivement jusqu'au niveau de puissance désiré. TOUCH START
6. Appuyer sur **START/EASY MINUTE**.

Mode De Démonstration

POUR CHOISIR LE MODE DÉMO

1. Appuyer 5 fois sur **SETUP/HELP**. DEMO ON? HOLD START 3 SEC s'affichera.
2. Appuyer sur **START/EASY MINUTE**. DEMO ON s'affichera.

POUR ANNULER LE MODE DÉMO

1. Appuyer 5 fois sur **SETUP/HELP**. DEMO OFF ? TOUCH START s'affichera.
2. Appuyer sur **START/EASY MINUTE**. DEMO OFF s'affichera.

NOTA:

- Le micro-onde tiroir ne chauffe pas en mode démo.
- Le compte à rebours s'affiche rapidement.

Réglages/Aide

Si l'alimentation électrique de votre micro-onde tiroir est coupée, ENJOY YOUR MICRO- WAVE TOUCH CLEAR AND TOUCH CLOCK s'affichera et clignotera dès que l'alimentation sera rétablie. Dans un tel cas, l'optio **SETUP/HELP** que vous avez entrée sera effacée. Appuyer simplement sur la touche **STOP/CLEAR** et remettre à zéro.

Nettoyage et Entretien

Extérieur

La surface extérieure est en métal peint et en plastique. Nettoyer la surface extérieure à l'eau et au savon doux; rincer et sécher au moyen d'un chiffon doux. Ne pas utiliser de produits de nettoyage ménagers ou abrasifs.

Surface D'acier Inox

(Modèles Choisis)

Il faut essuyer souvent l'extérieur avec un chiffon doux humide et le frotter avec un chiffon doux sec pour lui garder son lustre. Toujours essuyer dans le sens du grain. Il existe aussi de nombreux produits conçus spécialement pour nettoyer et faire briller l'extérieur en inox du four. Nous recommandons d'appliquer le nettoyant sur un chiffon doux et de s'en servir ensuite sur l'inox plutôt que de le vaporiser directement dessus. Suivre à la lettre les instructions de l'emballage.

Avant Du Tiroir

Essuyer les deux surfaces du hublot à l'aide d'un chiffon humide pour enlever les éclaboussures. Il est plus facile de nettoyer les parties métalliques si on les essuie fréquemment avec un chiffon humide. Éviter tout emploi de produits nettoyants vaporisés ou abrasifs car ils peuvent tacher, strier ou ternir la surface de la porte.

Tableau De Commandes

Si désiré, les touches peuvent être désactivées avant le nettoyage. Voir les renseignements sur le verrouillage des commandes à la page 16 de ce manuel. Essuyer le tableau de commande avec un chiffon humecté d'eau. Sécher avec un chiffon doux. N'utiliser ni poudre à récurer ni produits chimiques de nettoyage. Refermer la porte et suivre les instructions de la page 13 pour déverrouiller les commandes. Appuyer sur **STOP/CLEAR**.

Intérieur

Le nettoyage est facile car les parois intérieures n'absorbent pas de chaleur de telle sorte que les éclaboussures ne cuisent pas. Pour nettoyer les parois intérieures, y compris les surfaces d 'étanchéité du tiroir, essuyer avec un chiffon doux humide. NE PAS UTILISER DE PRODUITS ABRASIFS OU DE TAMPONS À RÉCURER. Pour les taches tenaces, utiliser du savon doux et nettoyer avec un chiffon doux humide Ne pas utiliser de nettoyants chimiques pour les fours.

Glissières Du Micro-onde Tiroir

Nettoyer les glissières du tiroir des miettes de nourriture. Les essuyer avec un chiffon doux et sec pour que le tiroir s'ouvre et se ferme en douceur.

Couvercle Du Guide D'ondes

ATTENTION Tenir propre le couvercle du guide d'ondes pour assurer un bon fonctionnement du four. Essuyer immédiatement et délicatement avec un chiffon humide toute éclaboussure d'aliments sur la surface du couvercle. Une accumulation d'éclaboussures peut surchauffer et causer de la fumée ou même s'enflammer. Ne pas retirer le couvercle du guide d'ondes.

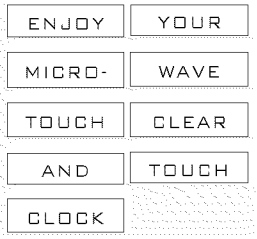
Désodorisation

Il peut arriver qu'une odeur de cuisson persiste dans le tiroir. Pour l'éliminer, mettre dans un récipient pouvant contenir 2 tasses, 1 tasse d'eau, le zeste et le jus d'un citron, et plusieurs clous de girofle entiers. Faire bouillir pendant plusieurs minutes à 100 %. Laisser reposer dans le micro-onde tiroir jusqu'à ce qu'il soit froid. Essuyer l'intérieur avec un chiffon doux.

Avant d'appeler pour une Réparation

Vérifier ce qui suit avant de faire appel à un réparateur. Vous pourriez sauver du temps et de l'argent.

PROBLÈME	CAUSE POSSIBLE	SOLUTION
1. Une pièce ou tout le Microwave In-A-Drawer™ ne fonctionne pas.	• Le cordon du Microwave In-A-Drawer™ n'est pas complètement branché à la prise.	• Vérifier que le cordon est bien branché dans la prise.
	• Coupure de courant.	• Vérifier les lumières de la maison pour vous en assurer. Appeler la compagnie d'électricité.
	• Le fusible ou le disjoncteur de la maison ne fonctionne pas.	• Remplacer le fusible ou réenclencher le disjoncteur.
	• Le Microwave In-A-Drawer™ est en mode démo.	• Voir page 14 comment annuler le mode Démo.
2. Le micro-onde ne chauffe pas les aliments.	• Pas de courant à l'appareil.	• Voir la SOLUTION pour le PROBLÈME 1.
	• Les commandes du tiroir sont mal réglées.	• Vérifier les réglages de commandes
	• Le Microwave In-A-Drawer™ est en mode démo.	• Voir page 14.
3. La lumière du Microwave In-A-Drawer™ ne fonctionne pas.	• L'ampoule est desserrée ou brûlée.	• Appeler un réparateur.
4. Les touches de commande ne fonctionne pas.	• Les commades sont verrouillées.	• Voir page 13 pour déverrouiller.
5. L'afficheur clignota.	• Panne de courant.	• Appuyer sur **STOP/CLEAR** et remettre l'horloge à l'heure. Si le Microwave In-A-Drawer™ était en marche, vous devez redémarrer la fonction de cuisson.
6. Vapeur sortant de l'évent	• Pendant la cuisson aux micro-ondes, de la vapeur peut s'échapper par le côté droit de l'évent.	



Guide des Touches Automatiques

Microwave In-A-Drawer™

RÉGLER L'HORLOGE

1. Appuyer sur la touche **TIMER/CLOCK** et sur 2.
2. Appuyer sur les chiffres pour corriger l'heure du jour et appuyer de nouveau sur **TIMER/CLOCK**.

   En cas d'une interruption du courant de votre four, l'écran affichera de façon intermittente:

TEMPS DE CUISSON

Cuisson à haute puissance

1. Entrer la durée de cuisson en appuyant sur les chiffres. (Ex: 5 minutes) 5 0 0.

2. Appuyer sur **START/EASY MINUTE**.

Cuisson à puissance variable

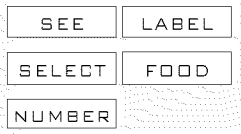
1. Après l'étape 1 ci-dessus, appuyer sur **POWER LEVEL** jusqu'à ce que le niveau de puissance désiré s'affiche.
2. Appuyer sur **START/EASY MINUTE**.

SENSOR COOK

La cuisson au capteur calcule automatiquement la bonne durée et le bon niveau de puissance pour cuire parfaitement les aliments inscrits sur l'aide-mémoire.

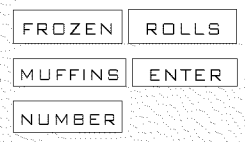
1. Appuyer une fois sur la touche **SENSOR COOK**.

2. Voir l'aide-mémoire. Choisir un aliment en appuyant sur un chiffre. Ex : Appuyer 5 fois pour des pommes terre au four.
3. Appuyer sur **START/EASY MINUTE**.



SENSOR POPCORN/SENSOR REHEAT

Appuyer sur **SENSOR REHEAT** ou **SENSOR POPCORN** puis sur la touche **START/EASY MINUTE**.



REHEAT

Reheat calculera automatiquement le temps de réchauffage approprié et la puissance du four à micro-ondes pour les aliments inscrits à l'aide-mémoire.

1. Appuyer une fois sur la touche **REHEAT**.

2. Voir l'aide-mémoire. Choisir l'aliment désiré en appuyant sur un chiffre. Ex : Appuyer sur 2 pour des petits pains ou des muffins congelés.

3. Appuyer sur un chiffre pour choisir la quantité. Ex : Appuyer sur 2 pour 2 pains ou muffins.

4. Appuyer sur **START/EASY MINUTE**.

DEFROST

Utiliser cette caractéristique pour décongeler les aliments inscrits à l'aide-mémoire.

1. Appuyer sur la touche **DEFROST**.

2. Voir l'aide-mémoire. Choisir l'aliment désiré en appuyant sur un chiffre. Ex : Appuyer sur 2 pour les biftecks ou les côtelettes.

3. Entrer le poids en appuyant sur les chiffres. 1 0.

4. Appuyer sur **START/EASY MINUTE**.
5. Le micro-onde s'arrêtera pour permettre de tourner, masquer et/ou retirer les aliments. Fermer le tiroir. Appuyer sur. Appuyer sur **START/EASY MINUTE**.

Guide des Touches Automatiques

MICRO WARM

Micro Warm vous permet de garder les aliments au chaud pendant 30 minutes.

Usage direct

1. Appuyer sur la touche **MICRO WARM**.

2. Entrer la durée désirée en appuyant sur les chiffres. Pour entrer 30 minutes appuyer sur 3 0 0 0.

3. Appuyer sur **START/EASY MINUTE**.

Avec cuisson en mode manuel

1. Entrer le temps de cuisson et le niveau de puissance.
2. Appuyer sur la touche **MICRO WARM**.
3. Entrer la durée de réchauffage désirée jusqu'à 30 minutes.
4. Appuyer sur **START/EASY MINUTE**.

TIMER

1. Appuyer sur la touche **TIMER/CLOCK** et sur 1.
2. Entrer l'heure.
3. Appuyer à nouveau sur la touche **TIMER/CLOCK**.

   Pour annuler la minuterie appuyer sur **STOP/CLEAR**.

EASY MINUTE

Appuyer sur **START/EASY MINUTE** pendant une minute à 100% de puissance ou pour ajouter une minute pendant la cuisson en mode manuel. Continuer à appuyer pour des minutes supplémentaires.

Autres Caractéristiques

CONTROL LOCK

Le verrouillage des commandes vise à empêcher l'utilisation non désirée du four comme par de jeunes enfants. Le Microwave In-A-Drawer™ peut être réglé de telle sorte que le tableau de commande est inopérant ou verrouillé.

Pour verrouiller

Appuyer sur **CONTROL LOCK** pendant 3 secondes.

To Unlock

Appuyer sur **CONTROL LOCK** pendant 3 secondes.

AIDE

Reportez-vous au mode d'emploi pour les détails spécifiques.

Appuyer sur **SETUP/HELP**.

2 fois pour Suppression du Signal Sonore.

3 fois pour Rappel de Fin de Cuisson.

4 fois pour Auto Démarrage.

5 fois pour Mode De Démonstration.

Garantie du Produit

Ce Qui Est Couvert

CERTIFICAT DE GARANTIE

Microwave In-A-Drawer™ DACOR

DANS LES CINQUANTE ÉTATS DES É.-U., LE DISTRICT DE COLUMBIA ET AU CANADA* :

GARANTIE COMPLÈTE D'UN AN

Si votre produit DACOR cesse de fonctionner durant l'année qui suit la date initiale d'achat, à cause d'un défaut de matériel ou de main-d'œuvre, DACOR corrigera le défaut sans frais pour vous ou les usages ultérieurs. Le propriétaire devra fournir une preuve d'achat sur demande et l'appareil devra être accessible pour la réparation.

* La garantie est nulle et non avenue si un produit non approuvé CSA est transporté des É.-U.

HORS DES CINQUANTE ÉTATS DES É.-U., LE DISTRICT DE COLUMBIA ET AU CANADA :

GARANTIE LIMITÉE À LA PREMIÈRE ANNÉE

Si votre produit DACOR cesse de fonctionner durant l'année qui suit la date initiale d'achat, à cause d'un défaut de matériel ou de main-d'œuvre, DACOR fournira une nouvelle pièce, FAB en usine, pour remplacer la pièce défectueuse. Tous les frais de livraison, installation et main-d'œuvre sont la responsabilité de l'acheteur. Le propriétaire devra fournir une preuve d'achat sur demande et l'appareil devra être accessible pour la réparation.

Ce Qui N'est Pas Couvert

- Une panne du produit causée par une mauvaise installation,un usage inadéquat, ou un manque de l'entretien requis.
- Les appels de service pour former le client aux bons usage et entretien du produit.
- Une panne du produit s'il est utilisé pour le commerce, les affaires ou la location ou pour tout autre application que pour l'usage résidentiel du client.
- Le remplacement des fusibles ou des boîtes de fusibles de la maison ou le réenclenchement des disjoncteurs.
- Les dommages au produit causés par accident, incendie, inondation ou autres actes de Dieu.
- Le bris, la décoloration ou les dommages au verre, aux surfaces métalliques, aux composantes plastiques, aux garnitures, à la peinture, la porcelaine ou autre fini esthétique, causés par un usage ou un entretien inadéquats, un abus ou par négligence.

LES RECOURS OFFERTS DANS LES GARANTIES EXPRESSES CI-DESSUS SONT LES RECOURS UNIQUES ET EXCLUSIFS; PAR CONSÉQUENT AUCUNE AUTRE GARANTIE EXPRESSE N'EST OFFERTE, ET HORS DES CINQUANTE ÉTATS DES É.-U., LE DISTRICT DE COLUMBIA ET AU CANADA, AUCUNE GARANTIE IMPLICITE, Y COMPRIS MAIS SANS Y ÊTRE LIMITÉE, TOUTE GARANTIE IMPLICITE DE QUALITÉ MARCHANDE ET D'ADAPTATION À UN USAGE PARTICULIER POUR UN ACHAT. EN AUCUN CAS, DACOR NE SERA TENU RESPONSABLE POUR DES FRAIS ACCESSOIRES OU DES DOMMAGES INDIRECTS. AUCUNE GARANTIE N'EST OFFERTE, EXPRESSE OU IMPLICITE À UN ACHETEUR POUR LA REVENTE.

Certains états ou provinces n'autorisent pas de restriction à la durée d'une garantie implicite ni l'exclusion ou la restriction de dommages accessoires ou indirects; les restrictions ou exclusions pourraient donc ne pas s'appliquer à vous. Cette garantie vous donne des droits particuliers et vous pourriez également avoir d'autres droits qui varient selon les états et provinces.

Care and Cleaning Methods

Hand Dusting

Most routine care of Lutron window treatments will consist of dust removal. Hand dusting is best done using gentle methods which minimize the possibility of damaging or disturbing woven fabrics, lift cords, venetian slats, etc. Soft filament and feather dusters are recommended. Careful wiping with a soft, lint-free cloth may also be effective.

Vacuuming with a Soft Brush Attachment

As stated above, most routine care of Lutron window treatments will consist of dust removal. When hand dusting isn't practical due to the height of a window or other factors, vacuuming is an effective method. Use a soft brush attachment to temper the strength of suction and help lift unwanted dust and fibers from the surface of fabrics, cornices, and lineals.

Low Heat Steaming

Steam cleaning is not recommended as a method of regular care of Lutron® window treatments. However, application of low heat steam as a means of wrinkle removal is acceptable for many of the fabrics in the Lutron collections. Be sure to check the Care and Cleaning Methods by Fabric/Material chart starting on page 13 before applying steam.

Spot Cleaning

In the event that fabric in a Lutron® window treatment becomes soiled or stained, spot cleaning with a mild detergent and water may be appropriate. Use detergent that is intended for fabrics without bleach or fabric softener additives. Apply diluted detergent by blotting with a clean cloth. Do not rub. Then, use a second clean cloth to apply a clear-water rinse. Allow to dry thoroughly.

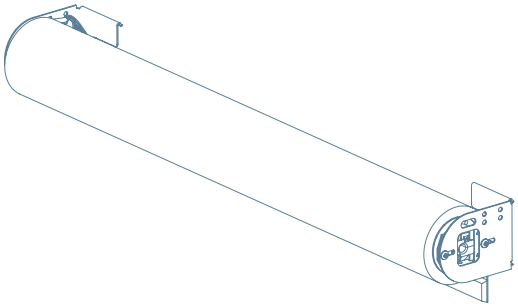
Be sure to check the Care and Cleaning Methods by Fabric/Material chart starting on page 13 before spot cleaning. Any cleaning product should be tested on a small, inconspicuous area prior to broad application on the shade panel. An 8" x 10" sample of the fabric may also be obtained through Lutron Customer Service for testing purposes.

Professional Cleaning

Reputable drapery and upholstery cleaning services are experts in fabric care and the cleaning methods that work best for specific materials. The methods referenced in this guide are:

Ultrasonic: Usually involves taking down the window treatment and dipping in an ultrasonic bath. This is a very effective cleaning method, and may even include anti-static treatment to help repel dust.

Injection/Extraction: Similar to the popular carpet cleaning method, loose dust and dirt are removed with a vacuum, then, a cleaning solvent is applied, (injection), and immediately suctioned out, (extraction). This heat and agitation-free method can often be performed with shades and drapes left in place.



Dry Cleaning: Typically appropriate for drapery fabrics, this method is actually similar to injection/extraction, but is usually done off-site, although service providers who offer on-site dry cleaning do exist.

Be sure to check the Care and Cleaning Methods by Fabric/Material chart starting on page 13 before ordering or allowing any type of professional cleaning.

Roller Shade Products

- Sivoia® QS single and coupled roller shades
- Sivoia® QS Wireless single and coupled roller shades
- Sivoia® QED single and coupled roller shades
- Lutron® AC roller shades
- Lutron® Stanza roller shades
- Lutron® manual roller shades

Maintenance

Lutron roller shade systems are manufactured to provide maintenance-free performance for the life of the product. All internal and external components are designed to function without user intervention aside from normal operational input. After the shades have been installed correctly by a qualified installer, there is no mechanical upkeep required. In the event adjustments or repairs are needed, the original provider of the systems should be notified. All adjustments and repairs must be made by qualified personnel.

Lutron Roller Shades are backed by Lutron's limited 8-Year Warranty on all components.
http://www.lutron.com/TechnicalDocumentLibrary/Window Systems Warranty.pdf

Fabric Care

Lutron roller shade fabrics are manufactured and process treated for extra strength to prevent wear. Lutron roller shade fabrics are not easily damaged and require only light maintenance to keep them dust and dirt free. Fabrics can be periodically dusted in place using a feather duster or vacuum with a soft brush attachment.

Hand Dust

If staining occurs, most* fabrics may be cleaned with a mild detergent and water applied with a soft cloth. Follow this with a thorough rinsing of clean water and allow the shade to air dry in an unrolled position. There are also numerous restorative vinyl cleaners on the market that can clean and revitalize vinyl and PVC coated sheer weave fabrics, if desired.

Soft Brush Attachment

Any mild cleaning product should be tested on a small, inconspicuous area prior to broad application on the shade panel. An 8" x 10" sample of the fabric may also be obtained through Lutron Customer Service for testing purposes.

Spot Clean

* Refer to the Cleaning Methods by Fabric/Material chart starting on page 13 for Roller Shade fabrics that allow for spot cleaning.

Inline-Coupled Roller Shade Addendum

Shade Mounting & Adjustment Guide for Inline-Coupled Roller 100, 150, 200CW, & 300—Please Read Before Installing

English

CAUTION: RISK OF FALLING OBJECTS. Read and follow all instructions for mounting the shade system. Failure to follow these instructions could result in minor to moderate injury.

Important Notes: Please Read Before Installing

A. Plan the installation to maintain sufficient clearance between the shade and any other object, including window trim, hardware, cranks, lock levers, and drapery.

B. For safety, all shades and coupled panels must be installed by 2 people.

C. The shade system must be mounted to blocking or other suitable structural material. It is the responsibility of the installer to choose and install fasteners that are appropriate for the mounting surface.

D. Lutron systems are intended for use with only Lutron hardware, controls, and power supplies.

NOTE: The pictures and instructions in this document detail the installation of wall-mount sub-brackets. The sequence and methods for installing other types of sub-brackets are the same or similar. Refer to the chassis mounting instructions included with your sub-brackets.

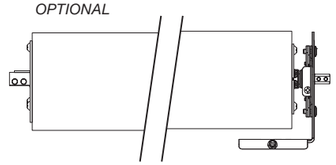
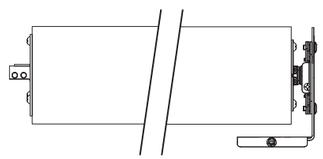
1 Prepare to Install

1.1 Included with inline-coupled shades:



(1) Drive Shade with Shade Brackets and Coupler Pre-Installed

Sub-Brackets
(2 per Drive Shade + 1 per Coupled Panel)



OPTIONAL

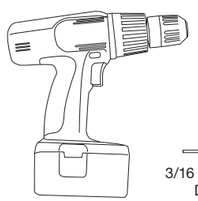
Coupled Panel(s)
(up to 4)*

#8 x 1¾ in Mounting Screws
(qty varies with Sub-Bracket type)

#6 x 1 in Coupler Screws
(2 per Coupler + 2 Spares)

(1) Coupled Idler Panel

Coupler Screw Clip
(1 per Coupler)



5/64 in Hex Wrench

*A total of 6 panels may be coupled, including the drive shade and coupled idler panel. (Subject to limitations based on drive capacity, panel sizes, and fabric selection; contact Lutron for more information.)

1.2 Additional items you'll need:

FOR MOUNTING SUB-BRACKETS USING SUPPLIED MOUNTING SCREWS

Power Drill

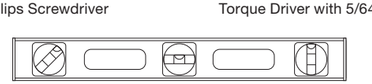
Pencil

Tape Measure

3/16 in (4.8 mm) Drill Bit

5/16 in (8 mm) Hex Driver Bit
(6 in extension recommended)

#1 Phillips Screwdriver



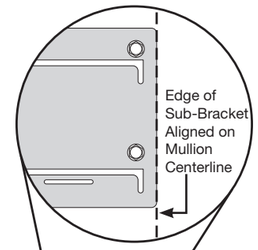
1/4 in Nut driver

#2 Phillips Screwdriver

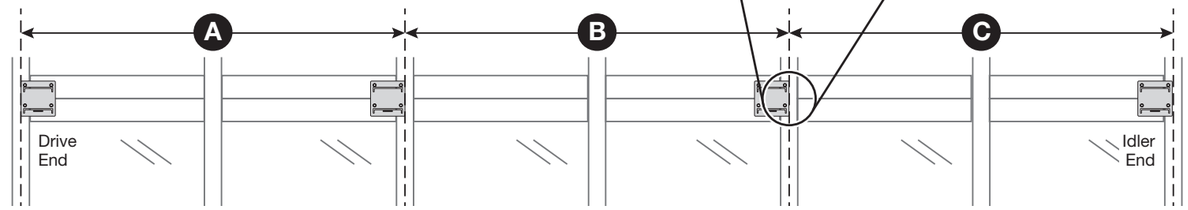
Torque Driver with 5/64 in hex bit

Level

2 Install the Sub-Brackets



Lay out the sub-brackets at the originally specified bracket-to-bracket distances, as shown below. Verify that all sub-brackets are level and aligned.

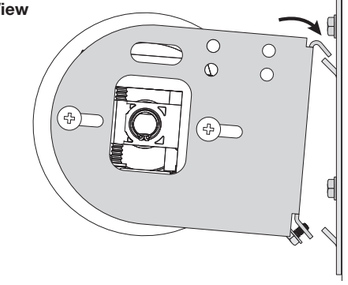


Typical 3-Shade Combination*

A Drive shade bracket-to-bracket width

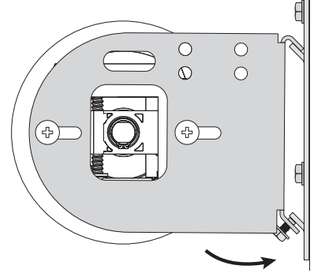
B Coupled panel bracket-to-bracket width

C Coupled idler panel bracket-to-bracket width



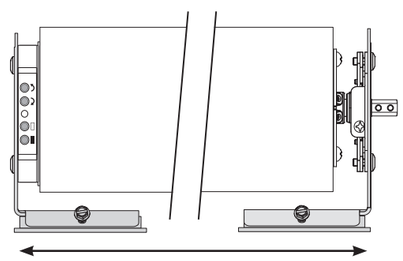
*A total of 6 panels may be coupled, including the drive shade and idler panel.
(Subject to limitations based on drive capacity, panel sizes, and fabric selection; contact Lutron for more information.)

3 Install the Drive Shade (for more information and other bracket types, refer to the chassis installation instructions packaged with the shade)



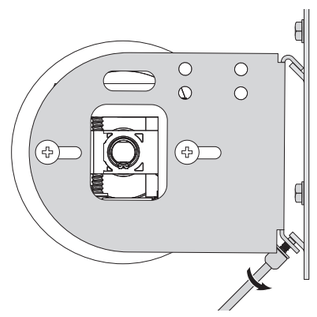
a. Position the drive shade in front of the mounted sub-brackets and hang the top hook of each shade bracket on the upper hook of the sub-bracket as shown.

Profile View



b. Swing the shade down, allowing the lower part of the shade brackets to rest against the sub-brackets.

Profile View



c. Adjust the position of the shade left-right as needed to center the fabric panel on the window opening.

View from Below

d. Use the 1/4 in nut driver to tighten the securing screw of each shade bracket.

Profile View

CAUTION: RISK OF FALLING OBJECTS. The shade bracket securing screw is factory-installed in the shade bracket, and must be tightened firmly into the sub-bracket to ensure safe installation of the shade. If the securing screw is missing, **DO NOT** substitute a different type of screw or omit Step **d.** Check the hardware kit for spare shade bracket securing screws, or contact Lutron for replacement screws. Failure to follow these instructions could result in minor to moderate injury.

LUTRON
Lutron Electronics Co., Inc.
7200 Suter Road
Coopersburg, PA 18036-1299, U.S.A.

11/2016

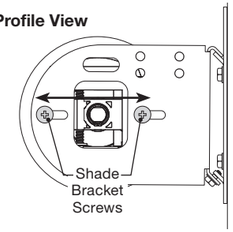
4 Alignment & Adjustment

As coupled panels are added, it is essential for smooth operation that the coupled shade tubes form as straight a line as possible. Depending on the straightness of the sub-bracket mounting surface and the level-alignment of the mounted sub-brackets, it may be necessary to adjust the shade tube projection (distance from the sub-brackets), and/or the level (idler height). Start with the drive shade, then make adjustments as needed to each coupled panel after it is added, before adding the next panel.

4.1 Projection Adjustment:



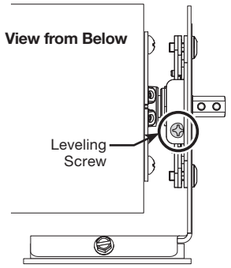
Each shade bracket provides for projection adjustment as shown.

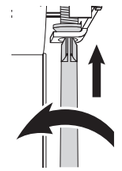
a. Use the #2 phillips screwdriver to loosen both shade bracket screws.

b. Slide the shade toward or away from the sub-bracket.

c. Re-tighten the shade bracket screws.

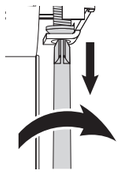
Profile View





NOTE: When projection adjustment is necessary, it is the responsibility of the installer to maintain adequate clearance around the shade, and to ensure the fabric roll does not come in contact with any surrounding objects; e.g., ceiling, pocket, fascia, brackets, mounting hardware, etc.

4.2 Level Adjustment:



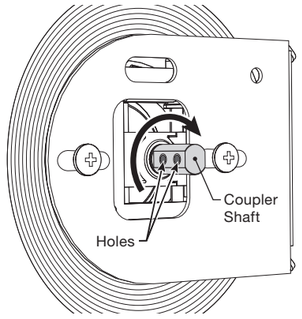
Each idler, coupling and non-coupling, features a leveling screw, accessible from below the shade, which can be used to raise or lower the idler-end of the shade tube. Use the #2 phillips screwdriver.

View from Below

Turn the leveling screw counter-clockwise to raise the idler

Turn the leveling screw clockwise to lower the idler

Complete the Setup of the Drive Shade:



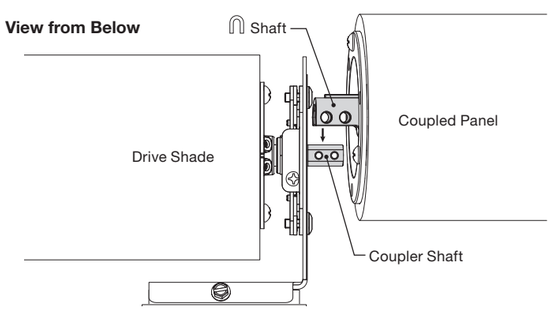
Follow the instructions in the Sivoia QS Basic Wiring & Setup Guide included with the drive shade to connect power and perform operational setup of shade. Ensure that the shade is mounted securely and operating properly, with all wiring dressed and secured, before proceeding to the next Section.

5 Install a Coupled Panel

NOTE: The instructions in Sections **5** and **6** pertain to all coupled panels, including the coupled idler panel. Complete both sections for each coupled panel before another coupled panel is added.

5.1 Position the Coupler Shaft

Use the Arrow buttons (↶↷) on the EDU controls to rotate the drive shade (and any previously-installed coupled panels, if applicable), so that the holes in the coupler shaft are facing downward.



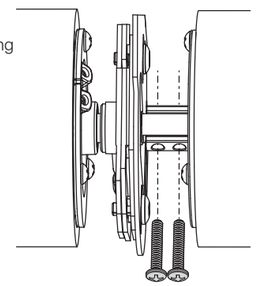
5.2 Attach the Coupled Panel

The coupled panel has one shade bracket, at the idler end, opposite the coupling.

a. Position the coupled panel in-line with the previously-installed shade, hanging its shade bracket on the upper hook of the sub-bracket, then allowing it to rest against the sub-bracket, as shown in Steps **a** and **b** of Section **3**.

b. Rotate and position the coupled panel so that its ⋂ Shaft engages the coupler shaft of the previously-installed shade as shown, with holes aligned.

View from Below

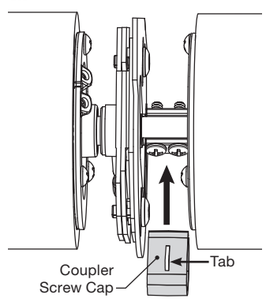


5.3 Secure the Coupled Panel

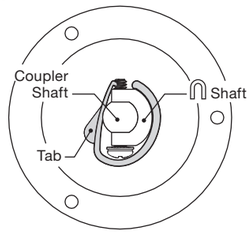
a. Install both coupler securing screws, threading them through the joined coupler shaft and ⋂ Shaft. Use the #1 phillips screwdriver to tighten until the heads are fully seated.

b. Adjust the position of the coupled panel left-right as needed to center the fabric on the window opening. (The coupler shaft is extendable.)

c. Use the hex-head driver to tighten the securing screw of the coupled panel shade bracket, as shown in Step **d** of Section **3**.



5.4 Install the Coupler Screw Cap



a. Push the Coupler Screw Cap over the joined Coupler Shaft and ⋂ Shaft until it snaps into place.

b. The closed side of the Coupler Screw Cap must cover the screw heads, and the tab must be located on the open side of the ⋂ Shaft as shown.

a.

b.

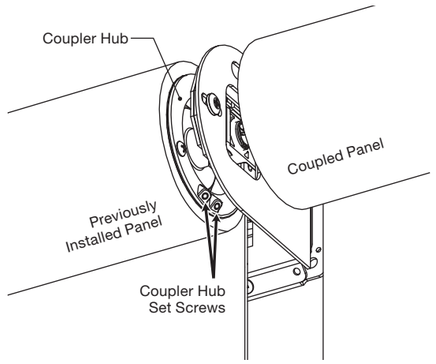
Profile View of Assembled Coupling

c. Complete all of the steps in Section **6** before adding another coupled panel.

6 Alignment & Adjustment of Coupled Panels

6.1 Adjust Projection

Follow the instructions in Step **4.1** to adjust the projection of the newly-added coupled panel, if necessary.



6.2 Adjust Level

Follow the instructions in Step **4.2** to adjust the level of the newly-added coupled panel, if necessary.

NOTE: Before leveling a coupled panel, recheck and verify that the drive shade and any previously installed coupled panels are level, and correct as needed.

6.3 Adjust Hembar Alignment

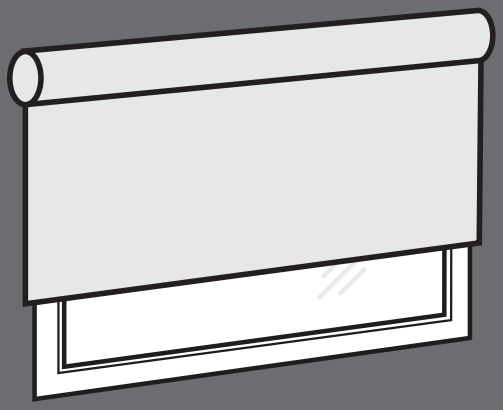
a. Use the Arrow buttons (↶↷) on the EDU controls to rotate the drive shade so that the set screws in the coupler hub are accessible.

b. While the second person holds the coupled panel fabric roll in place to prevent it from unrolling, loosen the coupler hub set screws.

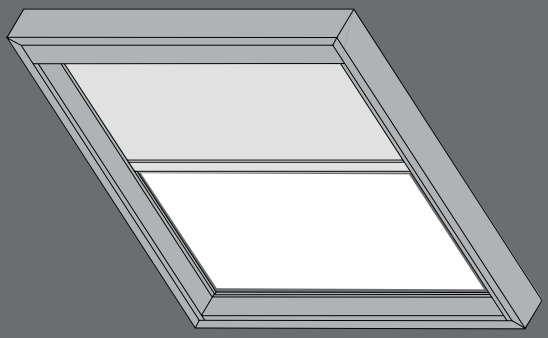
c. Carefully rotate the coupled panel to align its hembar with the hembar of the previously-installed panel.

d. With the hembars aligned, use the torque driver to re-tighten the coupler hub set screws to a torque of 6.0 in-lbs (0.7 N•m).

⚠ CAUTION: RISK OF FALLING OBJECTS. The coupler hub set screws are tightened at the factory to a torque of 6.0 in-lbs (0.7 N•m). Failure to re-tighten the coupler hub set screws to a torque of 6.0 in-lbs (0.7 N•m) could result in minor to moderate injury.



e. Repeat all of the steps in Sections **5** and **6** for each additional coupled panel.



LUTRON

Sivoia® QS

wiring and programming guide

LUTRON®

Sivoia QS Drives are available for control of Draperies, Roller Shades and Tensioned Shades. *Sivoia QS* Shades and Draperies can be controlled as part of a *QS* System, incorporating *GRAFIK Eye QS* lighting controls, or as a *Shades/Draperies only* System, without lighting controls.

Sivoia QS Drives and Keypads are powered from a 24 V⎓ power supply. All drives, power supplies, keypads and other control devices are linked together with the same four wire communication link. This link provides 24 V⎓ to all components.

The Shades/Draperies can also be operated via an infrared Hand-Held Remote Control. These can be used in either a *GRAFIK Eye QS* Integrated System or *Sivoia QS* Standalone System. The IR remotes can move the Shade or Drapery to the open and close limit. They also provide the additional functions of storing and recalling a favorite preset, and setting open and close limits remotely.

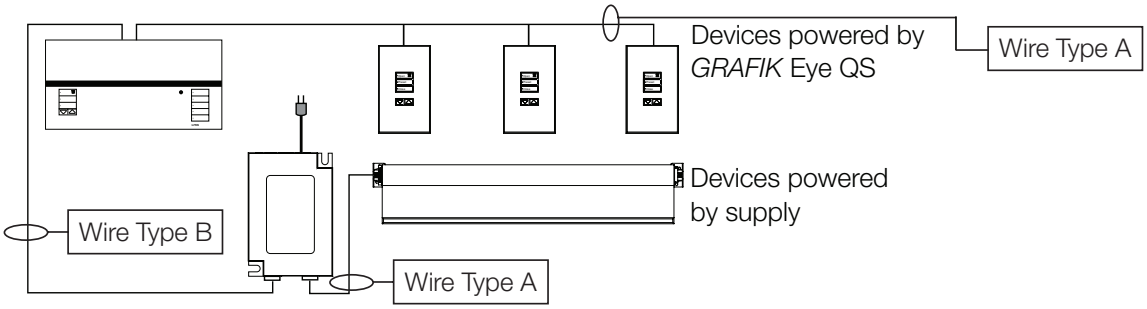
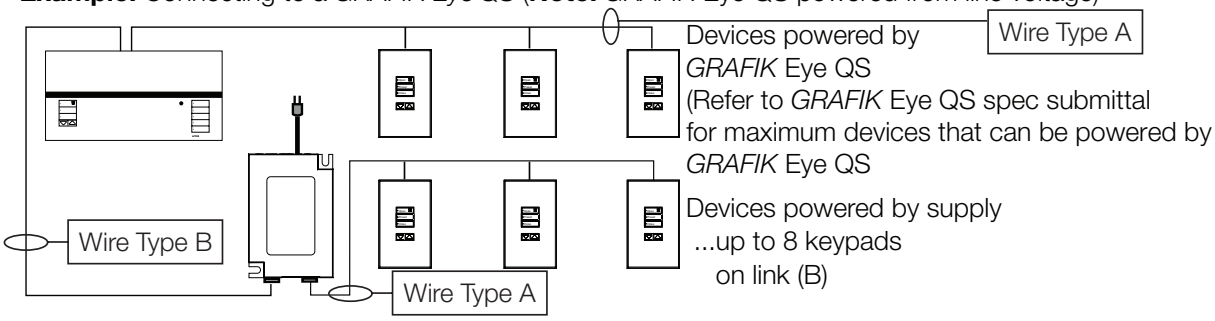
1 System Wiring Overview: QS Link Power Supply



Example: Powering one shade / drapery drive unit
(max of one shade / drapery drive unit per output of a power supply)

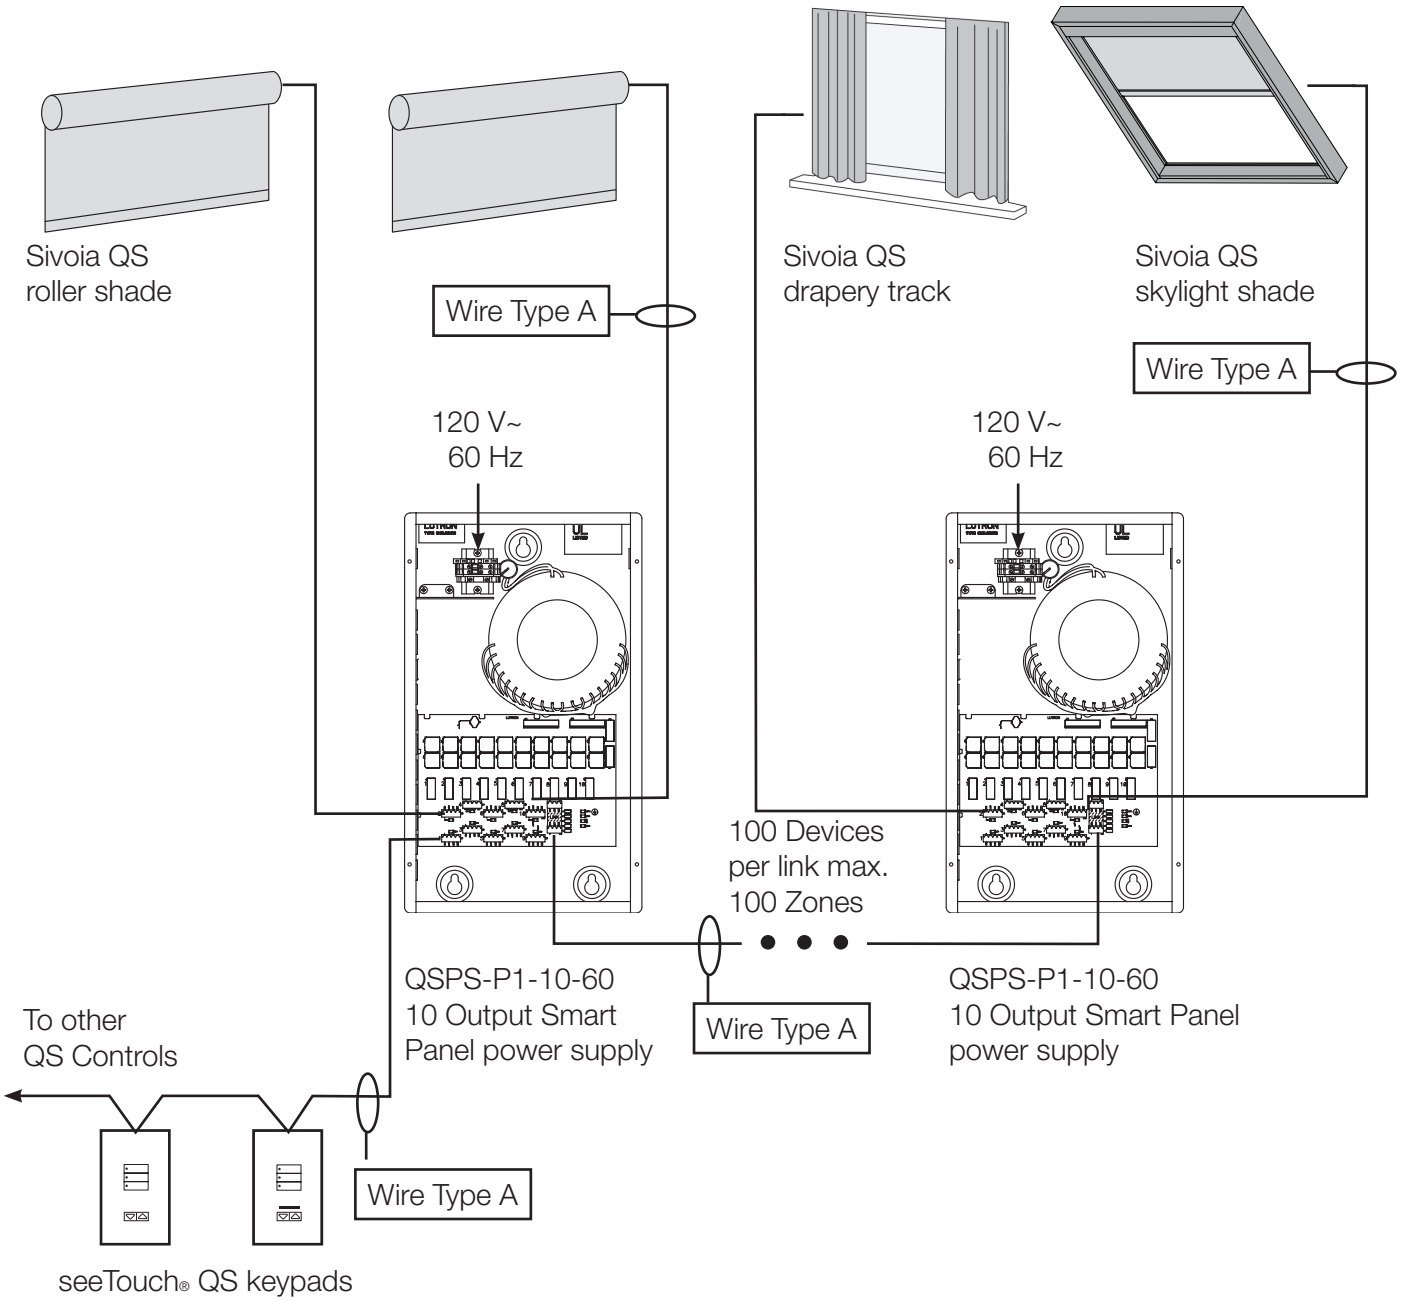


Example: Powering keypads

Example: Connecting to a *GRAFIK* Eye® QS (**Note:** *GRAFIK* Eye QS powered from line voltage)

Example: Connecting to a *GRAFIK Eye* QS (**Note:** *GRAFIK* Eye QS powered from line voltage)

Wiring Type Key



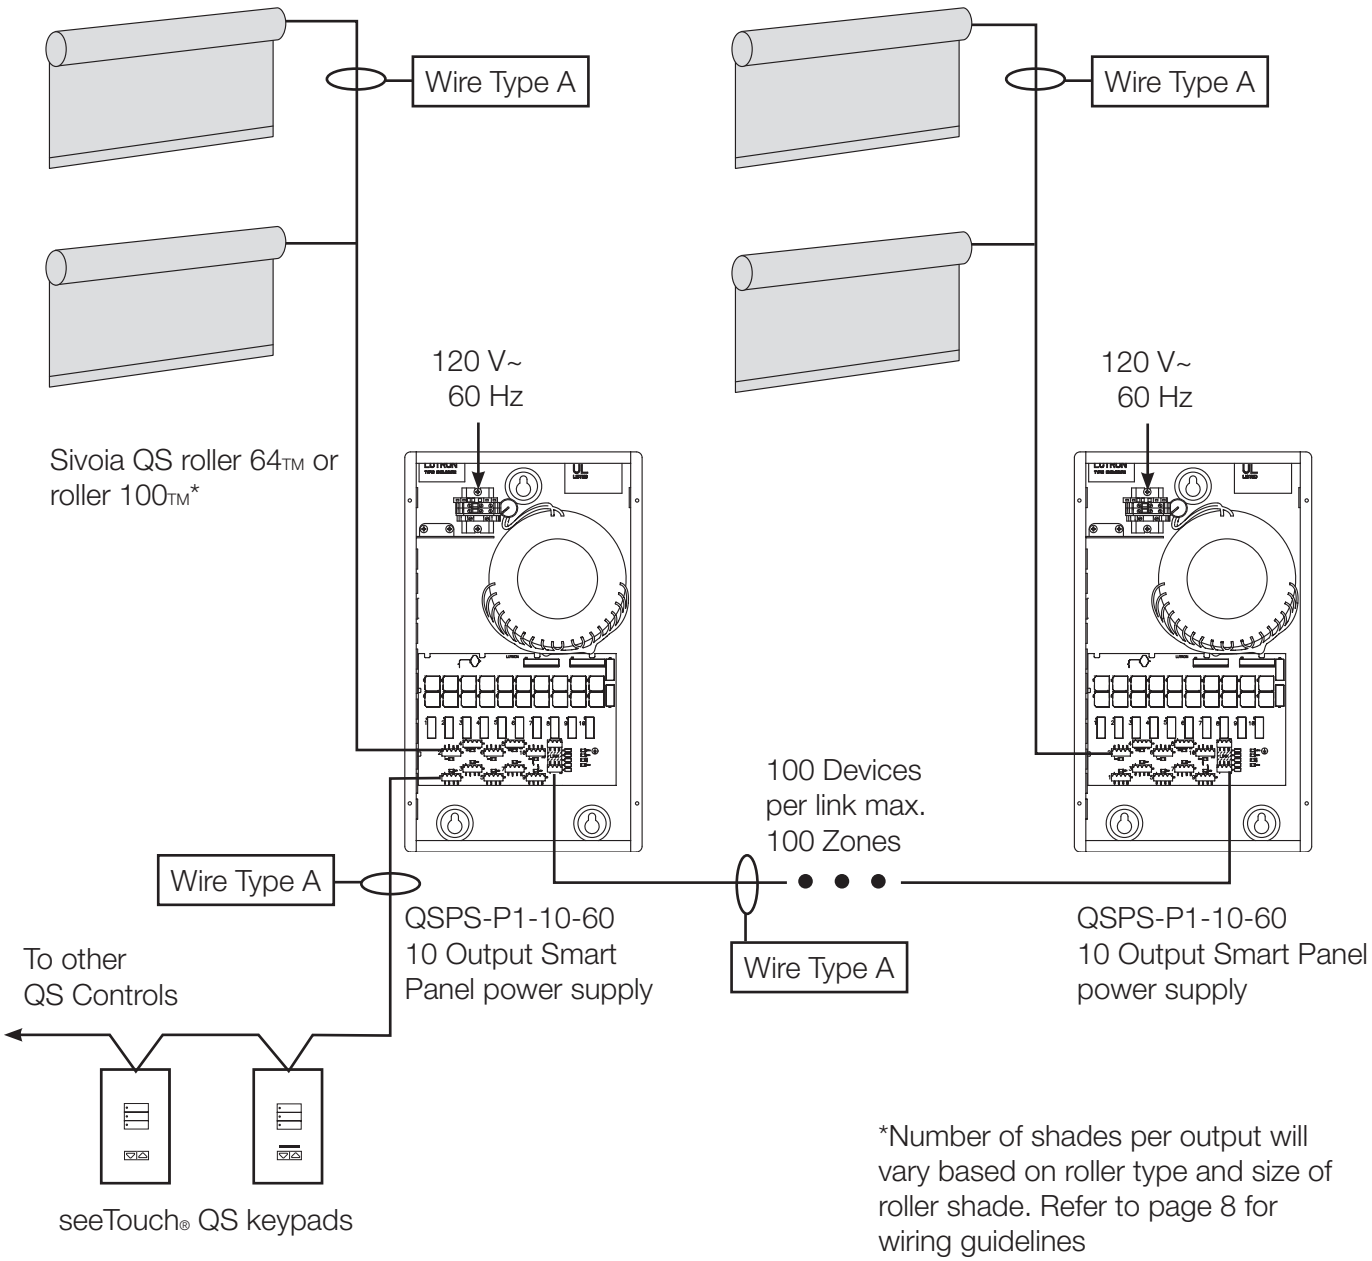
Type A Power and communication link (4 conductor)
Provides power and communication to QS shades or keypads
12-26 AWG (4-0.15 mm²) standard, twisted/shielded

Type B Communication link (3 conductor)
Communications used to connect power supplies to each other or to *GRAFIK* Eye QS
12-26 AWG (4-0.15 mm²) standard, twisted/shielded

Refer to wiring guide on pg 8 for wire gauge based on distance.

Note: Secondary wiring must be of type CL2, CL2P, CL2R, CL2X or other cable with equivalent or better electrical, mechanical, and flammability ratings in accordance with local and national electric code.

2 Sivoia QS System Wiring: Smart Panel power supply, single shade per output



Wiring Type Key

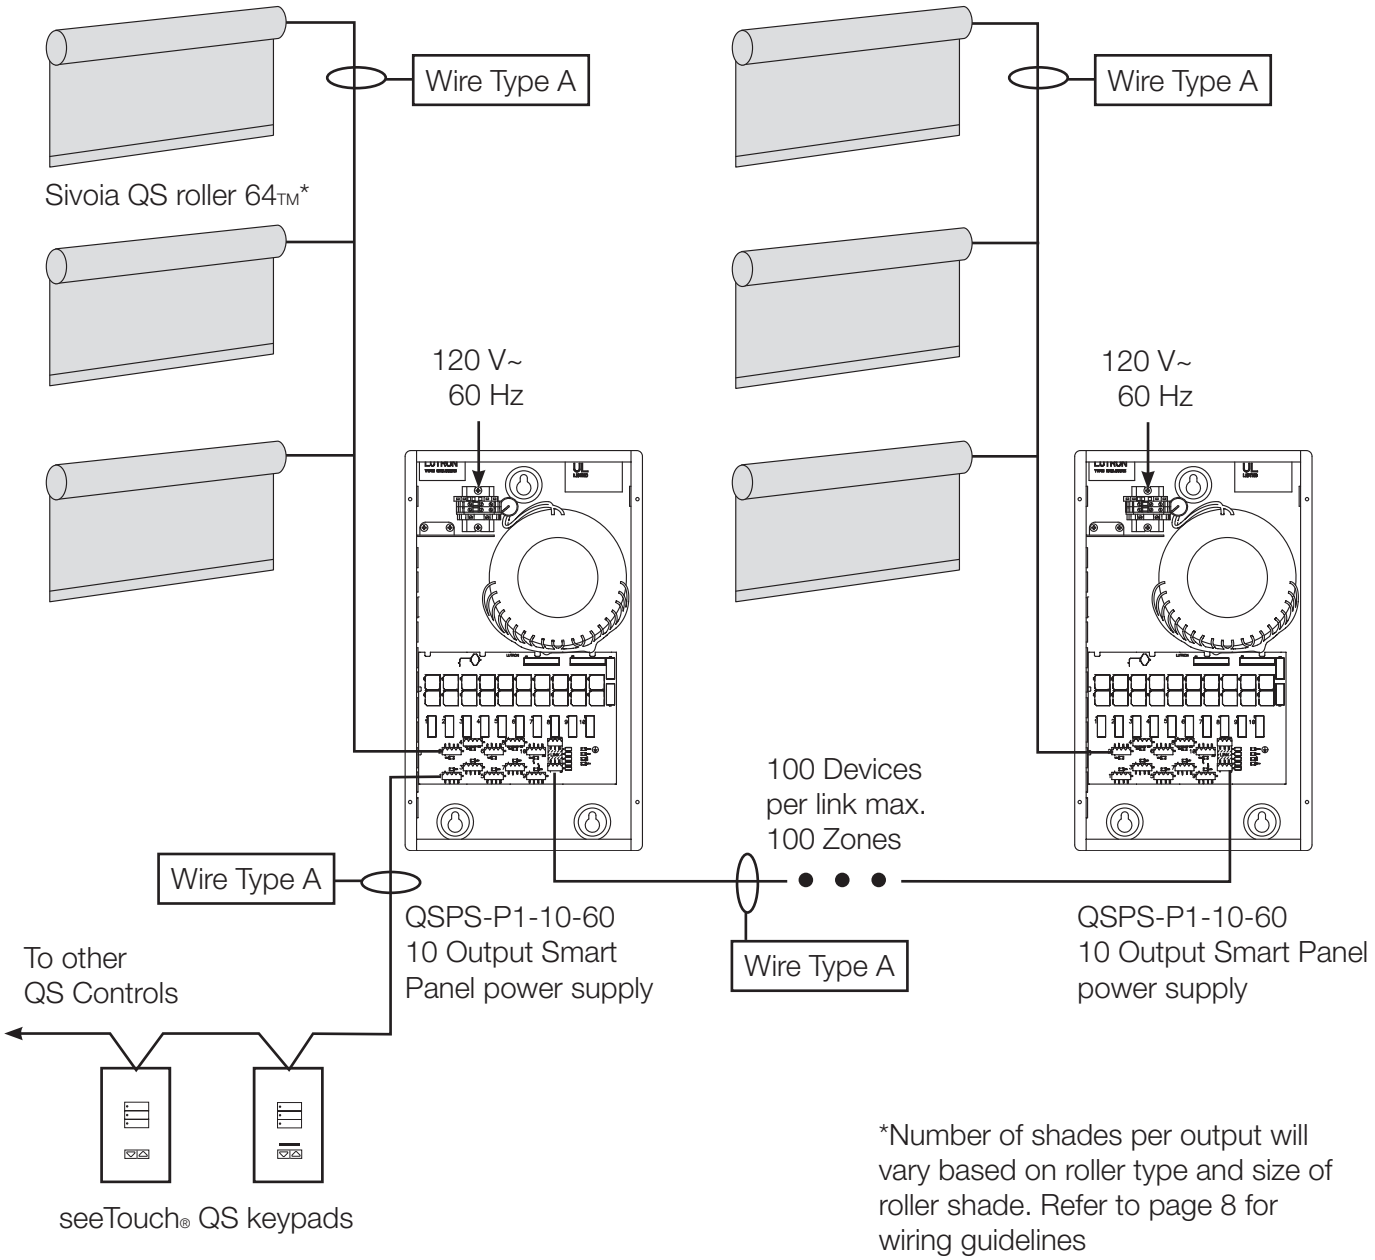
Type A

Communications Link: 4 Conductor (twisted and shielded), listed for application
Refer to wiring guide on pg. 8 for wire gauge based on distance
Maximum comm. link: – Up to 2000 ft (600 m) connecting
all QSPS-P1-10-60 panels

Note: Secondary wiring must be of type CL2, CL2P, CL2R, CL2X or other cable with equivalent or better electrical, mechanical, and flammability ratings in accordance with local and national electric code.

3 Sivoia QS System Wiring: Smart Panel power supply, two shades per output*

*Number of shades per output will vary based on roller type and size of roller shade. Refer to page 8 for wiring guidelines



Wiring Type Key

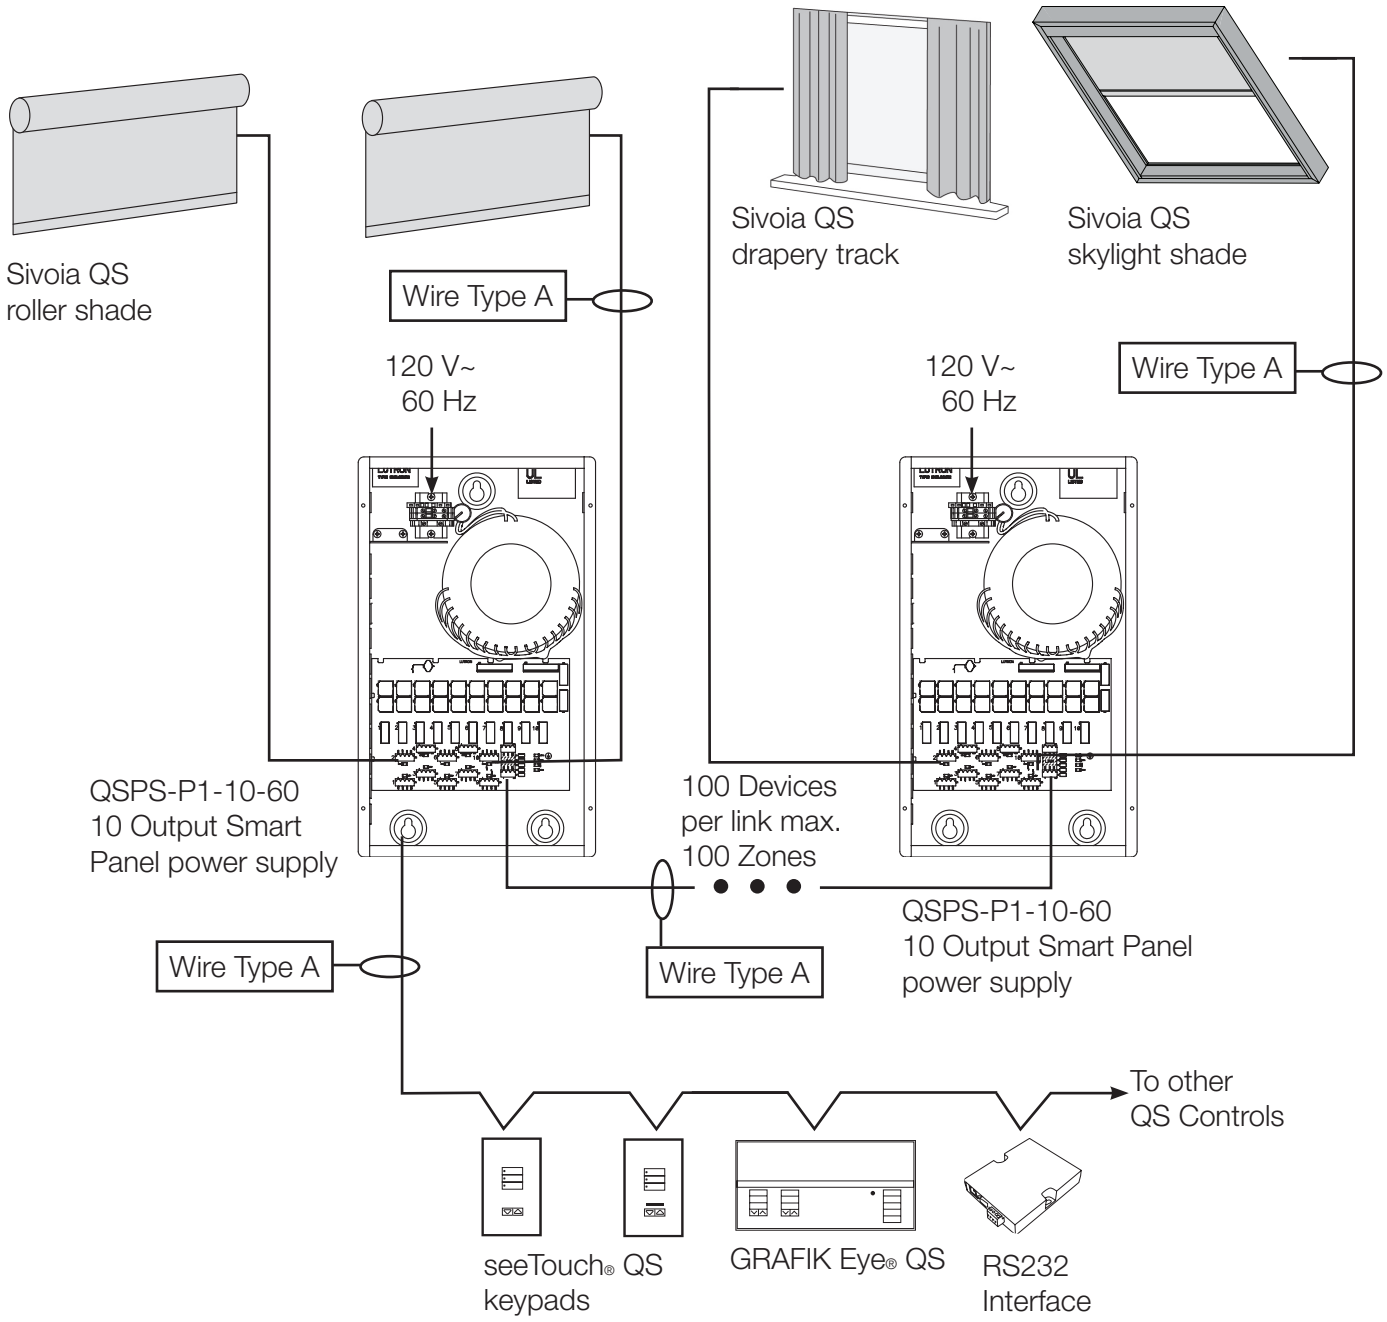
Type A

Communications Link: 4 Conductor (twisted and shielded), listed for application
Refer to wiring guide on pg. 8 for wire gauge based on distance
Maximum comm. link: – Up to 2000 ft (600 m)
connecting all QSPS-P1-10-60 panels

Note: Secondary wiring must be of type CL2, CL2P, CL2R, CL2X or other cable with equivalent or better electrical, mechanical, and flammability ratings in accordance with local and national electric code.

4 Sivoia QS System Wiring: Smart Panel power supply, three shades per output*

*Number of shades per output will vary based on roller type and size of roller shade. Refer to page 8 for wiring guidelines



Wiring Type Key

Type A

Communications Link: 4 Conductor (twisted and shielded), listed for application
Refer to wiring guide on pg. 8 for wire gauge based on distance
Maximum comm. link: – Up to 2000 ft (600 m)
connecting all QSPS-P1-10-60 panels

Note: Secondary wiring must be of type CL2, CL2P, CL2R, CL2X or other cable with equivalent or better electrical, mechanical, and flammability ratings in accordance with local and national electric code.

5 Sivoia QS with GRAFIK Eye® QS System Wiring: Smart Panel power supply, single shade per output*

Wiring Type Key

Type A

Communications Link: 4 Conductor (twisted and shielded), listed for application
Refer to wiring guide on pg. 8 for wire gauge based on distance
Maximum comm. link: – Up to 2000 ft (600 m)
connecting all QSPS-P1-10-60 panels

Note: Secondary wiring must be of type CL2, CL2P, CL2R, CL2X or other cable with equivalent or better electrical, mechanical, and flammability ratings in accordance with local and national electric code.

6 Wire Length Chart

QS Smart Panel Power Supply Wiring Guide

Link Rules

- Maximum of 100 devices (such as GRAFIK Eye® QS, seeTouch® QS keypad, smart panel power supply, or Sivoia® QS shade/drapery drive unit)
- Maximum of 100 zones (such as Sivoia QS shade/drapery drive unit, or a lighting zone on a GRAFIK Eye QS)
- Maximum 2000 ft. (600 m) of cable connecting all smart panel power supplies
- Maximum 2000 ft. (600 m) of cable to devices wired from each smart panel power supply
- Only use cable with at least one twisted/shielded pair for communications

Use this chart to determine the number of shades and/or controls that can be run from one output on the Sivoia QS Smart Panel power supply, depending on the size of the shade. Then, verify the maximum cable length for the output configuration, based on the wire gauge that will be used.

Maximum devices per one output		Maximum distance per one output based on wire guage		
Shades + Controls		12 AWG 4 mm² QSH-CBL-L-500 QSH-CBLP-L-500	16 AWG 1.5 mm² QSH-CBL-M-500 QSH-CBLP-M-500	18 AWG 1 mm² GRX-CBL-346S-500
None	Up to 8 seeTouch QS keypads	1200 ft (350 m)	500 ft (150 m)	300 ft (90 m)
1 Sivoia QS shade/drapery drive unit	Up to 1 seeTouch QS keypad	500 ft (150 m)	200 ft (60 m)	125 ft (35 m)
2 Sivoia QS roller 64, ≤ 30 sq ft (2.75 sq m) each	None	200 ft (60 m)	75 ft (20 m)	50 ft (15 m)
3 Sivoia QS roller 64, ≤ 20 sq ft (1.80 sq m) each	None	200 ft (60 m)	75 ft (20 m)	50 ft (15 m)
2 Sivoia QS roller 100, ≤ 50 sq ft (4.6 sq m) each	None	200 ft (60 m)	75 ft (20 m)	50 ft (15 m)

QS Link Power Supply Wiring Guide

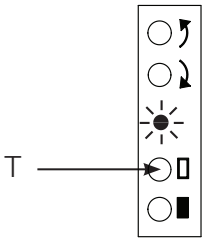
Link Rules

- Only use cable with at least one twisted/shielded pair for communications
- Total length of power supply link (A) wire plus device link (B) wire in entire system must be less than 2000 ft. (600 m)

Use this chart to determine the number of shades and/or controls that can be run from one QS Link power supply. Then, verify the maximum cable length for the output configuration, based on the wire gauge that will be used.

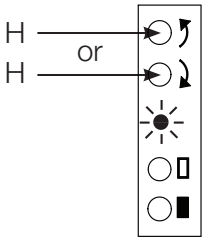
Maximum devices from one QS Link power supply		Total wire length based on wire gauge		
Shades + Controls		12 AWG 4 mm² QSH-CBL-L-500 QSH-CBLP-L-500	16 AWG 1.5 mm² QSH-CBL-M-500 QSH-CBLP-M-500	18 AWG 1 mm² GRX-CBL-346S-500
None	Up to 8 seeTouch QS keypads	1200 ft (350 m)	500 ft (150 m)	300 ft (90 m)
1 Sivoia QS shade*/drapery drive unit	Up to 1 seeTouch QS keypad	250 ft (75 m)	100 ft (30 m)	50 ft (15 m)

Note: Secondary wiring must be of type CL2, CL2P, CL2R, CL2X or other cable with equivalent or better electrical, mechanical, and flammability ratings in accordance with local and national electric code.



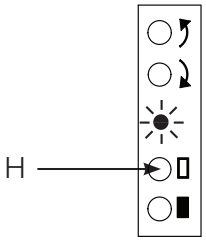
* 2 seeTouch QS keypads may be exchanged for 1 control interface (QSE-CI-NWK-E)

7 Setting Limits From the Drive



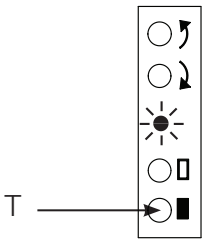
The open and close limits define the travel range of the shade or drapery. Limits can be set at the Drive, or from a keypad or an IR Remote previously assigned to that Drive. It is recommended that limits be set initially at the Drive.

Setting Open Limit

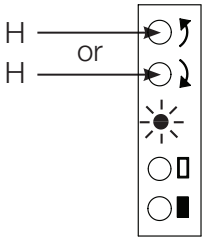


7.1 Tap Open Limit button. Green LED will turn on.

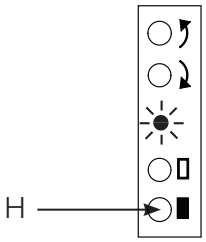
7.2 Move the Shade or Drapery to desired Open Limit by pressing arrow buttons.



7.3 Press and hold the Open Limit button until the Green LED flashes. Open Limit is stored.

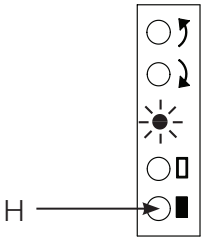


Setting Close Limit

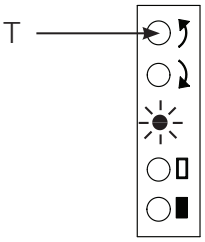


7.4 Tap the Close Limit button. The Green LED will turn on.

7.5 Move the Shade or Drapery to desired Close Limit by pressing arrow buttons.

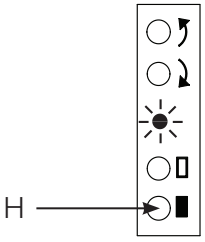


7.6 Press and hold the Close Limit button until the Green LED flashes. Close Limit is stored.



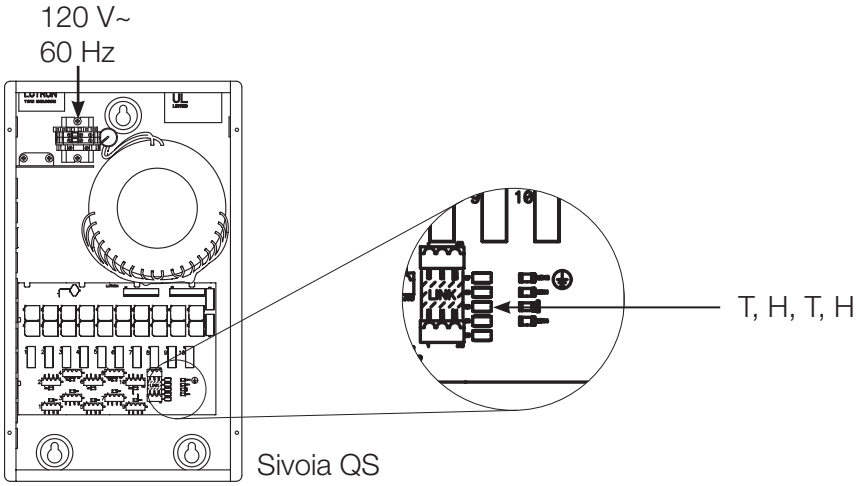
8 Verify Communication

From a Drive:

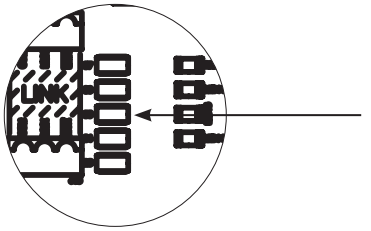


8.1 Press and hold Close (▮) for 5 seconds,

8.2 Tap CCW (↰) to enter Link Diagnostics mode
-All shades/draperies will wiggle*



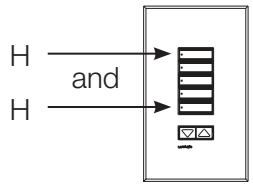
8.3 Press and hold Close (▮) to exit Link Diagnostics Mode.



From the Sivoia QS Smart Panel:

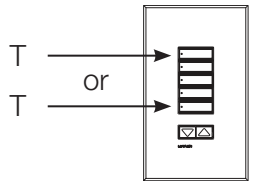
8.4 Tap Open, hold Open 5 seconds., tap Open, hold Open 5 seconds.
- All shades/draperies will wiggle*

8.5 Press and hold Open 5 sec. to exit Link Diagnostics mode



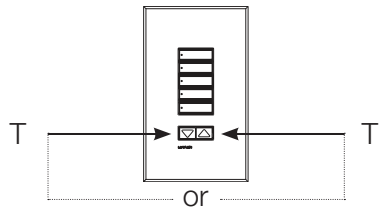
(*) If any shade/drapery is not wiggling, check the wiring

9 Assigning Shades/Draperies to Keypads



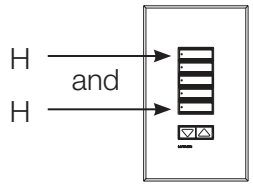
9.1

Press and hold Open and Close simultaneously for 5 seconds
-Shades/draperies that are assigned will move to close (down)
-Shades/draperies that are unassigned will move to open (up)



9.2

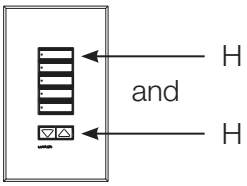
Tapping Open jogs “forward, Close jogs “backward” through the shades/draperies



9.3

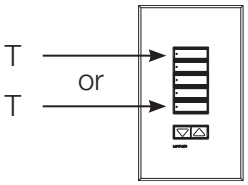
Tap the Lower (▽) to assign or Raise (△) to unassign a shade/drapery

9.4



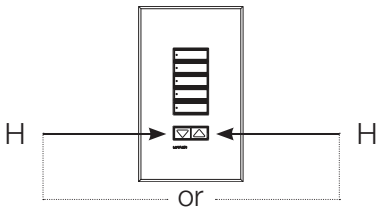
Press and hold Open and Close simultaneously for 5 seconds to exit

10 Setting Limits From a Keypad



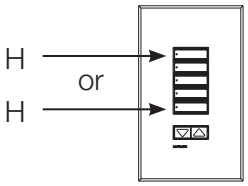
10.1

Press and hold Open and Raise (△) simultaneously for 5 seconds



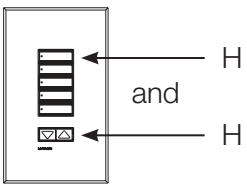
10.2

Tapping Open jogs “forward, Close jogs “backward” through the assigned shades/draperies



10.3

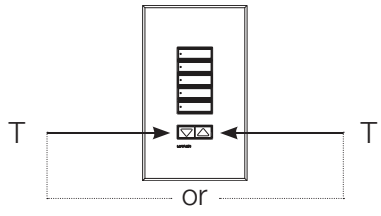
Use Raise (△) and Lower (▽) to adjust shade/drapery position



10.4

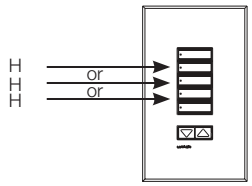
Press and hold Open for 5 seconds to store the open limit or Close for 5 seconds to store the close limit

10.5



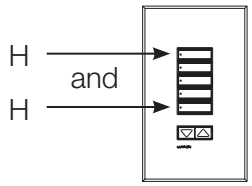
Press and hold Open and Raise (△) simultaneously for 5 seconds to exit

11 Storing Presets from a Keypad



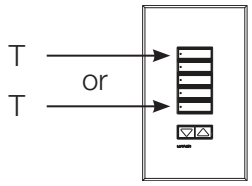
11.1

Adjust the shade/drapery to the desired position using raise or lower buttons.

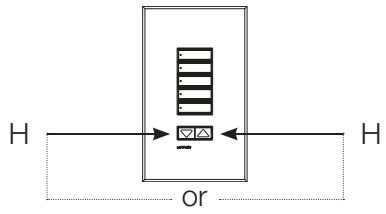


11.2

Store the current position of the shade/drapery by pressing and holding the desired Preset button for 5 seconds

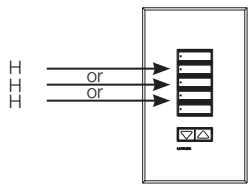


12 Individual Level Adjust

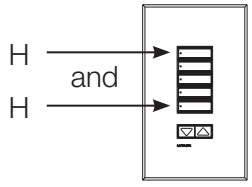


12.1 Press and hold Open and Close simultaneously for 5 seconds
-Shades/draperies that are assigned will move to close (down)
-Shades/draperies that are unassigned will move to open (up)

12.2 Tapping Open jogs “forward, Close jogs “backward” through the assigned shades/draperies



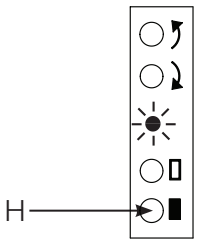
12.3 Use Raise (△) and Lower (▽) to adjust shade/drapery position



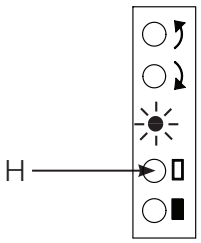
12.4 Repeat steps 12.2 & 12.3 to adjust additional shades/draperies

12.5 Store the current position of the shades/draperies by pressing and holding the desired Preset button for 5 seconds

12.6 Press and hold Open and Close simultaneously for 5 seconds to exit

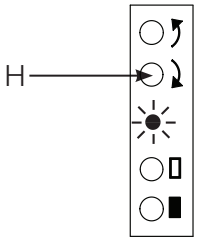


13 Programming | Restoring Drive Default Settings

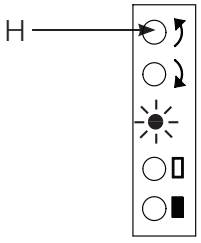


- Restoring a Drive to factory defaults will reset all keypad assignments but will not affect the open and closed limits.

Returning a Drive to its Factory Default Setting

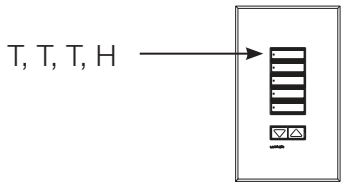


13.1 Press and hold Close Limit button until LED flashes Green then turns on steady.



13.2 Press and hold Open Limit button until LED flashes Green then turns on steady.

13.3 Press and hold CW arrow button until LED flashes Green then turns on steady.

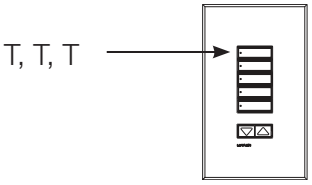


13.4 Press and hold CCW arrow button until LED flashes Green then turns on steady.

14 Programming | Restoring Keypad Default Settings

14.1

Triple tap and hold the top button on the keypad. DO NOT release the button after the third tap.



14.2

Keep the button pressed on the third tap until the LED next to the top button turns on solid (approximately 3 seconds).

14.3

Immediately release the button and triple tap it again. The LED next to the top button will flash quickly. When the LED stops flashing, the control has been returned to Factory Settings.

15 Troubleshooting

Symptom	Solution
Drive will not move	Drive is not powered - Check Drive power
	Fabric is obstructed - Free obstruction
	Drive not connected to keypad
Drive does not fully open or fully close	Limits have been set incorrectly - try using raise and lower buttons
	Fabric is obstructed - Free obstruction
Drive opens when pressing close button, and closes when pressing open button	Open and close limits have been reversed - Refer to “setting limits”
	Keypad wired incorrectly - Refer to wiring diagram
Drive does not move smoothly.	Check for binding of fabric
Keypad will not operate drive	Check that keypad is wired properly
IR controls will not operate shade, keypads work properly	IR transmitter does not have line of sight to IR receiver
	Out of range - Move to within 30 ft of IR receiver
Tripping fuse or breaker in power supply	Verify there is no obstruction in the path of the shade, drapery or carriers
	Verify the drapery stackback is not being over compressed
	Verify the Master Carrier is not driving into the idler end or adjacent Master Carrier

Limited Warranty

SCOPE

This limited warranty ("Warranty") covers the Lutron supplied (a) Sivoia Shade Systems ("Sivoia Shade Systems"), (b) manual shade system and (c) alternating current or a/c shade system (each of the foregoing being a "System"). Customer acknowledges and agrees that use of the System constitutes acceptance of all terms and conditions of this Warranty.

LIMITED WARRANTY

Subject to the exclusions and restrictions described below, Lutron warrants that each System will be free from manufacturing defects from the date of shipment by Lutron for a period of (a) one year as to the wall controls, interfaces and system accessories of the Sivoia Shade System ("External Sivoia Components") and (b) eight years as to the other Systems and the electronic drive unit, shade fabric and shade hardware of the Sivoia Shade System. If any manufacturing defect exists in the External Sivoia Components, so long as Customer promptly notifies Lutron of the defect within the one year warranty period and, if requested by Lutron, returns the defective part(s), Lutron will, at its option, either repair the defective part(s) or provide comparable replacement part(s). If any manufacturing defect exists in any of the components of a System other than the External Sivoia Components, so long as Customer promptly notifies Lutron of the defect within the eight year warranty period and, if requested by Lutron, returns the defective part(s), Lutron will, at its option, either repair the defective part(s) or issue a credit to the Customer against the purchase price of comparable replacement part(s) purchased from Lutron as provided below:

Number of Years from Date of Shipment	Percentage of Cost of Replacement Parts Credited by Lutron
Up to 2	100%
More than 2 but not more than 5	50%
More than 5 but not more than 8	25%
More than 8	0%

Replacement parts for the System provided by Lutron or, at its sole discretion, an approved vendor may be new, used, repaired, reconditioned, and/or made by a different manufacturer.

EXCLUSIONS AND RESTRICTIONS

This Warranty will be void, and Lutron and its suppliers will have no responsibility under this Warranty, if Lutron or its representatives cannot access any components of the System to inspect, diagnose problems with or repair the System or any of its components as a result of concealment or inaccessibility of such components within a building structure.

This Warranty does not cover, and Lutron and its suppliers are not responsible for:

1.Damage, malfunction or inoperability diagnosed by Lutron or a Lutron approved third party as caused by normal wear and tear, abuse, misuse, incorrect installation, neglect, accident, interference or environmental factors, such as (a) use of incorrect line voltages fuses or circuit breakers; (b) failure to install, maintain and operate the System pursuant to the operating instructions provided by Lutron and the applicable provisions of the National Electrical Code and of the Safety Standards of Underwriter's Laboratories; (c) use of incompatible devices or accessories; (d) improper or insufficient ventilation; (e) unauthorized repairs or adjustments or alterations; (f) vandalism; (g) an act of God, such as fire, lightning, flooding, tornado, earthquake, hurricane or other problems beyond Lutron's control; or (h) direct exposure to corrosive materials.

2.On-site labor costs to diagnose issues with, and remove, repair, replace, adjust, reinstall and/or reprogram the System or any of its components.

3.Components and equipment external to the System, such as, non-Lutron lighting and automation systems; building wiring audio-visual equipment; and non-Lutron time clocks, photosensors and motion detectors.

4.The cost of repairing or replacing other property that is damaged when any System does not work properly, even if the damage was caused by the System.

THIS WARRANTY IS IN LIEU OF ALL OTHER EXPRESS WARRANTIES. ALL IMPLIED WARRANTIES, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND OF FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED TO EIGHT YEARS FROM THE DATE OF SHIPMENT, EXCEPT THAT SUCH IMPLIED WARRANTIES ARE LIMITED TO ONE YEAR FROM THE DATE OF SHIPMENT AS TO THE EXTERNAL SIVOIA COMPONENTS.

NO LUTRON AGENT, EMPLOYEE OR REPRESENTATIVE HAS ANY AUTHORITY TO BIND LUTRON TO ANY AFFIRMATION, REPRESENTATION OR WARRANTY CONCERNING THE SYSTEMS. UNLESS AN AFFIRMATION, REPRESENTATION OR WARRANTY MADE BY AN AGENT, EMPLOYEE OR REPRESENTATIVE IS SPECIFICALLY INCLUDED HEREIN, OR IN STANDARD PRINTED MATERIALS PROVIDED BY LUTRON, IT DOES NOT FORM A PART OF THE BASIS OF ANY BARGAIN BETWEEN LUTRON AND CUSTOMER AND WILL NOT IN ANY WAY BE ENFORCEABLE BY CUSTOMER.

IN NO EVENT WILL LUTRON OR ANY OTHER PARTY BE LIABLE FOR EXEMPLARY, CONSEQUENTIAL, INCIDENTAL OR SPECIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO DAMAGES FOR PERSONAL INJURY, FAILURE TO MEET ANY DUTY, INCLUDING OF GOOD FAITH OR REASONABLE CARE, NEGLIGENCE, OR ANY OTHER LOSS WHATSOEVER), NOR FOR ANY REPAIR WORK UNDERTAKEN WITHOUT LUTRON'S PRIOR WRITTEN CONSENT ARISING OUT OF OR IN ANY WAY RELATED TO THE INSTALLATION, DEINSTALLATION, USE OF OR INABILITY TO USE THE SYSTEM OR OTHERWISE UNDER OR IN CONNECTION WITH ANY PROVISION OF THIS WARRANTY, EVEN IN THE EVENT OF THE FAULT, TORT (INCLUDING NEGLIGENCE), STRICT LIABILITY, BREACH OF CONTRACT OR BREACH OF WARRANTY OF LUTRON OR ANY OTHER PARTY, AND EVEN IF LUTRON OR SUCH OTHER PARTY WAS ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

NOTWITHSTANDING ANY DAMAGES THAT CUSTOMER MIGHT INCUR FOR ANY REASON WHATSOEVER (INCLUDING, WITHOUT LIMITATION, ALL DIRECT DAMAGES AND ALL DAMAGES LISTED ABOVE), THE ENTIRE LIABILITY OF LUTRON AND OF ALL OTHER PARTIES UNDER THIS WARRANTY ON ANY CLAIM FOR DAMAGES ARISING OUT OF OR IN CONNECTION WITH THE MANUFACTURE, SALE, INSTALLATION, DELIVERY, USE, REPAIR, OR REPLACEMENT OF THE SYSTEM, AND CUSTOMER'S SOLE REMEDY FOR THE FOREGOING, WILL BE LIMITED TO THE AMOUNT PAID BY CUSTOMER FOR THE SYSTEM. THE FOREGOING LIMITATIONS, EXCLUSIONS AND DISCLAIMERS WILL APPLY TO THE MAXIMUM EXTENT ALLOWED BY APPLICABLE LAW, EVEN IF ANY REMEDY FAILS ITS ESSENTIAL PURPOSE.

THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS. YOU MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE. SOME STATES DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS OR THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATIONS OR EXCLUSIONS MAY NOT APPLY TO YOU.

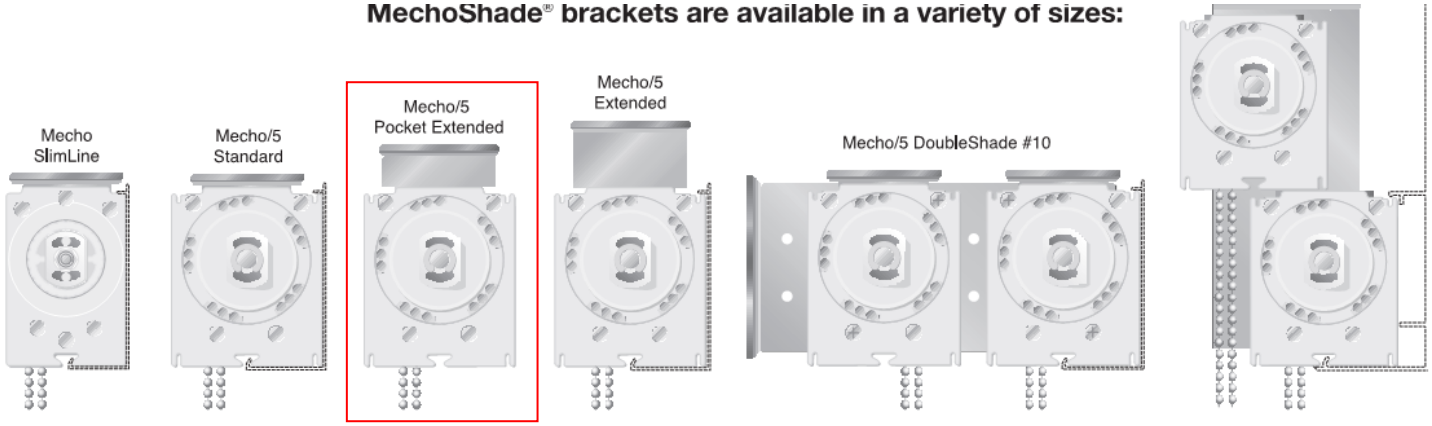
The MechoShade® Manual Drive System

Mecho®/5

Mecho®/5, MechoShade's latest patented design featuring an overrunning clutch, self lubricating components and larger diameter sprocket, providing 67% more lift capacity. As a result, Mecho/5 increases the shade size range that a manual drive system can lift before motorization is required. Plus, the Mecho/5 carries a **Lifetime*** Limited Warranty on the hardware and shadecloth.

Mecho/5 requires no adjustments, resulting in faster, easier installation. Mecho/5 has been field tested and performance proven on hundreds of thousands of shades installed worldwide. Available in Standard, Pocket Extended, Extended and DoubleShade® bracket sizes.



The Mecho/5 can accommodate shades up to 126" (320cm) wide by 180" (457cm) high.

Mecho® SlimLine™:

SlimLine™ is MechoShade's compact heavy-duty bracket system designed for small shades in narrow spaces, uses the Mecho®/3 operating system and carries a 10-Year Limited Warranty† on the hardware and shadecloth.

MechoShade® brackets are available in a variety of sizes:

Bracket Type			Max. Roll Diameter With Fascia	Max. Roll Diameter Without Fascia	Bracket Dimensions Without Optional Fascia, Roll Up Diameter or Wall Mount Bracket
Mecho® SlimLine™			2-1/4" (57mm)	2-3/4" (70mm)	2-3/8" (60mm) W x 3-3/4" (95mm) H
Mecho®/5 Standard			2-3/4" (70mm)	2-3/4" (70mm)	3" (76mm) W x 3-3/4" (95mm) H
Mecho®/5 Pocket Extended			N/A	4" (102mm)	3" (76mm) W x 4-3/8" (111mm) H
Mecho®/5 Extended			3-7/16" (87mm)	5" (127mm)	3" (76mm) W x 4-13/16" (122mm) H
Mecho®/5 DoubleShades®					
#10	Rear shade	Blackout	2-3/4" (70mm)	2-3/4" (70mm)	7-1/2" (191mm) W x 3-3/4" (95mm) H
#10	Front shade	Sunscreen	2-3/4" (70mm)	2-3/4" (70mm)	
#15	Top shade	Blackout	2-3/4" (70mm)	3-3/8" (86mm)	4-5/16" (110mm) W x 7-9/32" (185mm) H
#15	Bottom shade	SunScreen	2-3/4" (70mm)	4-5/16" (110mm)	

*Mecho/5 Lifetime Limited Warranty: for the life of the interior project, not to exceed 25 years. See pages 2.26 – 2.28 for specific details.

MechoShade® Parts, Components and Optional Accessories

Multiband MechoShade® exploded view and edge clearances

Edge clearances

Edge clearances = 1/8" (3mm). Shown: A Mecho/5 3-banded shade, right-hand drive, regular roll, no fascia. Mecho SlimLine is the same except the Drive-End clearance is 11/16" (17.5mm)

MechoShades are available in a choice of two drive systems in multiple bracket sizes.

1. Wall-Mount Angle
2. Fascia End Caps
3. Idle-End Bracket
4. Tube Plug (idle-end)
5. SnapLoc® Tube
6. SnapLoc Spline Mounting Channel
7. Snaploc Spline
8. Hembar (standard cloth covered)
9. Center Support Bracket
10. Tube Connector ("dog bone")
11. Tube Plug (Center Support)
12. Room Darkening Center Channel (double) (with Polybond Light Seal)
13. Exposed Hembar with Light Seal (Shown with Optional Welt)
14. Mecho®/5 Drive-End Bracket
15. Room Darkening Shadecloth Guides (pair)
16. Room Darkening Side Channel (single) (with Polybond Insert)
17. SnapLoc Regular-Roll Fascia
18. SnapLoc Reverse-Roll Fascia
19. Bead Chain Keeper
20. Upper and Lower Bead Chain Stops
21. Drive Chain (stainless-steel bead chain)
22. Heavy-Duty Bumper
23. Bead Chain Connector
24. Chain Retainer*
25. Optional Spring Loaded Chain Retainer*

Aluminum Accessory Finishes: Clear Anodized, White, Grey, Black, Quaker Bronze (Duranodic color) and Colonial White (fascia only)

*** Chain Retainers included for all residential and public facilities.**

Optional Regular-Roll Fascia available for: Mecho/5 Standard and Extended brackets and Mecho SlimLine™ brackets.
Optional Reverse-Roll Fascia available for: Mecho/5 Standard brackets. • No Fascia Available: Mecho/5 Pocket brackets.
For Edge Clearances of specific brackets see the last section of this binder.

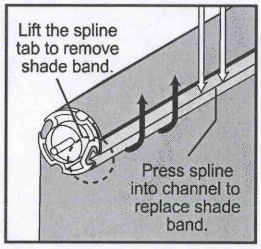
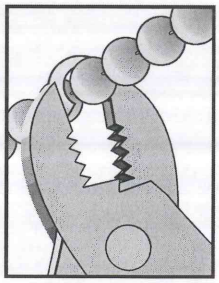
Maintenance Guide for MechoShade® and ElectroShade® Systems



Shadecloth Maintenance

The shadecloth is washable and it is recommended that the shadecloth be cleaned annually. To maintain the shadecloth properly, use a static eliminating chemical on a dry mop to occasionally wipe down the fabric and free it from dust. If the shadecloth should become spotted for any reason, such as from grease, etc., simply use a mild soap to "spot" clean.

MechoShade System



Changing the shadecloth on manually operated shades

Remove the top stop bead and then lower the shade so that the SnapLoc® Spline is visible. The spline, which is welded to the top of the shade cloth, can be removed from the tube by pulling the spline back towards the shade band so that it pops out of the channel a little at a time. A new shade band is easily inserted by centering the shade band left to right on the tube and pressing the spline into the channel. NOTE: Be sure that the winding direction of the shade band, toward or away from the window, is the same as when originally installed. The top stop bead is then reset at its initial position.

MechoShade Brackets and Chain Maintenance

Shade brackets require no maintenance other than the rare repair of a broken chain. If the chain breaks, it can be repaired by splicing with a chain connector or invisibly spliced by utilizing a pair of bead-chain splice pliers. If new chain is required, the length you require is twice the height of the unit less 2 inches. The chain is inserted into the bottom channel of the drive end bracket and led around the sprocket. To guide the chain into the offset-position slot, insert a thin plug into the chain slot to be bypassed. To attach one end of the chain to the other use a clasp which MechoShade Systems supplies. New bead stops should be placed in the same positions on the new chain.

MechoShade® Lifetime Limited Warranty Announcement

One of the best reasons to specify MechoShade is its LIFETIME*of dependability.

Introducing the MechoShade® and ElectroShade® System Lifetime* Limited Warranty.

We are so confident about the quality and dependability of our Manual and Motorized Shading Systems that we gave them a LIFETIME* Limited Warranty. MechoShade Systems, Inc. warrants to original purchasers that the hardware and shade cloths of dependable service of its Mecho/5™ Manual Shade System and ElectroShade Motorized Shade System (interior use products) are free of manufacturing defects in factory materials or workmanship for a LIFETIME*.

LIFETIME* Limited Warranty is defined to be the life of the project for which it was originally purchased, not to exceed 25 years from the date of shipment. This warranty does not depreciate in value.

See full warranty details on page 2.27 – 2.28.

MechoShade® Lifetime Limited Warranty (Non-Depreciating)

LIMITED WARRANTY
(interior product use)

MechoShade Systems, Inc. warrants to original purchasers that its Interior Use Products are free of manufacturing defects in factory materials or workmanship for the specified warranty period.*

- ThermoVeil®, EuroVeil®, Faux Natural™, EuroTwill™, Equinox™ and Soleil® brand **shadecloths** on the associated MechoShade®, ElectroShade®, or Suburban™/2 brand shade systems are warranted to be free of manufacturing defects in factory materials or workmanship for the specified warranty period.
- MechoShade®, ElectroShade®, SlimLine™ and Suburban™/2 brand **hardware** are warranted to be free of manufacturing defects in factory materials or workmanship for the specified warranty period.
- ElectroShade® Motors and Controls are warranted to be free of manu facturing defects in factory materials or workmanship for 5 years from date of shipment.
- Hardware and shadecloths have a Lifetime Warranty not to exceed 25 year from the date of shipment.
- All Limited Warrantees are subject to the general terms and conditions of sale. Copies are available upon request.

All in accordance with MechoShade Systems, Inc. Warranty General Terms and Conditions. The MechoShade Limited Warranties are exclusive and in lieu of all other warranties, whether written, oral or implied (including any implied warranty of merchantability, fitness for a particular purpose, or otherwise).

MechoShade®/5 System*

Lifetime Limited Warranty
to original purchasers on all hardware and shade cloths for the life of the interior project for which it was originally purchased, not to exceed twenty-five years.

MechoShade® SlimLine™ System*

10-Year Limited Warranty
to original purchasers on all hardware and shade cloths.

ElectroShade® System*

Lifetime Limited Warranty
to original purchasers on all hardware and shade cloths for the life of the interior project for which it was originally purchased, not to exceed twenty-five years.

5-Year Limited Warranty
on Motors and Electronics to be free of manufacturing defects in factory materials or workmanship for 5 years from date of shipment.

Suburban™/2 System*

10-Year Limited Warranty
to original purchasers on all hardware and shade cloths.

A 5-Year Limited Warranty
for motors and electronic controls.

MechoShade Systems'® Warranty General Terms and Conditions

From the Warranty portion of the MechoShade Systems, Inc. General Terms and Conditions of Sale

(INTERIOR USE PRODUCTS)

VII. WARRANTY

MechoShade Systems, Inc. MSS warrants to the original purchaser that its products are free of manufacturing defects in factory materials or workmanship for the following specified warranty periods:

Hardware and ShadeCloth (interior use):

- Lifetime of the interior project for which it was originally purchased, from date of shipment for the Mecho®/5 and ElectroShade Systems, but not to exceed 25 years.
- 10 years from date of shipment for the Mecho SlimLine System.
- 10 years from date of shipment for the Suburban™/2 System.

Electrical and Electronic Accessories:

- 5 years from date of shipment for ElectroShade products.
- 1 year from date of shipment for Suburban/2 products.

Bead chain in the manual system is a fail safe element and is not warranted.

Monumental Shades:

MechoShade Warrantee for Monumental Shades shall be limited to 10 years for hardware and shadecloth; 5 years for motors and electronics. Monumental Shades are defined to be any shade band over 300 Sq. ft. and shall be wider than 20 ft. and/or higher than 30 ft.

If any part of a MSS product (except for images or artwork on shadecloths) is found in the reasonable judgment of MSS to be defective in factory materials or workmanship during the above-prescribed warranty periods, MSS will repair or replace the defective part at its option. Repair or replacement under this warranty does not include labor or costs for installation, reinstallation, or removal of MechoShade products, parts or components. This warranty extends only to the original purchaser for MSS products installed by an authorized MechoShade dealer representative with a valid written dealer representative agreement with MechoShade® Systems, Inc.

This warranty does not apply if any of the following exclusions exist:

- The product has been subject to misuse, abuse, neglect, negligence, accident, or has been operated in any way contrary to MSS's operating instructions or specifications.
- Damages or conditions that have resulted from improper cleaning, maintenance, care or repair of the product.
- The product has been improperly installed or not installed according to MSS's guidelines or specifications.
- MSS's written instructions for installation and wiring of electrical connections were not followed.
- The product has been used to perform functions or operated in a manner contrary to its design or otherwise is used in a manner contrary to or in excess of MSS's specifications, drawings, or instructions.
- The product is used with electrical accessories or parts, including switches, relays, or other accessory components, that have not been previously approved in writing by the MSS Engineering Department.
- If any electrical accessories and other components have been used in disregard to the basic wiring diagram for which they were designed.
- Failure to comply with all MSS's written instructions and specifications.
- Repairs made necessary from normal wear of the product or by use of parts or accessories which are either incompatible with the product or otherwise adversely affect its operation, performance, or durability.
- Product used for non interior applications or otherwise exposed to outdoor environmental conditions.

MSS reserves the right to change or improve the design of any MechoShade product without assuming any obligation to modify or retrofit any product previously manufactured or supplied.

MSS does not warrant any images or artwork reproduced, printed, or placed on shade cloth by MSS or any imaging supplier, and MSS is not otherwise responsible or liable for fading, discoloration, color shifts, or any other failure or defect in such images or artwork.

MSS requires that the Buyer license or own the right to reproduce all images or artwork, photographs and other intellectual property provided by the Buyer, its agents, or customers. The Buyer shall indemnify, defend, and hold harmless MSS, its imaging supplier, and their employees and officers against any claims or actions for alleged or actual copyright or trademark infringement or any other claims resulting from reproduction of the images or artwork in any form or any other use of the images or artwork by buyer, MSS, it's imaging supplier, or other third parties.

THE FOREGOING WARRANTIES ARE EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES, WHETHER WRITTEN, ORAL OR IMPLIED (INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR OTHERWISE). MSS SPECIFICALLY DISCLAIMS ALL OTHER EXPRESS OR IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR OTHERWISE IN THEIR ENTIRETY. MSS' OBLIGATION UNDER THIS WARRANTY IS STRICTLY AND EXCLUSIVELY LIMITED TO THE REPAIR OR REPLACEMENT OF DEFECTIVE PARTS AS HEREIN DESCRIBED, AND MSS DOES NOT ASSUME OR AUTHORIZE ANYONE TO ASSUME FOR MSS ANY OTHER OBLIGATION, WHETHER WRITTEN, ORAL OR IMPLIED. NOTWITHSTANDING ANY OTHER REPRESENTATIONS OR AGREEMENTS BY ANY PARTY OR NON PARTY, WHETHER WRITTEN, ORAL OR IMPLIED.

MSS ASSUMES NO RESPONSIBILITY AND SHALL NOT BE LIABLE TO THE ORIGINAL PURCHASER OR ANY OTHER PARTY OR NON PARTY FOR ANY PERSONAL INJURY, LOSS, OR DAMAGE, WHETHER DIRECT, LIQUIDATED, INCIDENTAL, OR CONSEQUENTIAL, INCLUDING BUT NOT LIMITED TO THE LABOR OR COSTS RELATED TO THE REPLACEMENT OF A DEFECTIVE PRODUCT OR PARTS OR INSTALLATION, REINSTALLATION, OR REMOVAL OF SUCH PRODUCT OR PARTS, EXPENSE OF RETURNING A PRODUCT OR PART TO MSS OR ITS AUTHORIZED DEALER OR THE EXPENSE OF DELIVERING IT BACK TO THE ORIGINAL PURCHASER, LOSS OR DAMAGE TO PERSONAL OR REAL PROPERTY, LOSS OF REVENUE, LOSS OF THE USE OF THE PRODUCT, LOSS OF TIME, OR INCONVENIENCE.

This warranty gives the original purchaser specific legal rights, and the original purchaser may also have other rights which vary from state to state.

CARE & MAINTENANCE

Easier to maintain than other stone surface materials, such as granite, Viatera® will provide years of captivating beauty and hygienic reassurance. Please review the following section to ensure you get the most out of your Viatera Quartz countertops.

DESIGNER FAVORITES

HI-MACS

REGULAR CLEANING

Viatera is resistant to most stains including wine, lemon juice, tea, coffee, and fruits and vegetables. Normal cleaning only requires the use of a damp cloth and a mild household detergent. For best results, clean spills as soon as possible.

STAINS & SPILLS

While Viatera is stain-resistant, some stains might be more difficult to remove than others. For tough stains, mild non-abrasive cleansers are a good solution to restoring your surface?s original appearance.

- For dried spills, a non-abrasive scrub pad can be used. Rinse thoroughly and wipe with a damp cloth to remove all residue.

- For tough spots made by substances such as paint, gum, grease or food, carefully use a razor blade to scrape away the residue prior to cleaning. The scraping may leave a grey metal mark on the surface and can easily be cleaned off us a recommended cleanser and non-abrasive pad. Buff with a damp cloth.

- For stubborn spots or stains, apply a pad of soaked paper towels and approved cleanser to the area and allow it to sit for a few minutes. After proceed with necessary cleaning methods and buffing.

DARK COLORS AND HONED FINISHES

Honed finishes require more frequent cleaning to maintain their appearance. Metal marks, fingerprints and other signs of daily wear will be more apparent. The removal of visible marks such as these can be easily performed using a non-abrasive pad and any of the recommended cleaning products listed on this page.

Under ordinary use, dark colors will show dirt, dust, rubs, fingerprints and watermarks more readily than lighter-colored surfaces. Naturally, these colors will require more maintenance and upkeep to maintain their appearance.

VIATERA IS NOT INDESTRUCTIBLE!

Viatera is one of the toughest countertop surfaces available, but there are a few things that can damage it. Avoid contact with harsh chemicals or solvents, especially those containing trichlorethane or methylene chloride, found in car batteries, furniture strippers, oven cleaners, as well as products containing bleach. These substances can cause permanent discoloration and surface damage. In the event any of these agents come in contact with the surface, wipe immediately, rinse with water, and then clean with vinegar-based cleaner. If stain persists, contact the supplier/installer of your Viatera surface.

area.

Excessive/prolonged heat can damage your Viatera surface — always use a trivet between the countertop and any hot pan or heat source. While Viatera is scratch-resistant, materials harder than quartz can scratch it. For example, the bottom of some ceramic dishes may be abrasive enough to inflict minor damage to the surface. Also, be aware that Viatera can be chipped or cracked if it is heavily impacted.

THE FOLLOWING ARE RECOMMENDED BLEACH-FREE, NON-ABRASIVE COMMERCIAL CLEANERS FOR THE ROUTINE CARE AND MAINTENANCE OF YOUR VIATERA QUARTZ SURFACE:

- Simple Green® lime-scale remover
- Vinegar cleaner (diluted)
- Bar Keeper's Friend®
- Formula 409® Glass and Surface Cleaner
- Lysol®
- Greased Lightning®

ROUTINE CARE AND CLEANING

LAMINATE:

To clean the surface, use a damp cloth or sponge and a mild soap or detergent. Difficult stains such as coffee or tea can be removed using a mild household cleaner and baking soda; mixing to achieve a paste consistency. Use a stiff nylon bristle brush, scrubbing (approx. 15-20 strokes) the affected area. Do not scrub so as to mar (damage, scratch) the surface finish.

Stubborn stains that resist any of the above cleaning methods may require the use of undiluted household bleach or nail polish remover. Use a cotton ball saturated with bleach or nail polish remover (acetone); gently rub the stain for up to two minutes. Rinse thoroughly with warm water and wipe dry using a soft cloth. This step may be repeated if the stain appears to be going away and the color of the laminate has not been affected.

WARNING: Prolonged exposure of the laminate and powder coat surfaces to bleach will cause discoloration. Always rinse laminate and powder coat surfaces after cleaning! Failure to rinse after cleaning can cause damage; even if a small amount of cleaning solution remains on the surface. A dry residue may be invisible; however, moisture from cups or drinks can reactivate it, and result in permanently etched scars or stains over time.

Recommended Household Cleaners:

- Clorox®*
- Formula 409®
- Dawn®
- Glass Plus®
- Dow Bathroom Cleaner with Scrubbing Bubbles™
- Fantastik®
- Favor®
- Windex®
- Lestoi®
- Pledge®
- Grease Relief®
- Lysol® Brand Disinfectant Basin/Tub/Tile Cleaner
- Mr. Clean®
- TOP JOB®

* Prolonged exposure can mar the surface

A Few Notes of Caution:

Acidic or **abrasive** cleaners can damage laminate and powder coat surfaces; do not use them. Drain cleaners containing lye will permanently damage the laminate surface. If you spill a drain cleaner, wipe it up immediately and rinse several times with water.

Hair, textile and food **dyes** can cause permanent stains. If dye should happen to spill, wipe it up immediately with dishwashing detergent or an all-purpose cleaner.

Wipe spills away promptly and rinse several times with water.

Rust removers contain harsh chemicals, which will quickly cause permanent damage. If a spill occurs, wipe off all residues immediately, wash thoroughly with soapy water and rinse several times.

Steel wool and other abrasive pads will damage the laminate and powder coat face. Do not use them for cleaning and don't store steel wool pads on your countertop; the metal can rust and leave stains.

Toilet bowl cleaners contain harsh chemicals that can cause permanent damage. If spills occur, wipe up immediately, wash surface with soapy water and rinse several times.

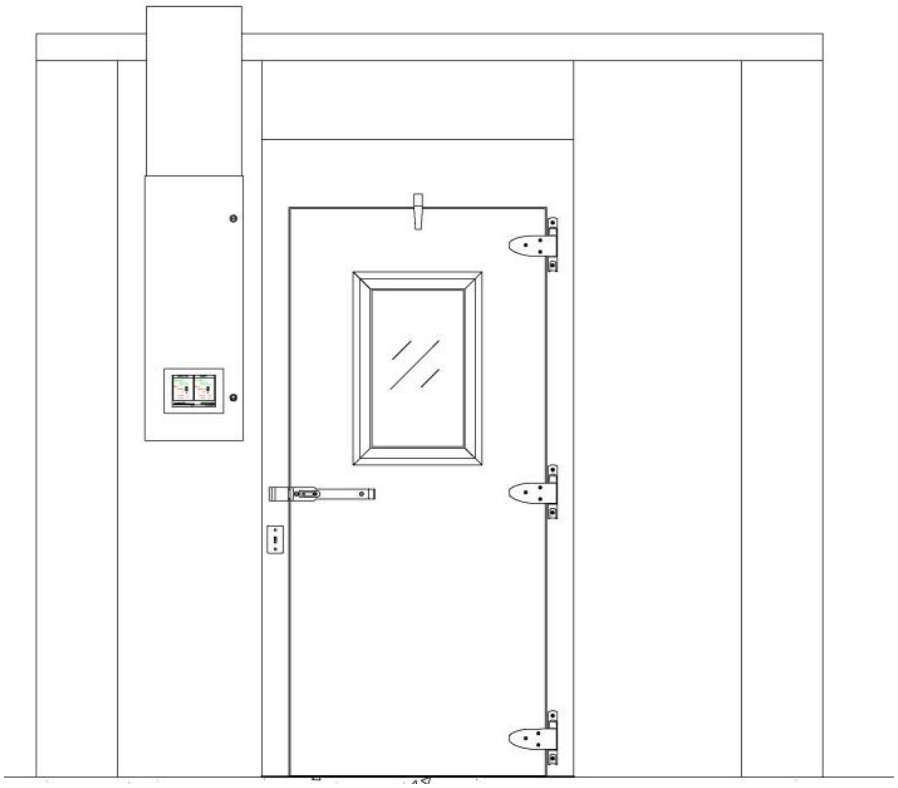
The cleaners listed below can cause damage to the surface of laminate:

Chemical Ingredient	Synonymous Names
Hydrochloric Acid	Muriatic Acid Hydrogen Chloride
Sulfuric Acid	Oleic Acid Oil of Vitriol Oleum
Hydrofluoric Acid	Rust Remover
Phosphoric Acid	Rust Remover
Sodium Hydroxide	Caustic Soda Caustic Lye Soda Lye
Pumice (abrasive)	

Remember, sharp objects can damage the surface of laminate and powder coat surfaces, marring its beauty and lowering wear and stain resistance. Although the laminate and powder coat surfaces are somewhat resistant to scratch and marring, they can be damaged, even under normal use.

Laminate and powder coat surfaces may need occasional dusting depending on where it's used. To keep the surface beautiful, use a non-oily furniture spray. (Remember to clean the spray off several times a year to prevent build-up.) Furniture polish can also help hide fine scratches in the surface.

UPHOLSTERED FABRIC:



Clean with water-based cleaning agents, foam or pure water-free solvents.

Vacuuming or light brushing is recommended to prevent dust and soil buildup.

For answers to additional questions regarding care or cleaning please contact Sedia Systems.

1. Introduction

BioCold Environmental rooms offer exceptional temperature and humidity control, as specified, for a wide range of applications. This manual is prepared for the walk-in environmental room installed at Webster University for the Interdisciplinary Science Building (ISB) in Webster Groves, Missouri. This manual contains information needed for proper operation of the BioCold environmental room. This chamber uses a BioCold Continuous Refrigeration system with hot gas bypass system with resistive heat, designed to accurately control room temperature at +4°C with ambient / non-condensing.

The control console also complies with the Americans with Disabilities Act (ADA). The BioLogic™ touchscreen allows system monitoring with a secure and dynamic interface at the screen or remotely.

This manual contains information needed for proper operation of the BioCold environmental rooms using the BioLogic™ touchscreen. For any questions or troubleshooting information not addressed in this manual, please contact the BioCold Environmental factory in Ellisville, Missouri (USA) at 636.349.0300 or service@biocold.com.

2. Principles of Operation

The BioCold refrigeration system operates as a "continuous proportional hot gas bypass system." The compressor / condenser unit operates 100% of the time and does not cycle on/off or pump down even during a defrost cycle. BioCold takes the third refrigeration line (5/8" hot gas line) to the evaporator and introduces this through a side port manifold after the liquid expansion valve and before the distributor. The three refrigeration lines are introduced to the room through the ceiling and directly into the side of the air handler with only a few inches of exposed refrigeration lines. The liquid and hot gas solenoid valves are set on top the room, located near the ceiling stub out of the three refrigeration lines.

The BioCold control system includes a 7" color touchscreen user interface as well a programmable logic controller (PLC) with integrated process controls. The PLC is a modular system that includes a temperature process module, as well as dedicated logic modules for controlling chamber components. All operating parameter changes can be made via password-protected access at the color touchscreen interface, which also offers alarm history log and chamber trend data recording.

During normal operation, the 3/8" liquid line (cooling) solenoid valve (Sporlan Model XUP) and the 5/8" hot gas line (heating) solenoid valve (Sporlan Model XRM) cycle in order to control temperature in the evaporator coil. Both valves are normally closed and open when energized.

These valves are controlled by the microprocessor-based temperature controller with a 3/32 VDC output from a solid state relay inside the controller. This signal operates two (2) triac relays with one normally open for the liquid valve and the other normally closed for the hot gas valve. Thus, when one valve is open, the other is closed.

During normal operation, if there is a low temperature alarm event, the control signal is removed from both triac relays, causing both normally closed solenoid valves to close, the unit to pump down, and the compressor to shut off on low suction pressure control. When the remote interlock circuit is wired in series with the compressor contactor, both pump down and contactor coil interlock will occur during a low temperature alarm event. Also during a low limit alarm event in the cold rooms (default alarm temperature of +1°C), the alarm and compressor will cycle on / off, due to the fact that the room will begin to warm as soon as the compressor shuts off. When the room warms above the low limit alarm setpoint, the compressor will come back on, again dropping the temperature below the low alarm setpoint until the malfunction is diagnosed and remedied.

The control console is protected at all times. The unit is wired with a branch circuit using UL489 circuit breakers. Independent temperature safety limit controls are present for high and low temperature monitoring. Remote dry contacts also protect the mechanical equipment. Both an audible and visual alarm, and if applicable, personnel emergency alarm indicators are present as an additional safety feature; the alarm includes an adjustable delay and callback features.

3. Chamber Operations

The BioCold BioLogic™ Console is located on the walk-in exterior wall adjacent to the entry door. The console has a 7" color touchscreen and is connected to the component box mounted on top of each room via low voltage (24VDC) connections. This touchscreen has an "always on" display and high-precision touch accuracy for easy reference and adjustment.

All normal chamber operations are controlled at the BioLogic™ control panel, with temperature setpoint, current temperature reading, alarm setpoints, alarm history, temporary silence switch, and data logging / trend screen incorporated into the control panel. The component box houses the controls that operate the following: interior evaporator fans, lights, heaters, dehumidifier, and alarms.

NOTE: The component box contains equipment that operates on 115/230V, 1-phase or 3-phase power. This component box has a rotary disconnect and should only be opened by a trained professional.

3.1. Overview and Startup

Operation begins by applying power at the circuit breaker panel. After a few seconds of a self-test warm-up, the system will be ready to operate. The desired operating temperature is set or verified on the MAIN screen. The wide range rooms can be set to any temperature between +2°C and +40°C.

The startup procedure requires the user to have administrator privileges to modify the factory parameters like the setpoint. Details of each screen are provided in its corresponding section below.

a) Ensure control console and condensing unit have power and power disconnects are in ON position.

b) Touch LOG ON button on welcome screen (Figure 1, left).

c) Enter the appropriate USER NAME and PASSWORD in the LOG ON popup window.

d) Touch MAIN button on the welcome screen.

e) Set controller setpoint to desired operating temperature.

NOTE: If room is in alarm condition on initial startup, temporarily adjust alarm settings to mitigate an alarm condition. Alarm settings can be readjusted once room reaches normally operating temperatures.

3.2. BioLogic™ Screens and Windows

BioCold designs specialized screens for the control console that monitors and modifies changes in the CER. This section educates the user on the basic functions and / or operations of the screen and its corresponding windows that may pop-up during user options, configuration settings or alarms.

NOTE: The control console screens for your specific CER may vary slightly from those shown in this manual as each console is uniquely tailored for each room. This manual allows the user(s) to gain basic understanding to control the console and its settings.

3.2.1. Log On Window

The LOG ON window (Figure 1) will appear when the LOG ON button is selected. Each parameter has a predetermined security setting in which a user only with that security level or higher may modify that specific parameter. Details are provided in the corresponding Security section below.

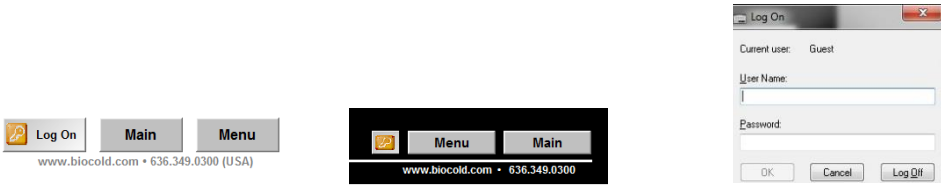

Figure 1. Log On Window

3.2.2. Main Screen

The BioLogic™ MAIN operating screen (Figure 2) navigates to all the information needed for normal system monitoring, including temperature and humidity, as applicable, setpoints, current temperature and / or humidity reading(s), and high / low alarm setpoints. The MAIN button is available on each console screen. The temperature or humidity setpoint is changed directly from the MAIN screen or the TEMPERATURE TUNING screen.

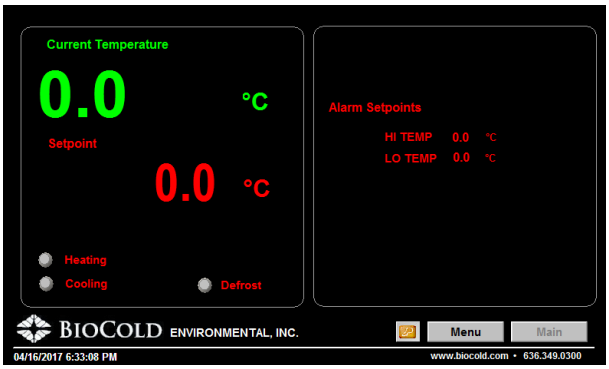

Figure 2. Main Screen

The MAIN screen also displays the status of various parameters, based on the specifications of the room. The status will show a green circle when that parameter is enabled or active. Examples of the various statuses available for display include, but are not limited to, (1) the heat being pumped in via resistive heater(s) or hot gas typically, (2) the cooling of the liquid valve(s), (3) the humidifier(s), (4) dehumidifier(s), (5) defrost, and / or (6) the specific system or zone in a multi-system or multi-zone chamber.

NOTE: When a loss of power to the control panel occurs, an error message may be seen. This is due to the RTD resetting itself; at initial power, the RTD reads a temperature of -270°C, which results in a failure / alarm. This is as-designed and allows the personnel to acknowledge the power incident and assess any other conditions as needed.

To adjust any parameters, users must first log on with the corresponding privileges (See Security, Section 3.3.).

Once logged on, the user may adjust temperature setpoints either by using the + / - buttons, or by using the popup keypad (Figure 3) to input the specific value. To access the popup keypad, first click on the setpoint digits (in Figure 2, this would be "0.0") to view the cursor, and then double-click to activate the popup keypad.

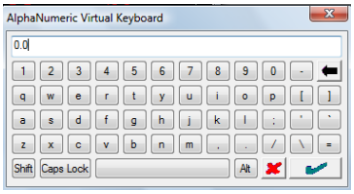

Figure 3. Alphanumeric Keyboard

3.2.3. Menu Screen

The BioLogic™ MENU operating screen (Figure 4) navigates to all the information needed for normal system monitoring, including temperature and humidity, as applicable, setpoints, current temperature and / or humidity reading(s), and high / low alarm setpoints. The MAIN button is available on each console screen. The temperature or humidity setpoint is changed directly from the MAIN screen. The screen contains buttons for each page needed for chamber operation. Based on the logon privileges, unavailable features will be grayed and non-selectable. The MAIN button is available on each console screen.

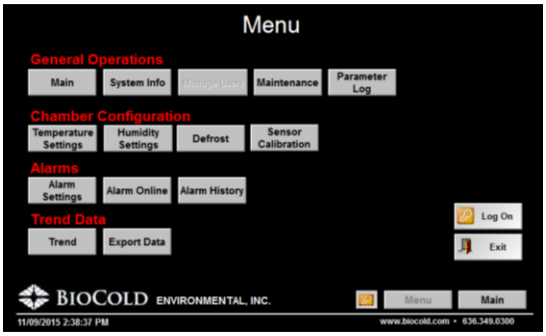

Figure 4. Menu Screen

The MENU screen is divided into four primary options and CER-dependent secondary options of control:

1. General Operations
    a. Main
    b. System Info
    c. Factory (for BioCold or authorized use only)
    d. Log On
    e. Exit (user must be logged on)
2. Chamber Configurations (may include but are not limited to these options)
    a. Temperature Settings
    b. Defrost Settings (not applicable for warm rooms)
    c. Humidity Settings
    d. Redundancy Settings
    e. Grow Lights
    f. Sensor Calibration

   g. Parameter Log
   h. Ventilation
3. Alarms
   a. Alarm Settings
   b. Alarm Online
   c. Alarm History
4. Trend Data
   a. Trend
   b. Export Data.

These screens and any corresponding windows not identified earlier are further detailed in its corresponding sections.

3.2.4. System Information (Startup) Screen

The BioLogic™ SYSTEM INFORMATION screen (Figure 5) is the central screen to navigate to other screens, if needed. The user can LOG ON via this screen or the MENU screen. The information on this startup screen cites factory information such as the version of the software and its corresponding project name.

Figure 5. System Information (Startup) Screen

3.2.5. Parameter Log Screen

The BioLogic™ PARAMETER LOG screen (Figure 6) is a table that is automatically generated to display changes made by a user to the settings of the control console. The timestamp, details of the change, new value, previous value, and user, respectively are captured in this table.

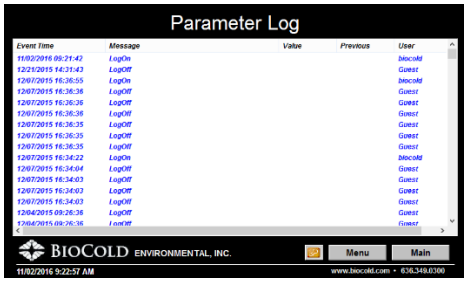

Figure 6. Parameter Log Screen

3.2.6. Maintenance Schedule Checklist Screen

BioCold Environmental highly recommends the upkeep and maintenance of the CER (see Section 3.5). The MAINTENANCE popup window (Figure 7a) provides a reminder for Facilities and/or the responsible team to ensure that the scheduled maintenance is performed. To remove this popup window, hit the Maintenance Reminder acknowledged button.

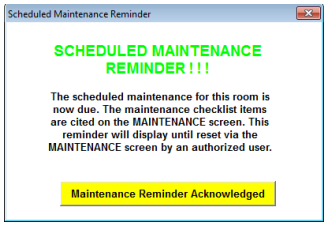

Figure 7a. Maintenance Schedule Checklist Screen

The MAINTENANCE screen (Figure 7b) will appear with maintenance information. The checklist includes:

1. Check the fan motor operations
2. Remove any obstructions from fan intake
3. Clean any dust accumulation from compressor / condensing unit
4. Verify the alarm settings and modify as needed
5. Clean the condenser coil, based on the hours of operation.

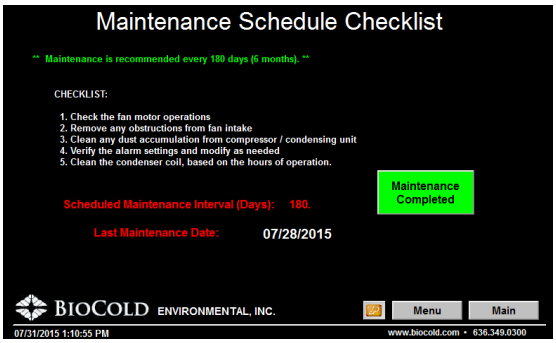

Figure 7b. Maintenance Schedule Checklist Screen

A scheduled interval of 180 days is recommended. This field is editable but a value no greater than 180 days is suggested to ensure that the equipment is checked and operates as specified by the requirements. Once this maintenance is completed, the authorized user will select the MAINTENANCE COMPLETED button and the "Last Maintenance Date" will show as that current day and the interval clock will reset.

3.2.7. Temperature Configuration (Settings) Screen

The BioLogic™ Control Panel incorporates a microprocessor-based Proportional, Integral, and Derivative (PID) controllers for both temperature and humidity (where applicable). These controllers use the PID bands to provide straight-line control.

The TEMPERATURE CONFIGURATION (settings) screen (Figure 8) includes all the parameters needed for temperature operation and adjustment. This single room operates under a single sensor.

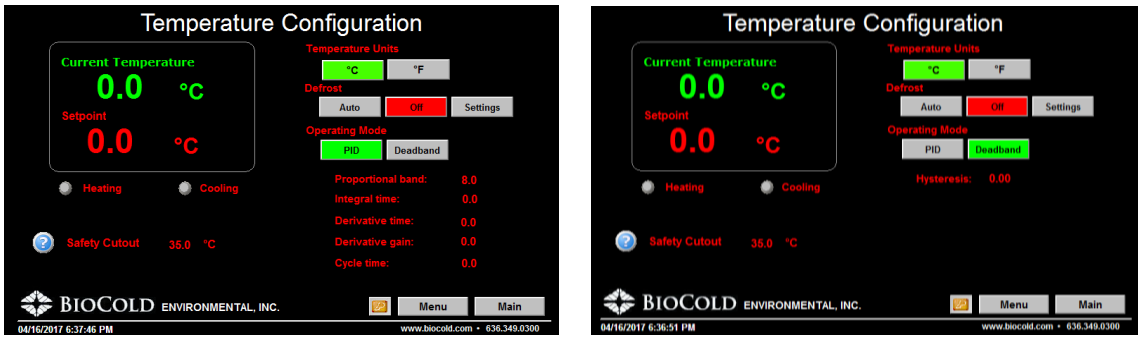

Figure 8. Temperature Configuration Screen with Deadband (left) and PID (right) Mode

The standard operating temperature of the room determines the available parameters on the screen. For example, a cold room or freezer will include the defrost setting. A stability, warm or wide range room may include Chamber Temperature Limits (i.e., cut-outs and cut-ins), which are set values to efficiently use as well as protect the equipment for the CER. More detail is provided in the Additional Information, Warning and Alarm Screen(s) section below.

3.2.7.1. Temperature Setpoint

To adjust the temperature setpoint, click on the temperature setpoint value, and use the popup keypad to adjust chamber temperature. Two operating modes are available: PID or Deadband or hysteresis control.

3.2.7.2. Temperature Units

The user has the option to select the units of temperature. Both the English unit of Fahrenheit and the metric unit of Centigrade (Celsius) are available. The numeric value of the temperature will be converted automatically based on the selected unit.

NOTE: When selecting a different temperature unit, the alarm may be triggered because the range of the alarm setting has not changed. An authorized user will need to adjust this value via the ALARM SETTINGS screen to disengage the alarm based on the selected unit for temperature.

3.2.7.3. Temperature Operation Modes

For normal operation, PID mode provides the tightest control. Each of the PID parameters may be individually adjusted using the Proportional Band, Integral, Derivative and Cycle Time parameters.

3.2.7.3.1. PID Mode

When in PID, five (5) control tuning parameters are calculated: Proportional Band, Integral Time, Derivative Time, Derivative Gain, and Cycle Time.

The default values for the temperature modes are:

1. Proportional Band: 2.0
2. Integral Time = 250.0

3. Derivative Time = 60.0
4. Derivative Gain = 1.0
5. Cycle Time = 15.0

a) **Proportional Band:** This band is a percentage value or amount of change for the input parameter to generate a full change (0 to 100% or vice versa) in the output of the controller. The narrower the band, the smaller the area of the controller's proportioning action. This value is also referenced as the gain, which is the reciprocal of the proportional band. For example, a PB = 25 will have a change of 100% in the output when the parameter has changed by 25° from the setpoint. Trial-and-error settings may need to be tried to achieve the desired PB control.

   a. The desired PB results in a value very close to the setpoint. In the Figure 9 below, the temperature oscillations of the purple line mimics that with close to ideal tuning, with the red line as the setpoint.

   b. If the result seen is more similar to the blue line with large over-and under-shooting values, then adjust the PB to one-half the current value.

   c. The green line correction action would be to multiply the PB by 2x since no oscillations are detected.

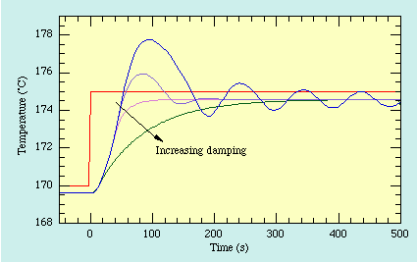

Figure 9. PID Oscillation Adjustments Graph

b) **Integral Time:** This reset adjusts the proportional bandwidth to the setpoint; this function of time compensates for the offset from the setpoint. Excessive overshoot may indicate that this value is set too high; output oscillations indicate that the Integral value may be too low. Note that changes to this value require a corresponding change in the Derivative Time; these values are inversely proportional.

c) **Derivative Time:** This value adjusts for the expected rate of the rise/fall of a system parameter like the temperature, and allows for an automatic modification of the proportional band to reduce the magnitude of the offshoot value. Excessive overshoot may indicate that this value is set too high as with the Integral Time. Note that changes to this value require a corresponding change in the Integral Time; these values are inversely proportional.

d) **Derivative Gain:** The other derivative parameter is the derivative gain. The magnitude of the derivative error to the control action is the derivative gain. If the controller is determining a significant change, the derivative value creates a "slowing" action for the change requested by the controller. The default derivative gain is 1.0.

e) **Cycle Time**: This time is also known as the duty cycle of the controller, which equates to the total length of time for the full on/off cycle. The unit for the cycle time is seconds and governs the frequency with which the controller monitors system conditions. A shorter cycle time will provide closer temperature control, with more frequent indexing of the refrigeration solenoid valves. Longer cycle time results in less frequent valve indexing with a gradual loss of straight line control as the cycle time value increases.

Controls are factory set with a cycle time of five (5) seconds, but this value may be adjusted to any non-zero value.

3.2.7.3.2. Deadband Mode

When in Deadband mode, hysteresis determines the operations. The hysteresis is the value above / below the set point that the operating condition does not change. For example, if the hysteresis is 1.0 and the temperature setpoint is +4.0°C then the heating will turn off at +5.0°C and turn off at +3.0°C. The general idea is to have a more steady heating or cooling when the temperature outside a range of tolerance.

The default hysteresis value is 0.1.

Chamber Temperature Limits (i.e., cutouts and / or cutins) are set values to efficiently use as well as protect the equipment for the CER. More detail is provided in the Additional Information, Warning and Alarm Screen(s) section below.

3.2.8. Defrost Setting Screen

The defrost setting can be accessed via the MENU screen or the TEMPERATURE CONFIGURATION (Figure 10) screen. Defrost cycles are not typically needed on BioCold rooms operating at +4°C or above, and the defrost cycles will default to ON for freezer rooms. Details of this screen are provided in its corresponding section below.

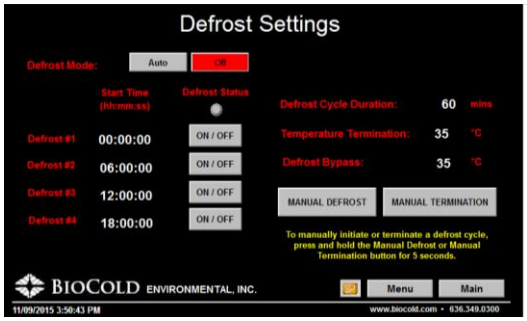

Figure 10. Defrost Setting Screen

In the event that regular defrost cycles do become necessary, the user sets this parameter by selecting the AUTO button for defrost on the Temperature Configuration Screen. The display allow the user to adjust the start times and duration of defrost cycles, up to four (4) cycles per day. The settings on the Defrost Settings screen will control defrost cycles when the Defrost Mode is set to AUTO, currently the button shows as OFF next to the corresponding start times. The defrost time clock is based on the touchscreen internal clock on the lower left corner.

This screen allows the authorized user to adjust the start times and duration of defrost cycles, up to four (4) cycles per day. Enter the start time using the military format for each cycle. For example, 2:15pm would equate to 14:15:00 value for the start time. The defrost cycles are individually enabled by selection the ON/OFF button next to the corresponding defrost start time. When the ON/OFF button is gray, that defrost cycle is disabled; when the button is green, the defrost cycle will trigger at the start time.

To enable the defrost cycles; select the Defrost Mode to AUTO in the DEFROST MODE field. Each individual cycle must be also enabled (i.e., set to ON (green)) to start the defrost cycle. To disable all the defrost cycles for the room; select the OFF button in the upper left for the DEFROST MODE field.

Note: The defrost time clock is based on the touchscreen internal clock on the lower left corner.

The room can be controlled manually for the defrost cycles. The MANUAL DEFROST button allows the room to start manually defrosting at that button request and will last based on the DEFROST CYCLE DURATION value entered. Alternately, if the system is currently in defrost mode, the MANUAL TERMINATION button allows the authorized user to instantly stop the current defrost cycle

3.2.9. Calibration Screens

The chamber is equipped with offset calibration capabilities for the temperature and humidity (as applicable) sensor(s), which can be accessed via the SENSOR CALIBRATION button on the MENU screen. Two calibration options are available to more accurately adjust to the room's present value temperature.

3.2.9.1. Calibration Mode

To calibrate chamber temperature on the CALIBRATION MODE screen (Figure 11), adjust the sensor calibration offset so that the system reading aligns with the standard instrument.

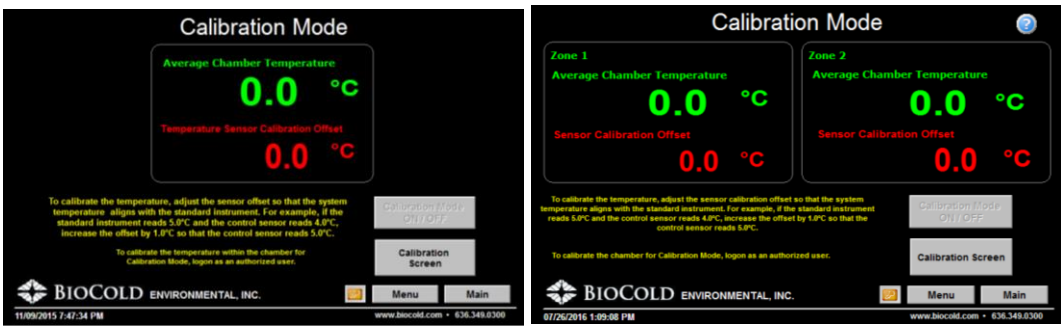

Figure 11. Sensor Calibration Mode Screen

Entering a negative value as the offset will subtract this value from the average sensor reading; a positive value for the sensor calibration offset will raise the sensor reading. This value is added to the current sensor reading prior to initially computing the average value.

The CALIBRATION MODE button allows the room to be calibrated by disabling all outputs from the PLC as well as the corresponding alarms. Only an authorized user can access this mode.

The CALIBRATION SCREEN button displays a new screen to allow adjustment to the average chamber parameters for mapping purposes.

3.2.9.2. Calibration with Uniformity Offset

The dimensions of a larger chamber can result in varying sensor readings. The sensor temperature is the averaged sensor calibration offset plus an initially averaged chamber parameter, given no uniformity temperature calibration offset.

The uniformity calibration offset is the value obtained during the room mapping process. The final averaged chamber temperature is the addition of the uniformity calibration offset with the average of both the sensor reading and the sensor calibration offset.

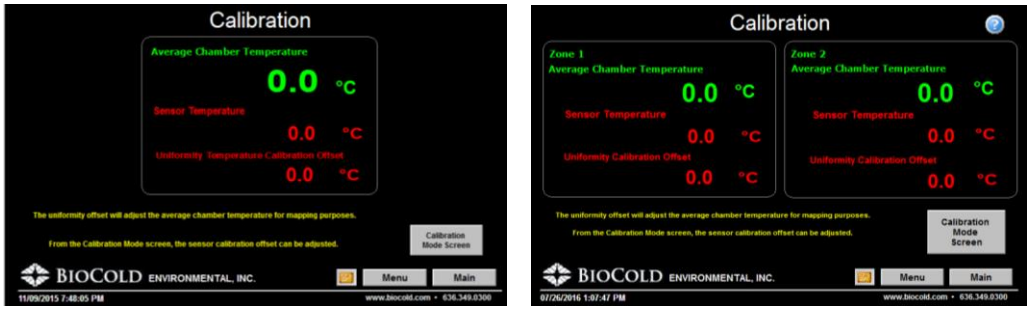

Figure 12. Calibration Screen

On the CALIBRATION SCREEN (Figure 12), entering a negative value as the offset will subtract this value from the average sensor reading; a positive value for the sensor calibration offset will raise the sensor reading. To enter a new value, double-tap on the sensor calibration offset value and use the popup on-screen keyboard to enter new values. This value is added to the current sensor reading prior to initially compute the average value.

3.2.10. Alarm Settings Screen

The BioLogic™ system provides alarm outputs if the room temperature. The high and lows of the parameters for this room are set in this screen (Figure 13) and are also displayed on the MAIN screen. Additional alarm parameters for delays and callbacks are also editable on this screen.

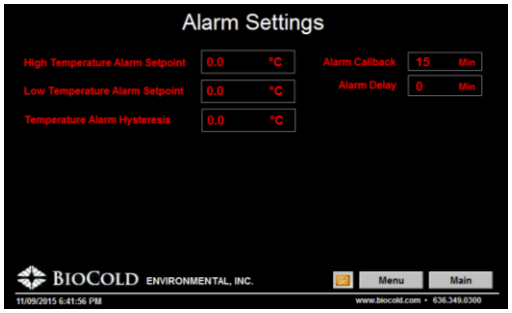

Figure 13. Alarm Settings Screen

3.2.10.1. High and Low Alarms

The high and low setpoints for the high and low alarms, respectively, can be set for the temperature as well as the humidity, if applicable. This value will trigger an alarm when the present value exceeds the high alarm setpoint or falls below the low alarm setpoint.

Upon operation near the desired setpoint the alarms can be set to the desired tolerance around the setpoint. BioCold recommends setting the alarms a minimum of 2.0°C from the setpoint to minimize the possibility of setting the alarms off when the door is left open for short periods of time. Do not change any other menu items

when setting the alarms. The operator with the appropriate security level may set these alarms based on site requirements and specifications.

3.2.10.2. High and Low Alarm Indicator

When an alarm event occurs, the audible alarm will sound and an alarm popup (Figure 14) will appear on the screen. To temporarily silence the audible alarm, press the ALARM SILENCE button. Use the ALARM DETAILS button to obtain the details of alarm and the alarm can also be silenced from this screen. This screen is also available on the MENU screen utilizing the ALARM ONLINE button for the status. See the below section for more details on the ALARM ONLINE screen.

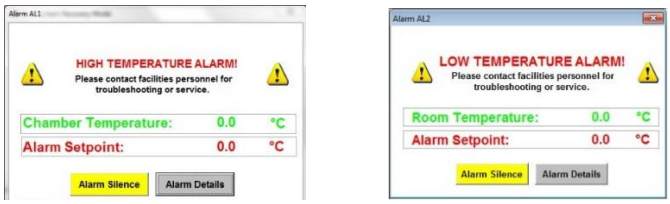

Figure 14. Temperature Alarm Popup Windows

The audible alarm, i.e., buzzer, will continue until the alarm condition is remedied or the alarm is manually silenced by the operator. If the alarm is manually silenced, the alarm will re-sound based upon the Alarm Callback value if the chamber is still in alarm condition.

3.2.10.3. Callback and Delay Timers

There are various timers associated with the alarms. Typically, two types of timers are available: callback timer and delay timer.

The callback timer re-sounds the alarm after the Alarm Callback value has elapsed and the CER is still in the alarm condition. The callback timer will be reset if the alarm condition is remedied. This timer is used to silence the timer in order to contact an authorized user, facilities, and / or BioCold to investigate this alarm as needed.

The delay timer prevents the alarm from triggering and the buzzer from sounding until the Alarm Delay value has elapsed. The delay timer also delays any of the fail-safe triggers until this delay value has completed. This delay is useful when often opening or closing the door for extended periods of time or other circumstances where there are known and frequent external factors that may trigger an alarm otherwise

3.2.11. Alarm Online (Status) Screen

The ALARM ONLINE (Figure 15) screen cites the status of the current or past alarms within this chamber. When an alarm event occurs, the ALARM ONLINE screen provides details concerning the nature of the alarm and user responding to the alarm. The specific details are:

a) the time the alarm occurred;
b) the type of alarm (i.e., high temperature alarm);

c) the time the alarm event cleared/normalized;
d) the user who acknowledged the alarm condition.

Additional fields may be selected by the user using the COLUMN button.

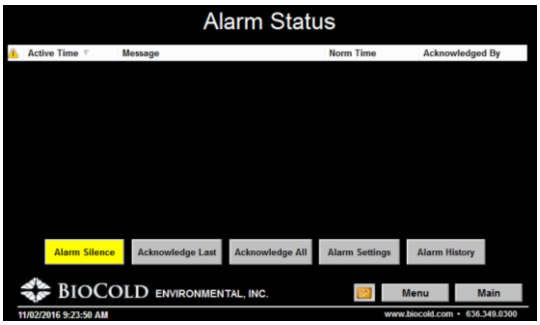

Figure 15. Alarm Online (Status) Screen

The ALARM SILENCE button is highlighted in yellow and appears on the ALARM ONLINE screen. This will silence the audible alarm until the failure can be diagnosed and repaired. If multiple alarms are triggered, then the latest individual or all the current alarms can be acknowledged by selecting the ACKNOWLEDGE LAST or ACKNOWLEDGE ALL button, respectively.

3.2.12. Alarm History Screen

The ALARM HISTORY screen (Figure 16) displays up to the last 100 alarm events with information showing:

a) the time the alarm occurred;
b) the type of alarm (i.e., high temperature alarm);
c) the time the alarm event was acknowledged; and
d) the time the alarm event cleared/normalized.

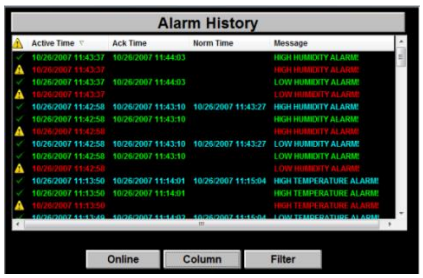

Figure 16. Alarm History Screen

Additional fields may be selected by the user using the COLUMN button on the ALARM HISTORY screen.

3.2.13. Trend Screen

The BioLogic™ HMI hard drive stores temperature and humidity trend data via the TREND screen (Figure 17) securely for a period of 365 days. Data can be accessed using the TREND button from the MENU screen.

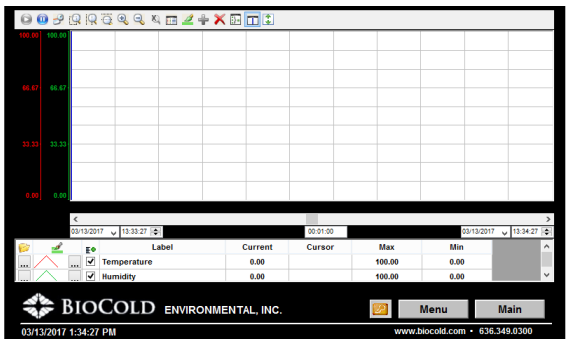

Figure 17. Trend Data Screen

The toolbar across the top of the Trend grid allows a single-button manipulation of the data within the grid. The options are from left to right:

Command/Tool	Description
Run	Sets the trend control to Run Mode (a.k.a. Online Mode). In this mode, the X-axis continues to scroll with the passage of time and the trends are updated with current tag values.
Stop	Sets the trend control to Stop Mode (a.k.a. Historical Mode). In this mode, the X-axis is stopped and the trends display only historical data. If decimation is enabled for one or more trends, the calculation and redrawing is done only in this mode.
Period	Opens a dialog which can be used to modify the X-axis scale main settings.
Window Zoom	Allows the user to click on the trend graph and drag the cursor to select the area that must be visible when the cursor is released. This option is disabled when the Multiple Section option (for the Y scale) is active.
Horizontal Zoom	Allows the user to click on two points in the trend graph, defining the horizontal scale that must be available.
Vertical Zoom	Allows the user to click on two points in the trend graph, defining the vertical scale that must be available. This option is disabled when the Multiple Section option (for the Y scale) is active.
Zoom In	Allows the user to zoom in (display half of the current X and Y scales) each time they click on the trend graph.
Zoom Out	Allows the user to zoom out each time they click on the trend graph.
Cancel Zoom	Cancels the current **Window**, **Horizontal** or **Vertical Zoom** and returns the trend graph to its original scale.
Legend Properties	Opens a dialog which can be used to modify the Legend main settings.
Pen Style	Opens a dialog which can be used to modify the pen style of the selected trend.
Add Pen	Opens a dialog which can be used to add a new trend to the trend control.
Remove Pen	Removes the selected trend from the trend control.
Multiple Sections	Switches the Y scale between Multiple Sections (a section for each trend) and Single Section (all trend share the same Y scale section).

Command/Tool	Description
Cursor	Switches the cursor (ruler) between visible and hidden.
Auto Scale	Changes the Y axis scale to fit all values from the trends that are currently being monitored.

3.2.14. Export Data Screen

From the MAIN menu, the EXPORT DATA button allows users to export the proprietary secure data stored on the HMI into a CSV file which can be easily viewed using spreadsheet software such as Microsoft Excel. This screen is called the EXPORT DATA screen (Figure 18).

Note: A mouse or stylus is recommended to enter information during this exporting of data exercise. To enter a new value without a mouse, double-tap on the desired field value and use the popup on-screen keyboard to enter new value.

Figure 18. Export Data Screen

1. To transfer the file to the USB device:
   - Unlock / unscrew and open the touchscreen enclosure.
   - Insert the memory stick in the USB port underneath the bezel of the touchscreen.
2. From the EXPORT Data screen, enter a start date (mm/dd/yyyy), start time (hh:mm:ss), and duration (in hours) for the period to be downloaded.

   For example, to download data for the week of July 1, 2016, enter a start date of 07/01/2016, start time of 00:00:00 and duration of 168 hours.
3. Select the LOCATION TO SAVE FILE button to enter the desired file name of the document being generated and the path where the file will be saved

   ** The downloaded data has a default location in the folder \\storagecard\biocold\TrendHstCSV\ on the storage card (typically an SD card).

   ** The USB memory device displays as the “HardDisk” icon in the Windows Explorer window.
4. Hit the EXECUTE FILE CONVERSION button to generate the file.

3.2.15. Fuji Limit Controller

The Fuji PXR4 limit temperature controller (Figure 19) provides alarm outputs if the room temperature exceeds the high or low temperature alarm settings as a safety cutout to shut down all or most heat-producing components to protect the control panel. When either alarm occurs, the appropriate HIGH or LOW alarm light will illuminate on the face of this controller and the remote alarm dry contacts will be activated. The range of this controller's alarm setpoints is wider than the range of the CER's alarm setpoints so the audible alarm would sound before the limit alarm would take effect.

Figure 19. Limit Controller

The upper right corner of limit controller indicates its function of °C, or as a temperature limit controller. As needed, a humidity limit controller may also be required and would be annotated with the %RH designation.

3.2.15.1. Display

The limit controller display is as follows:

- Upper right corner of controller indicates function: °C or %RH.
- PV (Process Value) = Indicates actual temperature/humidity level in chamber
- SV (Set Value) = Indicates temperature/humidity setpoint
- AL 1 AND AL2 = Indicate alarm conditions (Unit is in alarm when lit).

The controller automatically returns to the default display screen after about one (1) minute of inactivity.

3.2.15.2. Clock

The clock on the limit controller can be adjusted as needed. On the face of the limit controller, push the ESC button once or twice to show the following:

>Stop
Set Param
Set Clock
Prg Name

a. Push the down button to select "**Set Clock**."

b. Push the OK button once and then the up or down buttons as necessary to select the current day of the week.
c. Push the right arrow key to the first time digit. (Use a 24 hour format.)
d. Set the first digit by pushing the up or down buttons and then push the right button.
e. Similarly, set the subsequent time digits and the date digits.
f. When complete push the OK button

Push the ESC button and the date/time will be displayed.

3.2.15.3. Menu Selection

All control functions are available via the green SEL (select) button.

The three menus for the limit controller are accessed by pressing and holding the SEL button. While holding the SEL button, the menus will scroll automatically. Release the button at the menu desired; the up and down chevron or arrow buttons are to the right of the green SEL button, respectively. The submenus are adjusted using these buttons. Values are changed by tapping the SEL button until the value flashes then moving the value up or down using the arrow keys. Enter new values using the SEL button. After a period of approximately one minute, the control will revert to the default display.

- The first menu begins with the parameter "Stby"
- The second menu begins with the parameter "P"
- The third menu begins with the parameter "P-n1"

To change setpoint values, press the arrow button up or down, based upon the appropriate direction. No other adjustments will need to be made other than changing the alarm setpoints. The controllers can be "locked" by using the "LOC" function to prevent unauthorized tampering and are unlocked at the factory - consult the Fuji Microcontroller Manual for more details.

3.2.15.4. High and Low Alarms

The high and low alarms are factory preset at a safety setpoint temperature above ambient (+35°C for instance) and 1.0°C, respectively.

- **To change High Limit Alarm value:**
  - Press SEL button and hold down until you see "STby".
  - Press down arrow until you see "AL1"
  - Press SEL until lower number flashes.
  - Use arrow keys to create a new value for the high limit alarm
  - Press SEL to enter.
- **To change Low Limit Alarm value:**
  - Press SEL button and hold down until you see "STby".
  - Press down arrow until you see "AL2"
  - Press SEL until lower number flashes.
  - Use arrow keys to create a new value for the low limit alarm

- Press SEL to enter.

3.3. Adjusting the HMI Time and Date

The data collected is based upon the time and date located in the left side of the footer of most screens. If the date and time of the touchscreen need to be adjusted, then follow these instructions below. A USB mouse is recommended to make this adjustment and an admin user for the touchscreen is required.

3.3.1. Via the Factory Screen

1) Login to the touchscreen as a "biocold" user from the MAIN or MENU screen.
2) Select the FACTORY button from the MENU screen
3) Double tap on the parameter to be changed.
    a. Enter the time using the military format of 00:00:00 (hh:mm:ss)
    b. Enter the date using the format of MM/DD/YYYY
4) Hit the corresponding button adjacent to the parameter to set value

3.3.2. Via Windows Desktop

1) Open the control panel door.
2) Plug the USB mouse into the USB port on the bottom side of the HMI unit.
3) Login to the touchscreen as an "admin" user from the MAIN or MENU screen.
4) Go to MENU screen (Figure 20)
5) Select the Logon button (gold key icon)
    a) Enter valid username
    b) Enter valid password
    c) Hit "OK" button

Figure 20. Logging into Project

6) In the MENU screen, select the Exit button (to the right side of the screen) and confirm the command (Figure 21).

Figure 21. Logging Out of Project

7) The screen will now look similar to a Windows screen with a Remote Agent dialog window on the desktop.
8) Use the mouse to cursor to the lower part of the screen to view the Taskbar.
9) Double-click on the time in the Taskbar.
10) In the popup window, check the checkbox to "Automatically adjust clock for Daylight Savings."
11) Make any necessary adjustments to the date, hour and/or minute value(s) (Figure 22).

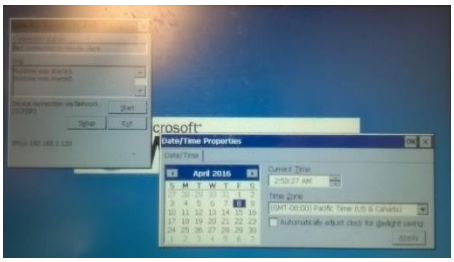

Figure 22. Adjusting Date and Time

12) Hit the "Apply" button.
13) On the Remote Agent window, hit the "Start" button.
    If the program does not start within one (1) minute, cycle the power to the touchscreen.

3.4. Security

The BioCold BioLogic™ HMI interface incorporates logic designed to ensure that only authorized users can modify various parameters to ensure the chamber integrity. The MANAGE USERS screen (Figure 23) allows the administrator to manage the users for the room via the MENU screen. This screen option is unavailable until an admin or user of higher privilege is authenticated and the button will be selectable by the admin. The administrator has up to four (4) user account management options: create user, delete user, reset user password, and unblock a user.

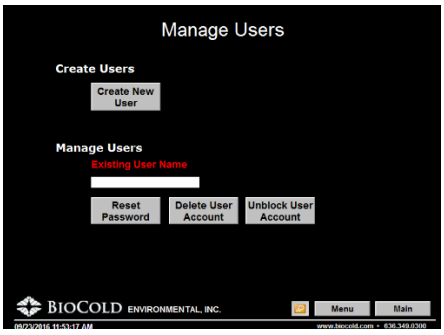

Figure 23. Manage Users Screen

3.4.1. User Accounts

The BioCold BioLogic™ HMI interface has three (3) levels of customer account access security during runtime: guest, user, and administrator. A fourth account is specifically set aside for the factory for development and runtime rights. Only the administrator can create and manage the users once the HMI is fielded.

Screen fonts will be a light grey when the current user logged in is not authorized to make changes to a button selection; conversely, the button font will be black with the appropriate access level. Editable values such as setpoints will show as a grey text field background when not accessible by that user level. A blue text field background on editable values indicates an authorized user is logged in.

A full group account matrix is provided below.

To create a new user account, log on with an administrator level username and password. The MENU screen will now show a MANAGE USER button in the top row. Click on that row to display the MANAGE USERS screen (Figure 24).

3.4.1.1. Guest Access Level

The GUEST account is the default access to the chamber operation and allows basic project control.

Without logging in, a user from the GUEST level can only view most chamber parameters as applicable via the MENU or system information screen:

- (MAIN, TEMPERATURE or HUMIDITY SETTING) temperature and humidity setpoints
- (MAIN, TEMPERATURE or HUMIDITY SETTING) current temperature and humidity readings
- (MAIN or ALARM SETTING) high and low alarms setpoints
- (SENSOR CALIBRATION) calibration values
- (MAIN or REDUNDANT) refrigeration system or controls status
- (ALL) alarm and notification / informational popup windows
- (ALARM HISTORY and ALARM ONLINE) current and past alarm information
- (SYSTEM INFO) startup or project information
- (PARAMETER LOG) changes to parameters by a user or PLC
- (MAINTENANCE) scheduled maintenance information.

Guests cannot modify any chamber settings but can silence an active alarm via its corresponding popup. Guests are able to manipulate the trend data to zoom in, zoom out, etc. because there is no modification to the actual values.

3.4.1.2. User Access Level

The USER level account has all the viewing rights as the GUEST account as well as can access most chamber functions. The user can edit the values or settings for the following parameters:

- (ALARM SETTING and TEMPERATURE / HUMIDITY SETTINGS) high and low setpoints and corresponding hysteresis, alarm delay, alarm callback
- (EXPORT DATA) reports for trend data
- (MAINTENANCE) maintenance duration and last timestamp
- (MENU) exiting or restarting the project server.

The USER has a minimum password size of five (5) characters with a minimum of one (1) alpha character and one (1) numeric character and no requirement for special characters. The password will expire after 180 days. This user will be logged off the project ten (10) minutes after the last user action. For security purposes, the account will be locked up after three (3) invalid attempts and will remain locked until unblocked by the administrator.

3.4.1.3. Administrator Access Level

The ADMINISTRATOR level account has all the viewing and editing rights as the USER account as well as can access most chamber functions.

- (MANAGE USERS) user access control
- (SENSOR CALIBRATION) sensor offsets

The chamber is shipped with one default administrator account:

Default Administrator Login: admin
Default Password: 63011 or 63011a

The ADMINISTRATOR has a minimum password size of six (6) characters with a minimum of one (1) alpha character and one (1) numeric character and no requirement for special characters. The password will expire after 180 days. This user will be logged off the project ten (10) minutes after the last user action. For security purposes, the account will be locked up after three (3) invalid attempts and will remain blocked until unblocked by the factory.

3.4.1.4. User Account Access Matrix

3.4.2. List User Accounts

A list of users can be displayed for the user with admin privileges and higher. To generate this list, login as an authorized user and then select the SHOW USERS button. The current users will display vertically next to the button.

3.4.3. Create New User Account

Click the CREATE USER button to display the NEW USER ACCOUNT window (Figure 24). On this screen, first enter the user name and password for the new user, then assign that user to a group, either user or admin. Click OK to establish the new login account.

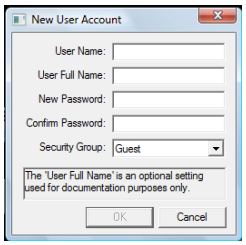

Figure 24. New User Account Window

SECURITY TIPS:

1. To prevent unauthorized access, always log out after making changes to chamber parameters. To log out, press the LOG ON button from the Startup or Menu screens. The popup window will provide an option to LOG OFF.
2. For additional protection, all accounts have an automatic logout function. User level accounts will automatically log off after 5 minutes of inactivity; Administrator level accounts will log off after 15 minutes of inactivity.

3.4.4. Delete User Account

An authorized admin user may remove accounts that are no longer needed. First enter the user name in the Existing User Name field and then click the DELETE USER button. Click OK to remove that login account.

3.4.5. Unblock User Account

The user will be locked out after three (3) consecutive invalid login attempts within five (5) minutes. Any locked out user can be unlocked by an authorized user of a higher security level; e.g., the user-level account must be unlocked by an administrative user account. However, the counter does reset and more attempts are possible by waiting five (5) minutes after the second invalid attempt to reset this counter. In other words, as long as the final attempt is not executed until after waiting the configured amount of time, the user will not be locked out.

To unblock a user, insert the locked out username in the Existing User Name field and then select the Unblock User button. The user will then be unblocked and now has permission to access the data for users.

3.4.6. Reset User Password

An authorized user may also reset another lower-level user's account. First enter the user name in the Existing User Name field. Enter the first verification password and the popup stating the password mismatch will likely appear. Enter the second password verification and the notification window for mismatched passwords will disappear. Click the Reset Password button the new password will take effect for the login account. The password successfully changed window will also appear; hit OK to acknowledge the change.

3.5. Remote Monitoring and Control

BioLogic™ control systems are equipped for remote monitoring and control using a TCP/IP web thin client and/or secure viewing software. The touchscreen is the server for the application (i.e., the thick client). Any thin client machine will need to run the Web Thin Client to remotely view the chamber information. The Ethernet port on the touchscreen must be connected to the local area network (LAN) of the site. To identify the IP address of the server after LAN connection,

14) Open the control panel door.
15) Plug the USB mouse into the USB port on the bottom side of the HMI unit.
16) Login to the touchscreen as an "admin" user from the MAIN or MENU screen.
17) Go to MENU screen at the footer of the screen
18) Select the Logon button (gold key icon)
    a) Enter valid username

b) Enter valid password
c) Hit "OK" button

19) In the MENU screen, select the Exit button (to the right side of the screen) and confirm the command when prompted.
20) The screen will now look similar to a Windows screen with a Remote Agent dialog window on the desktop.
21) Use the mouse to cursor to the lower part of the screen to view the Taskbar.
22) Under the Hidden Icons triangle, locate the Remote Agent startup icon (Figure 25) and click on that icon.

Figure 25. Remote Agent Startup Icon

23) The Remote Agent popup window (Figure 26) will display with the IP address.

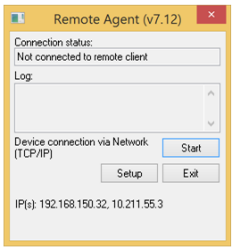

Figure 26. Remote Agent Popup Window

24) Download the Web Thin Client viewer from the following web address:
https://www.dropbox.com/s/u7bxnor436wvo44/ThinClientSetup.exe?dl=0

25) Open an Internet Explorer® browser window on the client machine and connect to the CER IP address using the following URL as an example with the identified IP address from Step 10 in its place. If a problem is encountered, then login to the IE program as an administrator.

http://192.168.1.57/startup.html

26) The login prompt will popup. Login with a valid username and password.

Note that only one web thin client license is available with each CER. Multiple licenses are available as an upgrade. With a single license, when more than one user attempts to access remotely, any secondary client will be denied access until the license is released.

4. Periodic Maintenance

BioCold environmental rooms are designed for long-term operation with minimal maintenance needs. BioCold recommends the following periodic maintenance schedule.

Regular Cleaning:

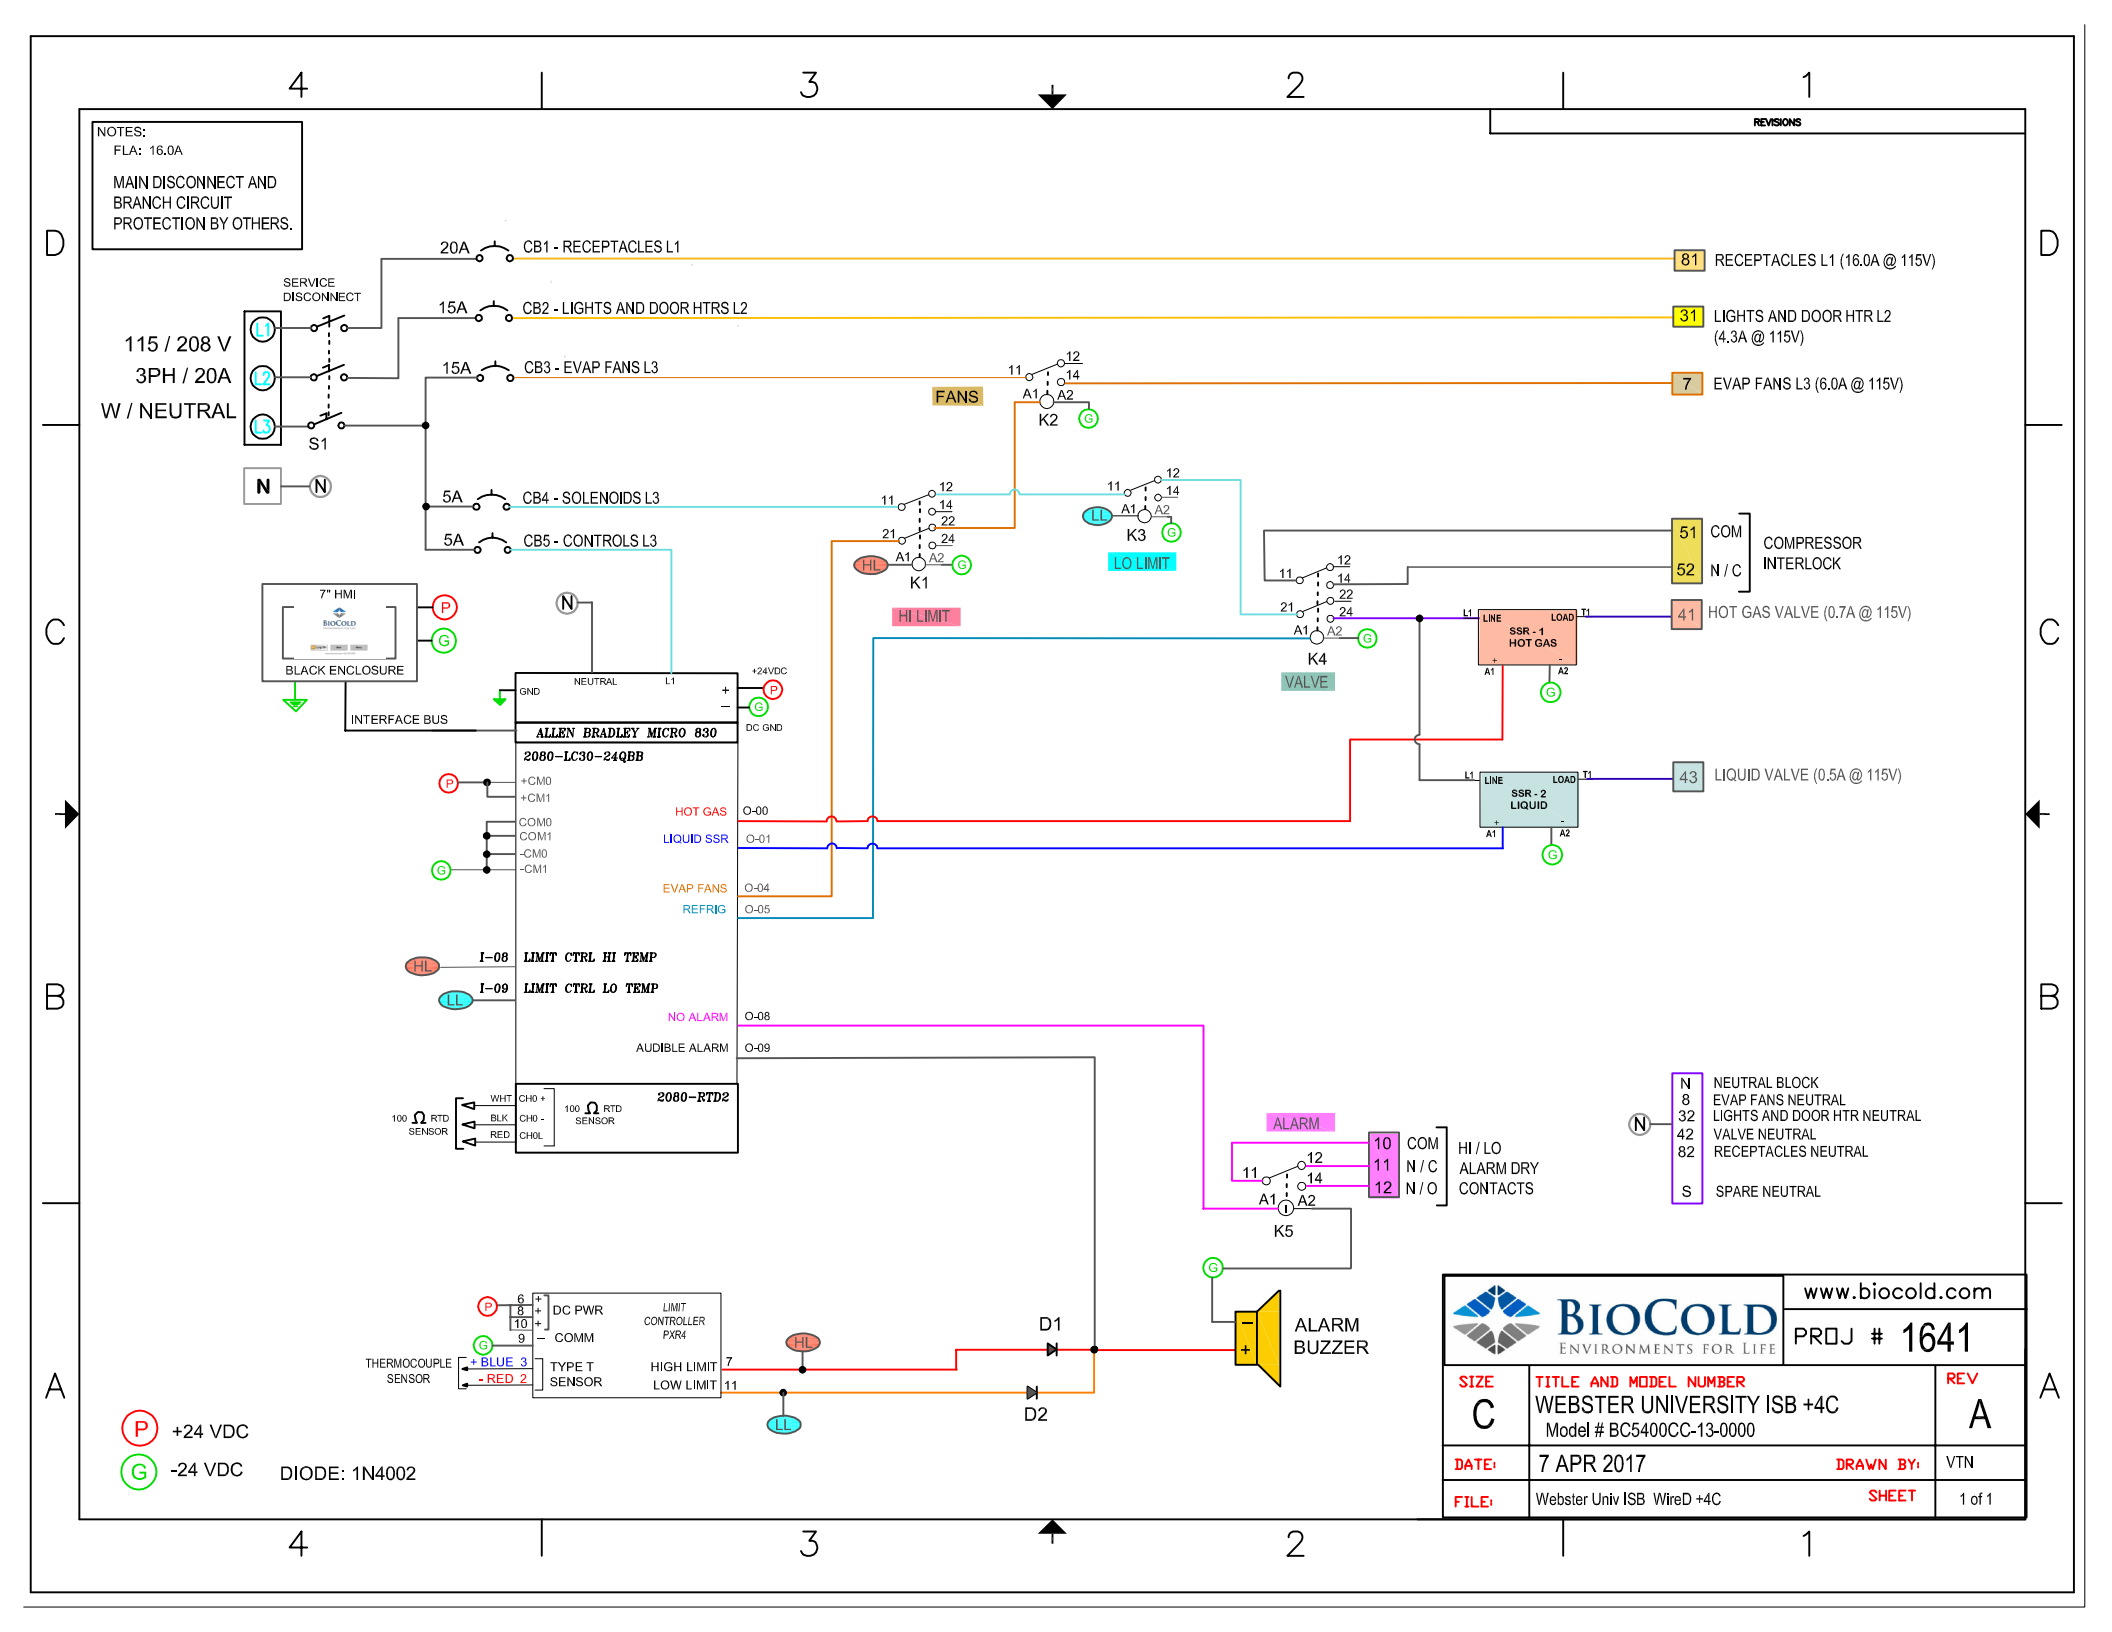
- ❑ Environmental room finishes may be cleaned on an as-needed basis with standard commercial detergents. Corrosive solvents may damage painted finish.

Monthly Maintenance:

- ❑ Visually inspect compressor/condensing unit to ensure fan intake is not obstructed.
- ❑ Visually inspect evaporator fan coil to ensure it is clear of ice.

Quarterly Maintenance:

- ❑ Clean compressor/condensing unit to remove dust accumulation and potential obstructions.



5. Regulatory Data Compliance

5.1. 21 CFR Part 11

Ensuring 21 CFR Part 11 compliance is fundamental to each BioCold project as electronic records are created, archived, and maintained within this control panel. The BioLogic design enables the client to retrieve and transmit the data through multiple media storage devices, via a secure network or externally. The applicable Predicate Control rules take precedence to ensure that the original automated data entries are stored properly.

BioCold understands that our compliance as the supplier or vendor of this project must be in accordance with your established processes. BioCold advises the authorized personnel or compliance department (i.e., the party liable for ownership of these records) to implement and adhere to established Procedural Requirements that includes but is not limited to formal training, accountability guidelines, and documentation control processes to maintain the integrity, confidentiality (as applicable), and authenticity of the automated electronic records generated. Ultimately, the record owner or end user has the responsibility to employ best practices for controls once the control panel is fielded.

The BioLogic offers its products and ongoing services through the life of the control panel.

- Replacing klixon on Pressure Relief Port ____ 9
- Replacing anti-condensate heaters on Pressure Relief Ports ____ 9
- Replacing magnetic gasket on Pressure Relief Ports ____ 9

Door Closer

- Replacing Door Closer ____ 10

ROUTINE MAINTENANCE

A. Keep all walkway surfaces clean and free of spilled liquids and food particles.

B. Walk-In panels and magnetic door gasketing should be periodically wiped clean with a damp cloth. Use only mild soap to clean the panels: never abrasive pads or powders that could mar the finish. Remove all soap film and thoroughly dry with a clean cloth. Protect Digital and Electronic Alarms from moisture, or warranty is null and void.

C. Never flush the inside of the Walk-In with water. Use a clean damp mop or rag when cleaning spills on the floor.

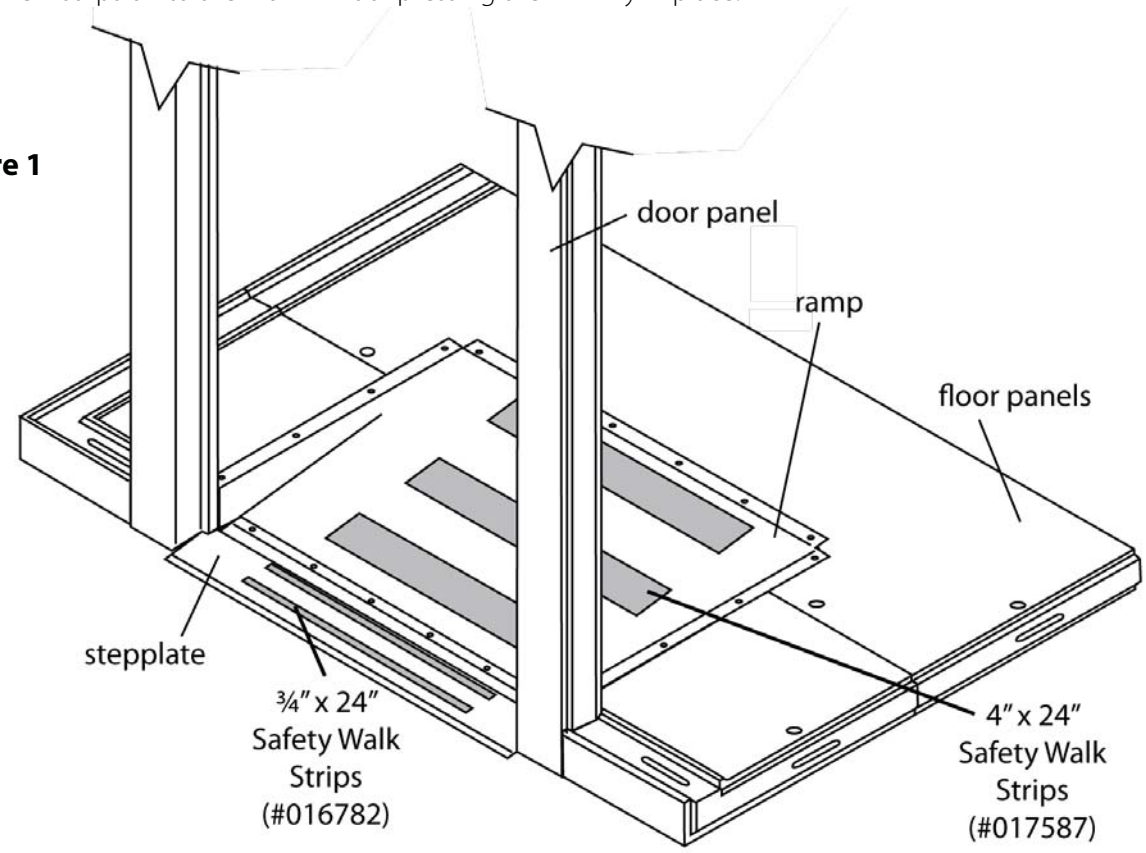
D. Heater wires should be checked for proper function. Feel for warmth around the door frames on hinged entrance doors and pressure relief port doors, if applicable. Note: Condensation or Ice buildup around doors may indicate leakage or heater failure. Contact a serviceman immediately.

E. Keep door gaskets clean with a solution of water and mild soap.

F. Inspect refrigeration units frequently for proper function of evaporator & condenser fan motors, drain pan heaters, defrost controls, and drain line heaters. Condensate water must never be permitted to drip on the Walk-In floor. Drain pan or drain line heater failure will result in ice buildup and Evaporator damage. Refer to the Refrigeration System Instructions for proper drain pan and condensate drain line instructions.

G. Don't overload the Walk-In with product. Maintain orderly storage to permit good airflow within the unit.

H. Inspect the condition of abrasive anti-skid strips monthly. Replace or add additional strips when necessary.



REPLACING SAFETY WALK STRIPS

A. Remove old worn Safety Walk Strips from Walk-In floor, ramps, or a stepplate. *See figure 1*.

B. Clean and completely dry areas where new strips are to be placed.

C. Install new strips on to the Walk-In floor pressing them firmly in place.

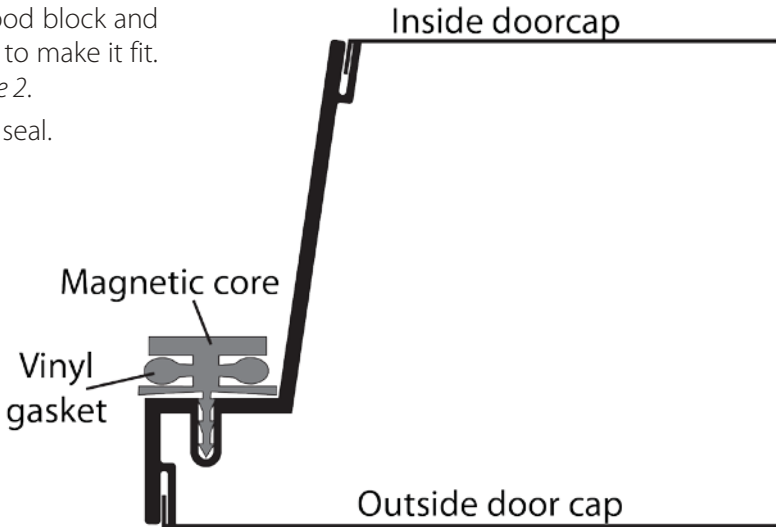
Figure 1

IM-268S-11 2013 © Bally Refrigerated Boxes, Inc.

GASKETS

Replacing magnetic door gasket on Hinged Walk-In doors

A. Remove the old gasket and clean the surface where the new gasket will be placed.



B. Position the new gasket, starting at the top corners. Tap it into place with a wood block and hammer. Do not stretch the gasket to make it fit. Be sure the gasket lies flat. *See Figure 2*.

C. Check door for proper operation and seal.

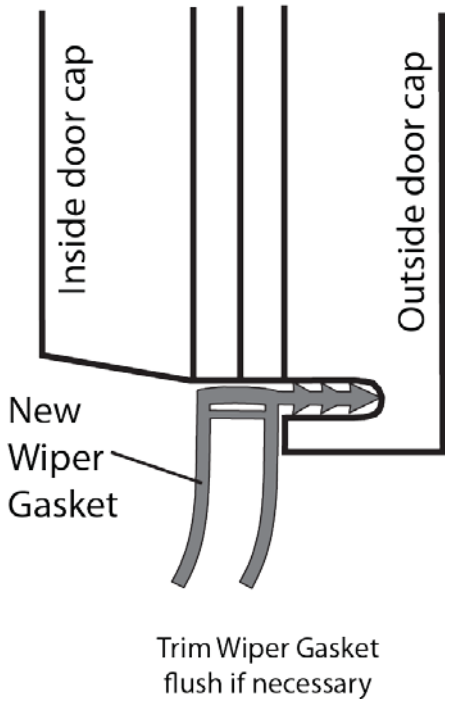
Part Numbers:

#016543 – 24" x 78"
#017402 – 30" x 78"
#017403 – 30" x 84"
#016546 – 34" x 78"
#016547 34" x 84"
#054117 – 36" x 78"
#054119 – 36" x 84"
#032999 – 42" x 78"
#032999 – 42" x 84"
#016548 – 48" x 84"
#016549 – 60" x 84"

Figure 2

A. Open the door 90 degrees.

B. Grasp the old gasket and pull it away from the interior skin of the door. Clean the surface where the new gasket is to be placed.



C. Position the new gasket; tap it into place with a wood block and hammer. Do not force the gasket into place; excessive force may damage the door cap.

D. If the gasket binds when the door is closed, the gasket is too wide. Be sure the gasket is properly centered, and trim the ends as needed. *See Figure. 3*.

Part Numbers:

#016614 – 30" Door
#016611 – 34" Door
#054028 – 36" Door
#016612 – 42" & 48" Doors
#016613 – 60" Door

Figure 3

HINGED WALK-IN DOORS

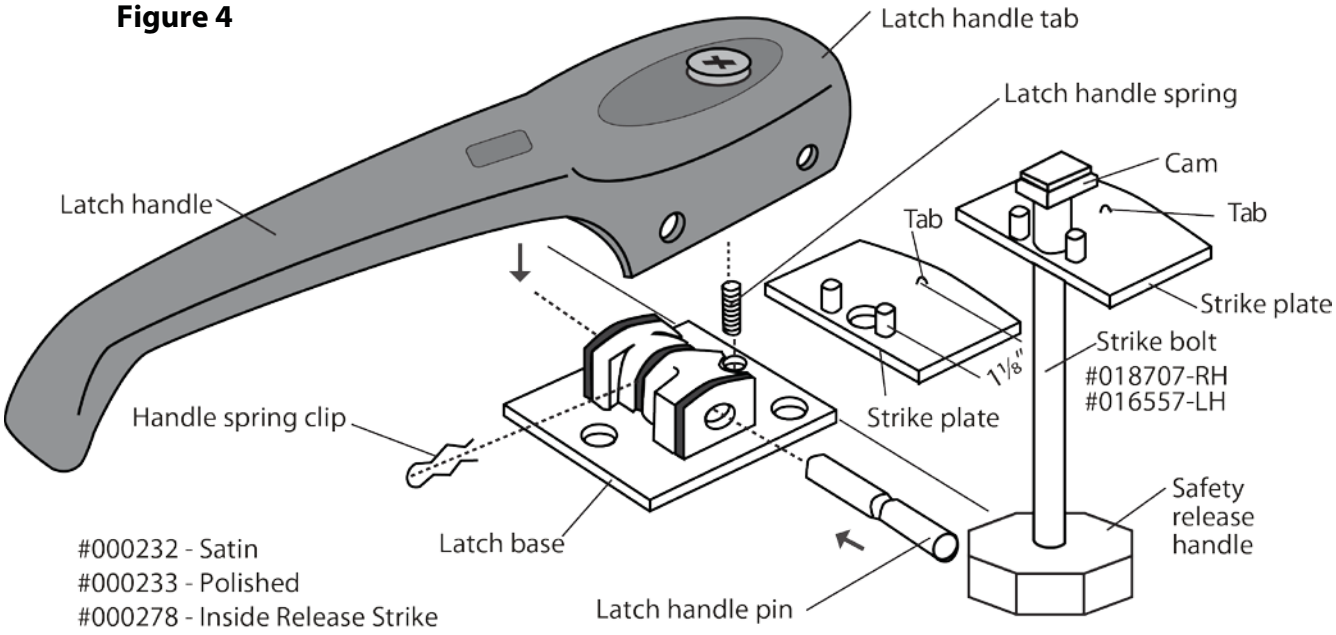
Replacing the D-1000 touch latch on Walk-Ins

A. Remove the defective latch assembly. First remove the handle spring clip from under the handle at the back of the latch base, using a pair of needle-nose pliers. *See Figure 4.*

B. Using a hammer and punch, drive out and remove the latch handle pin from the handle. Remove the three ¼-20 oval-head machine screws from the latch base and remove the base.

C. From the inside of the Walk-In, drill out the roll pin from the safety release handle and remove the handle. (Doors prior to 1995) Current production doors are provided with an interior mounted safety knob which is threaded directly onto the strike bolt. Loosen the allen screw located in the side of the knob using a 5/32 allen key and turn counter clockwise until disengaged from the strike bolt. Pull the strike bolt from the outside away from the Walk-In wall. The strike plate will fall away.

D. Secure the new D-1000 latch base to the Walk-In door with three ¼-20 oval-head machine screws.



E. Insert the new strike bolt with attached strike plate into the holes on the door jamb panel.

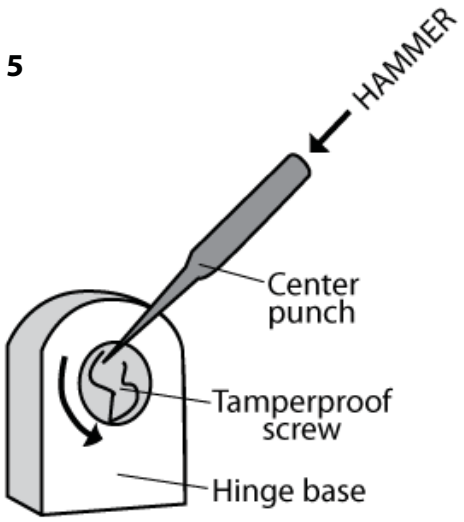
F. Screw the new inside knob onto the strike bolt until adequate tension is applied to the rod to hold the assembly firmly in place. Tighten the set screw on the side of the knob using a 5/32 allen key to allow for ¼ turn safety release operation Check to be certain that the "T" rod rotates freely when turning the inside knob.

G. Insert the latch handle spring into the indicated hole on the latch base. Slip the latch handle over the latch base and align all holes. Be sure the latch handle spring engages the latch handle tab on the underside of the handle. Insert the latch handle pin through the handle and base. Using needle-nose pliers, insert the spring clip through the slot in the latch base assembly. Make certain to align the slot in the latch handle pin with the slot in the base before inserting the clip. This will firmly secure the latch handle in place for use.

H. Open and close the door several times to assure proper operation of the latch.

Figure 4

IM-268S-11 2013 © Bally Refrigerated Boxes, Inc.



Replacing D-1250 spring-loaded hinges on Walk-In door panels

A. Close the door. Securely hold the door in place by shimming between the outside doorcap and the door frame. Remove the slotted machine screws from the hinge base and blade. If tamperproof screws are used *See Figure 5*. Remove the defective hinge assembly. Secure the new hinge assembly with a screwdriver by tightening the machine screws in the same holes.

B. Remove the shims from around the perimeter of the door frame.

C. Open the door and check for proper operation and seal.

Figure 5

Bally also offers a screw remover tool. Call the factory for details.

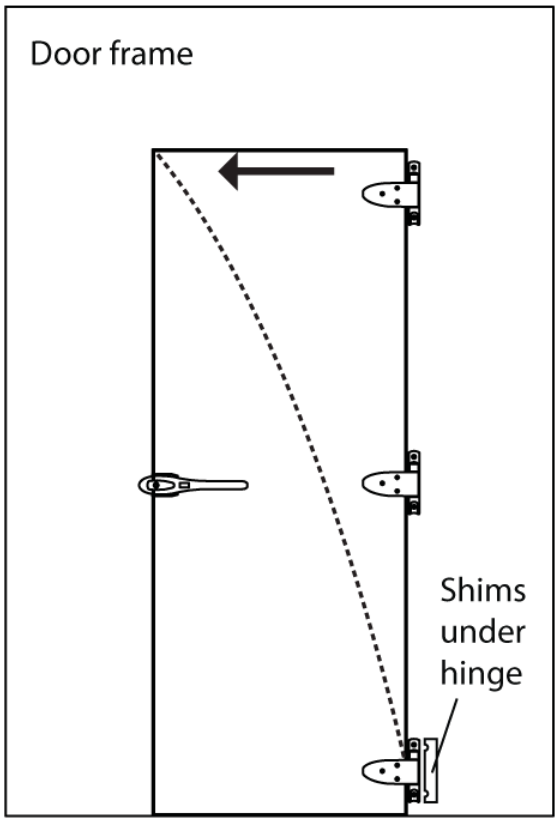
Shimming Walk-In door hinges

A. If the Walk-In door is installed properly, no shimming is required. Shim only where misapplication or poor installation of the door panel have caused the door cap to seal improperly. If the door cap toes outward at the top or bottom of the latch side of the panel, shim the diagonally opposite hinge base outward, forcing the corner of the door cap back into alignment with the door frame for a positive seal. *See Figure 6*.

B. To shim hinges on Walk-In doors, loosen the machine screws on the base of the hinge enough to slip the required number of shims into place behind the base. *See Figure 7*. Where tamper-proof screws are used, loosen them by tapping the screw head counterclockwise with a center-punch and hammer as shown in *Figure 5*.

C. Retighten machine screws and check door cap for proper seal.

Figure 6



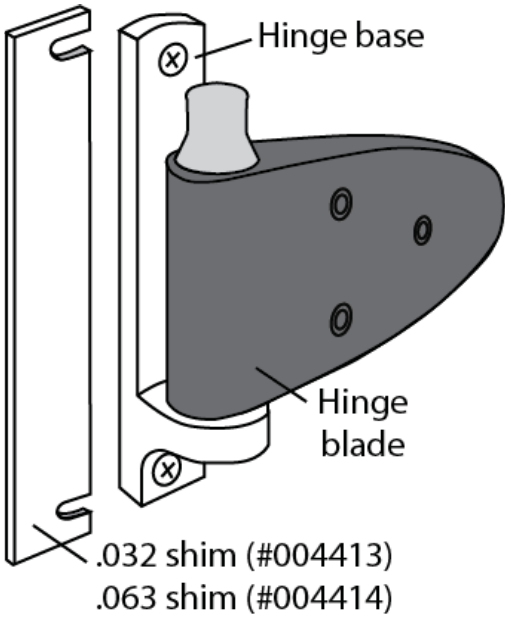


Figure 7

ANTI-CONDENSATE HEATER

Replacing anti-condensate heater element around door frame of hinged Walk-In doors

A. Disconnect the outside power source leading to the door frame light junction box. Open the door 180 degrees. A large piece of cardboard can be used to close off the open doorway until the heater is replaced.

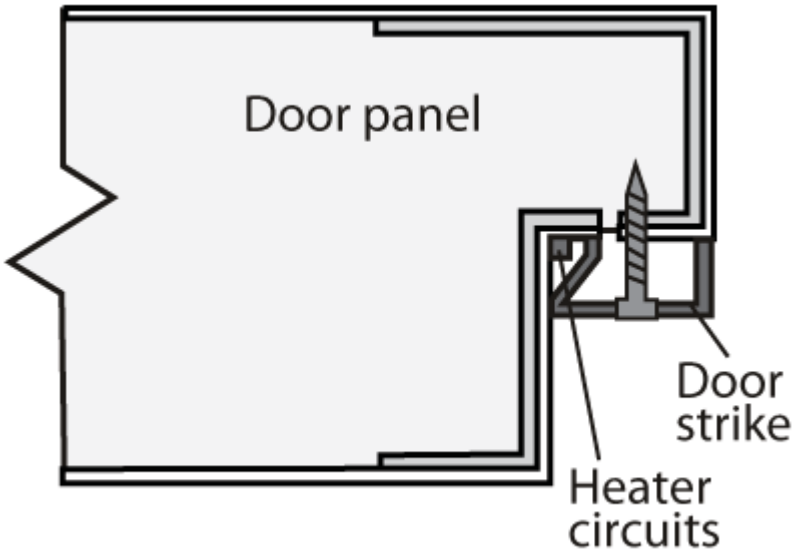
B. Remove the light switch on the exterior of the door panel. Disconnect the heater wire leads by unscrewing the wire nuts. Remember how the wires are connected so you can attach the proper leads on the new wire.

C. Remove the screws from the door strikes around the door frame. Remove the strikes. *See Figure 8.*

D. Remove the screws which secure the stepplate. Remove the stepplate.

E. Remove the defective heater element from the door frame and the grooved hardboard at the base of the frame. Take note of the position of the heater element in the grooved hardboard before removing it. (For replacement or updated heaters, a new hardboard will be supplied with an installation diagram.)

F. Apply a small bead of silicone caulking around the perimeter of the door frame to retain the new heater element until the door strikes can be reinstalled.



G. Guide the leads of the new heater element into the switch box containing the light switch. Note: Only heater wire leads are to protrude into the switch box-- this will prevent premature heater burnout. Press the heater element firmly into the corner around the perimeter of the door frame. Locate and press the heater element back into the grooved hardboard exactly the same way it was removed. When the heaters are first energized, they will contract. If the wire is not pressed into the corners, it could short out by pulling too tight against the edges of the strikes and sillplate.

H. Replace and secure the stepplate to the Walk-In floor. Replace the door strikes. Be careful not to pinch the wires when remounting the hardware.

I. Reconnect the new heater element to the heater wire leads. Recaulk the opening in the door frame where the heater wire passes through into the junction box. This is very important.

J. Re-energize the outside power source to the door frame light junction box. Check for proper operation.

Figure 8

IM-268S-11 2013 © Bally Refrigerated Boxes, Inc.

REACH-IN DOORS

Replacing magnetic gasket on Reach-In doors

Part Numbers:
#016582 – 18½" x 30"
#016584 – 20" x 30"
#016583 – 30" x 30"

A. To replace the magnetic door gasket, it may be necessary to remove the door from the Walk-In. Simply open the door and lift it off the hinge bases. Lay the door facedown on a flat working surface.

B. Remove the defective gasket and clean the surface where the new gasket will be placed.

C. Position the new gasket and tap firmly into place with a wood block and hammer. Be sure the gasket lies flat. *See Figure 2.*

D. Place the door back on the hinges. Check the door for proper operation and seal.

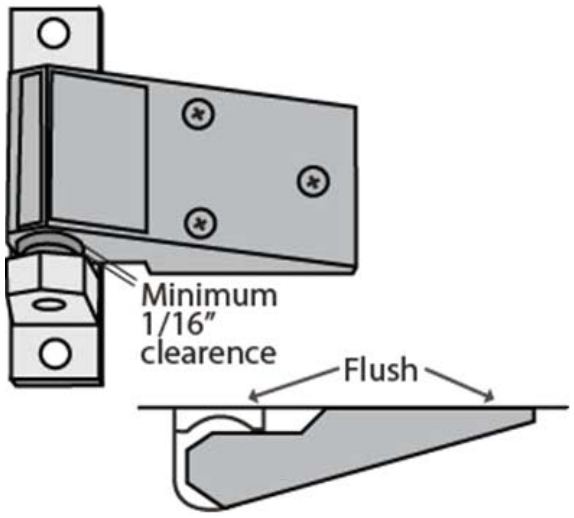
Adjusting self-closing hinges on Reach-In doors

A. Do not oil door hinges. If dirt accumulates on the Delrin cams and causes them to bind, apply dry silicone spray lubricant.

B. Begin by determining whether the hinge is correctly adjusted. When the strap of the hinge is flush with the flange, there must be clearance as shown in *Figure 9.* Without clearance, the door may not close. Adjust the hinge by following these steps:

1. Open the door 90 degrees and lift the door from its hinge bases.
2. Adjust the hinges as shown in *Figure 10*
    a. Put a pencil mark on cam and on hinge; this enables you to see how much the cam is being turned.
    b. Loosen bottom nut and turn half way off.
    c. Tap against bottom of nut with a hammer until pin and cam are loose. The reason for this is the pin has a tapered shaft.
    d. Turn cam in direction of the arrow in increase clearance; opposite direction to decrease.
    e. Hold cam in position and tighten bottom nut securely.
3. Replace the door on its hinge bases. Check to make sure door operates properly.

Figure 9



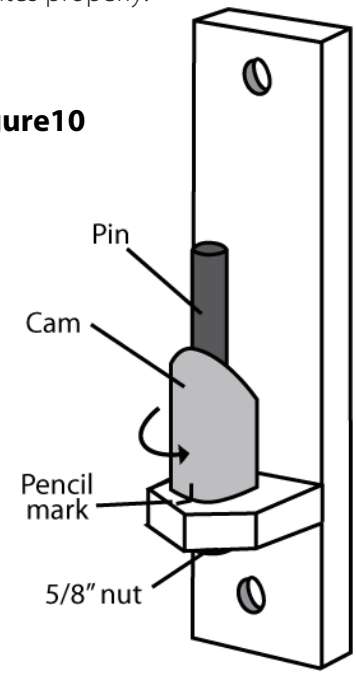


Figure10

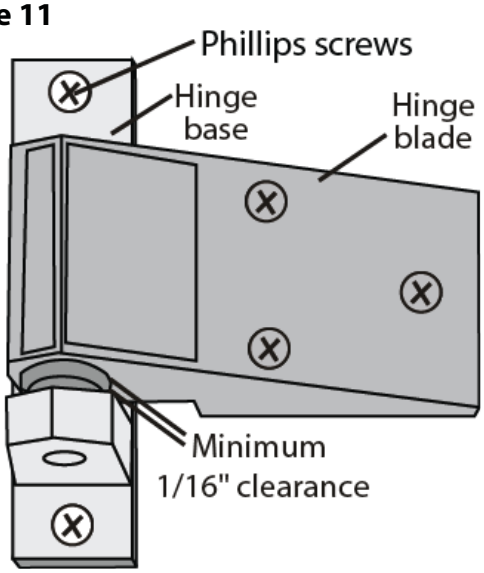
IM-268S-11 2013 © Bally Refrigerated Boxes, Inc.

Replacing hinges on Reach-In door panels



A. Close the door and shim the cap securely around the perimeter of the frame. Remove the slotted machine screws from the hinge base and blade. If tamperproof screws are used *Refer to Figure. 5*. Remove the defective hinge assembly. *See Figure 11*.

B. Secure the new hinge assembly using a screwdriver to tighten the slotted machine screws in the same holes.

C. Remove the shims around the perimeter of the door frame.

D. Open the door and check for proper

Figure 11

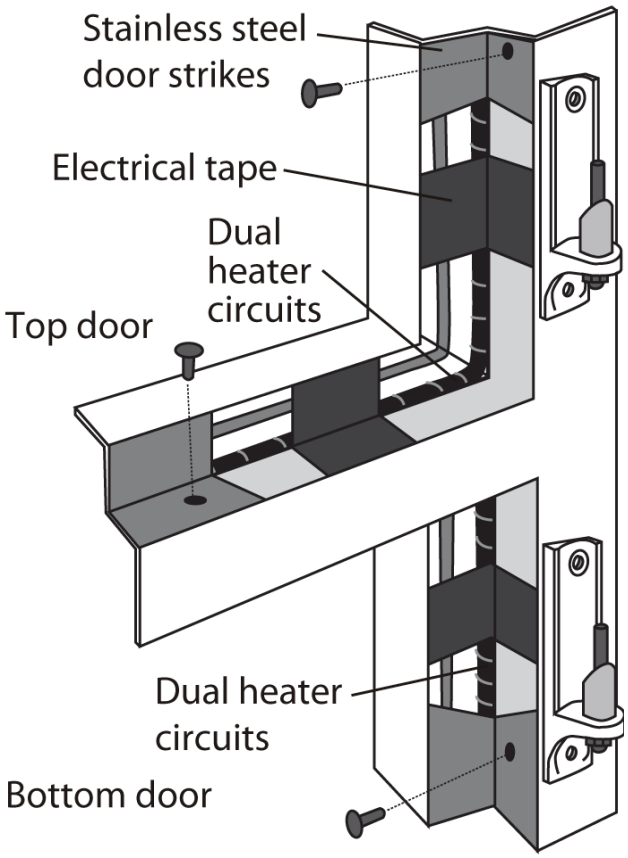
Replacing anti-condensate heater element around door frame of Reach-In doors

A. De-energize the outside power source leading to the door frame junction box. Open the door a full 180 degrees and lift it from the hinge bases.

B. Remove the screws from the stainless steel door strikes around the door frame. Remove the strikes. *See Figure 12.*

C. Remove the cover plate from the junction box on the inside of the door frame. Locate and disconnect the defective heater element from the door frame.

D. Remove the defective heater element from the door frame.



E. Apply a small bead of silicone sealant around the perimeter of the door frame to retain the new heater element. Press the new heater element firmly into the corner around the perimeter of the door frame. The heater element may also be taped into position with UL-approved electrical tape.(Remove) *See Figure 12*. Run the heater leads into the junction box.

F. Reconnect the heater element to the outside power source. Recaulk the opening in the door where the heater wire passes into the junction box.

G. Replace the door strikes and junction box cover plate. (Be careful not to break or pinch the heater element.) Replace the door on the hinge bases.

H. Re-energize the power source to the door frame junction box. Check the door for proper operation and seal.

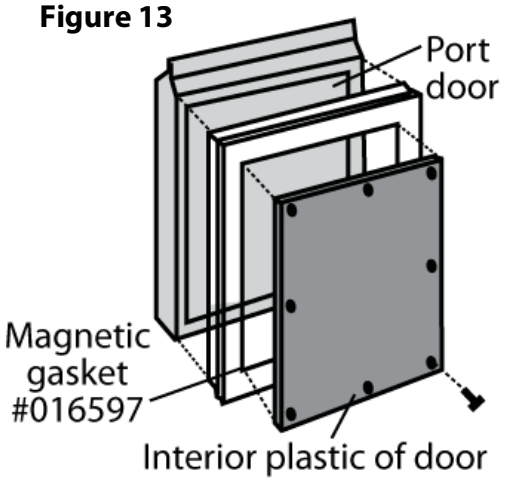
Figure 12

IM-268S-11 2013 © Bally Refrigerated Boxes, Inc.

Pressure Relief Ports (PRP)

Replacing magnetic gasket on PRP

A. Remove the port door by removing the screws from the poly-hinge at the top of the port door. *See Figure 14.*



B. Remove the interior plastic panel from the door by removing the screws around its perimeter beneath the magnetic gasket.

C. Remove and discard the defective gasket.

D. Position the new gasket (#016597) and the interior plastic panel on the door; secure with screws.

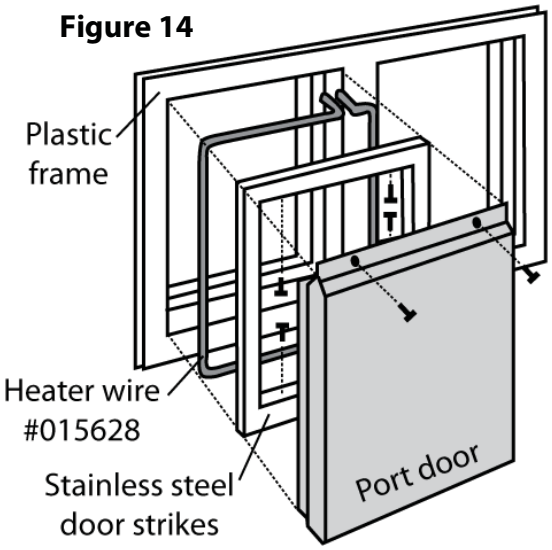
E. Reinstall the port door.

Figure 13

Replacing anti-condensate heaters on PRP

A. Disconnect the power supply at its source, and remove the port door by removing the two screws from the poly-hinge at the top of the door. *See Figure 14.*

B. Remove the stainless steel door strikes by removing the two screws in the top and bottom flanges.



C. Disconnect the defective anti-condensate heater in the junction box at the top of the door. Discard the old heater.

D. Insert the new heater (#015628) and reassemble the door strikes. Exercise care not to pinch the heater wire beneath the door strikes.

E. Replace the port door and refasten the screws.

F. Reconnect the electrical power.

Figure 14

Replacing klixon on PRP

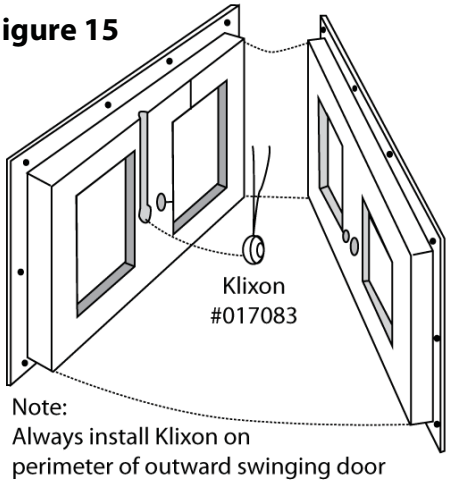
A. Disconnect power at its source, and remove the electrical junction box cover above the port.

B. Remove the screws located in flanges on the exterior of the port, and lift the unit from the panel.

C. Disconnect the appropriate wire nuts in the junction box. Remove and replace the defective klixon (#017083). *See Figure 15.*

D. Caulk around the perimeter of the opening, and replace the port. Rewire and replace the junction box cover. Reconnect electrical power. *See Figure 16.*

Figure 15



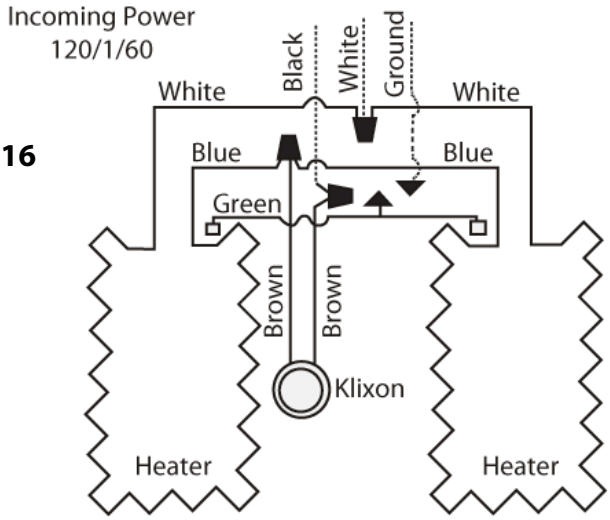


Figure 16

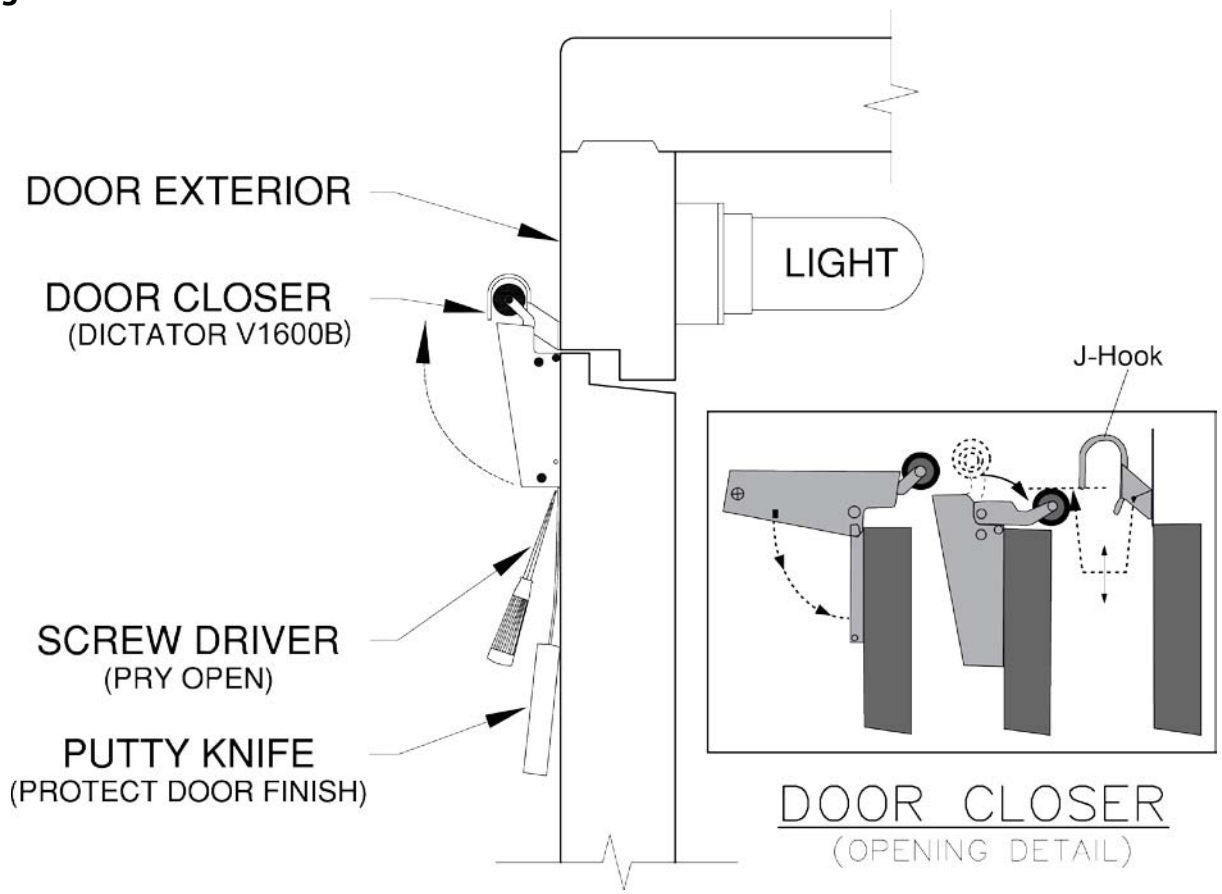
Replacing Door Closer



A. Position a putty knife against the base of the bottom of the closer cover to protect the door surface as shown. *See figure 17*. Pry open the cover using a small flat bladed screw driver. The closer cover is friction fit onto its base and will pry out and upward away from the door.

B. Remove all mounting screws from the closer base on the door and from the "J" hook mounted on the door frame.

C. Install new closer and "J" hook onto door and frame using the existing holes. If for any reason the existing holes do not line up with the holes in the new closer you will be required to drill and tap the door at the location of the holes for the new closer mounting base. Once firmly secured, rotate the cover back down over the base and snap into place.

D. Adjust the "J" hook, if required, to align the rubber wheel of the closer with the tip of the hook. When properly aligned the tip of the hook should touch the top of the rubber wheel as the wheel passed into the hook.

General Safety Information

1. Installation and maintenance to be performed only by qualified personnel who are familiar with this type of equipment

2. Some units are pressurized with dry air or inert gas. All units must be evacuated before charging the system with refrigerant.

3. Make sure that all field wiring conforms to the requirements of the equipment and all applicable national and local codes.

4. Avoid contact with sharp edges and coil surfaces. They are a potential injury hazard.

5. Make sure all power sources are disconnected before any service work is done on units.

WARNING: Refrigerant can be harmful if it is inhaled. Refrigerant must be used and recovered responsibly.
Failure to follow this warning may result in personal injury or death.

Inspection

Responsibility should be assigned to a dependable individual at the job site to receive material. Each shipment should be carefully checked against the bill of lading. The shipping receipt should not be signed until all items listed on the bill of lading have been accounted. Check carefully for concealed damage. Any shortage or damages should be reported to the delivering carrier. Damaged material becomes the delivering carrier's responsibility, and should not be returned to the manufacturer unless prior approval is given to do so. When uncrating, care should be taken to prevent damage. Heavy equipment should be left on its shipping base until it has been moved to the final location. Check the serial tag information with invoice. Report any discrepancies to your Heatcraft Refrigeration Products Sales Representative.

Warranty Statement

Seller warrants to its direct purchasers that products, including Service Parts, manufactured by SELLER shall be of a merchantable quality, free of defects in material or workmanship, under normal use and service for a period of one **(1) year from date of original installation, or eighteen (18) months from date of shipmen**t by SELLER, whichever first occurs. Any product covered by this order found to Seller's satisfaction to be defective upon examination at Seller's factory will at SELLER's option, be repaired or replaced and returned to Buyer via lowest common carrier, or SELLER may at its option grant Buyer a credit for the purchase price of the defective article. Upon return of a defective product to SELLER's plant, freight prepaid, by Buyer, correction of such defect by repair or replacement, and return freight via lowest common carrier, shall constitute full performance by SELLER of its obligations hereunder.

SELLER shall have no liability for expenses incurred for repairs made by Buyer except by prior, written authorization. Every claim on account of breach of warranty shall be made to SELLER in writing within the warranty period specified above – otherwise such claim shall be deemed waived. Seller shall have no warranty obligation whatsoever if its products have been subjected to alteration, misuse, negligence, free chemicals in system, corrosive atmosphere, accident, or if operation is contrary to SELLER's or manufacturer's recommendations, or if the serial number has been altered, defaced, or removed.

Seller makes no express warranties except as noted above. All implied warranties are limited to the duration of the Express Warranty. Liability for incidental and consequential damages is excluded.
The forgoing is in lieu of all other warranties, express or implied, notwithstanding the provisions of the uniform commercial code, the Magnuson-Moss Warranty - Federal Trade Commission Improvement Act, or any other statutory or common law, federal or state.

SELLER makes no warranty, express or implied, of fitness for any particular purpose, or of any nature whatsoever, with respect to products manufactures or sold by seller hereunder, except as specifically set forth above and on the face hereof. It is expressly understood and agreed that SELLER shall not be liable to buyer, or any customer of buyer, for direct or indirect, special, incidental, consequential or penal damages, or for any expenses incurred by reason of the use or misuse by buyer or third parties of said products. To the extent said products may be considered "consumer products," As defined in Sec. 101 of the Magnuson-Moss Warranty - Federal Trade Commission Improvement Act, SELLER makes no warranty of any kind, express or implied, to "consumers," except as specifically set forth above and on the face hereof.

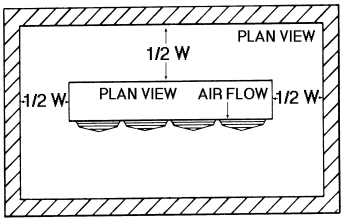
The following conditions should be adhered to when installing this unit to maintain the manufacturers warranty:

(a) System piping must be in accordance with good refrigeration practices.
(b) **Inert gas must be charged into the piping during brazing.**
(c) The power supply to the unit must meet the following conditions:
  A. Three phase voltages must be +/- 10% of nameplate ratings. Single phase must be within +10% or -5% of nameplate ratings.
  B. Phase imbalance cannot exceed 2%.
(d) All control and safety switch circuits must be properly connected according to the wiring diagram.
(e) The factory installed wiring and piping must not be changed without written factory approval.
(f) All equipment is installed in accordance with Heatcraft Refrigeration Products specified minimum clearances

Recommended Unit Cooler Placement

Some general rules for evaporator placement which must be followed are:

1. The air pattern must cover the entire room.
2. **NEVER** locate evaporators over doors.
3. Location of aisles, racks, etc. must be known.
4. Location relative to compressors for minimum pipe runs.
5. Location of condensate drains for minimum run.



The size and shape of the storage will generally determine the type and number of evaporators to be used and their location. The following are some typical examples:

NOTE: Leave space equal to unit height between bottom of unit and product. Do not stack product in front of fans.

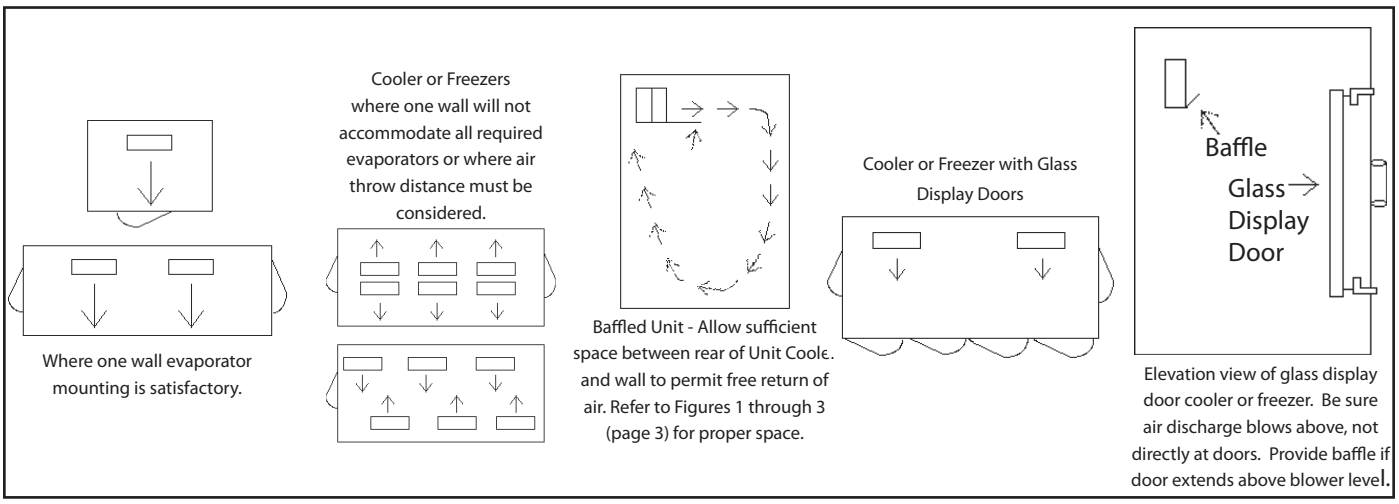
Unit Cooler Mounting



Most evaporators can be mounted with rod hangers, lag screws, or bolts. Use 5/16" bolt and washers or rod for up to 250 pounds, 3/8" for up to 600 pounds and 5/8" for over 600 pounds. Care should be taken to mount the units level so that condensate drains properly. Note that some unit cooler designs achieve drain pan slope by using different height mounting brackets. In this situation, the top of the mounting brackets should be level. Adequate support must be provided to hold the weight of the unit.

When using rod hangers, allow adequate space between the top of the unit and the ceiling for cleaning. To comply with NSF Standard 7, the area above the unit cooler must be sealed or exposed in such a way to facilitate hand cleaning without the use of tools. When lagging or bolting the unit flush to the ceiling, seal the joint between the top and the ceiling with an NSF listed sealant and ends of open hanger channels must be sealed to prevent accumulation of foreign matter.

When locating unit coolers in a cooler or freezer, refer to Figures 1 through 4 for guidelines.

NOTE: Always avoid placement of Unit Coolers direct above doors and door openings.

Figure 4. Large Coolers and Freezers Placement.

Defrost Troubleshooting

Fan Motor

If the motor does not operate or it cycles on thermal overload, remove motor leads from terminal block and apply correct voltage across the leads. If motor still does not operate satisfactorily, it must be replaced. Before starting the unit, rotate fan blades to make sure they turn freely and have sufficient clearance.

Fan Delay & Defrost Termination Control

This control is a single pole double throw switch. The red lead wire is wired to common. The black wire is wired in series with the fan motors. The brown wire is wired in series with the defrost termination solenoid in the timer. The brown and red contacts close and the black and red contacts open when the temperature is above 55°F. The black and red contacts close and the brown and red contacts open when the temperature is below 35°F.

On initial "pull down" of a warm box the fan will not start until the coil temperature reaches approximately 35°F. If the box is still comparatively warm (60°F) when the fan starts, then blowing this warm air over the coil may cause it to warm up to 55°F and thus stop the fan. Therefore, the fan may recycle on initial "pull down." This control cannot be adjusted.

If the fan motor fails to start when the control is below 35°F, disconnect the fan motor leads and check the motor as described for fan motors. Also check whether current is being supplied at "N" and "4" from the timer. The fan delay control must be below 35°F when checking for a closed circuit.

Defrost Heater

If unit shows very little or no defrosting and does not heat, disconnect heater and check to find if it is burned out. To test, apply correct voltage across heater or use continuity flashlight battery tester.

Drain Pan

If drain pan has an ice build-up, drain line may be frozen. The drain line should be pitched sharply and exit cabinet as quickly as possible. Sometimes location and ambient at the drain outside of cabinet may cause freeze-up. A drain line heater may be required to correct the freeze-up. Any traps in the drain line must be located in a **warm ambient.**

Field Wiring

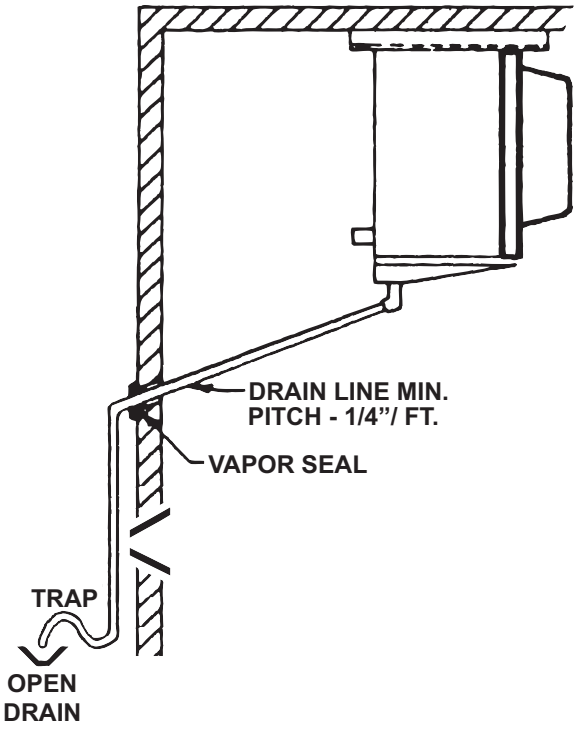
The field wiring should enter the areas as provided on the unit. The wiring diagram for each unit is located on the inside of the electrical panel door. All field wiring should be done in a professional manner and in accordance with all governing codes. Before operating unit, double check all wiring connections, including the factory terminals. Factory connections can vibrate loose during shipment.

1. The serial data tag on the unit is marked with the electrical characteristic for wiring the unit.
2. Consult the wiring diagram in the unit cooler and in the condensing unit for proper connections.
3. Wire type should be of copper conductor only and of the proper size to handle the connected load.
4. The unit must be grounded.
5. For multiple evaporator systems, the defrost termination controls should be wired in series. Follow the wiring diagrams for multiple evaporator systems carefully. This will assure complete defrost of all evaporators in the system.
6. Multiple evaporator systems should operate off of one thermostat.
7. If a remote defrost timer is to be used, the timer should be located outside the refrigerated space.

WARNING: All wiring must be done in accordance with applicable codes and local ordinances.

Condensate Drain Lines

Either copper or steel drain lines should be used and properly protected from freezing. In running drain lines, provide a minimum 1/4 inch per foot pitch for proper drainage. Drain lines should be at least as large as the evaporator drain connection. All plumbing connections should be made in accordance with local plumbing codes. All condensate drain lines must be trapped, and run to an open drain. They must never be connected directly to the sewer system. Traps in the drain line must be located in a warm ambient. We recommend a trap on each evaporator drain line prior to any tee connections. Traps located outside, or extensive outside runs of drain line must be wrapped with a drain line heater. The heater should be connected so that it operates continuously. It is recommended that the drain line be insulated to prevent heat loss. A heat input of 20 watts per linear foot of drain line for 0˚F (-18˚C) room applications and 30 watts per linear foot for -20˚F (-29˚C) rooms is satisfactory. In freezers, the evaporator drain pan fitting should be included when heating and insulating the drain line.



Inspect drain pan periodically to insure free drainage of condensate. If drain pan contains standing water, check for proper installation. The drain pan should be cleaned regularly with warm soapy water.

WARNING: All power must be disconnected before cleaning. Drain pan also serves as cover of hazardous moving parts. Operation of unit without drain pan constitutes a hazard.

Traps on low temperature units must be outside of refrigerated enclosures. Traps subject to freezing temperatures must be wrapped with heat tape and insulated.

NOTE: Always trap single evaporator system drain lines individually to prevent humidity migration.

Figure 5. Condensate Drain Lines

Check Out and Start Up

NOTE: All adjustable controls and valves must be field adjusted to meet desired operation. There are no factory preset controls or valve adjustments. This includes low pressure, high pressure, adjustable head pressure systems and expansion valves.

After the installation has been completed, the following points should be covered before the system is placed in operation:

(a) Check all electrical and refrigerant connections. Be sure they are all tight.
(b) Check the room thermostat for normal operation and adjust.
(c) Wiring diagrams, instruction bulletins, etc. attached to the condensing units should be read and filed for future reference.
(d) All fan motors on evaporators should be checked for proper rotation. Fan motor mounts should be carefully checked for tightness and proper alignment.
(e) Electric and hot gas evaporator fan motors should be temporarily wired for continuous operation until the room temperature has stabilized.
(f) Do not leave unit unattended until the system has reached normal operating conditions and the oil charge has been properly adjusted to maintain the oil level between 1/4 and bottom of the sight glass.
(g) Make sure all Schrader valve caps are in place and tight.

Operational Check Out

After the system has been charged and has operated for at least two hours at normal operating conditions without any indication of malfunction, it should be allowed to operate overnight on automatic controls. Then a thorough recheck of the evaporator operation should be made as follows:

(a) Check liquid line sight glass and expansion valve operation. If there are indications that more refrigerant is required, leak test all connections and system components and repair any leaks before adding refrigerant.
(b) Thermostatic expansion valves must be checked for proper superheat settings. Feeler bulbs must be in positive contact with the suction line and should be insulated. Valves set at high superheat will lower refrigeration capacity. Low superheat promotes liquid slugging and compressor bearing washout.
(c) Check defrost controls for initiation and termination settings, and length of defrost period. Set fail safe at length of defrost + 25%.
Example: 20 minute defrost + 5 minutes = 25 minute fail safe
(d) Check drain pan for proper drainage.
(e) Install instruction card and control system diagram for use of building manager or owner.

Evaporator Superheat

Check Your Superheat. After the box temperature has reached or is close to reaching the desired temperature, the evaporator superheat should be checked and adjustments made if necessary. Generally, systems with a design TD of 10˚F should have a superheat value of 6˚ to 10˚F for maximum efficiency. For systems operating at higher TD's, the superheat can be adjusted to 12˚ to 15˚F as required.

NOTE:	**Minimum compressor suction superheat of 20˚F may override these recommendations on some systems with short line runs.**

To properly determine the superheat of the evaporator, the following procedure is the method Heatcraft recommends:

WARNING:	**If the condensing unit has no flooded condenser head pressure control, the condensing unit must have the discharge pressure above the equivalent 105˚F condensing pressure.**

1. Measure the temperature of the suction line at the point the bulb is clamped.

2. Obtain the suction pressure that exists in the suction line at the bulb location by either of the following methods:

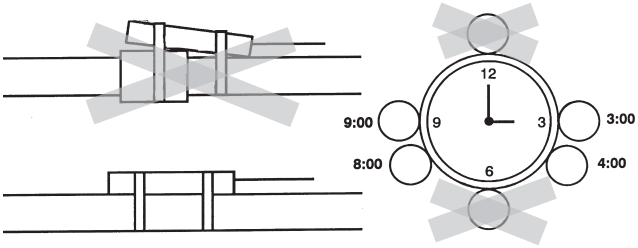
   a. A gauge in the external equalized line will indicate the pressure directly and accurately.

   b. A gauge directly in the suction line near the evaporator or directly in the suction header of the evaporator will yield the same reading as 2a above.

3. Convert the pressure obtained in 2a or 2b above to saturated evaporator temperature by using a temperature-pressure chart.

4. Subtract the saturated temperature from the actual suction line temperature. The difference is Superheat.

Figure 6. Bulb and Contact Location



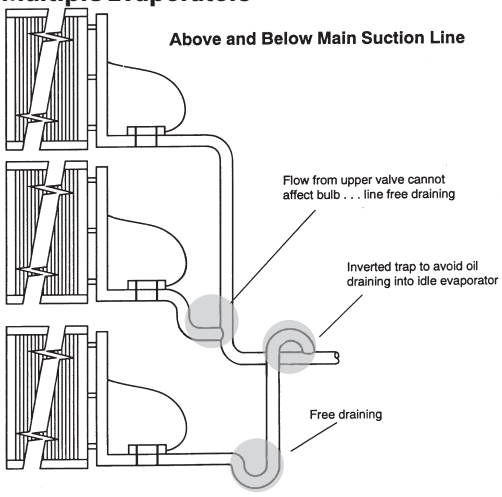


Figure 7. Multiple Evaporators

Alternative Superheat Method

The most accurate method of measuring superheat is found by following the previous procedure, Temperature/Pressure method. However, that method may not always be practical. An alternative method which will yield fairly accurate results is the temperature / temperature method:

1. Measure the temperature of the suction line at the point the bulb is clamped (outlet).

2. Measure the temperature of one of the distributor tubes close to the evaporator coil (inlet).

3. Subtract the inlet temperature from the outlet temperature. The difference is Superheat.

This method will yield fairly accurate results as long as the pressure drop through the evaporator coil is low.

Slim Contour Exclusive Information

The Slim Contour has several exclusive features that improve the servicability .

Cassette Removal/Replacement

Removal of modular cassettes in the Slim Contour improve access and the speed required to service the unit cooler.

1. Turn off electrical feed to the unit.

2. Remove the fan guard (2 Screws).

3. Remove screws from modular cassette and pull cassette forward, but do not fully remove cassette. (Figure 8)

4. With the cassette slightly removed, reach behind the cassette and unplug wired connection. This will separate the cassette from unit cooler. (Figure 9)

5. Once the cassette has been removed from the unit cooler, the cassette can be stored on the unit by using the service clip feature. (Figure 10)

6. To reinstall cassette, reconnect plug and slide cassette back into place. Re-secure the cassette by placing screws in place.

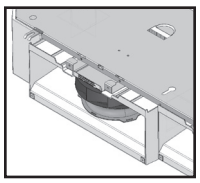

Figure 8.
Cassette Removal (Step 3)

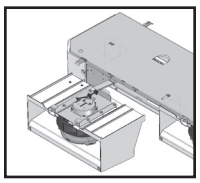

Figure 9.
Cassette Removal (Step 4)

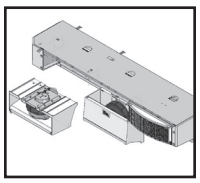

Figure 10.
Cassette Removal (Step 5)

Service Clip Feature

The Slim Contour features a service clip on all of its modular cassettes. The service clip is exclusive to Slim Contour cassettes and is designed to improve the serviceability of the unit cooler. The service clip features two separate hooks that can be used to aide in common maintenance.

The service clip that is featured on top of the cassettes motor can be used to suspend the cassette while being removed to assist in removing the power connection of the cassette(Figure 11.). The Slim Contour cassette also can be suspended from the drain pan using the screw mounts (Figure 12.)

Table 3. Evaporator Troubleshooting Chart

SYMPTOMS	POSSIBLE CAUSES	POSSIBLE CORRECTIVE STEPS
Fan(s) will not operate.	1. Main switch open. 2. Blown fuses. 3. Defective motor. 4. Defective timer or defrost thermostat. 5. Unit in defrost cycle. 6. Coil does not get cold enough to reset thermostat.	1. Close switch. 2. Replace fuses. Check for short circuits or overload conditions. 3. Replace motor. 4. Replace defective component. 5. Wait for completion of cycle. 6. Adjust fan delay setting of thermostat. See Defrost Thermostat Section of this bulletin.
Room temperature too high.	1. Room thermostat set too high. 2. Superheat too high. 3. System low on refrigerant. 4. Coil iced-up. 5. Unit cooler located too close to doors. 6. Heavy air infiltration.	1. Adjust thermostat. 2. Adjust thermal expansion valve. 3. Add refrigerant. 4. Manually defrost coil. Check defrost controls for malfunction. 5. Relocate unit cooler or add strip curtain to door opening. 6. Seal unwanted openings in room.
Ice accumulating on ceiling around evaporator and/or on fan guards venturi or blades.	1. Defrost duration is too long. 2. Fan delay not delaying fans after defrost period. 3. Defective defrost thermostat or timer. 4. Too many defrosts.	1. Adjust defrost termination thermostat. 2. Defective defrost thermostat or not adjusted properly. 3. Replace defective component. 4. Reduce number of defrosts.
Coil not clearing of frost during defrost cycle.	1. Coil temperature not getting above freezing point during defrost. 2. Not enough defrost cycles per day. 3. Defrost cycle too short. 4. Defective timer or defrost thermostat.	1. Check heater operation. 2. Adjust timer for more defrost cycles. 3. Adjust defrost thermostat or timer for longer cycle. 4. Replace defective component.
Ice accumulating in drain pan	1. Defective heater. 2. Unit not pitched properly. 3. Drain line plugged. 4. Defective drain line heater. 5. Defective timer or thermostat.	1. Replace heater. 2. Check and adjust if necessary. 3. Clean drain line. 4. Replace heater. 5. Replace defective component.
Uneven coil frosting	1. Defective heater. 2. Located too close to door or opening. 3. Defrost termination set too low. 4. Incorrect or missing distributor nozzle.	1. Replace heater. 2. Relocate evaporator. 3. Adjust defrost termination setting higher. 4. Add or replace nozzle with appropriately sized orifice for conditions.

Replacement Parts by InterLINK

Commercial Refrigeration Parts

InterLink is your link to a complete line of dependable and certified commercial refrigeration parts, accessories and innovative electronic controls for all Heatcraft Refrigeration Products (HRP) brands - including Bohn, Larkin, Climate Control and Chandler. At InterLink, we provide our wholesalers with a comprehensive selection of product solutions and innovative technologies for the installed customer base. And every product is built to ensure the same high performance standards with which all HRP brands are built — backed by a dedicated team to serve every customer need, delivering at the best lead times in the industry.

Replacement parts should be obtained from your local InterLink wholesaler. Replacement parts, which are covered under the terms of the warranty statement on page 2 of this manual, will be reimbursed for total part cost only. The original invoice from the parts supplier must accompany all warranty claims for replacement part reimbursement. Heatcraft Refrigeration Products reserves the right to adjust the compensation amount paid on any parts submitted for warranty reimbursement when a parts supplier's original invoice is not provided with a claim. **For more information, call 800-686-7278 or visit www.interlinkparts.com.**

For more detailed information on the following topics, please visit http://heatcraftrpd.com/service/publibrary.asp for our complete Refrigeration Systems Installation and Operation Manual (H-IM-64L).

General Safety

IMPORTANT SAFETY NOTE

Only a qualified refrigeration mechanic who is familiar with refrigeration systems and components, including all controls should perform the installation and start-up of the system. To avoid potential injury, use care when working around coil surfaces (if applicable) or sharp edges of metal cabinets. All piping and electrical wiring should be installed in accordance with all applicable codes, ordinances and local by-laws.

WARNING

Always **disconnect and lock off** the main power supply on any system that will be worked on to avoid accidental start up of the equipment.

Inspection

Inspect all equipment before unpacking for visible signs of damage or loss. Check shipping list against material received to ensure shipment is complete.

IMPORTANT: Remember, you, the consignee, must make any claim necessary against the transportation company. Shipping damage or missing parts, when discovered at the outset, will prevent later unnecessary and costly delays. **If damage or loss during transport is evident, make claim to carrier, as this will be their responsibility, not that of the manufacturer.**

Should carton be damaged, but damage to equipment is not obvious, a claim should be filed for “concealed damage” with the carrier.

IMPORTANT: Check the **electrical ratings** on the unit to make sure they correspond to those ordered and to electrical power available at the job site. Save all shipping papers, tags, and instruction sheets for reference by installer and owner.

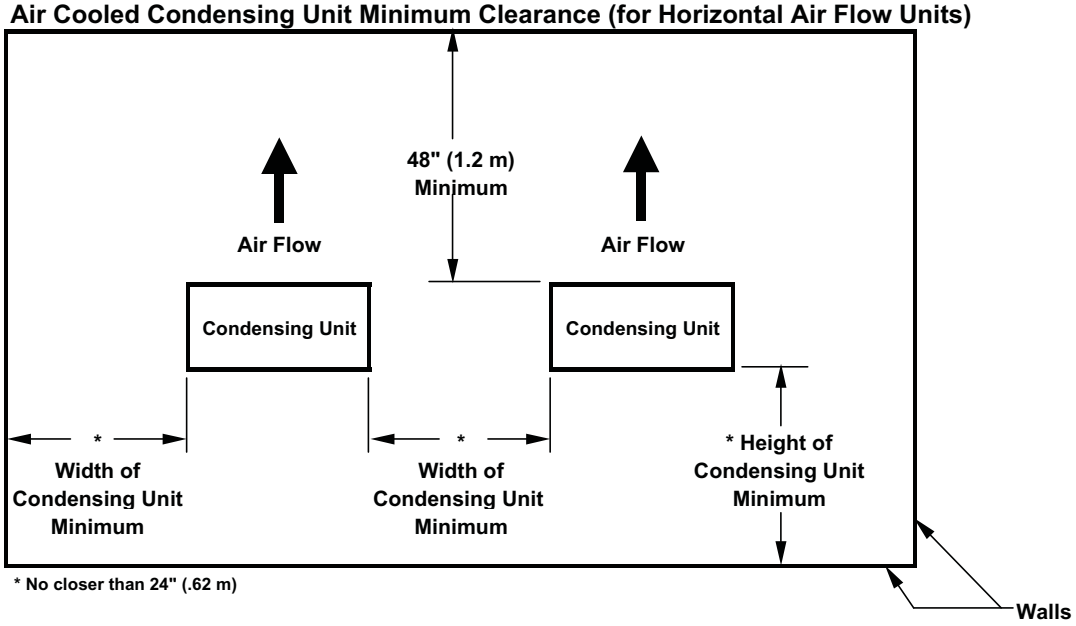
Handling, Placement and Installation

IMPORTANT: When selecting a location for the condensing unit, consideration should be given to some of the following:

(a) Loading capacity of the floor or roof. Check building codes for weight distribution requirements.
(b) Distance to suitable electrical supply.
(c) Distance to the evaporator.
(d) Adequate air circulation and ventilation.
(e) Close proximity to water source and floor drains (water-cooled units)
(f) Accessibility for maintenance.
(g) Local building codes.
(h) Adjacent buildings relative to noise levels.
(i) Wishes of the end user / owner.

When all of the above points have been considered and a specific location chosen, it is advisable to obtain written approval of this location from the building and/or condensing unit owner. This may be a means of avoiding disagreement and expense at a later date.

A fully qualified and properly equipped crew with the necessary tackle and rigging should be engaged to locate the condensing unit in position. When lifting the unit, spreader bars and chafing gear should be used to prevent damage.

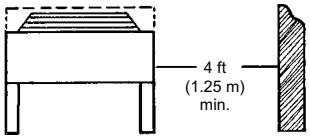


The unit should be placed on a base, which is level and even. Units should be lagged to sleepers or support base. Place unit where it will not be subject to damage by traffic or flooding. On critical installations where noise is liable to be transmitted through the floor structure, vibration isolators should be installed. Isolators should be installed under mounting base and may be rubber or cork or equal.

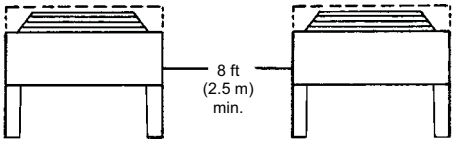
DO NOT USE THE SHIPPING SKID AS A PERMANENT BASE.

The condensing unit should be positioned to allow adequate space for performing service work.

Indoor and outdoor air-cooled condensing units should be positioned using the guidelines shown below.

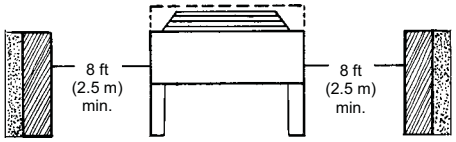


Air Cooled Condensing Unit Minimum Clearance (for Horizontal Air Flow Units)

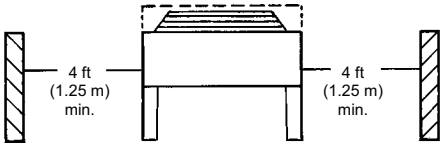


SPECIAL NOTE FOR LARGE AIR COOLED CONDENSING UNITS: Vertical flow air cooled condensing units are large and heavy pieces of mechanical equipment and must be handled as such. A fully qualified and properly equipped crew with the necessary tackle and rigging should be engaged to locate the condensing unit into location. The unit can be lifted by means of lifting holes located in the base frame of the unit. Spreader bars should be used to prevent damage to the sides of the unit. Do not sling directly around the base of unit. The unit should be placed on a base which is level and even.

Air Cooled Condensing Unit Minimum Clearance (For Vertical Air Flow Units)



WALLS OR OBSTRUCTIONS
All sides of the unit must be a minimum of 4 feet (1.25 m) away from the wall or obstruction. Overhead obstructions are not permitted. If enclosed by three walls, the unit must be installed as indicated for units in a pit.



MULTIPLE UNITS
A minimum of 8 feet (2.5 m) is required between multiple units placed side by side. If placed end to end, the minimum distance between units is 4 feet (1.25 m)

UNITS IN PITS:
The top of the unit must be level with, or above the top of the pit. In addition, a minimum of 8 feet (2.5 m) is required between the unit and the pit walls.

LOUVERS / FENCES:
Louvers/fences must have a minimum of 80% free area and 4 feet (1.25 m) minimum clearance between the unit and the louver/fence. Height of louver/fence must not exceed top of unit.

Units equipped with spring-mounted compressors have shipping spacers that are designed to hold the compressor rigidly during transit to prevent possible damage. Before operating the unit, it is necessary to remove these spacers. To remove the shipping spacers, follow these steps:

(a) Remove the upper nuts / washers.
(b) Discard the shipping spacers.
(c) Install the rubber cone washers (located in the electrical box).
(d) Replace the upper mounting nuts / washers.
(e) Allow 1/16 inch space between the mounting nuts / washers and the compressor foot.

On units equipped with rigid mounted compressors, check the compressor mounting bolts to insure they have not vibrated loose during shipping.

Ventilation

If the compressors or condensing units are to be located in machine rooms, adequate ventilation air must be provided in order to avoid an excessive temperature rise in the room. Air requirements vary with ambient air temperatures and the refrigeration load, however the following rule of thumb may be used to approximate ventilating air quantities:

Model Type	Air Quantity
Air-cooled condensing units (for horizontal air flow units)	1,000 cfm (472 L/s) per Hp
Air-cooled compressors (with remote condensers)	250 cfm (118 L/s) per Hp
Suction cooled or water-cooled compressors (with remote or water cooled condensers)	200 cfm (94 L/s) per Hp

All of the above mentioned air quantities are based on relatively short discharge line runs within the machine rooms. If using long uninsulated discharge line runs are unavoidable in the machine room, additional ventilation air is required to offset the heat added to the room by the discharge gas.

Electrical Information

WARNING

All wiring and connections to the unit must be made in accordance with national as well as local electrical codes and by-laws.

Electrical wiring should be sized in accordance with the minimum circuit ampacities shown on the unit nameplate and applicable electrical codes. The unit power connections are approved for copper wire only.

Connect the field power supply through a fused branch circuit disconnect switch. The entering service fuse must not exceed the maximum overcurrent protection (MOP) value on the unit data plate.

Field connected control circuit wires are terminated directly at the control circuit terminal block in accordance with the appropriate wiring diagram.

Voltage at the unit terminals must not vary more than the allowable variation during start-up and while under full load. If the voltage is normal at the supply with the compressor not running and drops considerably when the switch is closed and the motor is trying to start, there is a high resistance due to undersized wires or faulty connections. Voltage drop between inoperative and full load must not exceed 3% of line voltage. In addition, the phase imbalance at the motor terminals should be within 2% on three phase units.

60 Hz Supply		50 Hz Supply	
Power	**Allowable Variation**	**Power**	**Allowable Variation**
115-1-60	103-127 V	100-1-50	90-110 V
208/230-1-60	197-254 V	200/220-1-50	190-242 V
208/230-3-60	187-254 V	200/220-3-50	180-242 V
460-3-60	414-506 V	380/400-3-50	342-440 V
575-3-60	518-632 V		

All systems should use a liquid line solenoid valve (installed at the evaporator) and should be energized by the room or fixture thermostat. For systems with a defrost time clock, the liquid line solenoid and thermostat should be energized by the time clock. Initially set the defrost time clock (model 8145) as follows:

Air defrost evaporators; 3 per day (every 8 hours) with the time termination at 45 minutes.

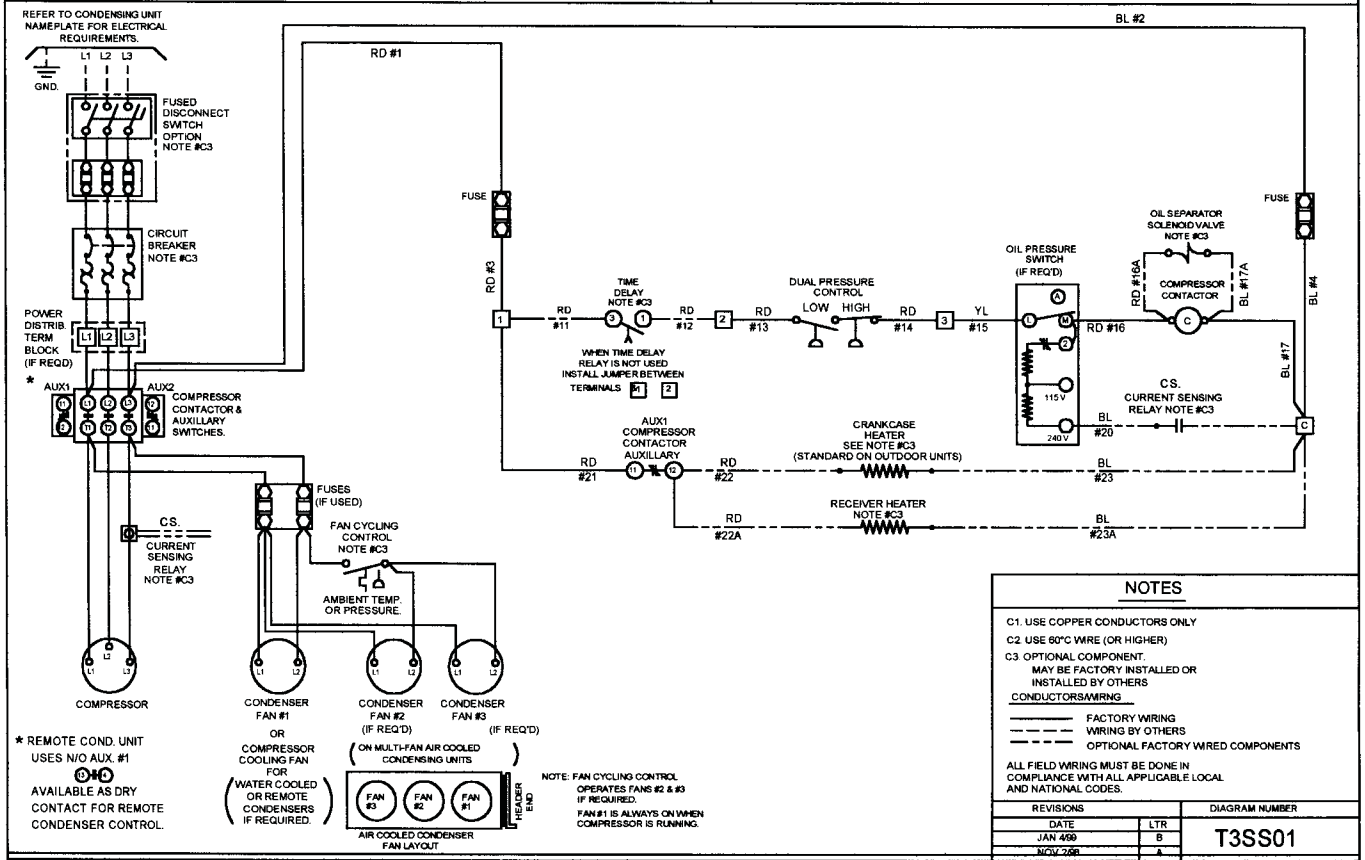
Electric defrost evaporators; 4 per day (every 6 hours) with time termination set (Fail Safe) at 30 minutes. Check that the wiring from the defrost termination thermostat is wired to terminal “X” on the clock and terminates the defrost cycle when the evaporator coil reaches approximately 55 ^{o}F. The fan delay thermostat wiring should also be checked for proper operation. This ensures that all water droplets have been refrozen to the coil before the evaporator fan starts back up.

Note: *The above settings are guidelines only and must be re-adjusted to suit local field conditions and actual evaporator equipment specifications.*

Refer to the evaporator installation manual for further information.

An evaporator airflow interlock is recommended on some installations so that the compressor will pump down and shut off in the event that the evaporator fan is off for any reason. This is wired into the control circuit in series with the thermostat and solenoid valve.

Refer to the following wiring diagrams for typical air defrost and electric defrost wiring arrangements.



WARNING

Any deviation or change to the electrical components or wiring as supplied on the original equipment, or noncompliance with the voltage and phase balance requirements without written authorization will void the warranty.

Refrigerant Piping

WARNING

All local codes must be observed in the installation of refrigerant piping.

IMPORTANT PIPING NOTE

Appropriate line sizing practices must be used throughout the installation of the refrigeration system. Special consideration must be taken when the condensing unit is installed above the evaporator. **REFRIGERATION GRADE COPPER TUBING MUST BE USED FOR PIPING SYSTEMS.**

Piping practice and line sizing charts as recommended by A.S.H.R.A.E. or other reputable refrigeration standards must be followed to ensure minimum pressure drop and correct oil return. An inert gas such as dry nitrogen should be passed through the piping during welding or brazing operations. This reduces or eliminates oxidation of the copper and formation of scale inside the piping. For specific piping requirements refer to your local distributor or sales representative.

Correct line sizing is most critical because of the several factors involved:

(a) Minimum pressure drop to ensure efficient compressor performance.
(b) Sufficient gas velocity to maintain proper oil return to the compressor under all load conditions.
(c) Elimination of conditions on multiple evaporators whereby oil may log in an idle evaporator.

Suction lines should be sized on the basis of a maximum total pressure drop equivalent to a 2°F (1.1°C) change in saturated temperature. At 40°F (4.4°C) suction temperature, this is approximately 3 psig (20.7 kPa) for R-22. At -20°F (-28.9°C) suction temperature, this is approximately 1.3 psig (9.0 kPa) for R-404A.

Horizontal liquid lines should be sized on a basis of a maximum pressure drop equivalent to a 2°F (1.1°C) drop in the sub-cooling temperature. If the lines must travel up vertically then adequate sub-cooling must be provided to overcome the vertical liquid head pressures. A head of two feet of liquid refrigerant is approximately equivalent to 1 psig (6.9 kPa). Liquid line velocities should not exceed 300 fpm (1.52 m/s). This will prevent possible liquid hammering when the solenoid valve closes.

Pressure Loss of Liquid Refrigerant in Liquid Line Risers

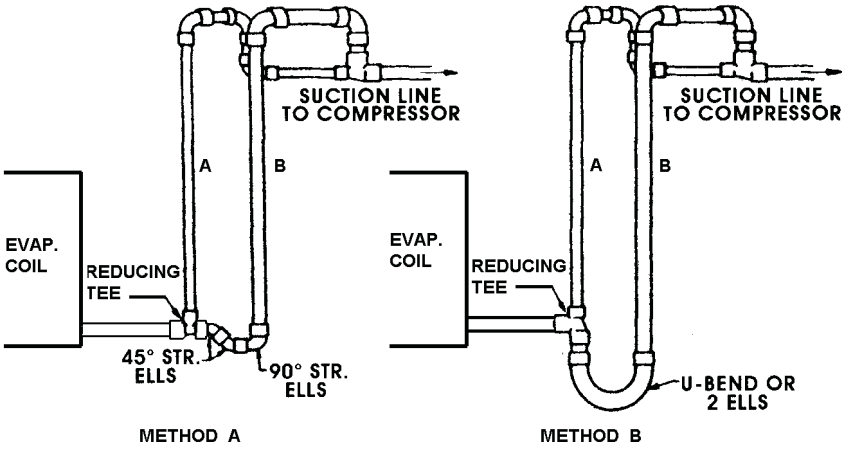
Based on 110 °F liquid temperature at bottom of riser.

At the temperatures encountered in the condenser, receiver and liquid line a certain amount of oil is always being circulated with the refrigerant through the system by the compressor. However, at the evaporator temperature, and with the refrigerant in a vapor state, the oil and refrigerant separate. This oil can only be returned to the compressor by gravity or by entrainment in the suction gas. Roof installations leave no alternative but by entrainment for oil return, so suction gas velocity and correct line sizing to maintain this velocity are imperative. Care must be taken not to oversize the suction line in the desire for maximum performance.

Gas velocity in vertical suction lines must not be less than 1,000 fpm (5 m/s) and preferably 1,250 to 1,500 fpm (6 to 8 m/s).
Important: A suction trap must be installed at the base of all suction risers of four (4) feet or more in order to trap oil and allow entrainment in the suction gas.

Typical Suction P-Trap



"INCORRECT" **"CORRECT"**

IMPORTANT PIPING NOTE

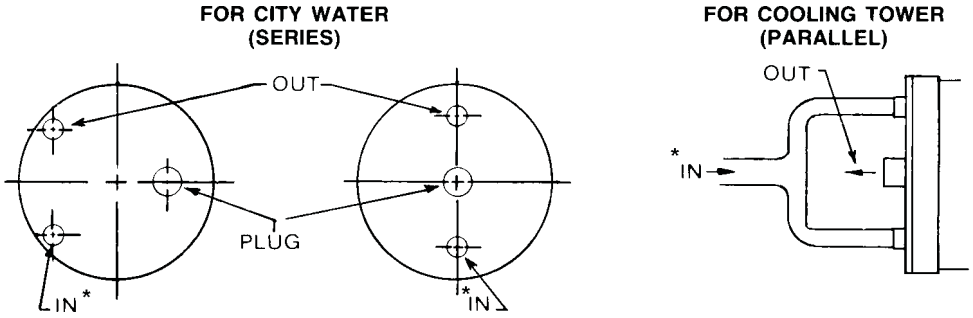
If steps of capacity control are supplied on a compressor, provisions must be made for oil return by sizing suction risers to maintain adequate gas velocities at reduced refrigerant flow.

Typical Double Riser Construction

During the lower capacity running mode (compressor capacity control energized) oil will collect in the elbow or at U-bend below pipe “B”. This will divert the gas and oil to flow up the smaller pipe “A” at a higher velocity.

IMPORTANT: When welding service valves or any components that may be damaged by heat, manufacturer’s installation instructions must be adhered to. Wrapping components with a wet cloth will help to prevent damage from heat.

IMPORTANT: All suction lines outside of the refrigerated space must be insulated.



Water-Cooled Condensers

WARNING

All water and drain connections to the unit must be made in accordance with national as well as local plumbing codes and by-laws.

Cooling water circuits in some shell and tube water-cooled condensers may be either series or parallel as required by the particular application. The “series” flow is usually for city water where lower entering water temperatures exist and higher-pressure drops can be tolerated (such as city water supplies). The “parallel” circuit flows are usually required when the water temperatures enter at 85°F (29.4°C) or higher requiring lower water pressure drops (such as closed loop cooling tower supplies).

On some condensers, the water circuiting may be entirely internal with only an inlet and outlet water fitting. The water inlet is always at the bottom connection.

*** From compressor cooling coil (if equipped) and water regulating valve**

All water-cooled condensers require a water regulating valve that must be installed upstream of the condenser. The water-regulating valve is adjustable and is set to provide the desired condensing pressure. As the condensing pressure rises, the valve will open and allow more water to flow. As the condensing pressure lowers the valve will start to close to reduce the amount of water flow into the condenser. If water supply pressure is excessive, a pressure-reducing valve must be used since the allowable working pressure of water valves and condensers is normally 150 psig (1136 kPa). Typical condensing temperatures normally range between 90 to 110 °F. The actual water inlet temperature and water supply flow capacity available at the site determines the suitable condensing temperature. Lower inlet water temperatures (below 70 °F) allow the condensing unit to run at a lower condensing temperature without resulting in a high water flow rate (consumption). Higher water inlet temperatures (above 85 °F) require the condensing temperature to be higher to avoid excessive water flow rates. Refer to the water flow rate chart to estimate the flow rate (GPM-US gallon per minute) at given water temperatures and loads. The TD (temperature difference) is the difference between the condensing temperature and the water inlet temperature.

Example: Given 80 °F inlet water available, +25 °F evaporating temperature application and 1 ton (12,000Btuh) evaporator load. The results are:

20 °F TD = 100 °F Cond.Temp., series flow is .148 x 12 = 1.78 GPM, parallel flow = .185 x 12 = 2.22 GPM
30 °F TD = 110 °F Cond.Temp., series flow is .103 x 12 = 1.24 GPM, parallel flow = .128 x 12 = 1.54 GPM

Knowing the GPM you can estimate the pressure drop through the condenser (and compressor, if with body coil). Refer to the Typical Pressure Drop tables and use the appropriate flow to estimate the resulting pressure drop. If using a condenser that has only ONE water circuit (two connections) use the “parallel” column on the GPM flow rate chart.

Care should be exercised in locating the condensing unit so that the condenser will never be exposed to temperatures below freezing.

Excessive water velocities or cavitation on the waterside of the condenser tubes may damage a water-cooled condenser. In order to prevent operating difficulties, care should be taken to follow the instructions outlined below:

(a) Water velocities through the condenser should not exceed 7 fps (2.13 m/s). Higher velocities can result in “impingement corrosion”. In order to maintain water velocities at an acceptable level, parallel circuiting of the condenser may be necessary when high water flow is required.

(b) If a water-circulating pump is used, it should be installed so that the condenser is fed from the discharge side of the pump.

(c) If the condenser is installed more than 5 ft (1.52 m) higher than the outlet drain point of the condenser, a vacuum breaker or open vent line should be provided to prevent the outlet line from creating a partial vacuum condition.

CONSULT THE FACTORY OR LOCAL SALES REPRESENTIVE FOR FURTHER INFORMATION.

Larger compressor models use fans in place of water cooling coils.

System Accessories

In order to ensure trouble free operation of the refrigeration system it is important that the following system accessories be reviewed and installed.

(a) A **moisture indicating LIQUID SIGHT GLASS** should be installed in the liquid line between the receiver and as close as possible to the expansion valve on the evaporator. If it is mounted on the condensing unit, it will be mounted downstream of the receiver outlet service valve and immediately after the liquid line drier. It will change color if there is moisture present in the system. It also allows the contractor to detect a shortage of refrigerant or flash gas in the liquid line. Bubbles are not normally visible in the sight glass of a properly charged system, however it is normal to see bubbles appear in the sight glass for a few minutes when the compressor starts. **Bubbles in a sight glass installed on the condensing unit must never be used as the final indicator for shortage of refrigerant in the system.**

(b) A **LIQUID LINE FILTER DRIER** (sealed or replaceable core) should be installed in the system to remove foreign matter and moisture that may have entered the system during installation. Liquid line driers should be installed downstream of the receiver outlet valve and upstream of the liquid line solenoid valve (if supplied). Liquid line driers may or may not have access valves, depending on the size and application. They should be replaced whenever there is excessive pressure drop across the filter, or when the system becomes contaminated due to system leaks, compressor burn-outs, acid formation, or moisture accumulation as indicated by the moisture indicating sight glass. Refer to the specific manufacturer's recommendation for servicing.

(c) A **DISCHARGE MUFFLER** may be used to help minimize the noise created in the discharge line of the compressor. This noise my be the result of variations in piping configuration, the pattern of the gas flow, line sizes, operating pressures or compressor and unit mounting. A particular combination of gas flow and piping will result in a resonant frequency, which may amplify the sound and vibration to an undesirable level. Gas pulsations from the compressor discharge may also be amplified in a similar manner.

(d) A **DISCHARGE OIL SEPARATOR** may be used with flooded systems, low temperature systems and systems with long runs of piping or other factors that tend to cause oil return problems. They help maintain oil volume levels in the compressor oil sump.

(e) A **LIQUID LINE SOLENOID VALVE** must be installed at the evaporator. Installing a solenoid valve will allow all of the refrigerant to be pumped out of the low side (evaporator and suction line) when the thermostat has been satisfied. This reduces the risk of refrigerant migrating or flooding back to the compressor. Locating the solenoid at the evaporator (instead of the condensing unit) will minimize the pump-down time and refrigerant capacity required by the receiver.

(f) A **SUCTION LINE FILTER** (sealed or replaceable core) when used are always installed upstream of the compressor suction service valve and any accumulators or other options that may be installed. Suction filters are equipped with "Schrader" type access valves that allow plugged filters and elements to be identified quickly when the pressure drops get too high. Refer to the specific manufacturer's recommendation for servicing.

(g) Units equipped with spring-mounted compressors should have **VIBRATION ELIMINATORS** in both the suction and discharge lines. They minimize noise transmission and provide flexibility if it is ever necessary to remove a compressor. Vibration eliminators should be installed at ninety degrees to the vibration for best results and whenever possible, in a horizontal position, parallel to the compressor crankshaft. Suction vibration eliminators **MUST be insulated** on low temperature systems to prevent refreezing of condensate, causing expansion damage to the bellows inside the eliminator. This expansion can eventually fatigue the copper bellows causing rupture and loss of refrigerant.

(h) A **SUCTION LINE ACCUMULATOR** is used to prevent liquid refrigerant from reaching the compressor. Liquid flood back can occur for various reasons such as a malfunctioning expansion valve, refrigerant overcharge, hot gas defrost cycle or extremely low load on the evaporator. An accumulator should be used if frost or dirt collect on the evaporator coil(s). This can reduce the heat transfer. Some suction line accumulators are equipped with a built in suction to liquid line heat exchangers. All hot gas defrost systems must use an accumulator.

(i) A **SUCTION TO LIQUID HEAT EXCHANGER** should be used if a system requires long liquid lines from the receiver to the evaporator or if the liquid has to rise vertically upward any distance. It can help prevent excessive frosting on the compressor body and increase superheat in the suction line reducing the possibility of liquid refrigerant from returning to the compressor.

(j) A **PHASE / VOLTAGE MONITOR** protects the system against phase loss (single phasing), phase reversal (improper sequence), high voltage and low voltage (brownouts).

Leak Testing

IMPORTANT: All system piping, including the condensing unit and accessories should be thoroughly tested for leaks prior to start up and charging. The system should be initially pressurized to a maximum of 150 psig (1136 kPa) with dry nitrogen to ensure that the system is free of major leaks. With the system free of major leaks, a more detailed leak check should be performed. Discharge the initial dry nitrogen charge and add enough refrigerant to raise the system pressure up to 10 psig (170 kPa) (tracer amount). Add dry nitrogen to increase the system pressure to a maximum of 150 psig (1136 kPa). It is recommended that an electronic leak detector be used when checking for leaks because of its greater sensitivity to small leaks. As a further check it is recommended that this pressure be held for a minimum of 12 hours and then rechecked. The system must be leak free for satisfactory operation.

WARNING

HFC-134a has been shown to be combustible at pressures as low as 5.5 psig (140 kPa) at 350 ^{o}F (176.7 ^{o}C) when mixed with air at concentrations more than 60% air by volume. At lower temperature, higher pressures are required to support combustion. Therefore, air should never be mixed with HFC-134a for leak detection.

IMPORTANT ENVIRONMENTAL NOTE

When conventional leak detection methods are employed using HCFC or CFC tracer gas, all of the tracer gas must be reclaimed and disposed of in a proper manner.

Evacuation and Dehydration

When the system is completely free of refrigerant leaks, an evacuation of the entire system should be completed by using a “high vacuum” pump. This evacuation, if completed correctly, will ensure long life for the system as well as elimination of moisture and non-condensable gas problems. **Moisture problems causing compressor failure will void warranty. Follow the recommended procedure carefully.**

CAUTION

Do not use the refrigeration compressor to evacuate the system. Never start the compressor or perform a megger insulation test while the system is in a vacuum.

Dehydration Procedure

Use only a “high vacuum” pump capable of drawing a vacuum of 100 microns. Change the vacuum pump oil frequently. Gauges or vacuum measuring instruments should be suitable to measure conditions at any stage of the process in order to give the operator indications of progress. For specific recommendations, refer to the vacuum pump supplier for these instruments.

Copper jumper lines should be used to interconnect both high and low-pressure sides of the system. These lines should be at least 3/8” O.D. in order to handle the light density vapor at high vacuum obtained at completion of operation. Lines smaller than 3/8” O.D. will slow down the process considerably as well as making final system vacuum questionable. The entire system temperature should be over 60 ^{o}F (16 ^{o}C) for evacuation to be effective. If the temperature is less than 60 ^{o}F (16 ^{o}C) the final vacuum should be 50 microns. Double evacuation with a “sweeping “ of dry nitrogen is recommended. First evacuation should be to at least 750-micron depth. When this point is reached, break the vacuum with refrigerant or dry nitrogen to melt any moisture, which may have frozen during the first vacuum stage.

IMPORTANT ENVIRONMENTAL NOTE

When conventional leak detection methods are employed using HCFC or CFC tracer gas, all of the tracer gas must be reclaimed and disposed of in the proper manner.

Reclaim any tracer gas from the system and re-evacuate to a final vacuum of at least 100 microns at a minimum 60 ^{o}F (16 ^{o}C) system temperature. With this degree of evacuation, all moisture and non-condensables will be removed from the entire system.

Line Insulation

After the final system leak test is complete, it is important that all refrigerant lines exposed to high ambient conditions must be insulated to reduce the heat pick-up and prevent the formation of flash gas in the liquid lines. Suction lines should be insulated with 3/4 inch wall insulation, Armstrong “Armaflex” or equal. To prevent rupture due to condensate re-freezing, all suction vibration eliminators on low temperature systems **must be completely insulated**. Liquid lines exposed to high ambient temperatures should be insulated with 1/2 inch wall insulation or better. Any insulation that is to be located in an outdoor environment should be protected from UV exposure to prevent deterioration of the insulating value.

Refrigerant Charging

Condensing units must be charged only with the refrigerant for which they were designed. The type of refrigerant to be used is specified on the name plate of the unit. Installing a liquid line drier between the service gauge and the liquid service port when charging a unit will ensure the refrigerant supplied to the system is clean and dry. This is especially important when charging a low temperature system. Blend type refrigerants (400 series, i.e. R404A) **must not be vapor charged** unless the cylinder is completely emptied into the system.

Weigh the refrigerant drum before and after charging in order to keep an accurate record of the weight of refrigerant put into the system.

IMPORTANT REFRIGERANT CHARGING NOTE

Overcharging a system can result in poor system performance, personal injury and / or compressor damage. **DO NOT** charge strictly by the holding capacity of the receiver. **DO NOT** assume that bubbles in a sight glass, when located at the condensing unit, indicates the system is undercharged.

Note: *To estimate the total system requirement, refer to the manufacturer’s evaporator and condensing unit specifications on typical operating charges and include the amount for the liquid lines (see tables below). Allow an extra 10% to 15% safety factor. Ensure the receiver can handle the required charge during the pump down mode. (Refer to the condensing unit brochure pump down specifications).*

Break the vacuum by charging liquid refrigerant into the receiver side only (charge through the receiver outlet valve gauge port with the valve in the open position). Close the valve and then continue to charge through the gauge port feeding the liquid line and evaporator. Start the compressor and continue to charge.

Refrigerant may be added at the compressor through the compressor suction service valve **in gas form only**. When liquid charging is used, a liquid charging valve must be installed. While charging the system, special attention should be paid to the oil level in the compressor.

If charging to the “bubble” method (observing liquid line sight glass), always use a sight glass located directly before the TXV (thermostatic expansion valve) for the final indicator.

On units that use an adjustable flooded condenser pressure-regulating valve (Sporlan ORI-6 or ORI-10) the proper adjustment must be set. Sporlan set their controls at 120 psig (929 kPa). These controls should be re-adjusted to the following pressures:

185 psig (1377 kPa) for R-22 (2 1/2 turns in clockwise for ORI-6, 4 turns in for ORI-10)
200 psig (1480 kPa) for R-404A (3 turns in clockwise for ORI-6, 5 turns in for ORI-10)

Refer to Sporlan’s installation instructions (bulletins 90-30-1 and 90-31) for further details.

sub-cooling circuit 100% full (where applicable)
** Based on condenser summer charge +condensers flooded
(between 60-80% full with fan cycling-- where applicable)
+receiver 15% full + sub-cooling circuit 100% full (where applicable)

Compressor Oils

Check to see that the oil level is 1/8 to 1/3 up on the compressor sight glass on compressors so equipped before starting the compressor and after 15 to 20 minutes of operation.

CAUTION: Oil levels should not be allowed to go above the centre or 1/2 of the sight glass. Excessive oil levels in the compressor can result in excessive compressor noise, higher power consumption or internal compressor damage.

Welded hermetic compressors normally do not have sight glasses or means of determining their oil level. This type of compressor is usually installed in packaged systems or in close proximity to the fixture.

All welded hermetic compressors are factory charged with enough oil to compensate for any piping losses up to about 35 ft (10.7 m) (one way) remote location. In the event of any substantial oil loss due to a leak or excessive line run, recharge as per the table below.

Add approximately 1/3 fl oz per foot (32 ml per meter) for any remote location over 35 ft (10.7 m). If in doubt of an actual oil level, the only positive check is to remove the compressor and drain the oil (through the suction connection) and recharge with the correct factory charge (refer to unit specifications). **DO NOT** re-use drained oil that has been exposed to the atmosphere. **DO NOT** re-fill, at any one time more than a total of 110 % of the compressor's factory specified charge. Allow time for some of the oil to circulate into the system.

Some restrictions may apply.For further information consult Carlyle factory or Carlyle web site.

Due to the extreme hygroscopic (moisture absorbing) characteristics of Polyol Ester (POE) oils, systems MUST NEVER be left open to the atmosphere for any extended period of time. Simply pulling a deep vacuum on the system during the evacuation and dehydration procedure WILL NOT remove moisture that is absorbed into POE oils.

System Start-up Check List

IMPORTANT START-UP NOTE

Only a qualified refrigeration mechanic who is familiar with compressor performance and the function and adjustment of all controls and components should start up the compressor. Finishing up work on the installations should be planned so that a qualified mechanic is on the job for at least the first full day that the unit is in operation.

Before any refrigeration system is started, the following items should be checked:

(1) Check that all electrical and refrigeration connections are tight.
(2) Check compressor crankcase oil level (if equipped with sight glass). It should be from 1/8 to 1/2 full in the sight glass.
(3) Insure that compressor shipping spacers (spring mounted compressors) or hold down nut (solid mounted compressors are properly in place.
(4) Check that the compressor discharge and suction shut-off valves are open.
(5) Ensure that the high and low pressure controls (see table below) pressure regulating valves, oil pressure safety controls and any other safety controls are adjusted properly.
(6) Check that the room thermostat is set for normal operation and adjust if required.
(7) Check all motors, fans and pump bearings in the condenser and evaporator. If they are the type that require oil or grease, make sure that this is attended to in accordance with the tag, which will be attached. Fan blades and pumps should be checked for correct rotation, tightness and alignment. Air should draw air through the condenser (air cooled condensing unit models).
(8) Electric and hot gas evaporator fan motors should be temporarily wired for continuous operation until the room temperature has stabilized.
(9) Observe the system pressures during the charging and initial operation process. **DO NOT** add oil while the system is low on refrigerant charge unless the oil level is dangerously low.
(10) Continue to charge the system until it has enough charge for proper operation. **DO NOT OVERCHARGE THE SYSTEM.** Note that bubbles in the sight glass may not necessarily mean a shortage of refrigerant. It could be caused by a restriction.
(11) **DO NOT** leave the system unattended until the system has reached its normal operating condition and the oil charge has properly adjusted itself to maintain the proper level in the sight glass.
(12) Compressor performance, and that of all of the moving components, should be watched carefully throughout the first operating cycle and then checked periodically during the first day of operation. **Careful attention to details at this time will pay dividends in trouble-free performance of the entire system.**
(13) Check that the wiring diagrams, instructions bulletins etc. are read and attached to the unit for future reference. Ensure that the Warranty Activation Certificate is filled in and either faxed or mailed back to the number or address provided.

CAUTION

Extreme care must be used when starting a compressor for the first time after the system has been charged. During this time liquid refrigerant may have migrated to the compressor crankcase, creating a condition that could cause the compressor damage due to slugging. Energizing a crankcase heater (if so equipped) 24 hours prior to start-up is recommended. If the compressor is not equipped with a crankcase heater, directing a 500 watt heat lamp or other safe heat source on the lower shell or crankcase of the compressor for approximately thirty minutes is recommended.

WARNING

Three phase scroll compressors must be checked for correct rotation. During the initial start up, observe the suction and discharge gauges to ensure the suction pressure drops and the discharge pressure rises.

Pressure Control Settings

Minimum Temperature °F *	R-134a		R-22		R-404A, R-507	
	Cut-in (PSIG)	Cut-out (PSIG)	Cut-in (PSIG)	Cut-out (PSIG)	Cut-in (PSIG)	Cut-out (PSIG)

-10	-	-	15	0	15	0
-20	-	-	10	0	10	0
-30	-	-	10	0	6	3" Hg

* The coldest Temperature of either the fixture or outdoor ambient.

High Pressure Control Settings

Refrigerant	Maximum Cut-out (PSIG)	
	Air-Cooled Units	Water Cooled Units
R-134a	250	200
R-22	370	315
R-404A	400	315

Low Temperature Room Pull-Down

It can take up to two weeks to properly start-up and pull-down a large freezer. Large freezers should be pull-down to temperature in stages. Too fast a pull-down can cause structural problems in pre-fabricated rooms and will damage (crack) concrete floors. Reduce room temperature by 10 to 15 °F (5.6 to 8.4 °C) per day. Hold this temperature for 24 to 48 hours at 35 °F (1.7 °C) and again at 25 °F (-3.9 °C). Monitor the amount of defrost water during this pull down stage.

Once the room is pulled down to temperature, expect frost on the compressor end bell and any exposed suction line. A lack of frost in these areas probably indicates too high of suction superheat. Reduce defrost frequency to 30 minutes every 6 hours if possible. Adjust the defrost termination (and time clock) so that the coil and drain pan are **COMPLETELY** free of frost / ice at termination. Too short of a defrost cycle will allow residual ice to grow. Too long of a defrost will allow the coil(s) to steam at the end of the cycle. The steam will condense and freeze fans, fan guards and create frosting on the ceiling of the room. The evaporator fan delay must allow any condensate left on the coil surface to refreeze before the fans start.

Checking Superheat

IMPORTANT SYSTEM BALANCING NOTE

To obtain maximum system capacity and insure trouble free operation it is necessary to check both the compressor and evaporator superheat.

Compressor Superheat

Compressor suction superheat must be checked. To check the superheat at the compressor the following steps should be followed:

(1) Measure the suction pressure at the suction service valve of the compressor. Determine the saturated temperature corresponding to this pressure from a "Pressure- Temperature" chart.
(2) Measure the suction temperature of the suction line about 6 inches (15 cm) back from the compressor suction valve using an accurate thermometer.
(3) Subtract the saturated temperature (from step 1) from the actual suction line temperature (from step 2). This difference is the **actual superheat at the compressor**.

System capacity decreases as the suction superheat increases. For maximum system capacity, the suction superheat should be kept as low as is practical. The superheat at the compressor should range within 20 to 45 ^{o}F (11.2 to 25.2 ^{o}C) Superheat.

NOTE: Too low of a suction superheat can result in liquid being returned to the compressor. This can cause dilution of the oil and eventually cause failure of the bearings and rings through wash out as well as liquid slugging.

NOTE: Too high of a suction superheat will cause excessive discharge temperatures which cause a break down of the oil and will result in piston ring wear, piston and cylinder wall damage.

If adjustment to the suction superheat is required, it should be done either by adjusting the thermostatic expansion valve at the evaporator, the use of liquid to suction heat exchanger or suitable use of suction line insulation.

Evaporator Superheat

Once the refrigerated space is at its design temperature or close to design temperature, the evaporator superheat must be checked. To check the suction superheat at the evaporator the following steps should be followed:

(1) Measure the suction pressure in the suction line at the bulb location by either,
  (a) A gauge in the external equalizer line will indicate the pressure directly and accurately.
  (b) A gauge directly in the suction line near the evaporator or directly in the suction header will suffice.
(2) Measure the temperature of the suction line at the point where the thermostatic expansion valve bulb is clamped to the suction line.
(3) Convert the pressure obtained in step 1 above to a saturated evaporator temperature from a "Pressure-Temperature" chart.
(4) Subtract the saturated temperature (from step 1) from the actual suction line temperature (from step 2). This difference is the **actual superheat at the evaporator**.

The superheat at the evaporator should be a minimum of 6 to 10 ^{o}F (3.4 to 5.6 ^{o}C) for systems with a 10 ^{o}F (5.6 ^{o}C) design TD (temperature difference) to a maximum of 12 to 15 ^{o}F (6.7 to 8.4 ^{o}C) for systems with a higher operating TD.

Low temperature applications (freezers) should be set at superheats of 4 to 6 ^{o}F (2.2 to 3.4 ^{o}C).

TD = Box temperature – evaporating temperature.

System Operational Check List

When the system has been running trouble free for an extended time (two weeks or more) and design conditions are satisfied, the following check list should be followed:

(1) Check that compressor **discharge and suction pressures** are operating within the allowable design limits for the compressor. If not, take the necessary corrective action.

(2) Check the liquid line sight glass and expansion valve operation. If there is an indication that the system is low on refrigerant, thoroughly **check the system for leaks before adding refrigerant**.

(3) Check the **level of the oil** in the compressor sight glass (if so equipped). Add oil as necessary.

(4) The thermostatic expansion valve must be checked for **proper superheat settings**. The sensing bulb must have positive contact with the suction line and should be insulated. Valves operating at a high superheat setting results in low refrigeration capacity. Low superheat settings can cause liquid slugging and compressor bearing washout. (Refer to the section on compressor and evaporator superheats)

(5) Check the **voltage and amperage** readings at the compressor terminals. Voltage reading must be within the recommended guidelines. Normal operating amperages can be much lower than the compressor nameplate values.

(6) To check the **high pressure control setting** it is necessary to build up the head pressure to the cut-out point of the control. This can be done by stopping the condenser fan(s) (air cooled condensing units) or pump and watching the pressure rise on a high pressure gauge to make sure the high pressure control is operating at the setting.

(7) Check the **low pressure settings** by throttling the compressor shut-off valve and allowing the compressor to pump down. This operation must be done with extreme caution to avoid too sudden a reduction in crankcase pressure, which will cause oil slugging and possible damage to the compressor valves. Close the valve a turn at a time while watching the compound gauge for change and allowing time for the crankcase pressure to equalize with the pressure control bellows pressure. The slower the pressure is reduced, the more accurate will be the check on the pressure control setting.

(8) Recheck all **safety and operating controls** for proper operation and adjust as necessary.

(9) Check **defrost controls for initiation and termination settings**, and the length of defrost period. Set the fail safe on the time clock at the length of defrost plus 25 %.

(10) If the system is equipped with winter head pressure controls (fan cycling or flooded valves), **check for operation.**

(11) Fill in the **Service Log** in the back of this Installation Manual.

System Troubleshooting

The following System Troubleshooting Guide lists the most common types of malfunctions encountered with refrigeration systems. These simple troubleshooting techniques can save time and money minimizing unnecessary downtime and end-user dissatisfaction.

Contact the factory or your local sales representative for further information or assistance.

System Troubleshooting Guide	
Condensing Unit Problem	**Possible Causes**
Compressor will not run. Does not try to start.	1. Main power switch open. 2. Fuse blown or tripped circuit breaker. 3. Thermal overloads tripped. 4. Defective contactor or coil. 5. System shut down by safety devices. 6. Open thermostat or control. No cooling required. 7. Liquid line solenoid will not open. 8. Loose wiring.
Compressor hums, but will not start.	1. Improperly wired. 2. Low line voltage. 3. Loose wiring. 4. Defective start or run capacitor. 5. Defective start relay. 6. Motor windings damaged. 7. Internal compressor mechanical damage.
Compressor starts, but trips on overload protector.	1. Improperly wired. 2. Low line voltage. 3. Loose wiring. 4. Defective start or run capacitor. 5. Defective start relay. 6. Excessive suction or discharge pressure. 7. Tight bearings or mechanical damage in compressor. 8. Defective overload protector. 9. Motor windings damaged. 10. Overcharged system. 11. Shortage of refrigerant. 12. Suction or discharge pressure too high. 13. Inadequate ventilation. 14. Operating system beyond design conditions.
Compressor short cycles.	1. Low pressure control differential set too low. 2. Shortage of refrigerant. 3. Low airflow at evaporator(s). 4. Discharge pressure too high. 5. Compressor internal discharge valves leaking. 6. Incorrect unit selection (oversized).
Start relay burns out.	1. Improperly wired. 2. Low or high line voltage. 3. Short cycling. 4. Improper mounting of relay. 5. Incorrect start or run capacitor. 6. Incorrect relay.
Contact welded stuck on start relay	1. Short cycling. 2. No bleed resistor on start capacitor.
Start capacitor burns out	1. Improperly wired. 2. Short cycling. 3. Low line voltage. 4. Relay contacts sticking. 5. Incorrect capacitor. 6. Start winding remaining in circuit for prolonged period.

Condensing Unit Problem	Possible Causes
Compressor noisy or vibrating.	1. Flood back of refrigerant. 2. Improper piping support on the suction or discharge lines. 3. Broken or worn internal compressor parts. 4. Incorrect oil level. 5. Scroll compressor rotating in reverse (three phase). 6. Improper mounting on unit base.
Discharge pressure too high.	1. Non-condensables in the system. 2. System overcharged with refrigerant. 3. Discharge service valve partially closed. 4. Condenser fan not running. 5. Dirty condenser coil.(air-cooled condensers) 6. Dirty tubes. .(water-cooled condensers) 7. Defective or improperly set water regulating valve. (water-cooled condensers) 8. Defective or improperly set flooded head pressure control.
Discharge pressure too low.	1. Low suction pressure. 2. Cold ambient air. 3. Suction service valve partially closed. 4. Shortage of refrigerant. 5. Defective or improperly set water regulating valve. (water-cooled condensers) 6. Defective or improperly set flooded head pressure control.
Suction pressure too high.	1. Excessive load. 2. Compressor internal valves broken. 3. Incorrect unit selection (undersized). 4. Improper TXV bulb charge.
Suction pressure too low.	1. Shortage of refrigerant. 2. Evaporator dirty or iced up. 3. Clogged liquid line filter drier. 4. Clogged suction line filter or compressor suction strainers. 5. Expansion valve malfunctioning. 6. Condensing temperature too low. 7. Improper TX valve selection. 8. Evaporator distributor feed problems.
Low or no oil pressure.	1. Low oil level. (trapped oil in evaporator or suction line) 2. Clogged suction oil strainer. 3. Excessive liquid refrigerant in the crankcase. 4. Worn oil pump. 5. Oil pump reversing gear sticking in the wrong position. 6. Worn bearings. 7. Loose fitting on oil line. 8. Pump housing gasket leaking.
Compressor loses oil.	1. Refrigerant leak. 2. Short cycling. 3. Excessive compressor ring blowby. 4. Refrigerant flood back. 5. Improper piping or traps. 6. Trapped oil in evaporator.
Compressor runs continuously	1. Excessive load. 2. Too low of a system thermostat setting or defective thermostat. 3. Shortage of refrigerant. 4. Leaking compressor internal valves. 5. Malfunctioning liquid line solenoid. 6. Incorrect unit selection (undersized).

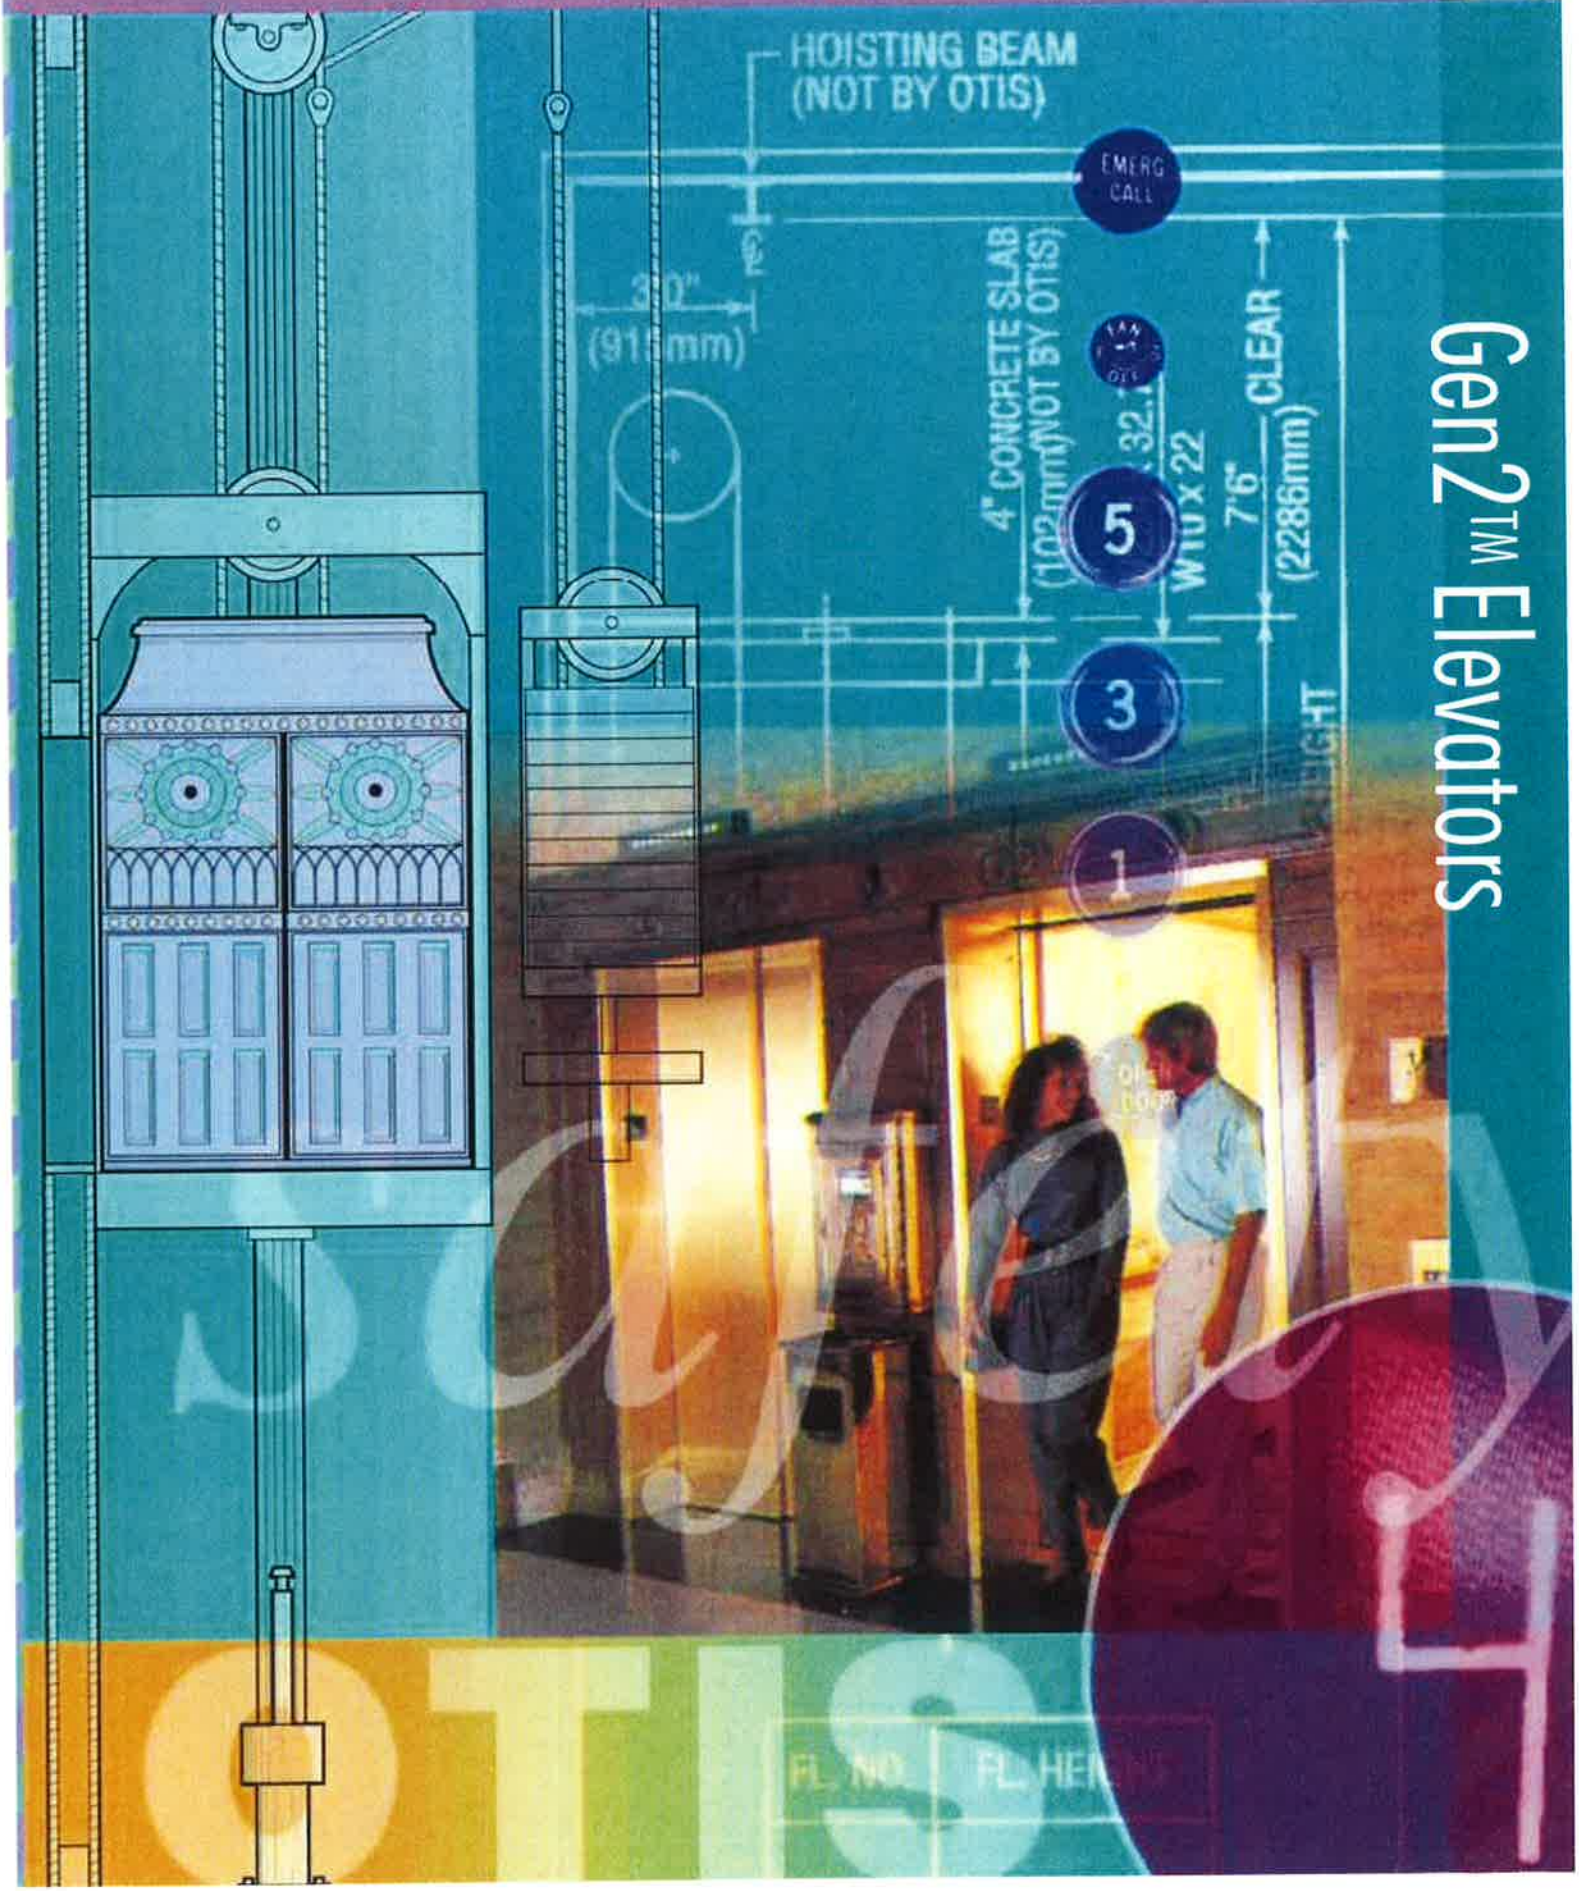
System Troubleshooting Guide	
Fixture Problem	**Possible Causes**
Room temperature too high.	1. Defective room thermostat or improper differential / setting. 2. Malfunctioning liquid line solenoid valve. 3. Insufficient air across evaporator coil (iced up coil, product blocking evaporator, fan blade / motor problem). 4. Improper evaporator superheat (low refrigerant charge, plugged TXV strainer, poor TXV bulb contact, incorrect TXV setting). 5. Malfunctioning condensing unit.
Room temperature too low.	1. Defective room thermostat or improper differential / setting. 2. Malfunctioning liquid line solenoid valve.
Ice accumulating on ceiling.	1. Defrost on too long (improper setting / defective termination thermostat, improper setting / defective time clock). 2. Too many defrosts per day. 3. Fans not delayed after defrost (improper setting / defective fan delay thermostat).
Evaporator coil not clear of ice after defrost.	1. Defrost on too short (improper setting / defective termination thermostat, improper setting / defective time clock). 2. Electric heaters defective / miswired / low voltage. 3. Not enough defrosts per day. 4. Air defrost evaporator operating at too low of temperature (require electric defrost). 5. Defective / miswired interlock at compressor contactor. 6. Defective defrost contactor or coil.
Ice building up in drain pan.	1. Improper slope in pan. 2. Blocked drain line (unheated , not insulated). 3. Electric heater in drain pan defective / miswired / low voltage). 4. Not enough defrosts per day. 5. Lack of or improper P-trap in drain line.
Evaporator fans will not operate.	1. Main power switch open. 2. Fuse blown or tripped circuit breaker. 3. Defective contactor or coil. 4. Room temperature too high (fan delay thermostat open). 5. Fan delay thermostat improper setting / defective. 6. Defective fan motor (low voltage / tripped on thermal overload). 7. Defective time clock. 8. Normal mode during defrost cycle (electric defrost type evaporator).

IMPORTANT TROUBLESHOOTING NOTE

Before any components are changed on the refrigeration system, the cause of the failure must be identified. Further problems will exist unless the true cause or problem is identified and corrected.

Customer Instructions

Maintenance Program



In order to ensure that the refrigeration system runs trouble free for many years, a follow-up maintenance program (consisting of a minimum of two inspections per year) should be set up. A qualified refrigeration service mechanic should carry out this semi-annual inspection. The main power supply **must be disconnected and locked off** to avoid accidental start up of the equipment.

(1) Check electrical components and tighten any loose connections.
(2) Check all wiring and electrical insulators.
(3) Check contactors to ensure proper operation and contact point for wear.
(4) Check that fan motors (if applicable) are operational, ensure fan blades are tight and all mounting bolts are tight.
(5) Check oil and refrigerant levels in the system.
(6) Ensure that the condenser surface (if applicable) is cleaned and free of dirt and debris.
(7) Check the operation of the control system. Make certain that all of the safety controls are operational and functioning properly.
(8) Check all refrigeration piping. Make sure that all mechanical joints and flare nuts are tight.

Service Parts Availability

Genuine replacement service parts should be used whenever possible. Refer to the Service Parts List on the back cover of this Installation and Maintenance Manual or attached to the unit. Parts may be obtained by contacting your local sales representative or authorized distributor.

Preface

Thank you for your recent purchase of the Otis Elevator Gen2® system. Your new Gen2 system meets the highest safety and performance standards available in the market today.

Otis has built a reputation based on quality, reliability and an OSHA-proven record of safety that's the best in the business. We continue to pursue a policy of innovation to ensure our customers receive the highest level of service in the industry. We look forward to the opportunity to continue to serve you and your elevator needs for years to come.

The information in this book will provide you and your staff with information about the Otis Elevator Company, the Gen2 system and its maintenance requirements.

Otis personnel have access to the latest information in support of our maintenance practices. We continuously look for ways to improve our processes; not only in support of your equipment, but in the ways we deliver information throughout our company.

To learn more about what genuine Otis maintenance can mean for you and your business, or to locate the Otis representative nearest you, please visit our website at www.otis.com.

How This Book Is Organized

This Owner's Information Manual is divided into five chapters.

The first chapter gives a history of Otis Elevator Company.

Chapter 2 is designed to make elevator owners more aware of their responsibilities, including passenger safety, code requirements, and emergency procedures. It also explains how Otis emphasizes safety in its everyday operations.

Chapter 3 provides information about how your Gen2 elevator operates, a description of its major components, and available features.

Chapter 4 describes the necessary maintenance needed on your new system.

Chapter 5 contains information about Otis' service and maintenance programs.

Chapter 6 provides unique procedures for Gen2 maintenance.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Use of Warnings

It is essential that you realize your Otis elevator is a complex piece of machinery and should be serviced only by a trained, authorized elevator mechanic. Tampering with the equipment is hazardous to you, to the person performing maintenance, to the passengers, and may be detrimental to the elevator itself.

Some of the topics in this manual deal with the inherent dangers of elevator operation, whether electrical, mechanical, or otherwise. These are identified by warning symbols placed near the application paragraphs. Some of the potential dangers include electrical shock from high voltage, crushing hazards, and flammable or combustible materials. Additionally, other symbols are used to reflect important information. The symbols used in this manual are:

WARNING

RISK OF ELECTRICAL SHOCK

NOTE

CRUSH HAZARD

Please contact your nearest Otis office if you have any question or require assistance with your elevator equipment.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Chapter 1: About Otis Elevator

Otis Elevator Company has a long and interesting history that began in the mid-nineteenth century with its founder, Elisha Graves Otis.

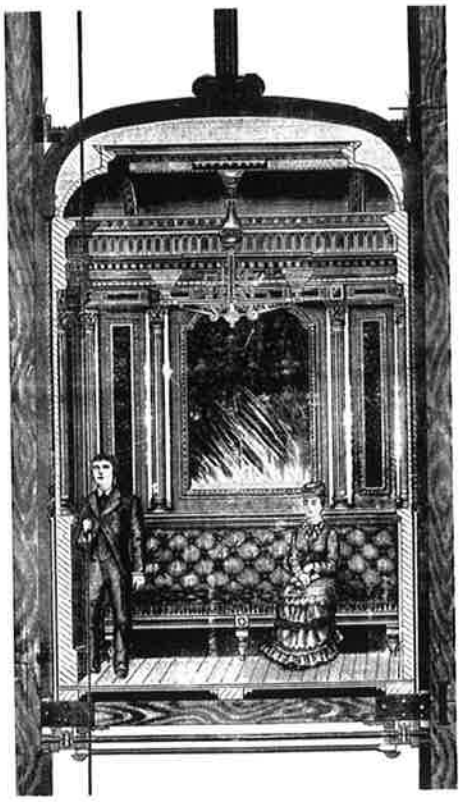
In 1852, while employed by the Yonkers Bedstead Manufacturing Company in Yonkers, New York, Otis built a hoisting machine with a safety mechanism that prevented the platform from falling if the hoisting rope broke. The following year, he opened his own shop in Yonkers, called Union Elevator Works.

It was at the 1854 New York World's Fair—also known as the Exhibition of the Industry of All Nations—that Otis introduced his first safety hoist to the public. His demonstration of riding up and down on the platform and cutting the hoisting rope without plummeting to the ground attracted huge crowds. The event became famous and the safety hoist's debut was a resounding success.

1854: Safety Hoist Elevator at the Crystal Palace, New York World's Fair

Elevators during the 1850s were used to hoist freight, and Otis and his sons sold their product on the existing market as a hoist. He also realized the safety mechanism made it possible to safely carry passengers, thus potentially opening up a whole new market.

1854: E.G. Otis Calling Card



WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

The next problem to overcome was development of a power source to run passenger elevators. Factories and warehouses with freight elevators were near water, but passenger elevators would be installed in stores, office buildings, and hotels, away from any central power source (this was 22 years before the opening of the first U.S. electric power station).

Otis' solution was to invent a small, oscillating steam engine to power each elevator. So in 1857, he designed, built, and installed the first Otis safety passenger elevator, in the E.V. Haughwout Store in New York City.

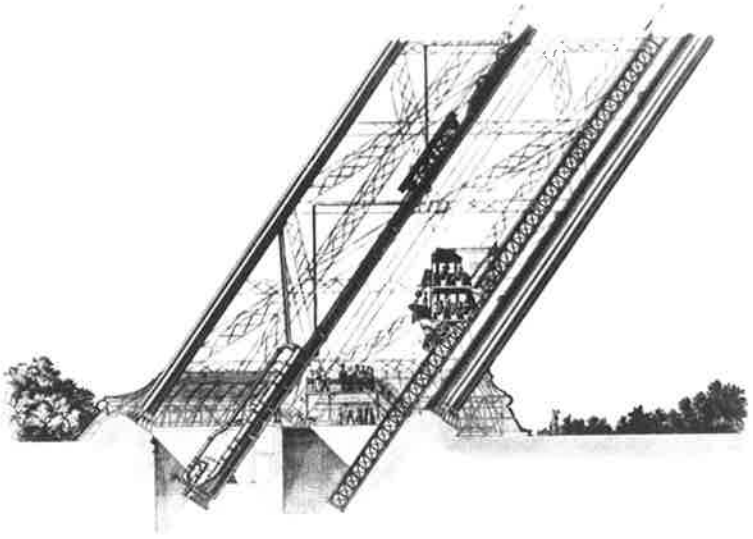
1857: The first passenger elevator ever built was installed in the E.V. Haughwout Store in New York City

1873: The elevator operator manipulates the control rope, regulating the direction and speed of the car.

Elisha Otis was a master mechanic and engineer. He obtained many patents in the 1850s, including the safety device he invented in 1852, the oscillating steam engine, a brake, steam plows, and a rotary oven for bakeries.

Unfortunately, at the age of 50, Otis died suddenly during a diphtheria epidemic in 1861. His sons, Charles and Norton, took over the business and utilized the elevator expertise their father taught them. They renamed the company N.P. Otis & Brother, then in the late 1860s changed it to Otis Brothers & Company.

Otis Brothers & Co. patented some 53 new advancements in elevator equipment, including hoisting apparatus, brakes, steam hoist, and pulleys. The brothers continued to use world's fairs and industrial fairs to showcase their elevator technology and create an international market for Otis elevators.



WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

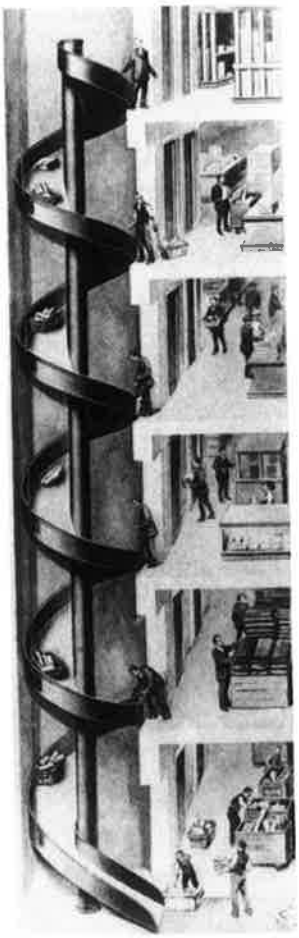
An Otis two-cylinder steam elevator machine and platform were exhibited at the second world's fair to be held in the U.S., the Centennial Exposition of 1876 in Philadelphia. Judges commended Otis for its adaptation of the freight hoist to passenger elevator and for its attention to safety.

Otis elevators were prominently displayed in 1889 at the Universal Exposition in Paris. The French government built the Eiffel Tower specifically for the world's fair and wanted an all-French monument to represent the construction and technological expertise. But no French company could overcome the structural demands of putting elevators inside the tower's curved legs. Otis Elevator successfully installed elevators, giving the company a chance to display its product at the fair's centerpiece attraction.

Post-Civil War era use of structural steel made it possible to construct taller buildings. Otis technology kept up with the construction pace during this "Era of the Skyscraper."

Otis opened offices in England, France, Canada, Germany, and Belgium, and had sales agents representing the company throughout the world. Its most famous elevator installations included the Eiffel Tower, the London Underground, and three elevators for Russian Emperor Nicholas II's private quarters in the Kremlin.

1889: Otis Elevators Inside the Curved Legs of the Eiffel Tower



WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Modern day Otis came into being during the late 1800s and the early 1900s, a time when "big business" flourished. Otis Brothers & Co. merged in 1898 with several U.S. elevator companies in Boston, Chicago, and Philadelphia to become the Otis Elevator Company. Forty more, small, independent elevator companies were acquired during the period prior to World War I.

The company expanded its product line by acquiring the patents for modern escalator technology from Charles D. Seenberger and Jesse W. Reno. The world's leading elevator manufacturer unveiled its new "escalator" (a term trademarked and owned by Otis for 50 years) at the Paris World's Fair of 1900.

1920: Freight Incline

1900: Gravity Conveyers

In 1903, Otis introduced what would become the "backbone" of the elevator industry, the gearless traction electric elevator. It could be used in buildings of any height and operated at greater speeds than steam elevators.

As skyscrapers got taller and taller, more Otis elevators were installed, particularly in New York City. For example, the 20-story Flatiron building was built in 1902 and had six Otis elevators. In 1912, the Woolworth building rose to 60 floors and was equipped with 26 elevators.

Skyscrapers reached a new pinnacle in 1931 when the world's tallest building—the Empire State Building—opened, serviced by 67 Otis elevators.

More tall buildings meant more elevators and a greater need to keep them in good running condition. Otis recognized this and in 1921 introduced the first preventive maintenance service. Today, maintenance represents 50 percent of Otis' overall business.

From its early days under Elisha Otis until late 1960s, Otis Elevator explored many different product lines outside its core business of elevators and escalators: the rotary oven for bakeries in the 1850s, a haymaker in the 1870s, gravity conveyors around 1900, the Sultan automobile from 1909–1912, and passenger and freight inclines in the 1920–1930s.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Otis converted to military production during World War I, World War II, and the Korean War. It manufactured crank cases for fighter planes, anti-aircraft guns, ammunition hoists, gun recoil mechanisms, depth charge throwers, and airplane elevators for aircraft carriers.

The wars disrupted the normal production, but they also changed Otis' business. Automatic elevators have been sold to homeowners since the 1890s, while most public buildings used elevator operators to run elevators well into the 1940s. But labor shortages during World War II brought the need for automated public elevators to the forefront. So, in 1950 the first group of Otis automatic elevators was installed in Texas.

1921: Preventive Maintenance

1969: Electric Cart

Following the Korean War, Otis continued to diversify its product line, producing military electronics, material handling equipment, and automatic bowling pinsetters. One of its more unique operations was the manufacture of electric buses, vans, and golf carts.

1969: Electric Golf Cart

By the late 1960s and early 1970s, Otis officials chose to concentrate on the core elevator and escalator business and divested the company's other holdings.

United Technologies purchased the Otis Elevator Company in 1975. Otis became a wholly owned subsidiary in 1976.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

One of the most significant developments in elevator technology was the use of computer chips to make elevator control decisions. Prior to this development, elevators relied on large collections of relays and switches. These relay-based systems required a lot more maintenance and occupied significant space.

In the early 1980s, Otis developed the first microprocessor control elevator system, called the Elevonic® 101. It was a watershed event and paved the way for future developments utilizing computer technology.

Advances in microprocessor and data communications technology led to Otis' first Remote Elevator Monitoring (REM®) system, which was introduced in 1985 and installed at an Otis elevator site in the United Kingdom.

REM systems monitor elevators 24 hours a day and provide diagnostic information via a telephone line to our technical center. This information assists our technicians in preventing elevator disruptions.

1985: Remote Elevator Monitoring (REM®) systems monitor elevators 24 hours a day.

Another important technological advance—the Elevonic® 411 software based control system—was released by Otis in 1990. These sophisticated Elevonic systems made "real-time" dispatching rules based on changing traffic conditions in a building. They also managed elevator ride quality, energy consumption, motor performance, and all the in-car information displays.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Elevonic Hall Position Indicator

1990: Elevonic® Hall Button

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Some other Otis products include:

- **Gen2™ Elevator System:** The first major breakthrough in elevator lifting technology in nearly 150 years. Gen2, an elevator system for low- and mid-rise buildings, is the first to use flat coated steel belts to lift the elevator cars. The belts are 1 in. (25 mm) wide and 0.1 in. (2.5 mm) thick, quieter, lighter, easily bend around a 4 in. (101 mm) diameter sheave, and last up to two to three times longer than traditional steel ropes. That means the Gen2 system requires a machine one-quarter the size of a traditional machine, eliminating the need for a separate machine room.

- **TRAV-O-LATOR®:** Moving walkways for expansive facilities such as airport terminals and shopping centers.

1996: TRAV-O-LATOR®

Otis is focused on advanced technology that will improve its operations and products in three key areas: quality, efficiency, and safety. For example:

- Otis dispatching technology improves service dramatically by analyzing and adapting to a building's traffic pattern, then assigning elevators to respond to variations in passenger traffic within the building. This is critical to an integrated building transit system because traffic patterns in the buildings of the future will be more complex than in today's buildings.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

- Otis engineers are also designing sophisticated remote elevator monitoring systems. The more closely an elevator is monitored, the easier it can be maintained with fewer costly shutdowns.

Elevator monitoring systems provide comprehensive information about elevator condition, status, and performance.

Today, Otis is recognized as the elevator industry leader, maintaining more than 1.7 million elevators and escalators worldwide. It is an $11.6 billion (U.S. dollars) company with 60,000 employees.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

(This page intentionally left blank.)

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Chapter 2: Performance and Safety

If anything improper is discovered, corrective action must be taken immediately. Do not attempt to repair the equipment. For safety reasons, only a trained, authorized elevator mechanic should ever service your elevator.

Knowing what to look for is probably the most important aspect of elevator awareness. When you know how to spot issues in performance, you can influence the efficiency of your equipment by taking care of issues before they become problems. The following information suggests ways you can look after your investment and help keep it running at optimum performance. More information about general maintenance procedures can be found in Chapter 4.

You or a member of your building staff should go through the following procedures regularly with each elevator car:

Emergency Lighting/Alarm Bell system provides passenger reassurance in emergencies

1. **Test the operations and safety devices.**

   Test alarm bells, stop switches, intercoms, telephone connections, and emergency lighting systems to make sure they will work in an emergency.

2. **Ride the elevators.**

   Ride the elevator and pay attention to the smoothness of starting and stopping, to any unusual sounds (such as squeaks or scrapes), and to any unusual movements, vibrations, or odors. Close your eyes to increase awareness of irregularities.

3. **Listen during rush hours.**

   Stand in the lobby during peak traffic periods listening to passengers' comments.

You should be aware of several things in order to prevent equipment failure and/or potential hazards. The following seven-point safety and performance checklist can be applied on a regular basis to most elevator systems.

- **How long must passengers wait for an elevator at the lobby?**

Well-timed arrivals and departures, as well as proper acceleration and deceleration, are critical to fast, efficient service.

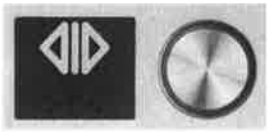
WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

- **Do the passengers have enough time to enter and exit before the doors close?**

There are a number of variables that determine the door's opening cycle. The minimum time may depend on the number of elevators in the bank and on the distance from a point in the center of the lobby to each elevator. Time may also be measured from notification that a car is arriving by a lantern and audible signal. Times might also be longer for elevators that service elderly or disabled persons.

- **Do the doors reverse direction without touching passengers?**

  Your elevator is equipped with an electronic detector to sense passengers in the door zone. This detector enables a closing door to reverse direction without touching passengers. Reversal should take place as soon as any portion of the passenger enters the door zone when the doors have begun to close.



Electronic detectors enable a closing door to reverse direction without touching passengers.

- **Does the car stop level with the hall floor?**

  Leveling is the process of the elevator platform attaining a stop position that is even with the landing. The car should stop within +/- 0.2 in. (+/-5 mm) of the hall floor, and leveling should be consistent whether the car is full or empty.

- **Does the alarm bell work?**

  The alarm bell should be tested once a week by pressing the alarm button on the car operating panel. This quick and simple procedure ensures that the bell will work when and if it is needed.

Door Open Button

Alarm Bell

Stop Switch

- **Is the intercom or telephone in good working order?**

  Intercoms and telephones should be tested regularly. Passengers can be spared inconvenience when minor mechanical difficulties occur by following instructions

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

received over the intercom or telephone. During an emergency, communication with passengers helps to alleviate or avert panic. At these times, information from passengers can be of great assistance to emergency personnel.

- **Is the interior of the elevator adequately lit?**

  Check that all light switches are on, all lamps are lit, and all light diffusers are clean to permit maximum transmission of light.

Only use the elevator for the purposes for which it was designed. The elevator has been designed to transport passengers and goods within a building, carrying loads up to the maximum weight indicated inside the elevator car, running at the speed for a rated traffic condition. Overloading will result in visual and/or audible signals in the car and further movements will be prevented until the overload condition has disappeared.

It is extremely important that planned maintenance be recorded with a reputable maintenance company. Maintenance is necessary to ensure the safe and correct operation of the equipment. Inspections of the equipment should be carried out in accordance with local regulations. Any irregularities in the operation or performance of the elevator should be reported to the elevator maintenance company immediately. Any alterations or changes to the building that may affect the elevator should also be discussed with the maintenance company.

The control room and access areas for servicing the elevator equipment should remain clean and free of debris at all times. For proper operation, the control room temperature must be between 32° F (0° C) and 104° F (40° C). Areas subject to excessive heat must have proper ventilation.

The elevator's two-way voice communication system must be kept in good working order. This includes the communication line between the car and a rescue service.

State-of-the-art elevator and escalator engineering has developed mechanisms that greatly reduce the risks to life and property in emergency situations. However, building personnel still play a vital role in directing occupants to safety, in monitoring equipment, and in operating controls that initiate emergency routines.

The proper handling of elevators and escalators in an emergency could mean the difference between life and death. You should ensure that all your building personnel are familiar with emergency procedures suitable to your building structure and all of its equipment in the event of accidents, fire, earthquake, or power failure. Contact your local authorities and fire department for appropriate advice, inspections, and drills.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Fireman's Service—SES

Fire service varies based on local code requirements. Contact your local authorities and fire department for appropriate advice, inspections, and drills.

Firemen's Service/Special Emergency Service allows control of elevator operation in the event of fire or other time-sensitive emergencies, particularly where immediate access to specific building areas or floors is necessary. Fireman's Service has two separate operations, or phases.

Firefighter's Service Phase 1

When a smoke or heat sensor is activated on any level (except the main fire return floor), a signal is sent to the elevator control system to return the elevator to the main fire return floor or main designated return landing. The elevator then proceeds immediately to this landing and parks with the door open.

If a smoke or heat sensor is activated at the main fire return floor, the elevator is placed in a "fire recall" status; however, the elevator will proceed to the alternate fire return floor, and park with the door open.

Firefighter's Service Phase 2

This feature is activated by the fire fighters using a keyswitch in the car, which places the elevator under their control. This feature includes the call cancel button and keyswitch in car. When the call cancel button is activated, all registered calls are cancelled and the car stops at the next landing.

Emergency Power Option

In the event of a power failure, your building's emergency power supply operates the elevator during the failure, but only if you have selected the Emergency Power Option for your elevators.

If your elevator system's Emergency Power Option is set to the AUTO mode, each car will automatically travel directly to the lobby (or the previously designated floor) and the doors will open to allow passengers to exit. After the cars arrive at the lobby, they remain parked there until one or more cars are selected to provide service under Emergency Power.

If your elevator system's Emergency Power Option does not have an AUTO mode, or if that mode is not turned on, the cars may be brought to the lobby by manually selecting them, one at a time, using the emergency power strip switch.

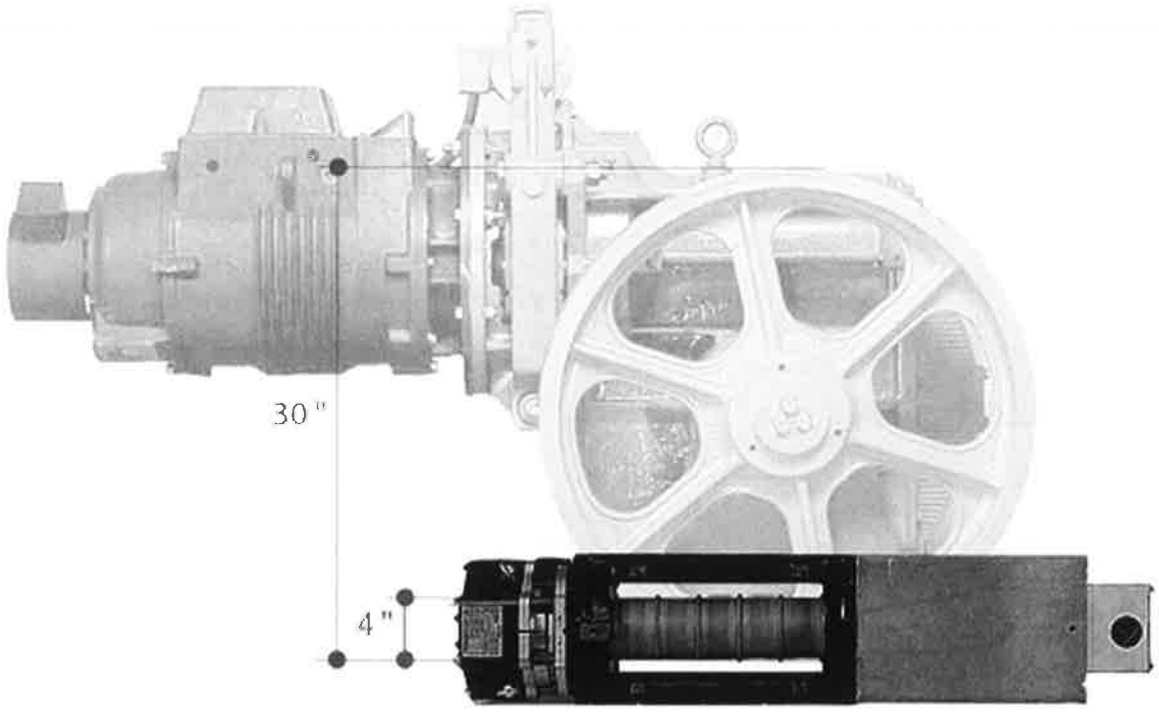
WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Chapter 3: Your Gen2® Elevator

Introduction

Today's elevators provide a safe, rapid means of passenger transportation. In large part, this is due to advances in elevator technology. The intent of the information presented here is to provide you with a general understanding of how your Gen2 elevator system is designed and how it operates.

At the core of the Gen2 elevator is a revolutionary new technology—flexible steel cords inside a tough polyurethane coating.



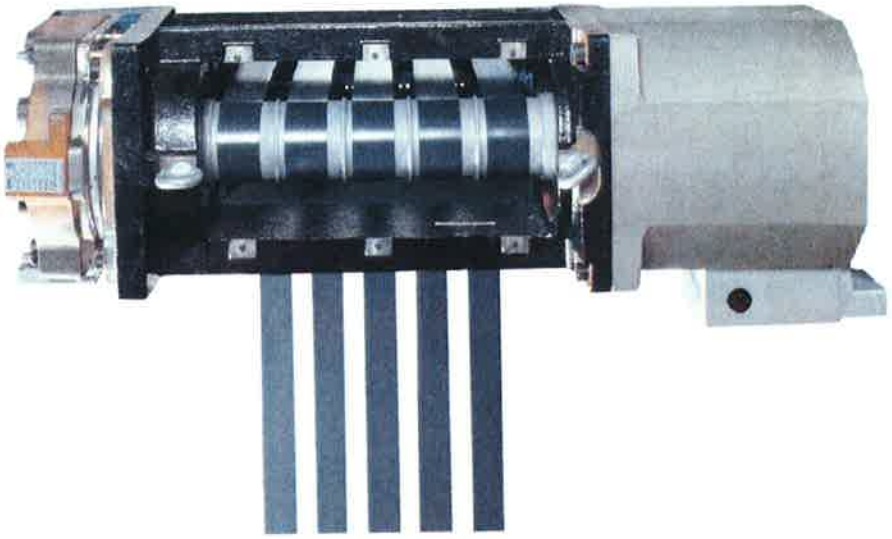
Coated Steel Belts

The coated steel belt technology rearranges the steel found in traditional ropes to form a flat belt. Each belt holds the same lifting capacity of the equivalent rope. Each cord of the belt has many strands of wires. Each coated steel belt has multiple steel cords within it. These wires are made of high tensile strength steel and are zinc plated to prevent corrosion. The wires are then coated with polyurethane that prevents the wires from rubbing against each other (referred to as fretting), thus allowing them to last up to two to three times longer than conventional round ropes. Each Gen2 system uses multiple coated steel belts, based on the application.

The coated steel belts are the "enablers" of the Gen2 system. Their flexibility allows us to use a small gearless machine. Elevator codes dictate the size of the sheave based on the diameter of the rope required to lift the load of the elevator system—this is referred to as the d/D ratio (d = diameter of rope, D = diameter of sheave). This ratio by code needs to be 1 to 40, which would require a 40 in. sheave for every inch of rope width.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

On conventional round-roped elevators, a 0.5 in. round rope is typically used to lift a 3500 lb. elevator cab while with Gen2® elevators, we use a 0.1 in. coated steel belt. As an added benefit, the d/D ratio for Gen2 is 60 to 1, thereby improving the overall durability of the belts. The sheave diameter changes from 20–30 inches (on some conventional traction machines) to a mere 4–6 inch diameter with the Gen2 system.



Permanent Magnet Gearless Hoist Machine

The hoist machine performs the muscle work of lifting and lowering the elevator car. The choice of hoist machine is classified according to the height of a building, the elevator car's load requirements, and the speed at which the load must move (passenger or material). The hoist machines used for the Gen2 elevator systems are referred to as gearless machines.

The Gen2 gearless machine's principal components consist of a high efficiency Permanent Magnet (PM) AC-motor, brake assembly, support frame, and grooved drive sheave. The motor and brake assembly are attached to the support frame and have a common rotating shaft. The pulley or drive sheave for the Gen2 elevator machine is an integral part of this common shaft. The Gen2 gearless machines do not use a gear reduction system; the motor and drive sheave turn at the same speed. The elimination of the gear reduction system simplifies the design and improves reliability and efficiency.

The Gen2 features a regenerative drive that reduces net power consumption. Matched with the efficiency of the permanent magnet motor, the Gen2 system delivers superior performance and ride quality with environmental sensitivity.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Gen2® PM Machine

Gen2 Machine (foreground) Compared to a Traditional Traction Machine (background)

Typical Sequence of Operation

In order to gain further understanding of how a Gen2® elevator system works, let's take you through a typical sequence of operation. A passenger registering an elevator call sets into motion a series of actions. The signal is first picked up by the controller, which acknowledges the request by illuminating an indicator on or near

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

the call button. Also placed into memory is the location of the call for pickup or delivery. All hall calls are sent to all elevators, if part of a group. (Multiple elevators within a building are referred to as a "group" of elevators.) Each elevator in the group calculates its response time to the call and the elevator with the shortest response time is dispatched to pick up the passenger.

The elevator checks itself against a preflight checklist before permission to run is given. Of particular importance is determining the integrity of the elevator's safety related devices prior to starting the run. In addition, the elevator contains a safety chain to prohibit elevator motion in response to an unsafe condition. The safety chain consists of electronic and electromechanical switches placed at strategic locations in the elevator system. Connected in series, they act as a safety circuit ensuring various elevator apparatus is in the correct operating state for the elevator to make a run. Any one device not in its expected state breaks the chain and the elevator does not operate. An emergency stop is initiated whenever a safety chain device "opens" while the elevator is in motion.

When the controller (the brain of the elevator) receives a request for service, it reviews a sequence of questions and issues instructions according to the responses.

Controller Sequence of Questions

Where do I need to send the elevator?

What is the weight in the car?

Is it safe to move the elevator?

While I'm moving, how do I know where I am in the hoistway?

How do I stop once I've reached the destination?

What do I do after I've stopped?

The Controller now has instructions to move the elevator car in response to the passenger call and has completed its safety check confirming that the elevator is safe to move. It then sends instructions to the elevator motor and car telling it the load in the elevator car and the speed at which to move the elevator car.

The technology driving your system is known as variable-voltage, variable-frequency (VF) control. Traditionally, most elevators were driven by direct-current (DC) hoist machines. This was necessary to achieve the precise control of speed applied to the hoist machine to assure smooth acceleration, cruise, and stopping speeds of the elevator. Doing so required converting the building's alternating current (AC) to DC and, in most cases, required a constantly operating motor-generator and a more complex DC operated hoist machine. Both pieces of equipment require more components, which may be subject to increased maintenance and repair.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Your AC-VF drive is able to use your building's AC power to precisely control the speed and torque of the permanent magnet gearless machine. The AC motor offers robust performance and is economical.

The hoist machine lifts or lowers the elevator car. Through the use of a counterweight, we can reduce the amount of work required to move the elevator. The counterweight is sized to equal the weight of the elevator cab assembly plus approximately 50% of the rated capacity. In this way, the hoisting machine never has to lift more than half the rated load.

The Controller continually compares the stored floor location of the target landing against the position of the elevator. When the car is within its "stopping distance" from the target landing, it begins to decelerate. Position is continuously monitored in order to stop the car level with the target floor. A vane is installed at each landing to provide a redundant means for checking position at floor level. A reader, located on the car, uses the vane to verify the car is level with the floor.

Once the elevator hoist machine stops the brake drops. The main purpose of the brake is to hold the car in place, not to stop the elevator car. Even in the event of a power failure, the brake will drop and hold the elevator.

When the elevator has reached the target floor, the doors automatically open to allow the passenger to leave the elevator. Just as the doors automatically open at the conclusion of a run, they also automatically close when demand for the elevator is present.

Gen2® Safety Features

The Elevator Safety and Governor System

Beneath the elevator car is the elevator safety mechanism. It is tied to a device called a governor. It is an independent system from the coated steel belts and is designed to operate if the elevator car exceeds its rated speed.

The governor performs two actions when the car exceeds 125% of its rated speed. First it attempts to stop the car electrically by activating a switch opening the safety chain circuit. The open circuit interrupts power to the hoist machine and stops the elevator movement. If the elevator car does not stop, the governor's second action is to mechanically stop the elevator by clamping the steel cable, which is fastened to the safety-releasing mechanism on the elevator car. This causes the car safeties to activate and grab the rails on which the car rides. The frictional forces generated between the rails and car safeties bring the elevator car to a controlled stop.

Door Operators and Control Devices

Safe and rapid response to elevator calls is an important measurement of elevator performance. How quickly passengers can enter and exit the car contributes to the

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

overall performance of the elevator system. The speed at which the doors can safely open and close is a contributing factor to achieving this goal.

At each landing there is a set of hoistway doors. The hoistway doors and car doors open in unison because of the door vanes and interlock system. Each entrance landing is furnished with an interlock and switch. The door vane is fastened to the elevator car door. When the elevator stops at a landing and its door starts to open, the vane engages the roller of the hoistway door interlock. This causes the lock to separate from the switch and open the entrance door along with the car door. If the car doors do not completely close within a predetermined time, they will reopen and then begin to close at a reduced speed. The car will extinguish its hall and car direction lanterns, sound the in-car buzzer, and, if part of a group, remove itself from group operation. If the car cannot close its doors after three attempts, it will shut down and park with the doors open. Every two minutes the car will retry closing its doors.

The latest door operators designed by Otis use closed-loop control technology. Environmental conditions, such as debris caught in the door closing path or excessive wind in the hoistway, can prevent a door operator from performing 100 percent efficiently. Closed-loop control compares the door's actual opening/closing speed to the speed stored in computer memory and then adjusts the door speed accordingly.

Car Door Protection Device

The car door protection system features an invisible "safety net" of infrared beams that help ensure the physical well being of passengers.

Using infrared emitters and detectors to create an invisible safety net across the entrance, the system continually scans for interrupted beams. If a beam is interrupted, the car door protection system reopens the door instantly. When an obstruction is present, the doors remain open until the obstruction is removed. If the obstruction enters the doorway as the doors are closing, the doors stop closing and reverse direction.

Remote Elevator Monitoring (REM®)

Information from the elevator's controller is transmitted to a product called Remote Elevator Monitoring (REM®), which is available only with Otis service. REM reacts to three types of information:

Alarms. Defined as a problem that indicates the elevator may be shut down.

Alerts. Defined as a problem that indicates elevator performance degradation, but the elevator continues operating.

Performance Data. Defined as routine elevator information, such as the number of elevator runs and number of door operations.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

This microprocessor-based product adds a new dimension to the service and repair of elevator systems. The REM hardware transmits information concerning the status of the elevator to a technical center. If a repair is needed, the technical center places a call to the appropriate Otis representative.

Otis' automated record keeping system provides a personal history of your elevator, which is used for planning maintenance and determining elevator efficiency. This information increases overall elevator performance, decreases downtime, and reduces tenant complaints.

Ideally, service is made on an elevator before any significant problems arise. This is the best possible method to keep your investment running. The history of your elevator's performance is maintained on line and can be viewed by you through our e*Service tool on otis.com. As Otis continues to move forward with technological advancements, we can utilize this historical information to help us with implementing new procedures and improved capabilities. Our goal is to continually reduce the amount of service required.

Emergency Lighting

Your elevator has a supplemental emergency power supply. If main power is lost, power is switched automatically to the emergency supply and lights two lamps inside the elevator. The lamps remain lit for at least four hours.

The alarm button and emergency stop switch located in the car operating panel are wired into the emergency power circuitry. When operated, an alarm bell located on the car top sounds continuously.

Emergency Communication Devices

The choice depends on the equipment and services specified for your particular elevator, including:

- Hands-free telephone (code-compliant).
- Intercom system (provided by other than Otis)

Fixtures

Fixtures are the components passengers use to interact with the elevator. The passenger activates a call for the elevator car at the landing entrance or at the elevator car operating panels. The fixtures perform additional actions that provide feedback to the passenger. For example, a hall lantern illuminates to indicate the car's next direction of travel as the elevator car stops at a floor.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

The information that follows describes the types of fixtures used in elevator systems. Some of these fixtures are located at the entrance landings (hall fixtures) others are within the elevator car (car fixtures).

Field Interface Panel

A Field Interface Panel is provided on the door jamb for the Gen2-150. The Field Interface Panel features lockable disconnects for main line power and car lighting circuits for use by Elevator Personnel.

Hall Panel Fixture Assembly

Hall Panels are located at the entrance landings. They contain buttons, keyswitches, and jewels. Activation, through pressing a button or turning a key, registers a call for the elevator to service the landing.

Car Operating Panel

The Car Operating Panel is located in the elevator car. It contains buttons for entering destination requests, door opening and closing, and alarms (activate the alarm bell and/or initiate a phone call). The buttons may illuminate, come in vandal-resistant versions, and have adjacent Braille markings available. The car operating panel also contains keyswitches, jewels, position indicator, and audible signal devices (buzzer, landing passing tone, speech synthesis, etc.).

Lantern Fixture Assembly

Lanterns are located at entrance landings or in the elevator car. They provide passengers with a visual representation of the elevator's next direction of travel. Arrival of the elevator car at a landing sounds a lantern chime: once for up direction and twice for down direction.

Position Indicator

Position Indicators are located at entrance landings and in the car operating panel. They provide passengers with a visual identification of the car's floor position within the hoistway.

Access Fixture Assembly

Access Fixtures are usually mounted in the entrance jamb and are used by service technicians. They contain keyswitch/es for special operation of zoned access, which allows the elevator to be moved (within defined distance and speed limits) with the landing and car doors open.

Buttons

Buttons come either illuminated or non-illuminated, with a raised or flush target, and in either standard or vandal-resistant versions. Pressure applied to a button

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

registers an elevator call or other operation, such as opening or closing the doors or sounding an alarm.

Keyswitches

Keyswitches operate electrical contacts by turning a key to set positions. They may offer one, two, or three key positions and are of spring and non-spring return types. Activating initiates special actions that are described in the pages that follow.

Jewels

Jewels are located in both hall and car fixture assemblies. These fixtures are illuminated lenses with printed or graphic information. They inform passengers of various elevator activities, operating most often in conjunction with keyswitch activation.

Emergency Stop

An Emergency Stop is a toggle or keyswitch wired within the elevator's safety chain. Activation causes a break in the chain, bringing the elevator to a stop. The emergency stop function is mandatory for all elevators in the U.S.

Braille Character Insert

Braille Character Inserts are raised letter/graphic markings and Braille characters for buttons to be used by the visually impaired.

Utility Outlet

A Utility Outlet is a receptacle offering access to 110 VAC power supply.

Audible Signal Device

An Audible Signal Device is a device that provides an audible tone each time the elevator car passes a landing.

Buzzer

A Buzzer is a device that provides a continuous alert when firemen's service operation is activated or when the doors are nudging closed.

Telephone/Service Cabinet

A telephone cabinet is an optional cabinet mounted below the car operating panel and contains a communication device (telephone or intercom provided by others). A service cabinet can contain special keyswitches as ordered.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Hands-Free Phone

A Hands-Free Phone is a device that helps trapped or disabled passengers call for help. No handset is required, allowing for hands-free operation.

Fixtures can perform special features for security, emergencies, or management operations to a single elevator or group of elevators. These are generally keyswitches operated by designated persons or emergency personnel, such as firemen. Some of these fixtures are standard equipment, while others are optional or variable and dependent on other features your system may employ.

Control Features

The elevator is capable of enhanced functionality well beyond the basic elevator operation of moving your passengers between the building's landings. For example, you may want to override passenger calls and place the elevator under your direct control or have the elevator bypass particular floors. There are numerous control feature options that your elevator is capable of performing. In most cases the action occurs automatically by software instructions or by direct user control, such as activating a key operated switch, or by a combination of the two. The feature may perform an individual action, a combination of actions, and may apply to a single elevator or a group of elevators. The following is a complete feature listing, divided into feature groups, and how they are initiated. The features included with your Gen2 system are listed on documents prepared by your Otis representative at the time of the sale.

Group: Car Operation Features

Full Collective Operation

Full Collective Operation answers calls in the order in which floors are reached, regardless of the sequence in which the calls were registered. Only car calls and up hall calls will be answered when the car is traveling up, and only car calls and down hall calls will be answered when the car is traveling down. When the car reaches the last registered call for the established direction, it reverses and proceeds to answer calls in the opposite direction (if they are present). In the absence of further calls, the car remains at the floor where the last call was answered with doors closed (or park at an alternate landing).

Simplex Operation

Simplex Operation is a single car operating in full collective operation, answering calls in the order in which floors are reached, regardless of the sequence in which the calls were registered. See "Full Collective Operation" for further information.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Anti-Nuisance

If an excessive number of car calls are registered, the elevator will determine whether calls should be canceled. This is a function of passenger load and predetermined weight settings.

Automatic Car Return Operation

Automatic Car Return Operation causes the car to park at a specified landing when there is no further demand. The car parks at the specified Automatic Car Return Landing whenever the car becomes idle. The operation is keyswitch activated, and overrides normal zoned parking. The car can be pre-programmed to park at the automatic car return position with its doors open.

Auxiliary Car Operating Panel

An Auxiliary Car Operating Panel is a second car operating panel, usually located on the opposite side of the main car operating panel on elevators with center opening doors. If an elevator has two openings, the rear opening is designated as the auxiliary car operating panel.

Call Parking Recognition

With Call Parking Recognition, doors only open in response to car and hall demand. Cars parked without a demand are parked without door operation.

Car Buttons—Illuminated

Car Fixtures employ mechanical LED illuminated buttons.

Direction Preference

Direction Preference is given to the hall passenger that registers a car call for the original direction of travel before the doors close. The elevator will not reverse direction for a passenger waiting at another floor.

Direction Reversal

A car without registered car calls arriving at a floor where both up and down hall calls are registered will first respond to the hall call in the direction that the car was traveling. If no car call is registered for further travel in that direction, the car will close its doors and immediately reopen them in response to the hall call in the opposite direction. The hall lantern always shows the direction the car will travel when it leaves a floor.

Emergency Exit Contacts

This feature consists of safety chain contacts for top emergency exits. The feature prevents the car from moving when the car top exit is open.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Fan and Light Sleep Mode

The cab's fan and light automatically turn off if the car is idle for a set period of time to save energy.

Hall Buttons—Illuminated

Hall Fixtures employ mechanical LED illuminated buttons.

Hall Button Protection

If the hall button communication network link fails, all of the cars in the group enter Hall Button Protection operation. Each car answers all pending car calls. When each car has no further demand, each car travels to the lobby and parks with the doors open. As an option, Hall Button Protection can also be configured to automatically activate Wild Car Operation. For more information, please refer to the section on Wild Car Operation.

Landing Passing Tone

A Landing Passing Tone is an audible signal, located in the car operating panel, that sounds when the car passes or stops at a landing.

Load Weighing Bypass

When a car is loaded above a predetermined percent of capacity, further hall calls will be bypassed. (This operation eliminates stopping for additional passengers who would be unable to enter an already filled elevator.) Load Weighing Bypass will not affect the stopping of the car in response to car buttons.

Platform Load Weighing

Platform Load Weighing measures car load so that proper starting torque is applied to the motor.

Group: Door Operation Features

Adjustable Door Time

The time interval that elevator doors remain open after a stop is independently adjustable for car call stops and hall call stops. Normally, more time is allowed for a passenger to enter the car from the corridor than for a passenger to leave the car because the waiting passenger in the corridor is usually further from the entrance of the arriving car than the riding passenger. Additionally, the lobby door time is normally longer than the time at other landings to allow extra passenger traffic at the lobby. Door timing is adjusted to suit the needs of the building, including handicapped code requirements. The door open time after obstruction detection and hall calls answered by a parked car are also adjustable.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Advanced Door Opening

To enhance performance time, the doors begin opening while the car is approaching to the landing.

Cafeteria Position

At a landing with a cafeteria, longer than normal door times may be selected to handle additional traffic.

Cancel Door Dwell Time

When the door close button or car call button is pressed (either/or; not both), any remaining door dwell time is canceled and the doors begin to close immediately. Note that some regions have handicapped codes that do not allow the cancellation of door dwell times.

Parking with Doors Open

Front and rear, the elevator car doors can be programmed to remain open or to remain closed when the car is parked at each landing.

Door Time Monitoring

When the car door protective device is activated after the car has stopped to answer a hall call, the door open time is reduced from the normal setting for a hall call stop. Other aspects of door operation continue normally. This feature can be enabled at all landings, or at all landings except the lobby and cafeteria positions.

Nudging Operation

If the doors are prevented from closing for a fixed time period and there is further demand on the system, the door protective device is rendered inoperable, the in-car buzzer sounds, and the doors close at a reduced speed. Normal operation resumes at the next landing.

Group: Operation Features

The group operates in one of two independent modes. Whenever hall calls are registered, the operating mode is "relative system response dispatching." When no hall calls are registered, the operating mode is "zoned car parking." Optimized response to hall calls is achieved through use of RSR Plus® time computed for each hall call registered. The computation of each car's relative system response time to a call is based on, but not limited to, such relevant factors as distance, service to previously assigned car and hall calls, direction, door and car motion status, and coincidence of car and hall calls. To even waiting times and eliminate particularly long waits while maintaining optimal system performance, the weighting of the factors varies with system traffic. The car with the least relative system response is

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

assigned the call. Relative system response computations for each hall call are repeated several times a second and the hall call assignment changed if a more suitable car is found. The RSR Plus dispatching software continuously evaluates the efficiency of its dispatching and varies the weighting of the bonuses and penalties to optimize the dispatching efficiency.

Zoned Car Parking

The section of a building served by a group of elevators is divided into a number of fixed zones equal to the number of cars in the group. The assignment of landings to zones is selectable. Each zone comprises a section of the hoistway consisting of one or more consecutive floors. Each zone normally is assigned to one car. This feature is used to park cars with doors closed in the absence of call demand.

Expanded Lobby Zone

Several landings above lobby are made part of the lobby zone. One lobby zone car always parks at the lobby.

Excluded Zone Operation

This feature prevents cars from parking in certain zones, and thus freeing these cars for service elsewhere. The excluded floors (a zone) will not appear as demand to an unassigned car unless a hall call exists in that zone.

Separate Basement Zone

This feature is used where substantial traffic is expected from the basement area (such as would occur in a large basement garage) and there are sufficient elevators in the group to create a single floor lobby zone and a separate basement zone.

Park and Shutdown Operation

Park and Shutdown Operation, activated by either a keyswitch or EMS, parks the car at the lobby. When activated, the car is removed from group operations. If the car has pending car calls, it answers any remaining car calls. Once the car has no further demand, the car travels to the lobby and parks with the doors closed (parking with doors open is available). The car remains out of service until the keyswitch is placed in the OFF position. If a lobby panel is provided, a jewel illuminates when operation is complete.

Delayed Car Protection

Any car not responding to a demand for service within a predetermined time interval is removed from group operation. This allows other cars in the group to pick up calls previously assigned to the delayed car.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Transfer Floor Service

The transfer floor is the common landing at the top floor of the low-rise group of elevators and the first landing above the lobby of the high-rise group of elevators.

Uneven Stops / Travel

Odd travel occurs when one or more cars in a group serve additional or different landings in a building. Mid-building travel occurs when certain cars within the group do not serve landings located in the middle of the building (also referred to as an express zone). When a car is traveling through such a zone, the position indicator displays "EZ".

Double Riser of Hall Button Operation

Double-Riser Operation allows two hall buttons at a landing to work in parallel and to illuminate simultaneously. When either of the hall buttons at the landing is pressed, the call is registered.

Separate Hall Button Riser

This operation uses two sets of hall buttons, one for normal group operation and the other for providing expeditious service to certain landings during specified periods of the day. Separate riser operation is initiated by a keyswitch. When activated, those cars connected to the separate riser answer hall calls registered on it and ignore the hall calls on the primary riser. Cars operating on the separate riser are not subject to group dispatching features such as Moderate Incoming Traffic.

Split Group Operation

In a building with two major tenants, it is often desirable to divide a group of elevators into two subgroups during certain periods of the day. Each subgroup serves one of the tenants.

Group: Group Dispatching Features

Relative System Response Dispatching

Relative System Response (RSR) is a numeric index that indicates the desirability of having a given car respond to a given hall call based on the car's parameters (position, direction, load, etc.) and the car's previously assigned demands for service (car and hall calls). The calculation of RSR involves the summation of applicable time increments associated with various operating states of the elevator. The car with the best (lowest) RSR is assigned to respond to a hall call.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Car to Landing Operation

An optional three-position car-to-landing keyswitch is available in a lobby panel or hall station fixture. The designations on the switch are: "Doors" (the neutral position), "Open" (calls the car to the lobby), and "Close" (which locks the car out of service when the car is placed on independent service).

Cars Parked at Lobby

In a multi-car group, the number of cars parked at the lobby is selectable. The normal condition is one car, but some configurations may require additional cars to handle constant heavy traffic at the lobby.

Moderate Incoming Traffic

When traffic at the lobby floor increases, as indicated by two cars leaving the lobby in the "UP" direction, or as activated by the up peak clock, cars assigned to upper zones are called to the lobby without waiting for a call from the lobby landing. Cars are automatically dispatched from the lobby when they become loaded to or near capacity. They also are dispatched if not loaded to capacity within a predetermined time after the previous car is dispatched. The cars continue to operate in this manner until the lobby traffic is reduced to a predetermined level.

Up Peak Clock Operation

This feature initiates Moderate Incoming Traffic operation after a designated Up Peak Clock period begins and one car leaves the lobby landing loaded to a predetermined percent of capacity (see Load Weighing Dispatch). Up Peak Clock maintains a group of elevators in this mode for the remainder of the designated Up Peak Clock period.

Load Weighing Dispatch

This feature is a variable in Moderate Incoming Traffic. The elevator is dispatched up from the lobby as soon as the weight-sensing device determines that the car is loaded to a predetermined percent of capacity. The load setting for dispatch is adjusted independently of load weighing operations other than Moderate Incoming Traffic.

Basement Service

This feature activates during Moderate Incoming Traffic operation and prevents a car from parking at a basement landing. During Moderate Incoming Traffic operation all cars park at a designated entrance floor and are selected for up-dispatch. The doors open and an "UP" lantern illuminates. Basement hall calls are served by the first down traveling car that answers the basement hall call, provided the "No Lobby Car Bypass" feature is not in effect. Basement service should not be specified if substantial traffic is expected at the basement. Instead use Separate Basement

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Zone operation. During periods of the day when the system is not operating in the Moderate Incoming Traffic mode, the basement (which is assumed to be part of the lobby zone) is served as any other floor in the zone.

No-Lobby-Car Bypass

This feature is a variable of Moderate Incoming Traffic operation and speeds the return of cars to the lobby during Up Peak Operation. In the absence of a lobby car, cars travel only to the highest car call and then reverse direction to the lobby. Cars bypass hall calls, stopping only in response to car calls. This operation remains in effect until a car arrives at the lobby.

Rotational Selection

This feature is a variable of Moderate Incoming Traffic operation. It provides for the selection of elevators for dispatch at the lobby in a prearranged sequence if more than one car is at the lobby at once.

Variable Interval Dispatching

This feature is part of Moderate Incoming Traffic operation. The assigned car with higher demand is dispatched at the expiration of a time interval. A car at the lobby and loaded to a preset percentage of its weight capacity is dispatched immediately.

Moderate Outgoing Traffic

Moderate Outgoing Traffic provides additional service during periods of heavy down hall call demand above the lobby. When activated, cars assigned to lobby or basement zones are dispatched to handle hall call demand above the lobby. Moderate Outgoing Traffic commences following the arrival at the lobby of two cars loaded to their preset weight capacity within a selectable time interval. Moderate Outgoing Traffic remains in effect for the same interval after the arrival of the last car loaded to a percentage of its preset capacity weight.

Down-Peak Clock

This feature initiates the Moderate Outgoing Traffic operation after a designated Down-Peak Clock period begins and one car arrives at the lobby loaded to a percentage of its preset capacity weight. Down-Peak Clock maintains a group of elevators in this mode for the remainder of the designated Down Peak Clock period.

Up Hall Call Bypass

During Down-Peak Clock Operation, any car traveling down with a "nonstop" load causes designated cars to bypass up hall calls. The number of cars operating in this bypass mode is adjustable as a function of building traffic. The operation remains in effect for the duration of Down-Peak-Clock Operation.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Group: Firefighters' Service

Local code requirements must be determined to ensure that Firefighters' Service Operations are correctly configured.

Firefighters' Service Phase I

When a building's smoke sensor or a keyswitch located at the designated return landing is activated, the car performs an emergency return to that designated landing. The return operation is in compliance with applicable codes. A buzzer alerts passengers that the car is returning and a message indicator in the car operating panel shows "Please Exit When Doors Open."

Remote Firefighters' Service Phase I Keyswitch

Adding a second Phase I keyswitch to a remote location can complement the primary Phase I keyswitch.

Alternate Return Landing for Phase I

The car, while responding to a Firefighters' Phase I operation, returns to the "alternate" landing if the smoke detector at the designated return landing is activated.

Heat and Smoke Sensing Device

The elevator controller is designed to receive signals from the devices (furnished by others) that sense heat and smoke or products of combustion. These devices provide normally closed contacts that open when heat and smoke is sensed.

Firefighters' Service Phase II

This feature is activated by the firefighters using a keyswitch mounted in the cab, and places the elevator under their control. The operation is in compliance with applicable codes. In the U.S. this feature includes the call cancel button in the cab. When the car cancel button is pressed, all registered calls are cancelled and a traveling car stops at the next landing. The car responds to car calls, but will only open its doors due to constant pressure on the door open button. The doors will remain open until the door close button is activated. When the Phase II keyswitch is in the hold position, the car parks with its door open, the door closed button is disabled, and car calls cannot be registered.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Group: Security Features

Anti-Crime Protection

Anti-Crime Protection, when activated, forces each car in the group to stop at a predetermined floor and open its doors. This allows a security guard or others at the floor to visually inspect the passengers of the elevator before the car completes its run.

Car Secure Access

This feature allows each car call button to be secured or cleared. If a car call button is secured, it will not register a call unless a landing access code is correctly entered on the car operating buttons within a predetermined time period after the secured car button is pressed. Selection and changing of the landing access codes is done on each car operating panel using the Car Secure Access keyswitch. Activation of Car Secure Access is done using the Group Secure Access keyswitch located in the hall or lobby. Activation illuminates the "Group Secured" lamp located in the hallway. A car call to a secured landing illuminates the "Restricted Landing" lamp in the car's cab car operating panel. It remains illuminated for a set time period, or until a valid landing access code is entered.

Landings that are secured by Car Secure Access are available when the car is operating under Independent Service Override (optional) or Firefighter's Service Phase II.

Car Secure Access is activated by a 3-position keyswitch located in the car operating panel. The three positions are CLEAR, SECURE, and an unlabeled position. The "Restricted Landing" lamp accompanies this switch.

Card Reader in Car

When car card reader security is activated, car calls to restricted landings do not register. When a passenger inserts a valid card into the card reader, they are allowed to register a car call to selected restricted landings. Car Secure Access, Express Priority Service, and Firefighters' Service Phases I and II, override the Card Reader in Car operation. Independent Service operation may selectively override Card Reader in Car operation.

Card Reader in Hall

When the Card Reader in Hall operation security is enabled, a valid card read by the reader is needed to register a hall call. Connections for Card Reader in Hall security are part of the elevator's hall link communication network. This allows a card reader mounted in the lobby, or the implementation of a card reader-type security, to use keyswitches.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Card Reader Lockdown

When this feature is enabled, the car responds only to hall calls from a card reader. When Card Reader in Hall security is activated, the Card Reader Lockdown feature parks the car at a specified landing and takes it out of service, removing it from group operation. If the car is set to park with its doors closed, the car moves to the specified landing, opens its front doors for the maximum hall door time then closes its doors and takes the elevator out of service.

Group Floor Cutoff Service

Group Floor Cutoff Service allows selected landings or calls to be secured for an entire elevator group. A keyswitch activates the feature. Any landings secured are still accessible during Firefighters' Service Phase II operation.

Car Call Cut-Off (Selected Landings)

Car Call Cut-Off operates from a keyswitch. The operation disregards and does not register car calls to pre-selected landings.

Generic Group Security

This feature utilizes keyswitches or clock inputs to cut off car and hall calls on specified cars at specified landings through a software matrix setup.

Special Security

When Special Security operation is activated, all cars in the group return to the lobby after first answering all pending car and hall calls. Once at the lobby, each car is capable of answering a single hall call, after which it returns immediately to the lobby and opens the car doors. When a hall call is entered, the following steps are followed:

- A car is dispatched from the lobby to answer the call. Each car is only assigned a single hall call.
- Once answered, no further hall calls are allowed for that car until it returns to the lobby.
- Once at the hall landing, if no car calls are entered, the car automatically returns to its designated landing and opens its doors.

Car call security, if desired, is handled separately. To secure car calls, some variation of Card Reader in Car security is suggested.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Hall Call Cut-Off—All Landings

Activating the keyswitch disables all hall calls. The car answers all registered car calls parking itself at its last landing with the doors open.

Hall Call Cut-Off—Selected Landings

Hall Call Cut-Off operates from a keyswitch. The operation disregards and does not register hall calls to pre-selected landings. All car calls are handled normally.

Riot Operation

This feature is invoked by a keyswitch that prevents cars from returning to the main lobby during periods of riot control.

Group: Enhanced Service and Operation Features

Attendant Operation

Attendant operation is activated from a keyswitch mounted in the car operating panel. Initiating the operation cancels all registered car calls and places the car in a semi-automatic control of the attendant to decide:

- Car Loading
- Door Closing
- Hall Call Bypass

Automatic door open operation is in effect for all hall and car calls. Manual door closing by the Door Close button is required. Doors automatically reopen if the Door Close button is released before the doors fully close. Door operation and starting of the car are the same as during independent service in that the start signal is not given until the door close button is operated. Constant pressure on the Non-Stop button will cause the car to bypass all hall calls. Nudging is disabled during Attendant Operation. Load weighing bypass and door protection devices are inhibited during Attendant Operation. This feature includes the "FURTHER DEMAND" message indicator and a Non-Stop button.

Independent Service

Activating the Independent Service keyswitch in the car operating panel removes the car from normal group operation. It responds only to calls registered on car buttons and disregards all hall calls. The doors are closed manually pressing the Door Close button. Car and hall lantern operation is suspended. The car independent service switch can be complemented with a hall independent switch, if specified. Independent Service includes a Call Cancel Button. When the button is activated, all registered calls are canceled and a traveling car will stop at the next landing.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Emergency Hospital Service

Turning a hall mounted keyswitch operates the car according to Express Priority Service (Hospital) rules. Once at the hall landing, a second action is required to activate the Emergency Hospital Service keyswitch in the car. When both actions are complete, the car is under the direction of Emergency Hospital Service operation. The operation function removes the car from normal group operation, responds only to registered car buttons, and door closing is a manual operation that requires pressing the Door Close button. The car resumes normal operation only after the car's Emergency Hospital Service keyswitch is turned to its OFF position.

Express Priority Service (Hospital)

A keyswitch initiates Express Priority Service at each landing requiring this service. The car able to respond in the shortest time answers the call after first canceling all registered car calls. When the car reaches the landing, one of the following occurs:

- If no car call is entered within a preset time, the car will close its doors and resume normal operation.
- If a car call is entered and the Door Close button is pressed, the car will serve the call, then resume normal operation.

This operation can be modified so that the car remains in Express Priority Service until no further car calls are present. When no car call is entered within a preset time, the car closes its doors and resumes normal operation. If an Emergency Hospital Service keyswitch is activated, the car will switch to Emergency Hospital Service until the keyswitch is deactivated. At that time, the car resumes normal operation. This feature includes a Priority Service Light in the hall panels and a message indicator on the car operating panel.

Executive Priority Service

A keyswitch is furnished for each hall landing performing Executive Priority Service Operation. When activated, the car within a group, calculated with the fastest response time, answers the call after first completing all existing car calls. When the car reaches the landing initiating the operation, one of the following occurs:

- If no call is entered within a preset time, the car closes its doors and resumes normal operation.
- If a car call is entered the car will serve the registered call then resume normal operation.
- If an Independent Service keyswitch is activated, the car will remain in Independent Service until the keyswitch is deactivated. At that time, the car resumes normal operation.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

This feature includes a Priority Service Light in the hall panels and a message indicator on the car operating panel.

Priority Penthouse Access

A separate hall button is furnished for each hall landing performing Priority Penthouse Access operation. When this button is activated, the car, calculated with the fastest response time answers the call after completing existing car calls. Once at the landing, the car performs its normal door open and close operations and then moves automatically to the designated penthouse landing. At the penthouse landing, the car again performs its normal door open and close operations. It then exits Priority Penthouse Access operation and returns to normal operation.

Sabbath Operation

Some religious beliefs do not allow work to be performed on the Sabbath, which includes pressing elevator call buttons. Sabbath operation shall cycle designated elevators to every landing without requiring a hall or car call. When the car reaches a terminal landing, it reverses direction and continues making stops in the opposite direction. Either a timed device or keyswitch normally activates this operation.

Wild Car Operation

Wild Car Operation is an option used when communications carrying registrations for hall calls fails. In that event, all elevators that make up the group complete their car calls until there is no further demand and then each elevator in the group parks at its lobby and takes itself out of service. Activating the Wild Car keyswitch places the elevator group into a programmed operation. Each car in the group moves to assigned floors to pick up passengers and at least two cars in each group are assigned duplicate floors. Car calls are answered normally.

Earthquake Operation (Seismic)

Earthquake emergency operation, actuated by a seismic switch and/or counterweight displacement switch, is required on all traction elevators operating at a rated speed of 0.76 M/s (150 ft./min.) or more in Seismic Risk Zone 2 or greater. Earthquake emergency operation is not required for Risk Zone 2 if the car and counterweight guide rail systems conform to the requirements for Zone 3 or greater. Resetting the elevator system after an earthquake is performed via a button located in the machine room. This feature is used in conjunction with a Major Component Displacement Detector, which produces a signal if the counterweight breaks free of the counterweight rails. Upon receipt of the signal, a car in motion will make a controlled emergency stop, then move at slow speed in a direction away from the counterweight. When the car reaches the next door zone, the car will open its doors and remove itself from service. The car will remain out of service until manually inspected and reset. In the event of a power failure, earthquake operation will remain active, even after power is restored.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Non-Otis Seismic Sensor Activation

This feature is used in conjunction with a seismic detector, which produces a signal if seismic activity occurs. Upon receipt of the signal, a car in motion will stop at its next committed floor, open its doors, and remove itself from service. The car will remain out of service until manually inspected and reset.

Building Sway Operation

This feature is used in conjunction with a building's motion detector. The elevator's speed is reduced to a secondary contract speed when a signal is received from the motion detector.

Emergency Medical Operation

Emergency Medical Operation operates from a hall mounted keyswitch. When activated, a buzzer in the car sounds and visual illumination alerts appear in car and hall landing fixtures. The operation cancels any existing car calls, reassigns all hall calls for the car, and returns the car non-stop to its designated emergency medical landing, where the doors open and the buzzer stops. Once at the landing, the car follows the rules for Emergency Medical Car Operation. If the emergency medical car switch is not activated within 60 seconds after the doors are fully open, the operation is cancelled.

Emergency Medical Car Operation

A landing designated as the emergency medical floor is specially programmed in the control software. A car positioned at this landing with its doors open performs either of two operations based on a 60-second interval:

- If the Emergency Medical Car keyswitch in the car is activated and a car call registered, the doors close and the car moves to the target landing, opens its doors, and holds them open until the next car call is registered. It repeats the operation with the next registered car call.
- Without further keyswitch action, the car disregards any signals for car calls and the door close buttons. After 60 seconds, the car automatically returns to normal operation.

To remove the car from Emergency Medical Car Operation, the car must return to the medical landing and the Emergency Medical Car keyswitch must be deactivated. When the car is on emergency Medical Car Operation, Fire Service Operation cannot be initiated.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Group: Remote Communications, Monitoring, and Control

EMS Panorama® (Elevator Management System)

EMS Panorama is a monitoring and control system used by building management and security personnel to observe and modify elevator operation and performance. Parnorama can provide time-based control of security access. Depending on the building requirements, a machine room display terminal and keyboard, a lobby display terminal, a security station system, and a fire station display terminal and keyboard are also available. The security station supports interactive operations such as security assignment (car and floor access), electroluminescent display message, and the storage of events and alarms. The personal computer allows display of up to eight 8-car groups on the same monitor.

Intercom (Provision)

An optional provision is made in the main car operating panel (auxiliary car operating panel if the main car operating panel includes speech synthesis) for a speaker and/or microphone.

Remote Elevator Monitoring (REM®)

REM is a robust monitoring system that records data on many aspects of your elevator's equipment and operation.

Group: Maintenance Operation Features

Zoned Access at Bottom Landing

Zoned Access operation is activated by a keyswitch typically located in the entrance frame. Under this operation, the car is permitted to move at a reduced speed with the hoistway door at the bottom landing and car door open. The operation is used to permit trained maintenance personnel to access the elevator's pit. Movement of the car away from the bottom landing is limited or "zoned" to prevent excessive movement.

Zoned Access at Upper Landing

Zoned Access operation is activated by a keyswitch typically located in the entrance frame. Under this operation, the car is permitted to move at a reduced speed with the hoistway door at an upper landing (typically the top landing) with the car door open. The operation is used to permit trained maintenance personnel to access the elevator's car top. Movement of the car away from the upper landing is limited or "zoned" to prevent excessive movement.

Top-of-Car Inspection

Top-of-Car Inspection is provided on the roof of the elevator. This feature allows authorized, trained personnel to move the elevator at a controlled, reduced speed.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Group: Standby Power Operations

Standby Power Operation (Automatic with Manual Override)

The number of cars that can operate simultaneously under standby power is designated by contract. Standby Power Operation returns the cars automatically to a designated landing. Preference is given to cars with passengers to reduce passenger waiting time. Any car that does not begin a return within 60 seconds is placed in a "Not Available" mode while the responding cars move. A second attempt is made to recover any car that failed to move. If again unsuccessful, they remain in the "Not Available" mode and only operate manually. Cars returned to their designated landing then go on automatic selection and run on normal operation. The priority of selection is as follows:

- Car(s) on Firefighters' Service Phase II.
- Car(s) designated by contract to be selected.
- First available car beyond the car(s) designated by contract.

If a car selected for normal operation under Standby Power Operation is delayed for 60 seconds, it is placed in a "Not Available" mode and another car is selected for normal operation based on the priorities listed above. Manual override of Standby Power Operation is operated by a strip of switches. A manually selected car may run either as a return operation to a designated landing or in normal operation under Standby Power Operation. If a manually selected car has not first returned to its designated landing, it will do so and then immediately go into normal operation. If a manually selected car is delayed, no other car can be selected in the group unless it is manually selected.

If car selection is changed by Manual Override while a car is running in return or normal operation under Standby Power Operation, the newly selected car is not permitted to run until the car that is running has stopped, opened its doors, and gone into the Standby Power Wait state.

Inter-Group Standby Power Operation

This operation monitors and controls the status of cars in multiple elevator groups in one or more machine rooms during Standby Power Operation. Initially, each group is enabled to return cars to their designated return landing. Once return operations are complete in all groups, a predetermined group or groups are enabled for automatic or manual selection for normal operation under Standby Power Operation protocols. To ensure the number of cars run by the standby power system is not exceeded by manual selections, a software interlocking system is used. If a manually selected car would exceed the total allowable number of running cars, it cannot move until another already moving car stops at its next committed landing, opened its doors, and is placed in the Standby Power Wait state.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Split Feeder Operation

This operation is required when two standby power feeders supply one group of elevators. Each feeder supplies power to some (but not all) cars in the group, causing a split group. A car operates under normal or standby power depending on the condition of its feeder. The two subgroups share the same designated return landing. If only one of the two feeders goes on standby power, the car(s) associated with the feeder begin Standby Power Operations (see "Standby Power Operation Automatic and Manual"). The rest of the group remains on normal operation under normal power. If the second feeder also goes on standby power, all the cars perform standby operations as a single group. To do this, the cars already on Standby Power Operation reset and again perform the return operation to the designated landing. Automatic selection for normal operation under Standby Power Operation occurs after the full group performs the designated return floor operation. Manual Override at this time is also available. Cars returned to normal power first enter Emergency Power Transfer mode, which performs a timed transition between the power supplies recounting the number of cars remaining under Standby Power Operation.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

(This page intentionally left blank.)

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Chapter 4: Maintaining Your Gen2® Elevator

It is in your best interest as an owner to ensure your elevator system is well maintained. This will minimize the incidence, inconvenience, and cost of unexpected breakdown. This chapter should serve as a guide to understanding the maintenance recommended by the Otis Elevator Company. This chapter is not intended as a guide or instruction manual for performing elevator maintenance. Some of the routines listed may not be relevant to your particular installation, based on the specific features chosen.

Failure to use genuine Otis parts may invalidate any guarantee and may adversely affect the safety of your elevator. Refer to Otis Elevator Company for further information.

For safety reasons, only a trained elevator maintenance technician may perform the operations listed in this chapter. The elevator must be removed from normal service and warning signs displayed. Safety barriers must be used if doors are opened without the car present.

From Inside the Car

1. Inspect car interior for damage and repair sharp and protruding edges.
2. Observe starting and stopping for signs of deterioration or malfunctions.
3. Observe floor leveling to ensure it is within tolerance.
4. Check operation of car and landing doors and ensure all reversal devices function properly.
5. Check operation of all controls within the car, especially alarm devices.
6. Check operation of normal and emergency car lighting.

Controller

The cabinet contains high voltage equipment. Power must be off unless suitable live working methods are employed.

Settings of resistors and other adjustable components should not be altered without a full understanding of their function. If in doubt, contact Otis Elevator Company. Fault finding must not be performed without the correct diagram and a full knowledge of the equipment.

1. Check all electrical connections for tightness.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

2. Ensure ventilation fans and grills are clean and functioning.
3. Keep all parts clean.
4. Ensure cabinet doors are locked shut after inspection.

Landing Fixtures

Turn off power before working on any fixtures.

1. Check the operation of all fixtures.
2. Ensure correct operation of the fire service switch and any other special service switches.

Landing Entrances

Do not open doors without a barrier in place if the car is not present. Turn off power or place the car on inspection operation and activate the stop switch before any inspection.

1. Clean landing door tracks.
2. Check doors for free operation.
3. Check that the doors close due to gravity or spring force.
4. Check correct lock engagement and contact wipe.
5. Check for excessive play in bottom door guides (gibs).
6. Check the condition of the air cords or other coupling devices.
7. Check that all bolts are tight.
8. Check the condition of the panels for damage.
9. Check the correct setting of upthrust devices.
10. Check the condition of the tracks and the sills.

Guide Rails

1. Check the condition of all hardware, rail fastenings, and brackets.
2. Remove any debris or dust.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Belts and Terminations

1. Inspect coated steel belts for signs of wear.
2. Check condition of all coated steel belt terminations.
3. Check and adjust lengths to maintain correct counterweight run-by.
4. Ensure that the tension on all belts is equal.

Car Entrance and Operator

Do not ride on the car top unless the cart is on inspection operation. Whenever the car is stopped, immediately activate the emergency stop switch. When working on the car doors, ensure the main power is off.

1. Clean the car door track of any debris.
2. Check the condition of all hardware.
3. Check the condition and adjustment of the door coupling mechanism.
4. Check the door gibs for excessive movement.
5. Check the upthrust rollers for recommended clearance.
6. Check electrical cables for signs of damage.
7. Check the security of all door tracks.
8. Check the clearances between door panels and returns.
9. Ensure correct operation of the door locking mechanism.
10. Check the door closing speed and force.
11. Check the operation of the door open button and all other reversal devices.

Hoistway Switches

Do not make adjustments without a full understanding of any item.

1. Clean the switches and check the arms and rollers for free movement.
2. Check the function of all terminal switches.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

3. Check the running clearance of the inductors and vanes.

Car Frame Equipment

Lock off power at the mains before inspection.

1. Clean off lint and dust.
2. Check the condition of all hardware.
3. Investigate any unusual noise, heat, or vibration.
4. Check the operation of the safety gear linkage.
5. Ensure adequate clearance is maintained between the safeties and the rails.
6. Check the safety gear for correct engagement.
7. Check the condition and adjustment of the cab steadier devices.
8. Check the traveling cables and compensation for correct hang and signs of damage.
9. Check the condition of cartop sheave.

Gearless Traction Machine & Brake

Lock off power at the main switch before inspection.

1. Investigate for any unusual noise, heat, vibration, or excessive movement of parts.
2. Check the condition of all bolts and attachments.
3. Check the condition of the machine sheave.
4. Inspect all sheaves for wear and damage.
5. Check the condition of all electrical connections.
6. Ensure all guards are in place.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Counterweight

Ensure the car is on inspection operation with the stop switch activated or lock off power at the main switch.

1. Check the condition of the filler weights.
2. Check the roller guides for correct position and lubrication.
3. Check the condition of the sheave, frame, compensation chain, and guiding devices.

No lubricating of counterweight sheave bearings is required.

1. Check and observe the operation of any safety gear linkage.
2. Ensure the recommended clearance is maintained between safeties and rails.
3. Check the safeties for correct operation and engagement.

Pit Equipment

Do not enter the pit without the power switched off or the pit stop switch activated.

1. Check for free movement of the governor tension frame and check for recommended switch adjustment.
2. Check the condition of the buffer (hydraulic or spring type).
3. Check for the correct hang and loop of the compensating chain(s).

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Cleaning

For safety reasons, the elevator must be immobilized for cleaning operations. Do not operate any electrical appliance inside the elevator car using a trailing power cord to an external power source, unless automatic elevator operation has been overridden and the car is safely parked with doors open. Do not leave car unattended while power cords pass through the door opening. The car is a confined space. Do not use cleaning agents that require good ventilation.

The car top must be kept clean of oil, lint, and debris to minimize the risk of fire.

The pit floor and its equipment must be kept clean, dry, and free of debris to minimize the risk of fire.

Car Interior Surfaces

The interior of your elevator car, including the doors and frames, are designed to retain their finish and to last for many years. To ensure that they do, follow these instructions:

Clean the surfaces regularly in accordance with the following advice.

Protect all vulnerable surfaces from damage, especially when an elevator is used for moving furniture or equipment or similar non-passenger activities. Protective pads may be obtained from Otis to protect your elevator.

Otis Elevator Company recommends the following cleaning techniques:

Glass

Clean with a non-abrasive glass cleaner and a soft lint-free cloth.

Stainless Steel

Use a soft lint-free cloth with a reputable stainless steel cleaner. Follow the grain of brushed stainless steel. Do not use any other types of cleaning powders or creams or any grade of steel wool.

Bronze-Tinted Stainless Surfaces

Use a soft lint-free cloth dampened with soap and water and finish with a soft dry cloth. Do not use any cleaning agents designed for un-lacquered brass or abrasive materials.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Laminated Surfaces

Use a soft lint-free cloth dampened with soap and water. Do not use any cleaning powders, creams, or sprays.

Painted Surfaces

Use a soft lint-free cloth dampened with soap and water. Do not use any cleaning powders or creams.

Landing Doors and Frames

Landing doors and frames should be cleaned in accordance with the preceding recommendations and protected against damage when necessary.

Car and Landing Door Sills

It is essential to regularly clean all debris from the car and landing door sill grooves. First immobilize the elevator (see note below) with the doors open at a convenient landing.

Then carefully brush out accumulated dirt and extract with a vacuum cleaner.

Use your independent service keyswitch or other supervisory system control lock (i.e., recall to the lobby) to immobilize the elevator. If you are unsure about carrying out the task safely, please call Otis first.

Inspection Requirements

Controllers

Wires. Examine all wiring for breaks, loose lugs, or loose connections.

Resistance Tubes. Inspect for loose connections. Examine tubes for breaks in the enamel. Replace broken resistance tubes with tubes of equal value.

Motors

Connections. Tighten all motor and field connections. Be sure to check all grounds and the bonding of all conduits, and the controller frame, etc.

Gen2® Brake Inspection Details

Check brake connections and wiring. Measure between the brake pad and magnet housing using a metric feeler gauge to ensure that brake clearance is within recommended tolerances. The Gen2 brake requires no lubrication or adjustment.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Governors

Check and clean dust and debris from the governor parts. Ensure that all covers are replaced after inspection. Check the wiring and connections on all solenoids and overspeed switch. No lubrication or adjustments required. Do not lubricate governor rope.

Sheaves

Check all sheaves for wear and debris. Clean if needed. **Do not use any solvents, cleaners, or chemicals on sheave surfaces.** Dust with a dry cloth only if needed.

Sheave bearings are sealed and do not require periodic lubrication.

Car

Flooring. Inspect for worn or loose flooring.

Emergency Exits. Check operation of top exit and switch.

Lighting and Fans. Check for cleanliness, burnt out lamps, and for lubrication. Be sure that globes are fastened.

Fixture Jewels and Lenses. Replace if any are cracked or broken. Glass used in the car should be in accordance with codes.

Car Operating Devices

Pushbuttons. Buttons should not stick and should work properly. Replace worn buttons and switches.

Indicators

Position Indicators. Position Indicators should be tested for proper operation and checked for burnt out lamps.

Car Door

Fastenings. Examine fastenings and check the door opening range. Examine for broken springs and loose connections.

Hangers. Check for worn tracks and rollers, making certain that the door cannot come out of its guides or jam at any point.

Bottom Guides (Gibs). Examine for wear, looseness, or the possibility of the guides coming out of the threshold.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Car

Fastenings. Check and tighten the fastenings if required.

Cab Steadier Plates. Check and tighten cab steadier plates if needed.

Roller Guides. Check the roller guides for wear, proper clearances, and adjustments.

Doors and Door Operators

Wear. Examine thoroughly the doors and door operator for wear, friction, or obstructions that may prevent proper operation.

Adjustment. Clean, align, and adjust the door operator for quiet operation and proper opening and closing speed. Test and observe operation.

Safety Operated Switch

Adjustment. Be sure that safety operated switch will function if the governor trips.

Releasing Carrier

Spring Tension. Ensure that the releasing carrier will operate properly if the governor trips. Check all setscrews, keys, levers, pins, nuts, and lock nuts.

Coated Steel Belts

Condition. Visually inspect Coated Steel Belts for wear, cuts, breaks, or damage. **Do not use any lubricants, cleaners, solvents, or chemicals to clean belts.** If cleaning is needed, use only a dry cloth.

Traveling Cables

Fastenings. Check the supportive device fastenings.

Condition. Examine the outside coverings for wear. Look for any abrasion from concrete or steel supports.

Hoistway Door and Operation

Adjustment. Examine each door carefully. Check for structural defects. Examine the doors to see if they can be opened without releasing the interlock. If the lock is worn or the door has sagged so that interlock does not engage properly, arrange for repairs at once. Clean, lubricate and inspect all pins, bushings, guides, etc. as needed. Be sure that bumpers are in place and in good condition.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Hangers. Examine the hangers for proper operation, wear, upthrust adjustment, and condition of the guides (gibs) in the bottom of the doors. Checks tracks for wear and alignment, and tighten all fastenings if needed.

Interlocks. It is extremely important that all lock failures be repaired immediately. Check contacts and the point at which they close. Try to pull the door open with the car outside the range of the lock. Carefully check clearances and tightness of bolts and screws to avoid future shutdowns.

Conduit

Check the fastenings and ensure the conduit has not pulled out of the fittings and that the duct is securely fastened to the wall.

Counterweight

Roller Guides. Check for wear, proper clearances, and adjustment.

Filler Weight Rods and Nuts. Tighten the rods and nuts, if necessary, and check cotter pins.

Limit Switches and Cams

Rollers. Check the roller guides for wear and replace if they do not engage cams properly.

Wiring. Be sure that all wiring connections are tight.

Test Operation. See that all switches and cams are in correct alignment. Check the operation of final limits.

Rails

Check the brackets, rail fastenings, and fishplates for loose bolts. Tighten and clean when required.

Buffers and Springs

Operation. Run the car at slow speed onto the buffers. Fastenings—Check for loose nuts and bolts and tighten if needed.

Sheaves (Governor)

Bearings. Check for the bearing wear, especially those on the governor tension frames.

Fastenings. Check all fastenings and tighten as needed.

Switches. Check all contacts and switch operation.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Clearances

Pit of Counterweight. Check the pit and striking blocks to be sure the counterweight will land before the car strikes the overhead.

Governor Tension Frames. Check to determine whether or not the rope should be shortened.

Hall Buttons. Check for broken or sticking buttons, and ensure that all screws are in place and the plates are properly fastened. If lights are used, inspect for proper operation.

Emergency Door Opening Keys. Check the operation of keys on doors arranged for their use. Use by people unfamiliar with elevators may result in an accident if the door is opened when the car is not at that floor. Emergency keys should be stored securely in compliance with all elevator codes.

Safety Devices

Check clearance between the safeties and rails. Check all machine screws in the links and rods, and be sure that all pins, nuts, and keys are in place and tight.

Governor Test of Safety. If a recent safety test is not a matter of record, and then a standard safety test at slow speed should be performed. Be sure to check local code requirements. All equipment should be thoroughly inspected before and after conducting the test.

Traveling Cables

Check traveling cables for signs of wear and ensure the attachment points at the car and hoistway are secure.

Environmental Requirements

The Gen2 uses sealed bearings and does not generate waste lubricant.

Escape/Evacuation Procedures

Occasionally passengers may become trapped in an elevator that has stalled due to power failures or other conditions. This section briefly outlines the process for emergency evacuation of passengers from a stalled elevator.

Manual Rescue Operation

Qualified personnel can use the Gen2 Manual Rescue Operation function to move the elevator when main power is lost, by remotely lifting the machine brake from the controller.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Manual Rescue Operation is to be used only after all other means to evacuate trapped passengers have been considered.

Basic Escape/Evacuation Rules

These rules apply in all cases and must be followed with any type of evacuation.

Never attempt an evacuation on your own. *Immediately call an experienced elevator mechanic to the site to perform an evacuation. Passengers need to be removed as quickly as possible but never with the risk of injury to the passengers, building personnel, or mechanics.*

A trained elevator mechanic must perform these basic rules, which include:

- **Lock out and tag the main line before removing passengers from any exit (except under normal operation). This rule applies even if there has been a power failure.**
- Do not open the doors unless someone is at the landing to assist the passengers when they are exiting the elevator.
- Communicate with passengers. Identify yourself and reassure passengers that they are safe and that steps are being taken to evacuate them from the car. Ask questions:
    - How many passengers are in the car?
    - Are any passengers ill, injured, or do any require special assistance?
    - Are the lights on in the elevator car?
    - Are the car doors open or closed?
    - What were the conditions leading up to the entrapment?
    - How long have passengers been trapped?
- Keep passengers informed of the steps being taken throughout the evacuation process:
    - Instruct the passengers to stay away from front door.
    - Instruct the passengers not to touch any buttons unless asked to do so.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

- Return the car to normal operation (if possible).
- Ask passengers to:
  - Check that the car Emergency Stop Switch is in the "RUN" position.
  - Try pushing the door open button.
  - Check car doors to make sure they are fully closed.
- A trained mechanic should perform a quick diagnostic check from the machine room to:
  - Check for power.
  - Check for blown fuses.
  - Check for tripped overload.
  - Check for contact(s) not making.
  - Check that the safety circuit ("safety chain") is closed.
- Restore normal operation (if possible) and ensure that passengers exit safely.

Do not open the doors unless someone is at the landing to assist the passengers when they are exiting the elevator. If the car is more than 30 cm (1 ft.) from floor level, a ladder should be used. In many cases, an additional rescue person is needed—one person in the car and the other at the landing—to assist the passengers. Have the ladder available before opening door; passengers will not wait for the ladder once doors are opened.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

(This page intentionally left blank.)

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Chapter 5: Otis Maintenance and Service

Elevator maintenance is more than just returning an elevator to service after an elevator shutdown occurs. Since elevator systems are a significant investment, proper maintenance on this equipment is critical to extend the life of the equipment and reduce the possibility of unscheduled disruptions or shutdowns.

Otis utilizes the vast knowledge it has accumulated over the years as the world's leader in the elevator and escalator industry to provide superior maintenance to extend elevator life. That means not only developing better, longer-lasting products, but also the technology to scrutinize their maintenance performance along with the technology to place valuable information into the hands of well-trained mechanics.

Otis Elite™ Service simplifies your day by taking one important responsibility off your mind. Through investments in new technology, Otis Elite service ensures a level of expedience previously unavailable in the industry. We'll respond to service issues in record time—typically in minutes; we'll provide you with status updates in real time; we'll even modify key elevator functions to align with changing patterns the moment you assess the need. You play a central role in optimizing the flow and efficiency of your building. With Otis Elite service, we'll make sure your elevator does also.

Otis Maintenance Management System (OMMS®) is a dynamic program that takes into account your elevators' maintenance needs, use and component life. Otis can tailor inspections and maintenance schedules based on your elevators' use in advance.

OMMS procedures are performed on your equipment at predetermined intervals. Components are replaced before their normal life cycle ends and their performance deteriorates. Although we cannot guarantee that no malfunctions will occur, OMMS procedures greatly minimize shutdowns. In addition, Otis continually re-evaluates and improves these procedures. Engineering testing is constantly underway to update and improve OMMS maintenance techniques and OMMS materials.

OMMS is a system tailored specifically to your environment, equipment and needs. Its standardized work practices and predetermined task scheduling ensure the right maintenance at the right time – today and for the extended life of your equipment. It is based not only on engineered, certified best methods, but on constant analysis of the work performed, to ensure consistent, high quality maintenance. This ultimately protects your elevator investment and ensures satisfied tenants.

The Otis Maintenance Management System is the single most advanced and effective support system available in the elevator industry.

Another Otis technological advance is **Remote Elevator Monitoring (REM®)**. REM uses advanced data communications and microprocessor technology to provide 24-

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

hour, on-site elevator monitoring. Sensors located in key areas of elevator operation provide diagnostic data in an effort to discover and correct problems before a failure occurs.

Because REM constantly monitors an elevator's performance, it can identify imminent problems that are fixable during a routine maintenance visit. If it finds a major problem, REM automatically sends a message to a customer care center and an Otis service mechanic is dispatched within minutes of the call.

REM continuously monitors your elevators 24 hours a day, 365 days a year. It reduces service interruptions and provides accurate operation information to identify and correct most problems quickly. For fast response, the REM® system makes the service calls for you. A mechanic is dispatched immediately for urgent problems and elevators are often back in service before you or your passengers know there is a problem.

Otis invests in the tools and technology necessary to make technical information easily accessible to Otis personnel. For instance, **OtisWave** is a fully searchable online library of technical documents providing up-to-date information. Otis service personnel now access information faster and easier using the OtisWave library. A maintenance supervisor at a work site needs only a few minutes on his laptop computer to identify a specific part, review a maintenance routine, or find replacement part numbers. The hours previously spent searching through thousands of pages of paper documents in the office are now history.

Otis continuously strives to provide exceptional service to our customers. Evidence of this commitment can be found in facilities such as **OTISLINE®**. OTISLINE is a 24-hour-a-day, centralized communications center that enables you to contact Otis at any time of the day or night. Customer service representatives are available at toll-free phone numbers to provide a prompt and professional response.

e*Service through Otis.com provides direct access 24 hours a day 7 days a week into your building's service history. You can access e*Service using your existing computer and internet browser – just log-in to otis.com and register for e*Service. Knowledge about all service calls and maintenance completed on your elevators or escalators is at your fingertips. E*Service also provides access to your financial statement of account information.

Otis is driven to develop products that improve an elevator's performance, safety, and reliability. Many of these products are incorporated directly into production at the factory for new elevator systems or are added to older equipment to modernize it.

Among the key elements in Otis' overall maintenance program are its customer service centers and testing facilities. For example, the **Otis Service Center (OSC)** in Bloomfield, Connecticut provides maintenance, repair, and modernization services to all Otis maintenance customers throughout the U.S. and Canada. The 220,000-

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

square-foot facility stocks, manufactures, and sources elevator and escalator parts. Printed circuit board repair and testing are also performed at OSC.

The **Otis Test Tower** and **Quality Assurance Center (QAC)** in Bristol, Connecticut serve as examples of Otis' commitment to minimizing elevator/escalator downtime through continuous improvement. A combination of real-world testing and computer simulation at this facility means faster, quieter, more efficient, and reliable equipment for Otis customers. Engineers not only test products, but also perfect installation and service methods before they are implemented.

Finally, Otis offers many forms of preventative maintenance programs designed to extend the life of elevator and escalator equipment. Monitoring and maintaining equipment properly also allows for the safest, most reliable performance possible. Please contact your Otis sales or customer service representative for more information about these services.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Chapter 6: Unique or Product-Specific Procedures or Methods for Inspection or Testing / ASME A17.1b-2009/CSA B44b-09 : Requirement 8.6.1.2.1(f)

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

Testing Procedures for GCS Controllers with Software Level BAH, or AAB or Later

Overspeed Test Instruction

PREPARING FOR TEST

This test allows you to run the car at normal speed and, on some systems, at governor tripping speed, to activate the safeties. This is to check that the safeties will apply and stop a fully loaded car in the down direction (or empty car in the up direction) within the distance determined by code.

Take control of the car, making sure there is no one in the elevator.

Test the brake's spring tension to ensure it will hold full load.

Leave the full load on the elevator for the safety test.

If the building has counterweight safeties, they must be tied down before testing the car (this is to prevent the counterweight safeties from setting during the test).

If you are performing a counterweight test then the car safeties must be tied down (this prevents the car safeties from setting during the test).

From the wiring diagram, determine both the car governor's overspeed switch (OS) and the counterweight governor's overspeed switch (CWOS), if present. These switches must be jumped out during the test.

Running Test

Read and become thoroughly familiar with the test instructions before beginning any test.

Plug the tool into the service tool maintenance port on the controller.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Disable OCSS to MCSS communication by going to menu (Module-2-4-7-2) on the tool.

This gives you control of the elevator.

1. Go to menu (Module-2-2-5-1-1-1). The tool will display the screen below.

Read Ovrspd Inst
Enter Code ????

2. Enter the code from Step 12, and then push [Blue + Enter] buttons. The tool screen will display:

Car Test = 1
CWT Test = 2

3. Select which test you want to run, by entering 1 for car or 2 for counterweight.
4. The tool will confirm the correct car position for the test selected.
5. If 1 was selected and the car is at the correct landing, the tool will display the screen below.

Ena Safety Test
1 = Yes 2 = End

6. If 1 was selected and the car is not at the correct landing, the following display will come up on the tool.

Car Not at Top
Landing <ENTER>

7. Push the [Blue + Enter] buttons on the tool; follow the instruction to move the car to the correct landing. At the end of run the tool will display the screen below.

Ena Safety Test
1 = Yes 2 = End

8. Enter 1 to select the safety test or 2 to abort the test.
9. If 1 is selected, the tool will show both test velocity and uncontrolled motion velocity.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Test V = UCM V =

10. Push the [GO ON] button and the tool will display the screen below.

Read Ovrspd Inst Enter Code ????

11. Enter code from Step 11, then push buttons [Blue + Enter] on the tool. The tool will display the screen below.

Run Test? 1=Yes 2=No

12. Selecting 1 causes the elevator to run towards the bottom landing at the test velocity.

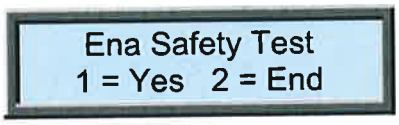
Pushing 1 disables the safety control. The safety function will be disabled for only one run.

You are about to run the car. Performing this test requires operating the elevator in a potentially unsafe and hazardous condition that may result in personal injury or property damage, including death, and damage to your elevator. In addition, not restoring the elevator to service properly at the completion of this test could result in a safety hazard. The code for Step 5 is 2655 and the code for Step 9 is 5429.

13. If your jurisdiction requires the governor to be tested at contract speed, then trip the governor manually.

14. If the jurisdiction requires overspeeding of the elevator, the safeties will set when the elevator reaches the governor's tripping speed. The following sequence would occur if 2 were selected in Step 6.

15. If 2 is selected and the car is at the correct landing, the tool will display the screen shown below.



Ena Safety Test 1 = Yes 2 = End

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

16. If 2 is selected and the car is not at the correct landing, the following will be displayed on the tool.

17. Push [Blue + Enter] on the tool. Follow the tool instruction to move the car to the correct landing. At the end of the run the tool will display the screen below.

18. Select 1 and follow Steps 8 through 11. The car will run toward the top landing at the counterweight test velocity.

19. If the jurisdiction requires the governor to be tested at contract speed, then trip the governor manually.

20. If the jurisdiction requires overspeeding of the elevator, the counterweight safeties will set when the elevator reaches the counterweight's tripping speed.

21. Push Module on the tool to exit the test and restore safety controls.

22. Confirm all tie downs and jumpers have been removed before putting the elevator back onto normal operation.

Not removing all jumpers and restoring the elevator to normal service properly at the completion of this test could result in a safety hazard.

23. Restore OCSS to MCSS communication by going to menu (Module -2-4-7-1).

Buffer Test Instruction

Preparing for Test

This test allows you to run the elevator or the counterweight at **Buffer Striking Speed** onto the buffer. This is to check that the buffer will retard the elevator or the counterweight if they run into the terminal. When the elevator or the counterweight is raised off the buffer, the buffer plunger must return to its normal position within 90 seconds.

Take control of the car, making sure there is no one in the elevator.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Test the brake's spring tension to ensure it will hold a full load.

Leave the full load on the elevator for the car buffer test.

If the building has counterweight safeties, they must be tied down before testing the car buffer. This is to prevent the counterweight safeties from setting during the test.

Before doing the counterweight buffer test, the car safeties must be tied down (this prevents the car safeties from setting during the test.).

The controller is calibrated in millimeters per seconds of car speed. To convert feet per minute to millimeters per second 5.08 x FPM (= mm/sec.) Calculate car speed in mm/s. The buffer striking speed is a speed the buffer is designed to absorb. This speed can be found on the buffer data plate.

Position the car at a landing in the middle of the building, in preparation for the test.

Running Test

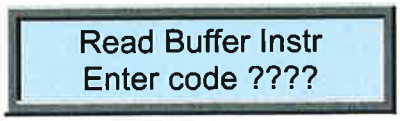
Read and become thoroughly familiar with the test instructions before beginning any test.

Remove power from the controller. Log out/tag out the mainline disconnect.

Remove and tape the ends of wires from terminal P21-1 and P21-2.

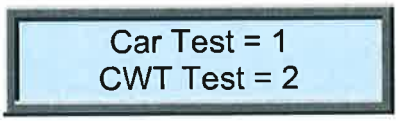
If the wires are not removed and the jumpers installed for the test, the sensors will be destroyed when power is applied to the controller.

Install jumpers between P21-10 to P21-1 and P21-2.



Plug the tool in the service tool maintenance port on the controller.

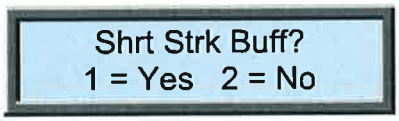
Disable OCSS to MCSS communication, by going to menu (Module-2-4-7-2) on the tool.



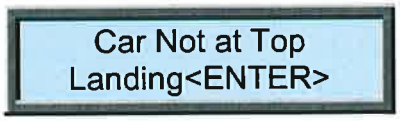
This will give you total control over the elevator.

1. Go to menu (Module-2-2-5-1-1-2) and follow the instruction to get to the buffer test.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

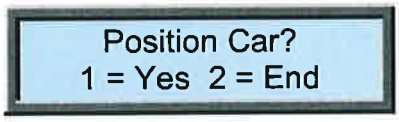


2. Enter code found in Step 15 and push [Blue+Enter], the following display below should be shown on the screen.

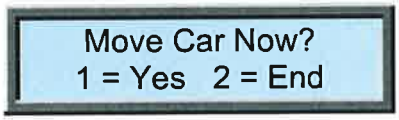


3. Select which test you want to run, by entering 1 for car test or 2 for counterweight test.

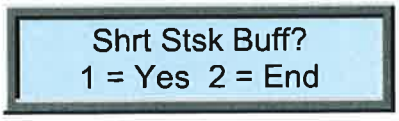
4. The tool will confirm the correct car position for the test selected.



5. If 1 was selected and the car is at the correct landing, the tool will ask if the buffer is full stroke or short stoke by the display shown.



6. If 1 was selected and the car is not at the correct landing, the following display will come up on the tool.



7. Push the [Blue+Enter] buttons on the tool and follow the instruction.

8. If 1 is selected, the display will show:

9. Select 1 and the car will move toward the top floor and then the tool will display.

10. If 1 is selected, the tool will display the buffer striking speed, which should be 85% of contract speed.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Buffer Test Velocity xxxx

11. Push the [GO ON] button on the tool, to display the following screen:

Ena Buffer Test ? 1 = Yes 2 = End

12. Pushing 1 will disable the safety control. The safety function will be disabled for only one run.

13. *You are about to run the car. Performing this test requires operating the elevator in a potentially unsafe and hazardous condition that may result in personal injury or property damage, including death to persons and damage to your elevator. In addition, not restoring the elevator to service properly at the completion of this test could result in a safety hazard. The code for Step 8 is 3877 and the code for Step 17 is 3974.*

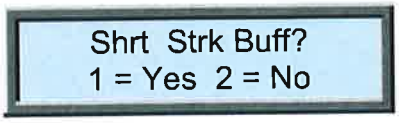
14. Press 1 to initiate the test or press 2 to abort the test and restore the safety controls.

15. Key in the code from Step 15 and press Blue + Enter.

Read Buffer Instr Enter Code> ????

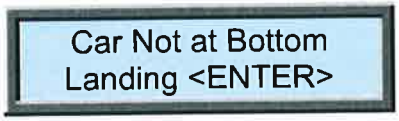
16. When the correct code is entered, the tool will display a final decision selection:

Run Test? 1=Yes 2=No



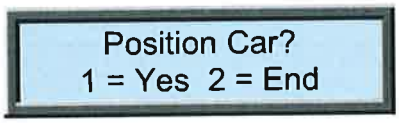
17. Selecting 1 will cause the elevator to run towards the bottom landing at 85% of contract velocity.

18. The following sequence will occur if the 2 is selected for the counterweight buffer test in Step 6.

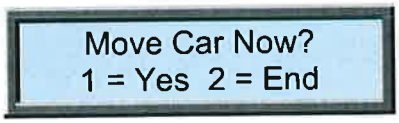


19. The tool will confirm the correct car position for the test selected.

20. If 2 is selected and the car is at the correct landing, the tool will ask what type of buffer.



WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.



21. If 2 is selected and the car is not at the correct landing, the following display will come up on the tool.

22. Push the [GO ON] button on the tool and follow the instruction, until the display below appears on the tool.

23. Select 1 to position the car.

24. The software is designed to prevent the elevator from operating under unsafe conditions, so certain software safety controls must be disabled for each test, they will automatically be restored after each attempt.

25. Follow instructions in Steps 8–14.

26. Selecting 1 will cause the elevator to run towards the top landing at the velocity selected in Step 8.

27. Push Module on the tool to exit the test and restore safety controls.

28. Confirm all the tie downs and jumpers have been removed before putting elevator back onto service.

29. Remove power from the controller. Lock out/Tag out the mainline disconnect.

30. Remove jumpers from the P21-10, P21-1, and P21-2 and then install the wires that were removed earlier.

31. Not removing all jumpers and restoring the elevator to normal service properly at the completion of this test, could result in a safety hazard.

32. Restore OCSS to MCSS communication by going to menu (Module -2-4-7-1).

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

NTSD Dynamic Test Instruction

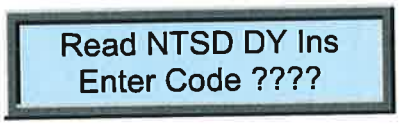
Preparing for Test

This test demonstrates the operation of the Normal Terminal Slowdown Device (NTSD) at the top and/or bottom landings. The normal stopping means is inhibited so that the car is forced to slowdown when it encounters the NTSD device. This test must be done before the NTSD static test.

Take control of the car, making sure there is no one in the elevator.

Running Test

Read and become thoroughly familiar with the test instructions before beginning any test.



Plug the Customer Tool into the service tool maintenance port on the controller.

Disable OCSS to MCSS communication, by going to menu (Module-2-4-7-2) on the tool.

This will give you total control over the elevator.

1. Go to menu (Module-2-2-5-1-1-3) and follow the instruction to get to NTSD dynamic test.
2. Enter code to proceed (see code is in Step 9).

3. The tool will display.

4. Select which test you want to run, by entering 1 or 2.
5. The tool will confirm the correct car position for the test selected.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

6. If 1 was selected and the car is at the correct landing, the tool will display "Enable Dynamic Test".

Enable Dyna Test?
1 = Yes 2 = End

7. If 1 was selected and the car is not at the correct landing, the following display will be on the tool.

Car Not at Bottom
Landing <ENTER

8. Push the [Blue+Enter] buttons on the tool, the car will move to the correct landing. When it stop the display below will appear on the tool.

Enable Dynamic Test?
1 = Yes 2 = End

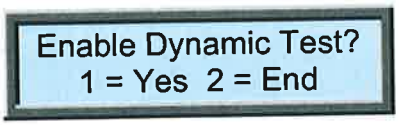
9. Pushing 1 will disable the safety control. The safety function will be disabled for only one run. The next display will request the NTSD dynamic test code.

10. *You are about to run the car. Performing this test requires operating the elevator in a potentially unsafe and hazardous condition that may result in personal injury or property damage, including death to persons and damage to your elevator. In addition, not restoring the elevator to service properly at the completion of this test could result in a safety hazard. The code for Step 5 is 4964 and the code for Step 11 is 5525.*

11. Press 1 to initiate the test or press 2 to abort the test and restore the safety controls.

Read NTSD Dy Inst
Enter Code > ????

12. Enter the correct code from Step 9 and then push [Blue+ Enter}. The tool will display a final decision selection.

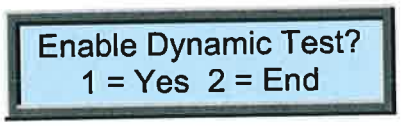


Run Test?
1 = Yes 2 = No

13. Selecting 1 will cause the elevator to run toward the top landing, to perform the test.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

14. The following sequence would occur if 2 were selected in Step 7.



15. If 2 was selected and the car is at the correct landing, the tool will display "Enable Dynamic Test".

16. If 2 was selected and the car is not at the correct landing, the following display will be on the tool.

17. Push the [Blue+Enter] buttons on the tool. The car will run to the correct landing and when it stop, the display below will appear on the tool.

18. Follow instructions from Steps 9–11 to run the test.

19. Push module on the tool to exit the test and restore safety controls.

20. Get ready to do NTSD static test.

21. To restore normal service, go to menu (Module-2-4-7-1) on the tool.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

NTSD Static Test Instruction

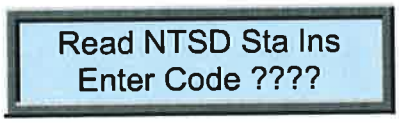
Preparing for Test

This test demonstrates the operation of the Normal Terminal Slowdown Device (NTSD) at the top and/or bottom landings. The normal stopping means is inhibited so that the car is forced to slowdown when it encounters the NTSD device. **The NTSD Dynamic Test must be performed before this test**.

Take control of the car, making sure there is no one in the elevator.

Running Test

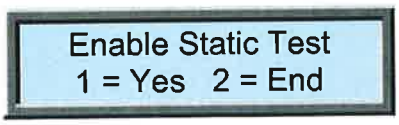
Read and become thoroughly familiar with the test instructions before beginning any test.



Plug the customer tool into the service tool maintenance port on the controller.

Disable OCSS to MCSS communication, by going to menu (Module-2-4-7-2) on the tool.

This will give you total control over the elevator.



1. Go to menu M-2-2-5 -1-1-4. The tool will display the screen below.

2. Enter code found in Step 9, then push the [Blue+Enter] buttons on the tool.

3. Select which test you want to run, by entering 1 or 2.
4. The tool will confirm the correct car position for the test selected.
5. If 1 was selected and the car is at the correct landing, the tool will display.

6. If 1 was selected and the car is not at the correct landing, the following display will be on the tool.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Car Not at Bot Landing<ENTER>

7. Push buttons [Blue+Enter] on the tool, the car will travel to the correct position. When it stop, the tool will display.

Enable Static Test? 1 = Yes 2 = End

8. Pushing 1 will disable the safety control. The safety function will be disabled for only one run. The next display will request the NTSD Static test code.

9. *You are about to run the car. Performing this test requires operating the elevator in a potentially unsafe and hazardous condition that may result in personal injury or property damage, including death to persons and damage to your elevator. In addition, not restoring the elevator to service properly at the completion of this test could result in a safety hazard. The code for Step 5 is 9642 and the code for Step 11 is 7489.*

10. Press 1 to initiate the test or press 2 to abort the test and restore the safety controls. If 1 is pressed, the tool screen will display as shown below.

Read NTSD Static Inst Enter Code >????

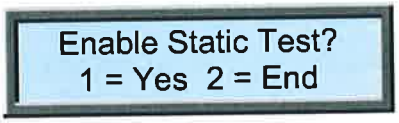
11. Enter the code from Step 9, and then push [Blue+ Enter}. The tool will display a final decision selection.

Run Test? 1 = Yes 2 = No

12. Selecting 1 will cause the elevator to run toward the top landing, to perform the test.

13. The following sequence would occur if 2 was selected in Step 5.

14. If 2 was selected and the car is at the correct landing the tool will display.



Enable Static Test? 1 = Yes 2 = End

15. If 2 was selected and the car is not at the correct landing, the following display will be on the tool.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

16. Push the [Blue+Enter] buttons on the tool, the car will move to the correct landing and then display the screen below when it stops.

17. Follow instructions from Steps 8–11 to run the test.

18. Push Module on the tool to exit the test and restore safety control.

19. To put the car back into normal service go to tool menu (Module-2-4-7-1).

ETSD Test Instruction

Preparing for Test

This test verifies the operation of the Emergency Terminal Stopping Devices (ETSD) at the top and /or bottom landing. During test the normal stopping means and the NTSD slowdown response are BOTH inhibited so that the car is forced to stop when it encounters the ETSD switch. This causes an emergency stop, and immediate application of the brake.

Take control of the car, making sure there is no one in the elevator.

Test the brake's spring tension to ensure it will hold a full load.

Leave the full load on the elevator for the ETSD test.

If the building has counterweight safeties, they must be tied down before performing the test. This is to prevent the counterweight safeties from setting during the test.

If the counterweight test is being performed, then the car safeties must be tied down. This is to prevent the car safeties from setting.

Running Test

Read and become thoroughly familiar with the test instructions before beginning any test.

Insert the tool in the service tool maintenance port on the controller.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Disable OCSS to MCSS communication, by going to menu (Module-2-4-7-2) on the tool.

This will give you total control over the elevator.

1. Go to menu M-2-2-5-1-1-6, the screen will show the display below:

Read ETSD Instr
Enter Code ????

2. Enter code from Step 10 and then push [Blue+Enter].
3. The tool will display the screen below.

ETSD Test Top = 1
ETSD Test Bot = 2

4. Select which test you want to run by entering 1 or 2.
5. The tool will confirm the correct position for the test selected.
6. If 1 was selected and the car is at the correct landing, the tool will display:

Enable ETSD Test
1 = yes 2 = End

7. If 1 was selected and the car is not at the correct landing. The tool display will look as shown below.

Car Not at Bot
Landing <ENTER>

8. Push the [Blue+ Enter] buttons on the tool, the car will move to the correct landing. When the car stops the display below appear on the tool.

Enable ETSD Test
1 = Yes 2 = End

9. Press 1, the tool display will show the screen below.

Read ETSD Inst
Enter Code ????

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

10. Enter code from this step, then push [Blue+Enter].

11. *You are about to run the car. Performing this test requires operating the elevator in a potentially unsafe and hazardous condition that may result in personal injury or property damage, including death to persons and damage to your elevator. In addition, not restoring the elevator to service properly at the completion of this test could result in a safety hazard. The code for Step 5 is 3484; the code for Step 10 is 3698.*

12. When the correct code is entered, the tool will display a final decision selection.

Run Test? 1 = Yes 2 = No

13. Selecting 1 will cause the elevator to run towards the bottom landing at contract velocity. The tool display will show.

Test in Progress MODULE when done

14. If 2 is selected in Step 7, the following occurs.

15. The tool will confirm the correct position for the test selected.

16. If 2 is selected and the car is at the correct landing, the tool will display "enable ETSD Test".

Enable ETSD Test 1 = yes 2 = End

17. If 2 is selected and the car is not at the correct landing. The tool display will look as shown below.

Car not at Top Landing <ENTER>

18. Push the [Blue+Enter] buttons. The car will move to the correct landing, and when it stops, the tool display the screen below.

Enable ETSD Test 1 = Yes 2 = End

19. Follow instructions in Steps 8–11.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

20. Selecting 1 will cause the elevator to run towards the top landing at contract velocity.

21. Push module on the tool to exit the test and restore safety controls.

22. Confirm all the tie downs and jumpers have been removed, before putting the elevator back in service.

23. To restore normal service, go to menu (Module-2-4-7-1).

Traction Test Instruction

Preparing for Test

This test allows you to override software direction limits and land the car (or counterweight) on its respective buffer, while on Inspection, to demonstrate that the hoist ropes will break traction and the drive sheave will spin under the stationary ropes.

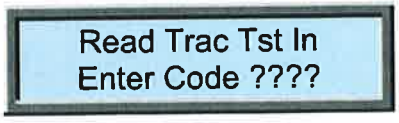
Take control of the car making sure there is no one in the elevator.

Test the brake's spring tension to ensure it will hold full load.

Leave the full load on the elevator for the traction test.

Running Test

Read and become thoroughly familiar with the test instructions before beginning any test.



Insert the tool into service tool maintenance port on the controller.

Disable OCSS to MCSS communication, by going to menu (Module-2-4-7-2) on the tool.

This will give you total control over the elevator.

1. Go to menu M-2-2-5-1-1-5 for Traction test. The tool will display:

2. Enter the code from Step 5 and then push [Blue+Enter].

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

3. The tool will instruct you to put the car on machine room inspection.

Put Car on CRI

4. Put the controller on inspection, then push [GO ON] button on the tool, the screen below will appear.

Enable Traction Test 1 = Yes 2 = No

5. Press 1 and the tool will display the screen below.

Read trac Tst Inst Enter Code ????

5. Enter the code from this Step and then push [Blue+Enter].

You are about to run the car. Performing this test requires operating the elevator in a potentially unsafe and hazardous condition that may result in personal injury or property damage, including death to persons and damage to your elevator. In addition, not restoring the elevator to service properly at the completion of this test could result in a safety hazard. The code for Step 2 is 4596; the code for Step 5 is 2792.

6. When the correct code is entered, the tool will display a final decision selection.

Run Test? 1 = Yes 2 = No

7. If 1 is selected, the tool will display.

Run Car on CRI

8. Run the elevator up to fully compress the counterweight buffer.

9. Attempt to run the elevator up again; the ropes must slip traction.

10. Push Module on the tool to exit the test and restore safety control.

11. Confirm all jumpers have been removed before putting the elevator back in normal service.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

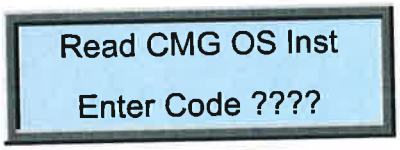
12. To restore normal service go to tool menu (Module -2-4-7-1), and then take the car off machine room inspection.

Cab-Mounted Governor (CMG) Trip Test

Preparing for Test

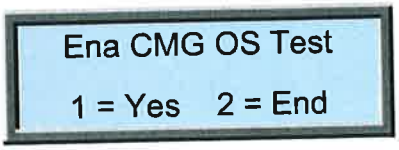
This test allows you to run the car at the governor electrical overspeed, check that when the car reaches the trip speed, immediately performs a timed deceleration, then shuts down.

1. Take control of the car, making sure there is no one on the elevator.
2. Test the brake's spring tension to ensure it will hold full load.



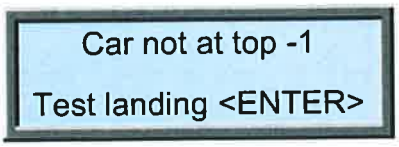
Running Test

1. Please review the flow chart in Figure 1 for a complete sequence map.
2. Plug the tool into the Service Tool Maintenance port on the controller
3. Disable OCSS to MCSS communication by going to menu (Module -2-4-7-2 on the tool

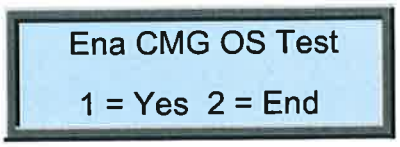


This will give you total control over the elevator.

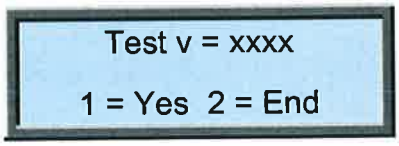
4. Go to menu Module-2-2-5-1-1-B and the tool will display:



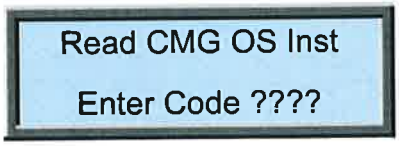
5. Enter code **1737** and then push [Blue+Enter] buttons. The tool screen will display the following screen if the car is at the correct landing:



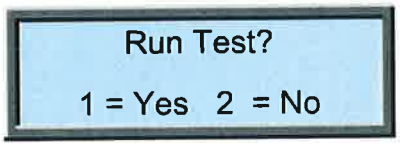
WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.



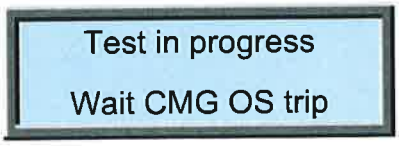
6. If the car was not at the correct landing when the code was entered in Step 5, the tool will display the following.



7. Push the [Blue+Enter] buttons on the tool and follow the instructions to move the car to the correct landing. At the end of the run the tool will display the screen below:

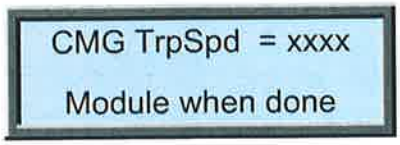


8. Select 1 on the tool, and it will display the speed the car will run to enable the test.



9. Select 1 on the tool and it will display:

10. Enter the code **3465** and the push [Blue+Enter]. The screen below the warning will be displayed.



11. Select 1 and the elevator will run at the test speed, while the tool displays:

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

12. When the elevator trips the overspeed, the tool will display the speed at which it trips.

13. Push the Module button on the tool, the display will show:

14. Go to menu M-2-2-2 and the tool display should confirm that the car is shut down with an overspeed fault.

15. Push the "Manual Reset" button on the input/output board.

16. Push Module, then Enter M-2-2-3-1. This should reset the controller.

17. Push Module on the tool, then enter M-2-4-7-1. This will put the car back in service.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

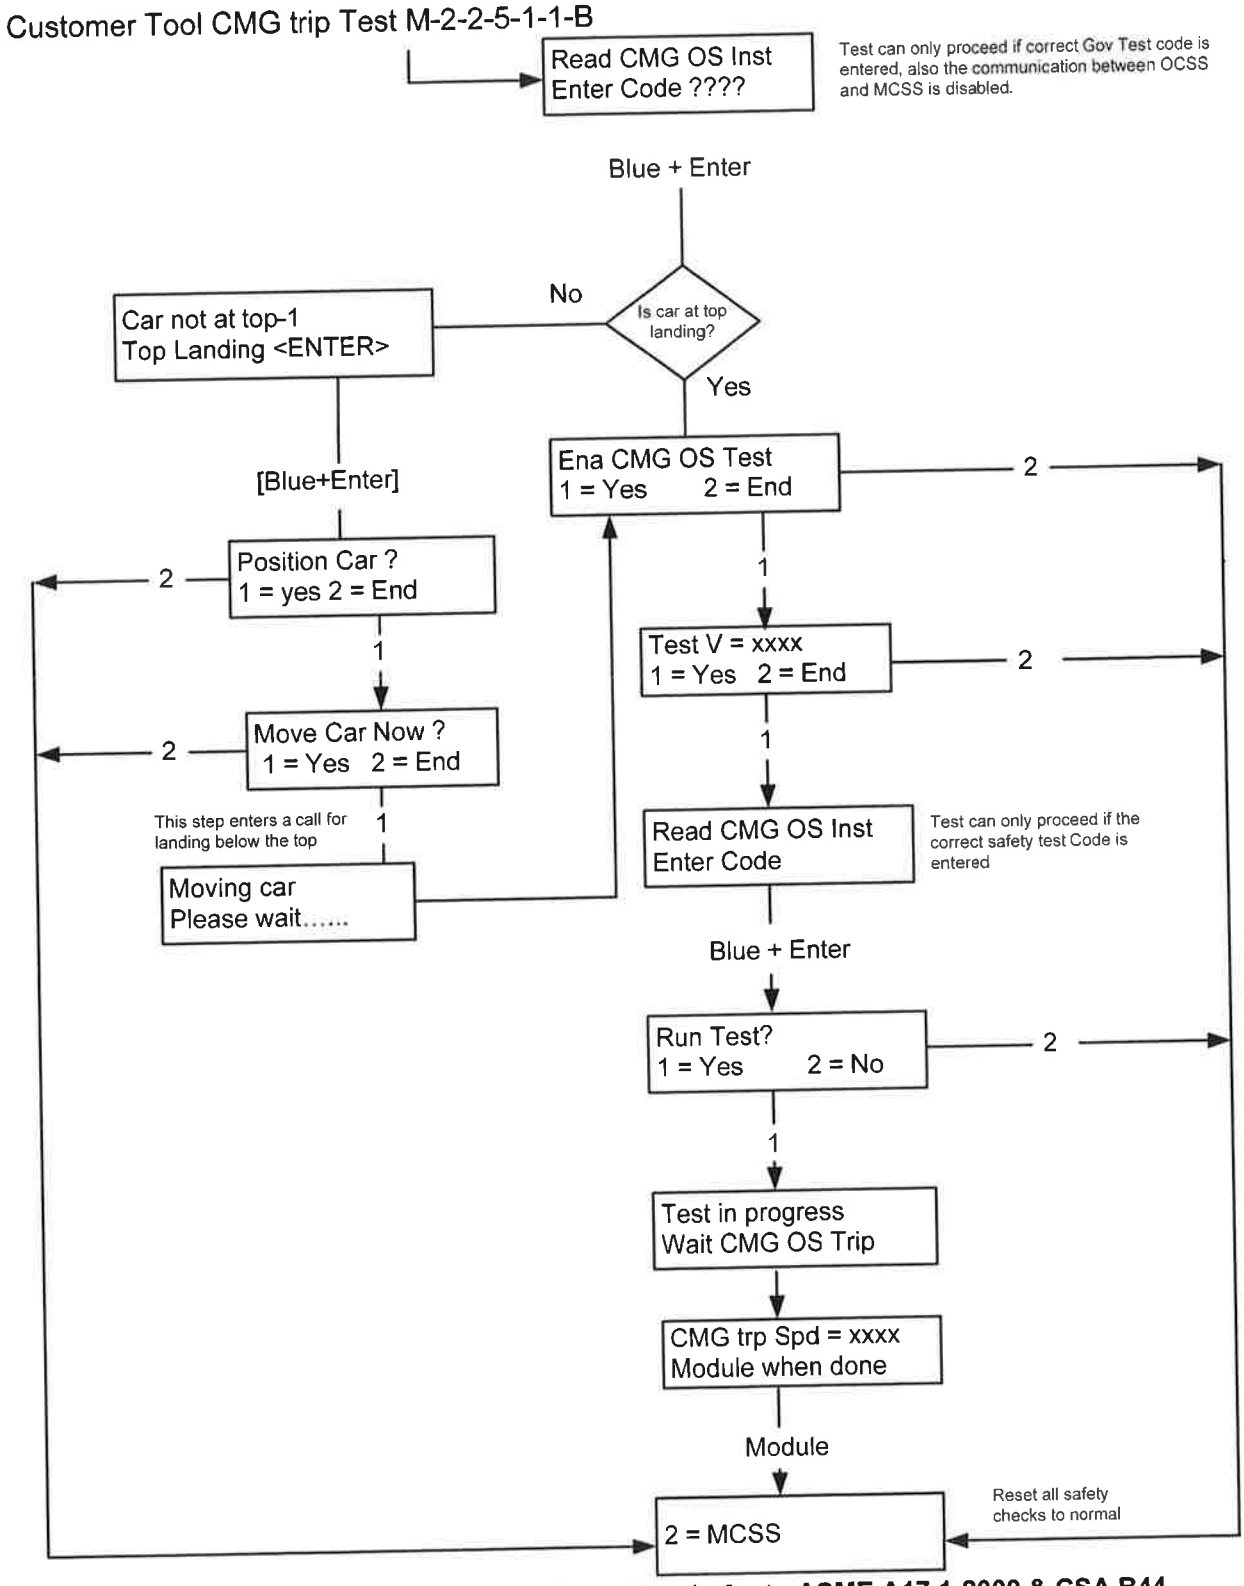


Figure 1: Unintended Car Movement Protection (refer to ASME A17.1-2000 & CSA B44, Section 2.19.2)

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Unintended Car Movement Protection instructions

If the car leaves the door zone with an open door, the emergency brake must be able to stop the car within 48 inches of the door zone. This test verifies that operation.

This test will only work with A__31256___ baseline and later.

Preparing for Test

1. Run the car to the bottom landing with no load in the car.
2. Verify the doors are closed and there is no one in the car.
3. Disable the OCSS-to-MCSS communication by going to the customer tool menu M-2-4-7-2.
4. Verify the doors are closed and there is no one in the car.
5. Remove power from the controller.
6. From the wiring diagram, find the connections for the hoistway door locks (FDS) and gate switch (FGS). Remove the field wires from the controller terminals.
7. Locate and remove PX jumper from the J1 plug in the controller and connect it to the J4 plug (see Figures 2 and 3).

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

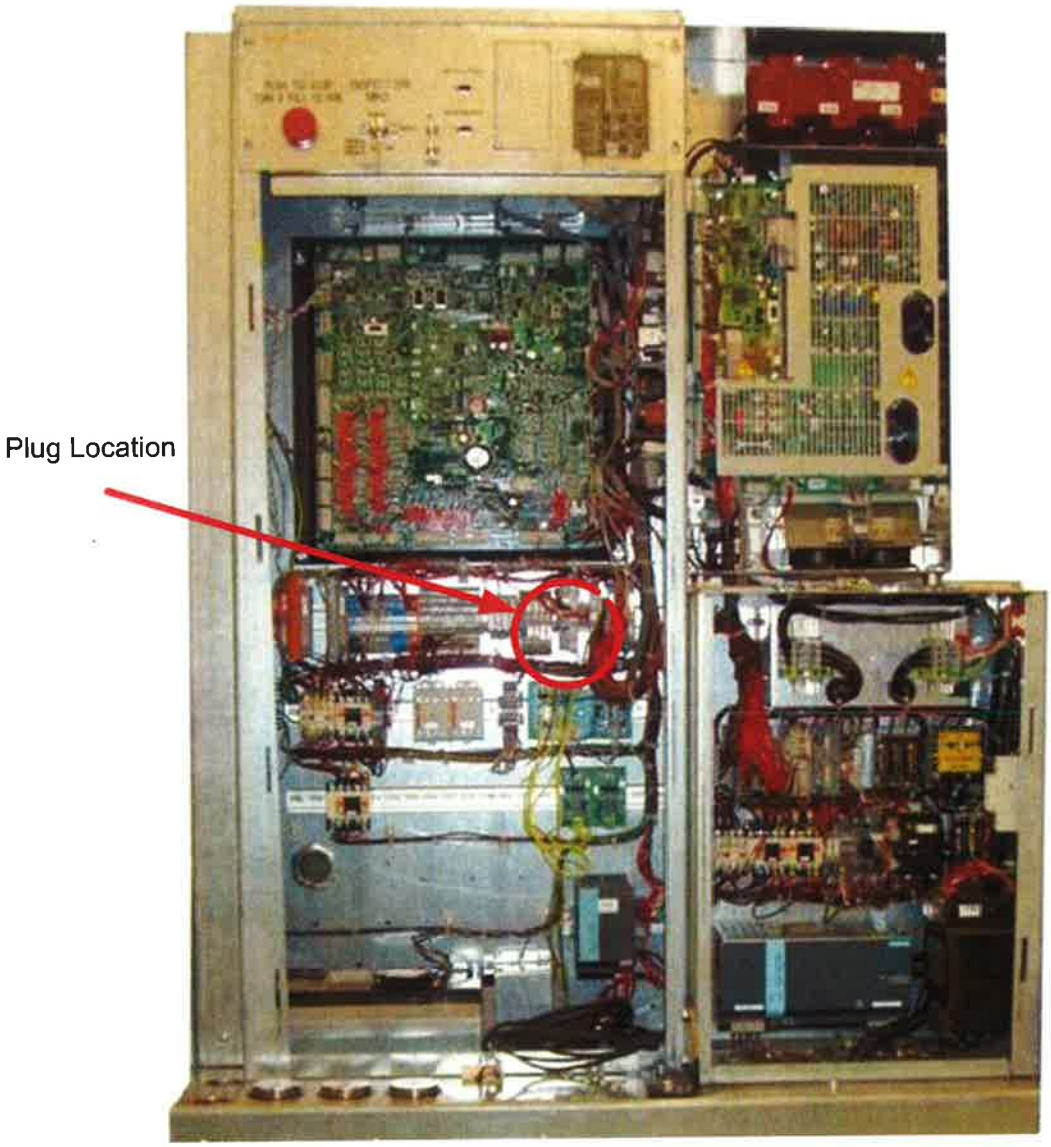

Figure 2: Plug Assembly Location

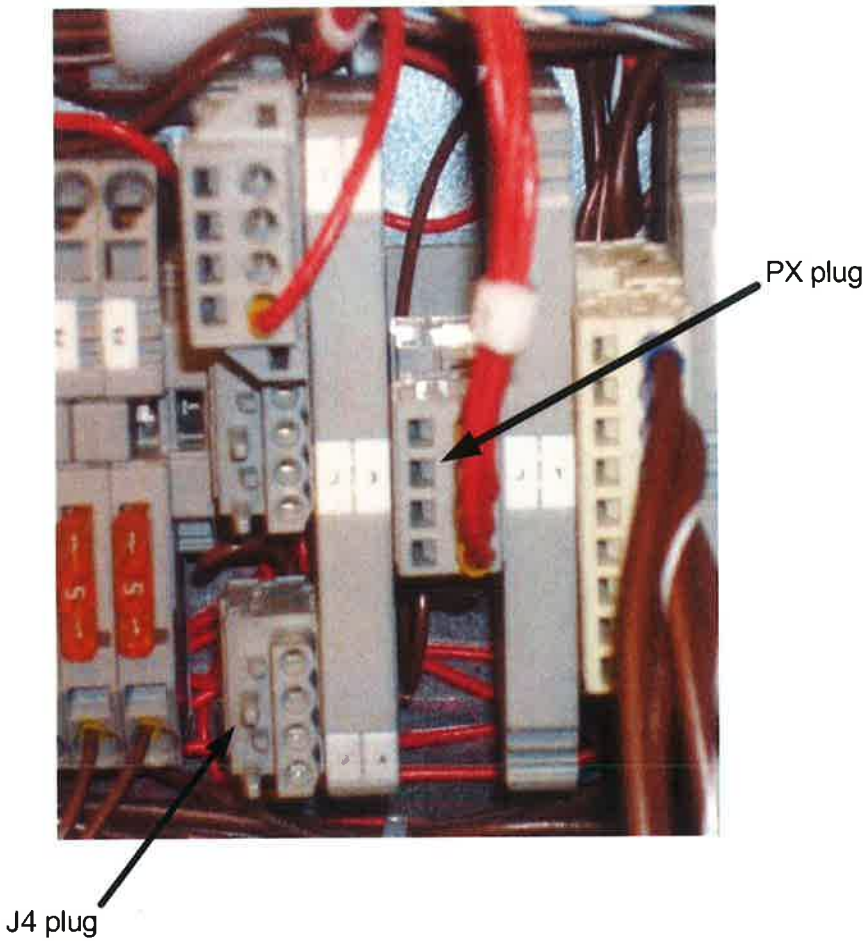
WARNING: The use and ownership of this work is defined in the legend upon the front page hereof



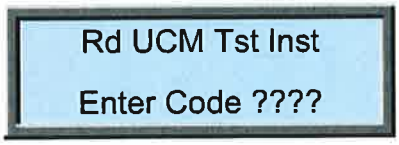


Figure3: Plug Location

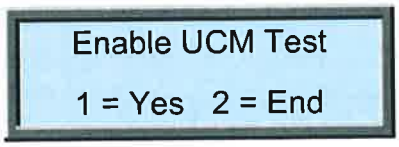
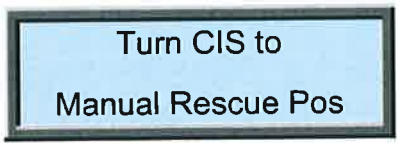
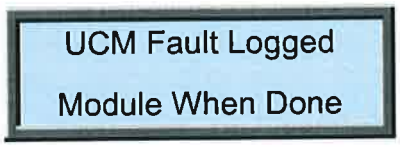
8. Restore power to the controller and confirm that the UCM relay is out.
9. Place the Inspection switch (CIS) to the BAT ON position.
10. Go to menu Module-2-2-5-1-1-C—this should energize the UCM relay.



To get C on the tool enter [Blue+6].



WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.



11.. Enter code **1927** and the tool will display:

12. Select 1 and then rotate the inspection switch clockwise to the "Manual Rescue Position" and hold. The tool will display:

13. The car should start to move and the emergency brake should stop the car within 48 inches of movement. The tool will display:

14. Push Module on the tool to disable the test.

15. Remove power from the controller and reconnect the door lock and gate switch field wire.

16. Move PX plug back to the J1 plug.

17. Turn the Inspection switch counterclockwise to the Inspection position.

18. Restore power to the controller and run it on Inspection.

19. Push the Manual Reset button on the input output board and on the tool go Module -2-2-3-1.

20. Turn the CIS switch to the Normal position.

21. Go to menu M-2-1-2 and go to the GTN command, run the elevator to a landing.

22. On the tool restore communication between OCSS and MCSS by going to Module-2-4-7-1.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

Maintenance:

Coated-Steel Belt Inspection : Visual Inspection

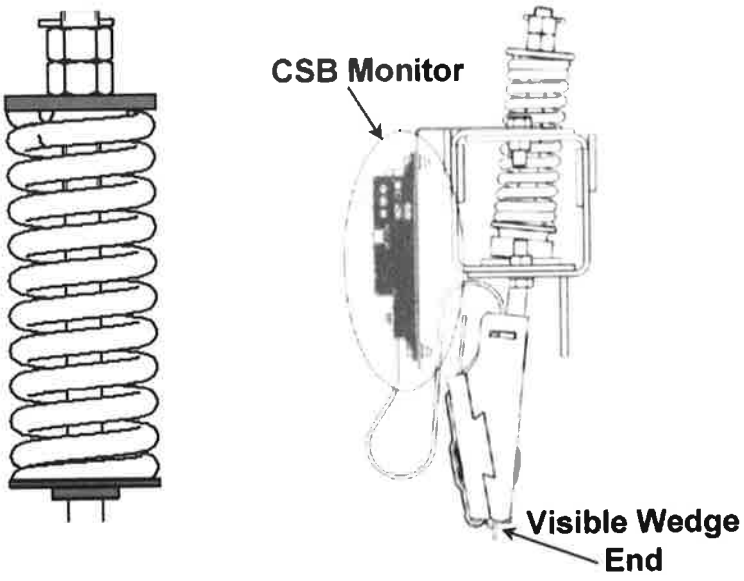
When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

Even though coated-steel belts are designed to last two to three times longer than traditional elevator wire ropes, an annual visual inspection is recommended.

This procedure defines the technique for the visual inspection of coated-steel belts. There are two main criteria for coated-steel belt replacement: evidence of wire strand breakage or evidence of polyurethane degradation that may expose belt cords to wear.

1. Turn Cartop Inspection Switch (CIS) to INSPECT. Using Control Room Inspection (CRI), position car top near floor level at the top landing.

2. Access the top of the elevator. Using top-of-car inspection, run the elevator from the top of hoistway to the bottom of the hoistway.



When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

3. Stop as needed to inspect the coated-steel belts using the following images for comparison and recommended action.

4. Inspect coated-steel belt installation, terminations, springs, nuts, cotter pins, wedges and rod condition.

   - Springs, no cracks
   - Wedges, tip visible just below termination basket
   - Nuts, two installed on each rod
   - Cotter pin present and tip bent to secure in place
   - All belts in the set should be installed facing the same direction to the drive sheave (if belt has chevron grooves on bottom) and all belts in the set should be installed running the same direction as the direction arrows printed on the belts

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

5. Egress the car top.

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

6. Return the Cartop Inspection Switch (CIS) to the NORMAL position.

7 Close the hoistway doors

Coated-Steel Belt (CSB) Inspection Using the Pulse™ Continuous Monitoring System

Pulse™ is the Otis commercial solution to CSB inspection. It monitors the condition of the steel cords inside the CSB continuously and signals the car controller with the CSB status. The CSB status is communicated as an alert or an alarm as detected. When in ALARM the elevator will go out of service immediately after allowing passengers to exit. If the system has REM® installed, alerts, alarms, and Pulse system health is reported to local personnel. If the system does not have REM, alerts, alarms, and Pulse system health are reported on the device. The Pulse unit is either located in the overhead of the hoistway mounted to the underside of the machine structure on MRL or located in the machine room mounted to the top-side of the machine bedplate when used in a machine room configuration.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Below is the label applied to the Pulse unit, explaining the faults.

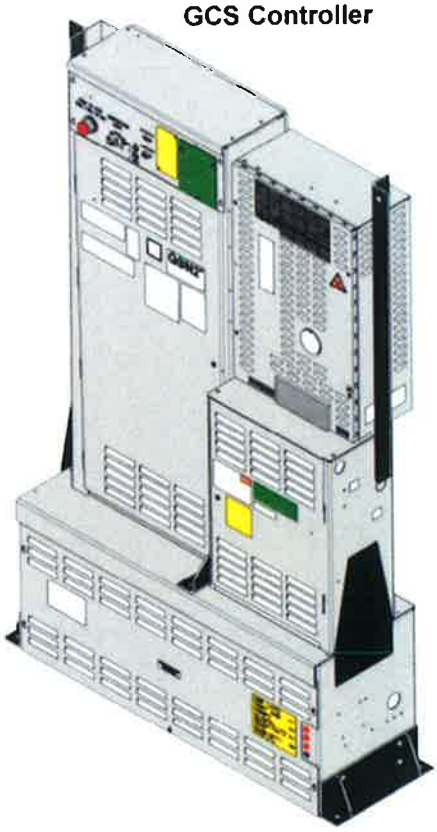
Machine and Emergency Brake Wear Inspection

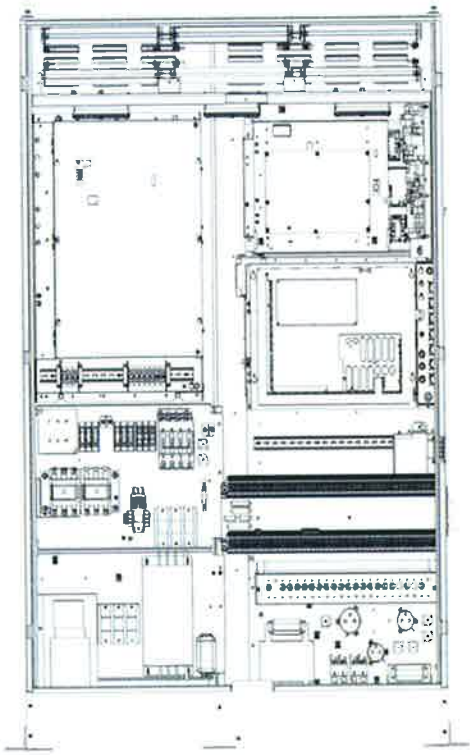
1. Access the brake.
2. With the brake de-energized, measure between the brake armature and magnet housing using a feeler gauge. Measure each of the brake/armature segments.

A new brake will have an air gap of 0.21 mm to 0.5 mm.

3. An air gap of > 0.60 mm or 0.024 inches requires brake replacement.



Gen2 Brake Details



WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

Other Operations

GCS Controller

NGGC Controller

MRO (Manual Rescue Operation)

Only properly trained, authorized and qualified personnel should perform Manual Rescue Operation.

1. Remove power to the elevator, lock out, tag out, test, and verify.
2. Verify that all hoistway and car doors are closed completely.
3. Set CB2 circuit breaker to the OFF position (for NGGC controller only).
4. Ensure the CB1 circuit breaker is in the ON position.
5.
   A. With the NGGC controller; insert the Manual Rescue (Group One Security: UTE) key in the INSP/Manual Rescue Enable Keyswitch on controller under the service panel board.
   B. With the GCS Controller the MRO keyswitch can be found top center of the outside of the controller.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

The MRO key should not be left in the MRO keyswitch or stored in the controller.

6. Turn and hold the MRO keyswitch to the ENABLED position and then depress and hold the BRB1 button located on the service panel board. The elevator should move in short pulses in the direction of system overbalance.

7. Direction and movement of elevator will be displayed on the service panel board LEDs. Car position will be on the service panel board display when car motion stops. The DZ light on the service panel board will illuminate when the car is in the door zone ±3 in. (±76 mm).

8. The elevator should automatically stop at the next door zone if constant pressure is maintained on BRB1 and the MRO keyswitch.

9. Release the BRB1 button and release the MRO keyswitch.

10. (Only during testing) Test and verify that the elevator can move to the next landing, if not already at a terminal landing by turning the MRO keyswitch to the ENABLED position again and then depress the BRB1 button. The elevator should move in short pulses in the direction of imbalance to the next door zone and stop.

11. When testing is complete, remove the MRO key from the MRO keyswitch.

12. On the NGGC controller, return CB2 to the normal position.

13. Return the car to service following proper procedures.

Car Top Access Using Zoned Access*

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

1. Call the elevator to the top landing.

2. Using the inspection keyswitch in the car operating panel place elevator on INSPECTION.

3. Place a barricade in front of the hoistway door.

4. Move the elevator down using the zoned access keyswitch located adjacent to the doorjamb to a height where the car top can be accessed safely.

5. Turn on the cartop work light.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

6. Place the car top stop switch to the STOP position and the cartop inspection switch to the INSPECTION position.

7. Access the car top and assume a safe position.

8. Test and verify the performance of the top of car run station buttons and features.

9. Close hoistway door and move elevator using car top inspection station buttons.

HAD, Pit Inspection Lock and TCI Lock Fault Description and Reset

If Hoistway Access Detection (HAD) determines that the pit or top of car have not been accessed following required procedures, it will not allow the elevator to return to normal service until the fault is reset. Below are the procedures.

Hoistway Access Detection (HAD)

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

The car is on automatic operation and the hoistway door is opened for 4 seconds or more if the car is in flight or stopped between floors, or if a hoistway door is opened when the car is at a landing with the car and hoistway doors closed.

Resetting

The Hoistway Access Detection condition shall be reset under the following conditions:

- Toggling Pit Emergency Stop Switch
- Entering Top of Car Inspection mode

Pit Inspection Lock

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

The hoistway door must be opened and blocked open with a door wedge device before either the pit stop switch or the inspection switch are placed back in normal operation.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

A Pit Inspection Lock condition will occur if the pit is not egressed following the prescribed procedure. If the correct procedure is not followed, the elevator will shut down with a Pit Inspection Lock fault. This is to prevent the car from moving if the pit safety switches have been turned back to Normal, but the hoistway door has not been opened.

Resetting

Toggling PIT EMERGENCY STOP SWITCH with the hoistway doors open (Bottom floor only)

Top of Car Inspection Lock

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

Hoistway door must be opened and blocked open with a door wedge device before either the top of car stop switch or the inspection switch are placed back in the normal run position.

A Top of Car Inspection Lock condition will occur if the top of the car is not exited following the proper procedure. If the correct procedure is not followed, the elevator will shut down with a Top of Car Inspection Lock fault. This is to prevent the car from moving if the top of car safety switches have been turned back to Normal, but the hoistway door has not been opened.

Resetting

A Mode change from something other than Top of Car Inspection to (e.g. NORMAL, Access, and Controller Inspection) and then back to Top of Car Inspection will reset the lock-up. (This is done to prevent a mechanic who may have accidentally turned the inspection switch from inspection to normal from being stuck on top of the car due to a Top of Car Inspection Lock condition.)

Manual Reset of the Governor Overspeed Switch

When it is necessary to access the car top or the pit, individuals should safely access them using a safe, industry-accepted procedure (for example, see NEII/Elevator World's Elevator Industry Field Employees' Safety Handbook*).*

1. Place controller on CRI for Control Room Inspection.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

2. Place temporary jumper on the required terminals (C-074 and C-075) in the elevator controller to bypass governor overspeed switch. Location to place jumper can be found in the controller wiring diagrams. Installing jumpers should only be carried out by trained and qualified elevator personnel.

3. Run car on CRI to a spot in the hoistway where safe car top access is possible.

4. Place service barricades. Open hoistway door.

5. Place top of car emergency stop switch to the STOP position. Place car on car top inspection by turning the Car Top Inspection switch to INSPECTION and turn on car top light.

6. Test and verify the top of car emergency stop switch, access the car top* and test and verify the UP/DOWN commands.

7. Using top of car inspection ride car top up to access governor.

8. Remove top cover from governor.

9. Inspect governor for any visual damage.

10. Manually reset governor overspeed switch (see photos).

OS in the Tripped Position

OS in the Reset or Normal Position

11. Re-install cover on governor.

12. Ride car down to the floor from where the cartop was accessed, open and mechanically block the hoistway door, then egress car top.

13. Turn off car top light, place top of car inspection switch to the NORMAL position and the car top stop switch to the RUN position.

14. Close hoistway door.

15. Place controller circuit breaker (CB1) to the off position.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

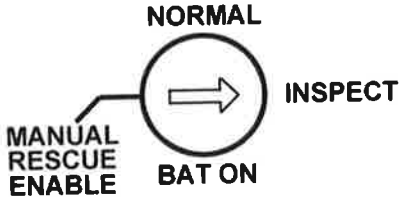
16. Remove temporary jumper C-074 to C-075, installed from in step 2.

17. Place controller circuit breaker (CB1) to the ON position.

18. Run the car using CRI to confirm correct operation. Turn CRI key switch back to NORMAL and ride car to verify performance.

Remote Governor Trip & Reset Confirmation

Due to the location of the governor(s) with the machine-room-less Gen2 system, remote trip and reset features are provided to facilitate testing the governor and resetting the overspeed switch.



The following procedure is provided to confirm operation of the remote governor trip and reset feature.

To protect the governor trip mechanism, the controller software will not enable governor trip operation if the car is running in a direction opposite to that required for governor activation.

Car Governor

1. Position the elevator one floor below the top terminal landing.

2.. Turn the CIS / MRO keyswitch to the INSPECT position.

3. Place a temporary jumper on GCS I/O board terminals P26-4 to P26-5 (OS switch).

4. Select the service tool sequence (M-2-2-5-1) to access the safety function display. Press the GO ON button to select Safety Checks and set as follows to enable car governor trip feature.

   - CAR Gov Trp:enab (Car Governor Trip: Enabled)

This setting will revert to "disabled" after one start.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

5.. Using the controller inspection station, initiate a down inspection run. With the car running down on inspection, press the "GOV TRIP / RESET" button on the GCS I/O board to activate the governor trip solenoid. Confirm that the car stops when the governor trips and the car safeties are applied.

Hold the "GOV TRIP / RESET" button for a period long enough to allow the governor sheave to rotate as least 180 degrees, as it may take that long for the mechanical governor linkages to engage.

6. Release the buttons as soon as the car stops to prevent belt damage.
7. **TURN OFF THE MAINLINE DISCONNECT SWITCH. LOTO - TEST & VERIFY.**
8. Place a temporary jumper on the GCS I/O board P22-8 and P22-7 to bridge the safety-operated switch (SOS).
9. Turn ON the main line disconnect switch.
10. Using the controller inspection station, run the elevator up to release the car safeties and reset the governor mechanism.
11. **TURN OFF THE MAIN LINE DISCONNECT SWITCH. LOTO - TEST & VERIFY.**
12. **Remove the temporary jumper from GCS I/O board plug P26-4 to p26-5 (OS switch).**
13. Turn ON the main line disconnect switch.
14. Select the service tool sequence (M-2-2-5-1) to access the safety function display. Press the GO ON button to select Safety Checks and set as follows to enable Car Governor Reset feature.

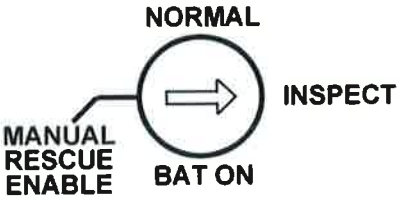
    CAR Gov Rst:enab (Car Governor Reset: Enabled)

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof

15..Press the "GOV TRIP / RESET" button on the GCS I/O board to activate the governor reset solenoid. It may be necessary to repeat the procedure several times to reset the car governor switch. Press the "MANUAL RESET" button on the GCS I/O board, cycle the main line disconnect switch and then confirm that the safety circuit is restored indicating that the governor overspeed switch and reset confirmation switch is reset.

16. **TURN OFF THE MAIN LINE DISCONNECT SWITCH. LOTO - TEST & VERIFY.**

17. **Remove the temporary jumper from GCS I/O board plug P22-8 to P22-7 (SOS switch).**



18. Turn ON the main line disconnect switch.

19. Run the car and ensure that the safeties have reset and are not dragging.

Counterweight Governor (if applicable)

1. Position the elevator one floor above the bottom terminal landing.

2.. Turn the CIS / MRO keyswitch to the INSPECT position.

3. Place a temporary jumper on GCS I/O board plug P27-4 to P27-5 (CWOS).

4. Select the service tool sequence (M-2-2-5-1) to access the safety function display. Press the GO ON button to select Safety Checks and set as follows to enable CWT governor trip feature.

   CWT Gov Trp:enab (Counterweight Governor Trip: Enabled)

This setting will revert to "disabled" after one start.

WARNING: The use and ownership of this work is defined in the legend upon the front page hereof.

5. Using the controller inspection station, initiate an up inspection run. With the car running up on inspection, press the "GOV TRIP / RESET" button on the GCS I/O board to activate the governor trip solenoid. Confirm that the counterweight stops when the governor trips and the counterweight safeties are applied.

Hold the "GOV TRIP / RESET" button for a period long enough to allow the governor sheave to rotate as least 180 degrees, as it may take that long for the mechanical linkages to engage.

6. Release the buttons as soon as the car stops to prevent belt damage.

7. Using the controller inspection station, run the elevator down to release the counterweight safeties and reset the governor mechanism.

8. **Remove the temporary jumper on GCS I/O board plug P27-4 to P27-5 (CWOS switch).**

9. Select the service tool sequence (M-2-2-5-1) to access the safety function display. Press the GO ON button to select safety checks and set as follows to enable CWT governor reset feature.

   CWT Gov Rst:enab (Counterweight Governor Reset: Enabled)

10. Press the "GOV TRIP / RESET" button on the GCS I/O board to activate the governor reset solenoid. It may be necessary to repeat the procedure several times to reset the counterweight governor switch. Press the "MANUAL RESET" button on the GCS I/O board, cycle the main line disconnect switch and then confirm that the safety circuit is restored indicating that the governor overspeed switch and reset confirmation switch is reset.

11. Run the car to ensure the safeties have reset and are not dragging

RE: PROJECT NAME: WEBSTER UNIVERSITY
FIRE PROTECTION SYSTEM WARRANTY
AFP PROJECT No.: 461259

Dear Mr. Mayhew:

Please be hereby advised that our above referenced Automatic Fire Protection System was placed in service on September 1, 2017.

Beginning with the above installation date, the system's materials and workmanship will be under warranty for one (1) year. However, we do not guarantee the operation of the installation due to factors beyond our control, i.e. potentially closed valves or depleted municipal water supply.

Thank you for this opportunity to be of service.

Very truly yours,

AHERN FIRE PROTECTION
A division of J. F. Ahern Co.

Casey Jackson

AHERN FIRE PROTECTION - ST. LOUIS

Contractor's Material and Test Certificate for ABOVE GROUND PIPING

PROCEDURE

Upon completion of work, inspection and tests shall be made by the contractor's representative and witnessed by an owner's representative. All defects shall be corrected and system left in service before contractor's personnel finally leave the job.

A certificate shall be filled out and signed by both representatives. Copies shall be prepared for approving authorities, owners, and contractor. It is understood the owner's representative's signature in no way prejudices any claim against contractor for faulty material, poor workmanship, or failure to comply with approving authority's requirements or local ordinances.

TEST DESCRIPTION

HYDROSTATIC: Hydrostatic tests shall be made at not less than 200 psi (13.6 bars) for two hours or 50 psi (3.4 bars) above static pressure in excess of 150 psi (10.2 bars) for two hours. Differential dry-pipe valve clappers shall be left open during test to prevent damage. All aboveground piping leakage shall be stopped.

PNEUMATIC: Establish 40 psi (2.7 bars) air pressure and measure drop, which shall not exceed 1-1/2 psi (0.1 bars) in 24 hours. Test pressure tanks normal water level and air pressure and measure air pressure drop, which shall not exceed 1-1/2 psi (0.1 bars) in 24 hours.

Missouri state regulation 10 CSR 60-11.010(6)(E) requires testers to report results of tests and inspections to the customer and the water supplier.

Figure 10-1(b) Contractor's material and test certificate for underground piping.

Contractor's Material and Test Certificate for Underground Piping

PROCEDURE

Upon completion of work, inspection and tests shall be made by the contractor's representative and witnessed by an owner's representative. All defects shall be corrected and system left in service before contractor's personnel finally leave the job.

A certificate shall be filled out and signed by both representatives. Copies shall be prepared for approving authorities, owners, and contractor. It is understood the owner's representative's signature in no way prejudices any claim against contractor for faulty material, poor workmanship, or failure to comply with approving authority's requirements or local ordinances.

Test description	Flushing: Flow the required rate until water is clear as indicated by no collection of foreign material in burlap bags at outlets such as hydrants and blow-offs. Flush at flows not less than 390 gpm (1476 L/min) for 4-in. pipe, 880 gpm (3331 L/min) for 6-in. pipe, 1560 gpm (5905 L/min) for 8-in. pipe, 2440 gpm (9235 L/min) for 10-in. pipe, and 3520 gpm (13,323 L/min) for 12-in. pipe. When supply cannot produce stipulated flow rates, obtain maximum available. Hydrostatic: Hydrostatic tests shall be made at not less than 200 psi (13.8 bar) for 2 hours or 50 psi (3.4 bar) above static pressure in excess of 150 psi (10.3 bar) for 2 hours. Leakage: New pipe laid with rubber gasketed joints shall, if the workmanship is satisfactory, have little or no leakage at the joints. The amount of leakage at the joints shall not exceed 2 quarts per hour (1.89 L/hr) per 100 joints irrespective of pipe diameter. The leakage shall be distributed over all joints. If such leakage occurs at a few joints, the installation shall be considered unsatisfactory and necessary repairs made. The amount of allowable leakage specified above can be increased by 1 fluid ounce per inch valve diameter per hr. (30 mL/25 mm/hr) for each metal seated valve isolating the test section. If dry barrel hydrants are tested with the main valve open so the hydrants are under pressure, an additional 5 ounces per minute (150 mL/min) leakage is permitted for each hydrant.	
Flushing tests	New underground piping flushed according to AWWA standard by (company) HAUSER CONST. INC — If no, explain: FLOW EXCEEDED 3 FT/SEC	☒ Yes ☐ No
	How flushing flow was obtained: ☒ Public water ☐ Tank or reservoir ☐ Fire pump — Through what type opening: ☐ Hydrant butt ☒ Open pipe	
	Lead-ins flushed according to _____ standard by (company) — If no, explain	☐ Yes ☐ No
	How flushing flow was obtained: ☐ Public water ☐ Tank or reservoir ☐ Fire pump — Through what type opening: ☐ Y connection to flange and spigot ☐ Open pipe	

Figure 10-1(b) *(Continued)*

Hydrostatic test	All new underground piping hydrostatically tested at 140 psi for 2 hours PSI TESTED MAY 2, 2017		Joints covered ☒ Yes ☐ No
Leakage test	Total amount of leakage measured — gallons — hours		
	Allowable leakage — gallons — hours		
Hydrants	Number installed 0	Type and make —	All operate satisfactorily ☐ Yes ☐ No
Control valves	Water control valves left wide open ☐ Yes ☒ No If no, state reason NEW CONSTRUCTION. INSIDE NOT COMPLETE WET TAP VALVE CLOSED Hose threads of fire department connections and hydrants interchangeable with those of fire department answering alarm ☐ Yes ☐ No

Additional explanation and notes * MIKE HARVEY, CITY OF WG. WITNESS PRESSURE TEST OF UNDERGROUND SYSTEM * Tom Yates Fire Marshal - Witness Flush of Domestic/Sprinkler Supply			

10-2 Acceptance Requirements.

10-2.1* **Flushing of Piping.** Fire service mains (from the water supply to the system riser) and lead-in connections to system risers shall be completely flushed before connection is made to sprinkler piping. The flushing operation shall be continued for a sufficient time to ensure thorough cleaning. The minimum rate of flow shall be not less than one of the following:

(1) The hydraulically calculated water demand rate of the system including any hose requirements

(2) That flow necessary to provide a velocity of 10 ft/sec (3.1 m/sec) *[see Table 10-2.1(2)]*

(3) The maximum flow rate available to the system under fire conditions

10-2.2 Hydrostatic Tests.

10-2.2.1* All piping and attached appurtenances subjected to system working pressure shall be hydrostatically tested at 200 psi (13.8 bar) and shall maintain that pressure without loss for 2 hours. Loss shall be determined by a drop in gauge pressure or visual leakage. The test pressure shall be read from a gauge located at the low elevation point of the system or portion being tested.

Exception No. 1: Portions of systems normally subjected to system working pressure of 150 psi (10.3 bar) or less shall be permitted to be tested at that pressure for 2 hours.

Exception No. 2: Where cold weather will not permit testing with water, an interim air test shall be permitted to be conducted as described in 10-2.3.

Exception No. 3: Modifications affecting 20 or fewer sprinklers shall not require testing in excess of system working pressure.

Exception No. 4: Where addition or modification is made to an existing system affecting more than 20 sprinklers, the new portion shall be isolated and tested at not less than 200 psi (13.8 bar) for 2 hours.

Exception No. 5: Modifications that cannot be isolated, such as relocated drops, shall not require testing in excess of system working pressure.

Exception No. 6: In buried pipe, leakage shall be permitted as follows:

(a) The amount of leakage at the joints shall not exceed 2 qt/hr (1.89 L/hr) per 100 gaskets or joints, irrespective of pipe diameter.*

(b) The amount of allowable leakage specified in item (a) of this exception shall be permitted to be increased by 1 fluid ounce (30 ml) per inch valve diameter per hour for each metal seated valve isolating the test section.*

(c) If dry barrel hydrants are tested with the main valve open so the hydrants are under pressure, an additional 5 oz/min (150 ml/min) of leakage shall be permitted for each hydrant.

(d) The amount of leakage in buried pipe shall be measured at

Pipe

SHEET 100

Pipe—NFPA 13, UL/FM as noted

Schedule 10 Steel Pipe

SHEET 101

Pipe—NFPA-13, UL/FM

Schedule 40 Steel Pipe

Valves

SHEET 208

Gate valve—*(2 1/2" thru 12")* 250-lb. wwp iron body gate valve—meets AWWA C-509 standard, flanged—UL/FM

Nibco Fig F-607-RW

SHEET 211

Grooved-end butterfly valve with built-in tamper switch *(2" thru 12")* ductile iron—UL/FM as noted—two (2) factory mounted internal supervisory switches

Victaulic 705 Firelock® Butterfly Valve

SHEET 213

Grooved swing check valve *(2-1/2", 3", 4", 6", and 8")* 175 psi—UL/FM as noted, rubber faced check valve approved for use in fire service systems. Valve may be installed vertically or horizontally.

Viking Model D-1/G-1

SHEET 215

Bronze OS & Y gate valve, threaded ends *(1" - 2")*, 175 psi—UL/FM

Nibco T-104-O

SHEET 216

Bronze angle valve, 175-lb. wwp, *(1-1/4" - 2")*, threaded ends, renewable disc

Nibco T-301-W

Valves (Cont.)

SHEET 217

Bronze globe valve, 175-lb. wwp, *(1/2" - 1")*, threaded ends, renewable disc

Nibco KT-65UL

SHEET 219

Bronze globe valve—175-lb. wwp, *(1-1/4"- 2")*, threaded ends—UL as noted

Nibco KT-211-W-UL

SHEET 220

Bronze side outlet globe valve *(1/4")*, 3-way, 400-lb. wwp, threaded ends

Nibco KT-291-W3

SHEET 222

Soft-seat Swing Check Valve, threaded top, 200-lb. wwp

Nibco Bronze Check Valve Model KT-403-W

SHEET 223

Bronze ball valve *(domestic use only)*, 300-lb. wwp, *(1/4" - 3")*, threaded ends—UL/FM as noted

Nibco KT-580/585-70-UL

SHEET 224

Bronze ball valve—provides slow opening & closing properties in a quarter turn valve with built-in tamper switch—two (2) sets of contacts—UL/FM (threaded ends Victaulic 1"- 2"); (grooved ends Victaulic 1-1/4"- 2" and Milwaukee 2-1/2")

Victaulic Series 728 FireLock® / Milwaukee BB-SC Series Ball Valves

SHEET 225

Pressure relief valve—1/2" & 3/4" inlet, all bronze construction & stainless steel spring, calibrated—adjustable range 50-175 psi

Watts 530C

Valves (Cont.)

SHEET 226

Inspector's test/pressure relief valve for gridded systems

AGF Model 1011A

SHEET 228A

Double check valve assembly *(2-1/2" thru 10")* flanged, flanged by grooved, or grooved by grooved, 175 psi—UL/FM as noted—backflow prevention to prevent potable water contamination caused by cross connection

Zurn® Wilkins Model 350A-OSY (FxF), 350A-OSYFG (FxG), & 350ABGVIC (GxG)

SHEET 240

Two-piece, full port, chrome plated, threaded ends forged brass ball valve *(1/2 thru 2-1/2")* PTFE seats—UL/FM as noted

Threaded Ball Valve KITZ Code #58 (AKSZA)

Hangers

SHEET 300

Standard duty loop hanger for suspension of non-insulated stationary pipe lines—UL/FM as noted

Pentair Standard Duty Loop Hanger 115

SHEET 301

Steel Beam clamp (1/2") with set screw—structural attachment to top or bottom of metal beams or bar joists—UL Listed/FM Approved as noted

Pentair/Caddy® Universal Beam Clamp 300

SHEET 301A

Beam clamp *(3/8")* cold rolled steel with a plated hardened cup point set screw and lock nut—structural attachment to top or bottom of metal beams or bar joists—UL/FM as noted

Globe's Silver Hawk Series 100 Universal Beam Clamp

Hangers (Cont.)

SHEET 302

Carbon steel screw anchor with an internally threaded hex washer head (1/4" X 1-5/8" | 3/8")—ICC-ES Listed and FM Approved as noted

Hilti KWIK HUS-EZ Screw Anchor

SHEET 303

Riser clamp for use with steel pipe—UL Listed & FM Approved for 3/4" thru 8" sizes. Complies with Federal Specification A-A-1192A (Type 8) and Manufacturers' Standardization Society ANSI/SP-69 and SP-58 (Type 8)

PHD Manufacturing, Inc. Riser Clamp Fig. 551

SHEET 308

Retains the beam clamp in its attached position to the structural member for use in preventing hanger failure—UL Listed as noted

Afcon #162 Universal Restraining Strap

SHEET 309

Pipe Clamp for use on smaller pipe sizes allowing the restraining clamps to be attached to the pipe—UL/FM as noted

B-Line, by Eaton, Pipe Clamp for Sway Bracing Fig. B3140 (Tolco Fig. 4)

SHEET 310

Sleeve expansion anchors—UL/FM as noted

Powers® Lok-Bolt™ Sleeve Expansion Anchors

SHEET 312

12-gauge steel channel for use with trapeze hangers

Gregory Strut Products Model G132OS, G582OS, G582A, G712OS, & G712A

SHEET 315

Surge restrainer used to restrict the upward movement of smaller branch line piping *(1/2" - 2")* during sprinkler operation—UL Listed

Pentair Hanger Surge Restraint SR6

Hangers (Cont.)

SHEET 322

Direct vertical attachment in Metal Deck and Purlin for 1/4" and 3/8" rod—UL/FM as noted

Sammy Xpress™ Model XP 20 & XP 35

SHEET 325

Steel Bar Joist Attachment (#CSBBARJEG) and Universal Structural Attachment (#CSBUNIV05EG/CSBUNIV075EG)

Pentair Structural Attachments

SHEET 326

Easy (1" thru 6") and Standard (8" and 10") Universal Sway Brace

Pentair Longitudinal Sway Brace

SHEET 327

Quick Grip Lateral Sway Brace (Jr. 1" thru 2") and (2-1/2" thru 8")

Pentair Lateral Sway Brace

Sprinklers

SHEET 423

Quick response dry pendent sprinkler head, 5.6 K-Factor—UL/FM as noted

Viking QR Dry Pendent Sprinkler VK176

SHEET 427

Quick response upright sprinkler head—small thermosensitive glass bulb spray sprinkler, 5.6 K-Factor, UL/FM as noted

Viking Microfast® QR Upright Sprinkler VK300

SHEET 428

Quick response pendent sprinkler head—small thermosensitive glass bulb spray sprinkler, 5.6 K-Factor—UL/FM as noted

Viking Microfast® Pendent Sprinkler VK302

Sprinkler (Cont.)

SHEET 429

Quick response, horizontal sidewall sprinkler head, 5.6 K-Factor—UL/FM as noted

Viking Microfast® Horizontal Sidewall VK305

SHEET 430

Quick response upright sprinkler head—small thermosensitive glass bulb spray sprinkler, 8.0 K-Factor—UL/FM as noted

Viking Microfast® QR Upright Sprinkler VK350

SHEET 431

Quick response pendent sprinkler head—small thermosensitive glass bulb spray sprinkler, 8.0 K-Factor—UL/FM as noted

Viking Microfast® Pendent Sprinkler VK352

SHEET 432

Standard and quick response concealed pendent sprinkler heads, standard orifice, 5.6 K-Factor—UL/FM as noted

Viking Mirage® Concealed Pendent Sprinkler VK462

SHEET 449

Spare sprinkler cabinet for ESFR and other large frame heads (6) (ESFR, Large Drop, ELO)—red enamel steel with close fitting hinge

Fire Protection Products

SHEET 451

Spare head cabinet & appropriate sprinkler wrench (12)—red enamel steel all welded joints and close fitting hinge

Tyco Spare Head Cabinet

SHEET 452

Slip-on Style Model E-1 Recessed Escutcheon and Model F-1 Adjustable Escutcheon—UL/FM as noted (Expansion Plate optional)

Viking Model E-1 and F-1 Escutcheons

SCHEDULE 10 STEEL PIPE

The Schedule 10 ferrous steel piping, black or galvanized, used on this project shall meet or exceed one of the following NFPA 13 (2007 Edition) standards found in Section 6.3, Aboveground Pipe and Tube:

1. ASTM A795 -- Specification for Black and Hot-Dipped Zinc-Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use.

2. ANSI/ASTM A53 -- Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

3. ASTM A135 -- Specification for Electric Resistance -- Welded Steel Pipe.

The following is a list of ferrous piping Manufacturers that Ahern Fire Protection may use on this project. This list also indicates the ASTM conformance standard(s) as well as the current UL Listing (VIZY-2005) and/or FM Approval (STEEL PIPE-2006) for each brand of pipe.

Allied Tube and Conduit Corp.
- UL Listed Sizes 1-1/4" through 8"
- FM Approved Sizes 1-1/4" through 8"
- ASTM A135 & ASTM A123

Bull Moose Tube Co.
- UL Listed Sizes 1" through 4"
- FM Approved Sizes 3/4" through 4"
- ASTM A135, ASTM A795, & ASTM A53

Wheatland Tube Co.
- UL Listed Sizes 1-1/4" through 4" *(black only)*
- FM Approved Sizes 1-1/4" through 8" *(black only)*
- ASTM A135 & ASTM A795

Youngstown Tube Company
- UL Listed Sizes 1-1/4" through 8"
- FM Approved Sizes 1-1/4" through 6" *(black only)*
- ASTM A795 Type E, Grade A, NH standards

Nominal	Minimum I.D.
1	1.097
1.25	1.442
1.5	1.682
2	2.157
2.5	2.635
3	3.26
4	4.26
5	5.295
6	6.357
8	8.249

If necessary, the Manufacturer's Technical Data Sheets for each of these products can be obtained from Ahern Fire Protection. Please contact the Ahern Fire Protection District office indicated on the cover of this submittal package.

SCHEDULE 40 STEEL PIPE

The Schedule 40 ferrous steel piping, black or galvanized, used on this project shall meet or exceed one of the following NFPA 13 (2007 Edition) standards found in Section 6.3, Aboveground Pipe and Tube:

1. ASTM A795 -- Specification for Black and Hot-Dipped Zinc Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use.
2. ANSI/ASTM A53 -- Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
3. ASTM A135 -- Specification for Electric Resistance -- Welded Steel Pipe.

The following is a list of ferrous piping Manufacturers that Ahern Fire Protection may use on this project. This list also indicates the ASTM conformance standard(s) as well as the current UL Listing (VIZY-2005) and/or FM Approval (STEEL PIPE-2006) for each brand of pipe.

Allied Tube and Conduit Corp.
- UL Listed Sizes 1" through 2-1/2"
- FM Approved Sizes 1" through 2-1/2"
- ASTM A135 & ASTM A123

Bull Moose Tube Co.
- UL Listed Sizes 1" through 4"
- FM Approved Sizes 1" through 4"
- ASTM A135 & ASTM A795

Wheatland Tube Co.
- UL Listed Sizes 1" through 2"
- FM Approved Sizes 1" through 2"
- ASTM A135, ASTM A795, & ASTM A53F 1" through 6"

Youngstown Tube Company
- Black UL Listed / FM Approved Sizes 1" through 2"
- Galvanized UL Listed only – 1" through 2"
- ASTM A135/A795 Type E, Grade A, NH standards

FireLock® Butterfly Valve
Style 705 with Weatherproof Actuator

10.81

Approvals/Listings:

c UL us LISTED | FM | VdS # G410001 | LPCB 104j/04 | CE TP

See Victaulic Publication 10.01 for more details.

Product Description:

The Series 705 Butterfly Valve features a weatherproof actuator housing Approved for indoor or outdoor use, a ductile iron body and disc with EPDM seats. Designed for fire protection services only. Victaulic FireLock Series 705 Butterfly Valve is cULus Listed, LPCB Listed, FM and VdS Approved for 300 psi/2068 kPa service. Contact Victaulic for details of agency approvals.

Material Specifications:

Body: Ductile iron conforming to ASTM A-536, grade 65-45-12

End Face, 2 – 6"/50 – 150 mm: Ductile iron conforming to ASTM A-536, grade 65-45-12

Seal Retainer, 8 – 12"/200 – 300 mm: Ductile iron conforming to ASTM A-536, grade 65-45-12

Coating: Black alkyd enamel

Disc: Ductile iron conforming to ASTM A-536, grade 65-45-12, with electroless nickel coating conforming to ASTM B-733

Seat:

☐ Grade “E” EPDM

Stems: 416 stainless steel conforming to ASTM A-582

Stem Seal Cartridge: C36000 brass

Bearings: Stainless Steel with TFE lining

Stem Seals: EPDM

Stem Retaining Ring: Carbon steel

Actuator:

☐ 2 – 8"/50 – 200mm: Brass or bronze traveling nut on a steel lead screw, in a ductile iron housing

☐ 10 – 12"/250 – 300mm: Steel worm and cast iron quadrant gear, in a cast iron housing

Performance:

C_V values for flow of water at +60°F/+16°C through a fully open valve are shown in the table below. For additional details, contact Victaulic.

Formulas for C_V values

$\Delta P = Q^2/C_V^2$

$Q = C_V \times \sqrt{\Delta P}$

Where:

Flow Coefficient	C_V
Q (Flow)	GPM
ΔP (Pressure Drop)	psi

Formulas for K_V values

$\Delta P = Q^2/K_V^2$

$Q = K_V \times \sqrt{\Delta P}$

Where:

Flow Factor	K_V
Q (Flow)	m^3/hr
ΔP (Pressure)	bar

Valve Size		Full Open

Switch and Wiring:

1. The supervisory switch contains two single pole, double throw, pre-wired switches.
2. Switches are rated:

   10 amps @ 125 or 250 VAC/60 Hz

   0.50 amps @ 125 VDC

   0.25 amps @ 250 VDC
3. Switches supervise the valve in the “OPEN” position.
5. One switch has two #18 insulated wires per terminal, which permit complete supervision of leads (refer to diagrams and notes below). The second switch has one #18 insulated wire per terminal. This double circuit provides flexibility to operate two electrical devices at separate locations, such as an indicating light and an audible alarm, in the area that the valve is installed.
6. A #14 insulated ground lead (green) is provided.

   Switch #1 = S1

   For connection to the supervisory circuit of a UL Listed alarm control panel

   Switch #2 = S2

   Auxiliary switch that may be connected to auxiliary devices, per the authority having jurisdiction

S1
- Normally Closed: (2) Blue
- Common: (2) Yellow

S2
- Normally Closed: Blue with Orange Stripe
- Normally Open: Brown with Orange Stripe
- Common: Yellow with Orange Stripe

Switch 1: 2 leads per terminal
Switch 2: 1 lead per terminal

NOTE: The above diagram shows a connection between the common terminal (yellow – S1 and yellow-with-orange stripe – S2) and the normally closed terminal (blue – S1 and blue-with-orange stripe – S2). In this example, the indicator light and alarm will stay on until the valve is fully open. When the valve is fully open, the indicator light and alarm will go out. Cap off any unused wires (e.g. brown with orange stripe).

Only S1 (two leads per terminal) may be connected to the fire alarm control panel.

The connection of the alarm switch wiring shall be in accordance with NFPA 72 and the auxiliary switch per NFPA 70 (NEC).

Installation
Reference should always be made to the I-100 Victaulic Field Installation Handbook for the product you are installing. Handbooks are included with each shipment of Victaulic products for complete installation and assembly data, and are available in PDF format on our website at www.victaulic.com.

Warranty
Refer to the Warranty section of the current Price List or contact Victaulic for details.

Note
This product shall be manufactured by Victaulic or to Victaulic specifications. All products to be installed in accordance with current Victaulic installation/assembly instructions. Victaulic reserves the right to change product specifications, designs and standard equipment without notice and without incurring obligations.

TECHNICAL DATA

SWING CHECK VALVE
MODEL D-1 & G-1

213

The Viking Corporation, 210 N Industrial Park Drive, Hastings MI 49058
Telephone: 269-945-9501 Technical Services: 877-384-5464 Fax: 269-818-1680 Email: techsvcs@vikingcorp.com

1. DESCRIPTION

The Viking Swing Check Valve is a general purpose rubber-faced check valve approved for use in fire protection systems. The Swing Check Valve is manufactured with a ductile iron body, brass seat, and a rubber-faced clapper assembly, hinged to a removable access cover for easy inspection and maintenance.

The valve may be installed vertically or horizontally with access cover facing up. For availability of flanged-flanged and grooved-grooved options, refer to Table 1. Tapped openings (with plugs) and gauge connections are provided on both the inlet and outlet chambers of the valve.

FEATURES

A. Ductile iron body for less weight and extra strength.
B. Rated to 300 psi (20.7 bar) water working pressure.
C. Rubber-faced clapper hinged to access cover for quick removal and easy servicing. All moving parts can be serviced without removing the valve from the installed position.
D. With the cover/clapper assembly removed, the clapper rubber replacement requires removal of only one screw.
E. Can be installed vertically or horizontally with access cover facing up.

2. LISTINGS AND APPROVALS

cULus Listed: Guide No. HMER
FM Approved: Single Check Valves
NYC Department of Buildings: MEA 89-92-E, Vol. XI

3. TECHNICAL DATA

Specifications:

Rated to 300 psi (20.7 bar) water working pressure.
Factory tested hydrostatically to 600 psi (41.4 bar).
Standard Flanged Connections: ANSI B16.42 Class 150 (mates with ANSI Class 125 and Class 150 flanges).
Standard Grooved Connections: ANSI/AWWA C606
Tapped Bosses: 2-1/2” (DN65), 3” (DN80) and 4” (DN100): Two 1/2” (15 mm) NPT
6” (DN150) and 8” (DN200): Two 3/4” (20 mm) NPT

Viking Technical Data may be found on The Viking Corporation’s Web site at http://www.vikinggroupinc.com. The Web site may include a more recent edition of this Technical Data Page.

Material Standards: Refer to Figure 1.

Ordering Information: Refer to Table 1 for part numbers and shipping weight.

8" (DN200)	Groove	Groove	23 ft. (7.0 m)	106 lbs. (48 kg)	08547

*Expressed in equivalent length of Schedule 40 pipe based on Hazen & Williams formula: C = 120.

Systems with water working pressures above 175 psi (12 bar) may require extra-heavy pattern fittings. Viking Swing Check Valve flanges are Ductile Iron ANSI B16.42, Class 150, with a maximum water working pressure of 300 psi (20.7 bar). ANSI B16.42, Class 150 flanges are NOT compatible with ANSI Class 250 or Class 300 flanges. To mate the Viking Swing Check Valve with ANSI Class 250 or Class 300 flanges, use the grooved-inlet/grooved-outlet style installed with listed grooved/ flanged adapters of the appropriate pressure rating. For piping with grooved connections, the grooved-inlet/grooved-outlet style Swing Check Valve may be installed with listed grooved couplings of the appropriate pressure rating.

VIKING®

TECHNICAL DATA

SWING CHECK VALVE
MODEL D-1 & G-1

213

The Viking Corporation, 210 N Industrial Park Drive, Hastings MI 49058
Telephone: 269-945-9501 Technical Services: 877-384-5464 Fax: 269-818-1680 Email: techsvcs@vikingcorp.com

4. INSTALLATION

The Swing Check Valve must be installed in an area not subject to physical damage. When corrosive atmospheres and/or contaminated water supplies are present, it is the owner's responsibility to verify compatibility with the Swing Check Valve and associated equipment. Prior to installing the valve, thoroughly flush the water supply piping to verify that no foreign matter is present. The Swing Check Valve may be installed in the vertical position with direction of flow up, or in the horizontal position with the access cover up.

Systems with water working pressures above 175 psi (12 bar) may require extra-heavy pattern fittings. Viking Swing Check Valve flanges are Ductile Iron ANSI B16.42, Class 150, with a maximum water working pressure of 300 psi (20.7 bar). ANSI B16.42, Class 150 flanges are not compatible with ANSI Class 250 or Class 300 flanges. To mate the Viking Swing Check Valve with ANSI Class 250 or Class 300 flanges, use the grooved-inlet/grooved-outlet style installed with listed grooved/flanged adapters of the appropriate pressure rating. For piping with grooved connections, the grooved-inlet/grooved-outlet style Swing Check Valve may be installed with listed grooved couplings of the appropriate pressure rating.

5. OPERATION (Refer to Figure 1)

Flow through the Viking Swing Check Valve lifts the rubber-gasketed clapper (8, and 9) off the seat (12) to enter the sprinkler piping. When flow through the valve stops, the clapper (8) closes quickly. The rubber gasket (9) forms a tight seal against the brass water seat (12), trapping pressure above the clapper and preventing reverse flow from sprinkler piping.

Hydrostatic Test:

The Swing Check Valve is manufactured and listed for use at a maximum water working pressure of 300 psi (20.7 bar). The valve is factory tested at 600 psi (41.4 bar). Check Valves may be hydrostatically tested (in accordance with NFPA 13) at 350 psi (24.1 bar) and/or 50 psi (3.4 bar) above the normal water working pressure for limited periods of time (two hours) for the purpose of acceptance by the Authority Having Jurisdiction. If air testing is required, do not exceed 40 psi (2.8 bar) air pressure.

6. INSPECTIONS, TESTS AND MAINTENANCE

NOTICE: The owner is responsible for maintaining the fire-protection system and devices in proper operating condition.

The Viking Swing Check Valve must be kept free of foreign matter, freezing conditions (when used on wet systems), corrosive atmospheres, contaminated water supplies, and any condition that could impair its operation or damage the device.

It is imperative that the system be inspected and tested on a regular basis. The frequency of the inspections may vary due to contaminated water supplies, corrosive water supplies, and corrosive atmospheres. For minimum maintenance and inspection requirements, refer to NFPA 25. In addition, the Authority Having Jurisdiction may have additional maintenance, testing, and inspection requirements that must be followed.

WARNING: Any system maintenance which involves placing a control valve or detection system out of service may eliminate the fire-protection capabilities of that system. Prior to proceeding, notify all the Authority Having Jurisdiction. Consideration should be given to employment of a fire patrol in the affected areas.

6-A. Five-Year Internal Inspection

Internal inspection of Swing Check Valves is recommended every five years unless inspections and tests indicate more frequent inspections are required.

(Refer to Figure 1)

1. Notify the Authority Having Jurisdiction, remote station alarm monitors, and those in the area affected that the system will be taken out of service. Consideration should be given to employment of a fire patrol in the affected areas.
2. Close the water supply main control valve, placing the system out of service.
3. Open the main drain. If necessary, open the system test valve to vent and completely drain the system.
4. Use the appropriate wrench to loosen and remove the cover screws (14), and remove the cover/clapper assembly (2-11).
5. Inspect the water seat (12). Wipe away all contaminants, dirt, and mineral deposits. DO NOT use solvents or abrasives.
6. Inspect the cover/clapper assembly (2-11) and the cover gasket (13). Test the hinged clapper (8) for freedom of movement. Renew or replace damaged or worn parts as required.

CAUTION: Never apply any lubricant to seats, gaskets, or any internal operating parts of the valve. Petroleum-based grease or oil will damage rubber components and may prevent proper operation.

7. When Internal inspection of the Check Valve is complete, perform step 6 of paragraph 11. VALVE MAINTENANCE to reinstall the cover/clapper assembly (2-11).

The Viking Corporation, 210 N Industrial Park Drive, Hastings MI 49058
Telephone: 269-945-9501 Technical Services: 877-384-5464 Fax: 269-818-1680 Email: techsvcs@vikingcorp.com

6-B. Valve Maintenance

(Refer to Figure 1)

1. Perform steps 1 through 5 of paragraph 6.A - FIVE-YEAR INTERNAL INSPECTION.
2. To remove clapper rubber (9):
   a. Use the appropriate wrenches to loosen and remove the button-head socket screw (11), hex nut (6), sealing washer (7), and rubber retainer (10).
   b. Remove the clapper rubber (9) for inspection. If the clapper rubber shows signs of wear, such as cracking, cuts, or excessively deep grooves where the rubber contacts the water seat, replace the rubber.
3. To re-install clapper rubber (9):
   a. Place the clapper rubber (9) over the center hub of the rubber retainer (10).
   b. Position the retainer (10) (with rubber in place) against the clapper (8) as shown in Figure 1.
   c. Replace and tighten the button-head socket screw (11), sealing washer (7), and hex nut (6). The sealing washer (7) and hex nut (6) must be located on the top side of the clapper as shown in Figure 1. Do not over-tighten.
4. To remove clapper (8), and/or hinge pin (4):
   a. Remove the hinge pin retaining rings (5) to free the hinge pin (4) for removal. After the hinge pin (4) is removed, the clapper (8) can be removed.
5. To re-install clapper (8), and/or hinge pin (4):
   a. Verify that the clapper rubber (9) is in good condition and that it is properly installed.
   b. Position the clapper (8) with the elongated hinge holes aligned between the holes of the hinge bracket welded inside the cover (2). The system (top) side of the clapper (8) must face the direction indicated by the flow arrow stamped inside the cover (2).
   c. Insert the hinge pin (4) through the holes at one end of the hinge assembly. Continue to push the hinge pin (4) through the holes at the remaining end of the hinge assembly.
   d. Re-install the hinge pin retaining rings (5).
6. To re-install cover/clapper assembly (2-11):
   a. Verify that cover gasket (13) is in position and in good condition.
   b. Slide the cover/clapper assembly (2-11) into the Swing Check Valve so that the clapper rubber (9) contacts the water seat (12).
   c. Replace the cover screws (14). Use the appropriate wrench to cross-tighten all screws to the torque value shown in Table 2 for the valve used. DO NOT over-tighten.

7. AVAILABILITY

The Viking Swing Check Valve is available through a network of domestic and international distributors. See the Viking Corp. Web site for closest distributor or contact The Viking Corporation.

8. GUARANTEES

For details of warranty, refer to Viking's current list price schedule or contact The Viking Corporation directly.

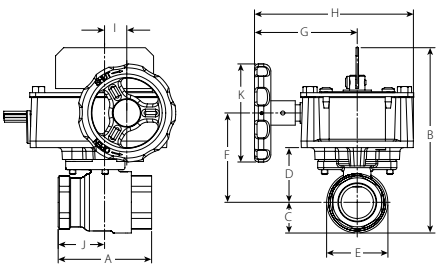
SERIES 728

210523 - Valves for Fire Protection Piping



The Series 728 FireLock valve is a full port, ball valve that is UL/FM rated for 365psi/25 BAR service in all sizes (LPCB and VdS listed for 20 BAR services). Available with grooved or threaded ends (NPT), the valve body is brass. The ball is chrome plated brass with a stainless steel stem. Reinforced seats aid ease of operation and provide a durable, corrosion-free seat. Flow characteristics exceed UL Specification 1091 and FM Approval Standard 1112. The valve is approved for indoor and outdoor use.

SERIES 728

SWITCH AND WIRING

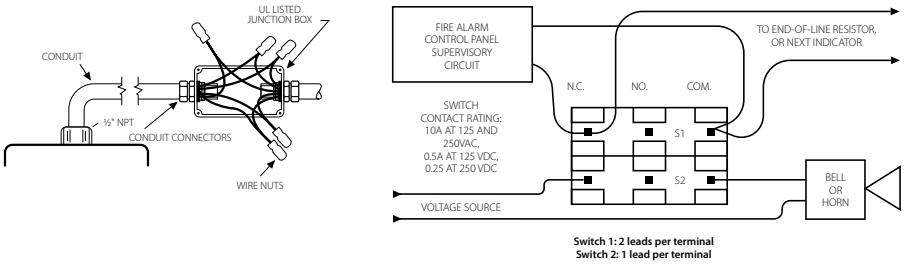
1. The supervisory switch contains two single pole, double throw, pre-wired switches.
2. Switches are rated:

   10 amps @ 125 or 250 VAC/60 Hz

   0.50 amps @ 125 VDC

   0.25 amps @ 250 VDC

3. Switches supervise the valve in the "OPEN" position.



4. One switch has two #18 insulated wires per terminal, which permit complete supervision of leads (refer to diagrams and notes below). The second switch has one #18 insulated wire per terminal. This double circuit provides flexibility to operate two electrical devices at separate locations, such as an indicating light and an audible alarm, in the area that the valve is installed.
5. A #14 insulated ground lead (green) is provided.

   Switch #1 = S1 For connection to the supervisory circuit of a UL Listed alarm control panel

   Switch #2 = S2 Auxiliary switch that may be connected to auxiliary devices, per the authority having jurisdiction

S1
- Normally Closed: (2) Blue
- Common: (2) Yellow

S2
- Normally Closed: Blue with Orange Stripe
- Normally Open: Brown with Orange Stripe
- Common: Yellow with Orange Stripe

NOTE: The above diagram shows a connection between the common terminal (yellow – S1 and yellow-with-orange stripe – S2) and the normally closed terminal (blue – S1 and blue-with-orange stripe – S2). In this example, the indicator light and alarm will stay on until the valve is fully open. When the valve is fully open, the indicator light and alarm will go out. Cap off any unused wires (e.g. brown with orange stripe).

Only S1 (two leads per terminal) may be connected to the fire alarm control panel.

The connection of the alarm switch wiring shall be in accordance with NFPA 72 and the auxiliary switch per NFPA 70 (NEC).

MATERIAL SPECIFICATIONS

Valve Body: Brass ASTM B124

Ball: Chrome Plated Brass

Ball Valve Stem: 316 Stainless Steel

Seat: Carbon Filled (TFE) tetrafluoroethylene

Stem Nut: Brass ASTM B-16 C36000

Actuator: Brass traveling nut, on a steel lead screw, in a ductile iron housing

INSTALLATION

Reference should always be made to the I-100 Victaulic Field Installation Handbook for the product you are installing. Handbooks are included with each shipment of Victaulic products for complete installation and assembly data, and are available in PDF format on our website at www.victaulic.com.

WARRANTY

Refer to the Warranty section of the current Price List or contact Victaulic for details.

NOTE

This product shall be manufactured by Victaulic or to Victaulic specifications. All products to be installed in accordance with current Victaulic installation/assembly instructions. Victaulic reserves the right to change product specifications, designs and standard equipment without notice and without incurring obligations.

Series 530C

Calibrated Pressure Relief Valves

Sizes: ½" or ¾" (15 or 20mm)

Series 530C Calibrated Pressure Relief Valves are spring operated brass valves designed for use only as protection from the build up of excessive pressure in systems containing water, oil or air. Series 530C valves incorporate a calibrated adjustment feature for setting the valve to the relief pressure required. These valves are ideally suited for bypass thermal expansion relief.

Model 530C

Features

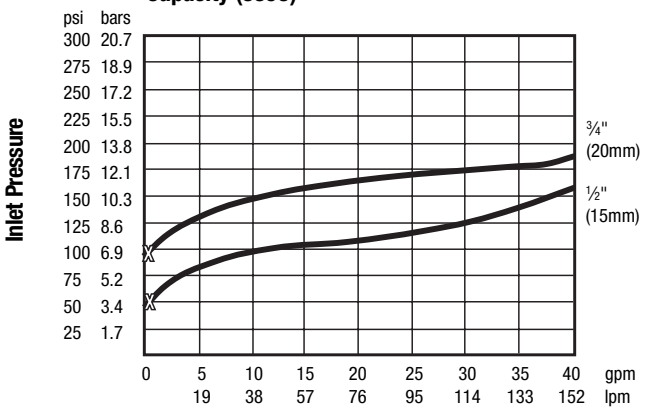
- Calibrated adjustment feature for setting valve to relief pressure required
- Adjustable range 50 – 175psi (3.4 – 12.1 bar)
- All brass construction
- All stainless steel spring
- Buna-N disc on machined body seat
- Inlet (bottom), male NPT threaded
- Outlet (side), female NPT threaded

Materials

1. Body	Brass
2. Bonnet	Brass
3. Disc Holder	Brass
4. Disc	Buna-N (Nitrile)
5. Adjustable Spring	Stainless Steel
6. O-ring	Buna-N (Nitrile)
7. Spring Washer	Brass

Pressure – Temperature

Maximum Temperature: 180°F (82°C)



Spring Ranges

½" or ¾" (15 or 20mm): 50 – 175psi (3.4 – 12.1 bar)
¾" (20mm): 100 – 300psi (6.9 – 20.7 bar)

Application Note: The Watts Series 530C are not ASME approved safety relief valves and should not be used in system application with this requirement.

Model 1011A TESTANDRAIN®

Sectional Floor Control Test and Drain Valve for Systems Requiring Pressure Relief Valve

Sizes:

¾"	1"	1¼"	1½"	2"

The AGF **Model 1011A TESTANDRAIN®** provides the test and express drain functions for wet fire sprinkler systems on multi-story installations requiring pressure relief (NFPA 13 and NFPA 13R). The **Model 1011A** features a **Model 7000 Pressure Relief Valve** with drain pipe.

The **Model 1011A** is available in a full range of sizes (¾" to 2") with NPT connections (BSPT available). The **Model 7000 Pressure Relief Valve** (UL/FM) features a flushing handle and a 175 PSI factory rating (other pressure ratings available).

- Complies with NFPA 13 and NFPA 13R Requirements
- Compact, Single-Handle Ball Valve
- Tamper-Resistant Test Orifice and Sight Glasses
- 300 PSI rated.
- Specifiable orifice sizes: ⅜" (2.8K), 7⁄16" (4.2K), ½" (5.6K), 17⁄32" (8.0K), ⅝" (11.2K, ELO), ¾" (14.0K, ESFR), and K25
- Relieves Excess System Pressure caused by Surges or Temperature Changes
- Shipped with Relief Valve and Bypass Drain Ports Plugged to Expedite Pressure Testing
- Locking Kit Available

Repair kits are available for all **TESTANDRAIN®** valves. Kit includes: Adapter Gasket (1), Ball (1), Valve Seats (2), Stem Packing (1), and Stem Washer (1). ***Valve and orifice size must be specified when ordering.***

NOTE: It is important to note that the pressure rating of the relief valve indicates an operating range of pressure for both opening and closing of the valve. Standard relief valves are required to OPEN in a range of pressure between 90% and 105% of their rating. The valves are required to CLOSE at a pressure above 80% of that rating. The relief valve should be installed where it is easily accessible for maintenance. Care should be taken that the relief valve CANNOT be isolated from the system when the system is operational. A relief valve should NEVER have a shutoff valve or a plug downstream of its outlet.

Reliability, Versatility, Code Compatibility

TESTANDRAIN® is a registered trademark of AGF Manufacturing Inc.

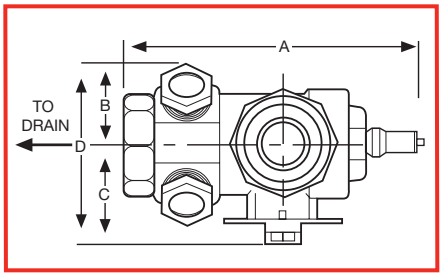
The Model 1011A provides the following…



From the 2013 Edition of NFPA 13

Chapter 8.16.2.4.1*	Provisions shall be made to properly drain all parts of the system.
Chapter 8.16.2.4.2 & 8.16.2.4.3	Drain connections, interior sectional or floor control valve(s) – shall be provided with a drain connection having a minimum size as shown in Table 8.16.2.4.2.
Chapter 8.16.2.4.4	Drains shall discharge outside or to a drain capable of handling the flow of the drain.
Chapter A.8.17.4.2	(Wet Pipe System) test connection is permitted to terminate into a drain capable of accepting full flow… using an approved sight test connection containing a smooth bore corrosion-resistant orifice giving a flow equivalent to one sprinkler…
Chapter 8.17.4.2.2	The test connection valve shall be accessible.
Chapter 8.17.4.2.4	shall be permitted to be installed in any location… downstream of the waterflow alarm.
Chapter 8.17.4.3.1	(Dry Pipe System) a trip test connection not less than 1" in diameter, terminating in a smooth bore corrosion-resistant orifice, to provide a flow equivalent to one sprinkler…
Chapter 8.17.4.3.2	The trip test connection… with a shutoff valve and plug not less than 1", at least one of which shall be brass.
Chapter 7.1.2	- a wet pipe system shall be provided with a listed relief valve set to operate at 175 PSI or 10 PSI in excess of the maximum system pressure, whichever is greater.
Chapter 8.16.1.2.3*	A listed relief valve of not less than ½" in size shall be provided on the discharge side of the pressure-reducing valve set to operate at a pressure not exceeding rated pressure of the system.
Chapter A.8.16.1.2.3	- consideration should be given to piping the discharge from the (pressure relief) valve

Model 350A

Double Check Valve Assembly

228A

Application

Designed for installation on potable water lines to protect against both backsiphonage and backpressure of polluted water into the potable water supply. The Model 350A shall provide protection where a potential health hazard does not exist. Ideal for use where Lead-Free* valves are required.

Standards Compliance (Horizontal & Vertical)

- ASSE® Listed 1015
- AWWA Compliant C510 (with gates only), and C550
- IAPMO® Listed
- Certified to NSF/ANSI 372* by IAPMO R&T
- CSA® Certified
- UL® Classified
- C-UL® Classified
- FM® Approved
- NYC MEA 220-04-M Vol 2 (2 1/2" - 8")
- Approved by the Foundation for Cross Connection Control and Hydraulic Research at the University of Southern California
- NSF® Listed-Standard 61, Annex G*

*(0.25% MAX. WEIGHTED AVERAGE LEAD CONTENT)

Materials

Main valve body	Ductile Iron ASTM A 536 Grade 4
Access covers	Ductile Iron ASTM A 536 Grade 4
Coatings	FDA Approved electrostatic epoxy finish
Internals	Stainless steel, 300 Series NORYL™, NSF Listed
Fasteners & springs	Stainless Steel, 300 Series
Seal ring	EPDM (FDA approved)
O-ring	Buna Nitrile (FDA approved)

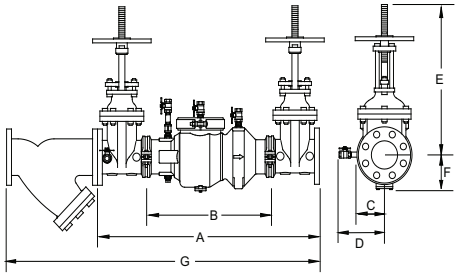
Features

Sizes: 2 1/2", 3", 4", 6", 8", 10"

Maximum working water pressure	175 PSI
Maximum working water temperature	140˚F
Hydrostatic test pressure	350 PSI
End connections	
(Grooved for steel pipe)	AWWA C606
(Flanged)	ANSI B16.1 Class 125

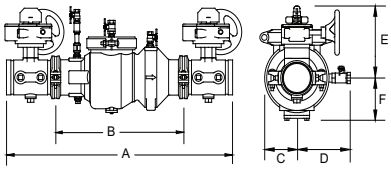
(with OSY gates)

(with BG valves)



Options (Suffixes can be combined)

- ☐ - with flanged end NRS gate valves (standard)
- ☐ FSC - with epoxy coated wye type strainer (flanged only)
- ☐ G - with grooved end connections
- ☐ GF - with grooved inlet connection and flanged outlet connection
- ☐ FG - with flanged inlet connection and grooved outlet connection
- ☐ L - less shut-off valves (grooved body connections)
- ☐ OSY - with flanged end OS&Y gate valves
- ☐ OSYG - with grooved end OS&Y gate valves
- ☐ PI - with Post Indicator Gate Valves
- ☐ BG - with grooved end butterfly valves with integral supervisory switches
- ☐ BF - with flanged end butterfly valves with integral supervisory switches



Accessories

- ☐ Repair kit (rubber only)
- ☐ Thermal expansion tank (Model XT)
- ☐ OS & Y Gate valve tamper switch (OSY-40)

Typical Installation

Local codes shall govern installation requirements. Unless otherwise specified, the assembly shall be mounted at a minimum of 12" (305mm) and a maximum of 30" (762mm) above adequate drains with sufficient side clearance for testing and maintenance. The installation shall be made so that no part of the unit can be submerged.

Specifications

The Double Check Backflow Prevention Assembly shall be certified to NSF/ANSI 372, ASSE® Listed 1015, and supplied with full port gate valves. The main body and access cover shall be epoxy coated ductile iron (ASTM A 536 Grade 4), the seat ring and check valve shall be NORYL™, the stem shall be stainless steel (ASTM A 276) and the seat disc elastomers shall be EPDM. The checks shall be accessible for maintenance without removing the device from the line. The Double Check Backflow Prevention Assembly shall be a ZURN WILKINS Model 350A.

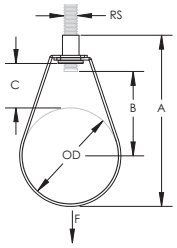
115 Standard Duty Loop Hanger



The 115 Standard Duty Loop Hanger is ideal for suspending stationary, non-insulated pipe lines, including CPVC pipes, in fire sprinkler systems. A knurled insert nut helps simplify vertical adjustments and flared edges on the base (1/2" to 4" sizes) help protect pipes from coming into contact with any sharp edges of the hanger.

- Flared edges help prevent any sharp surfaces from coming into contact with the pipe (1/2" to 4" sizes)
- Retained insert nut helps ensure the loop hanger and insert nut stay together
- Recommended for the suspension of stationary non-insulated pipe lines
- Manufactured to use the minimum rod size permitted by NFPA® for fire sprinkler piping
- Conforms with Federal Specification WW-H-171 (Type 10), Manufacturers Standardization Society (MSS) SP-58 (Type 10)

Material: Steel
Finish: Pregalvanized

Setscrew must be tightened and torqued onto the sloped side of the I-beam.

Recognizing that torque wrenches are generally not used or available on many job sites, the setscrew should be tightened so it contacts the I-beam and then an additional 1/4 to 1/2 turn added.

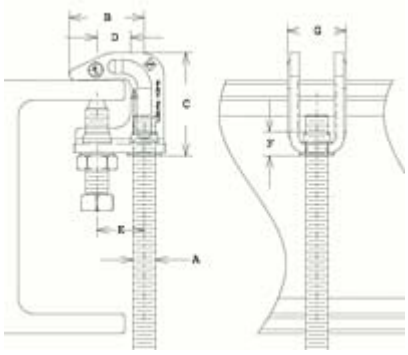
SilverHawk 100 Series Universal Beam Clamp

Check up to five results to perform an action.



SilverHawk Top Beam Clamps are our strongest, lightweight top beam clamps. Made from cold rolled steel with a zinc plated finish, they are rust and corrosion resistant. These super strong SilverHawk clamps exceed UL and FM testing requirements. Zinc finish aesthetically works with plated rods and plated swivel ring hangers.

Tested by industry professionals, SilverHawk installation is quick and easy. Their unique counter balance design makes it easy to “spin” them onto threaded rods so installation goes faster. The open back shape provides visual verification during installation.

- Made in USA.
- Supports 3/8” rod – metric also available
- 90° angle fits I-beam or T-bar up to 3/4” thick
- Extruded tap holes meet FM Approvals requirements
- Accommodates retaining strap usage
- Competitively priced domestic par

3.3.5.1 Product Description

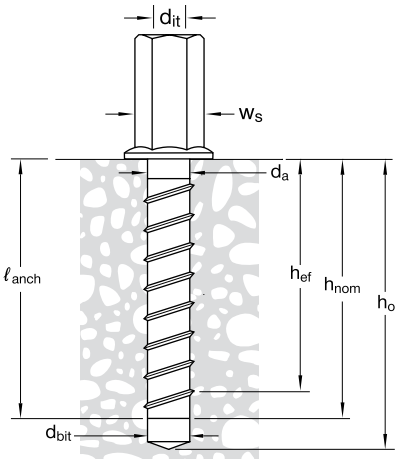
Hilti KWIK HUS-EZ I (KH-EZ I) anchors are comprised of a body with an internally threaded hex washer head. The anchor is manufactured from carbon steel and is heat treated. It has a minimum 0.0003 inch (8 µm) zinc coating in accordance with DIN EN ISO 4042. The internally threaded head is larger than the diameter of the anchor and is formed with serrations on the underside. The anchor body is formed with threads running most of the length of the anchor body. The anchor is installed in a predrilled hole with a powered impact wrench or torque wrench. The anchor threads cut into the concrete on the sides of the hole and interlock with the base material during installation. Applicable base materials include normal-weight concrete, structural lightweight concrete and lightweight concrete over metal deck.

Guide Specifications

Screw anchors shall be KWIK HUS-EZ I as supplied by Hilti, Inc. Anchors shall be manufactured from heat treated carbon steel material, zinc plated to a minimum thickness of 8µm. Anchors shall be installed using a drill bit of same nominal diameter as anchor.

Product Features

- Suitable for cracked and uncracked normal weight and lightweight concrete, and lightweight concrete over metal deck.
- Suitable for seismic and nonseismic loads.
- Quick and easy to install.
- Thread design enables quality setting and exceptional load values in wide variety of base material strengths.
- Anchor is fully removable
- Anchor size is same as drill bit size and uses standard ANSI B212.15 – 1994 drill bits.
- Suitable for reduced edge distances and spacing.



3.3.5.2 Material Specifications

Hilti KWIK HUS-EZ I anchors are manufactured from carbon steel. The anchors are bright zinc plated to a minimum thickness of 8µm.

3.3.5.3 Technical Data

The data contained in Tables 1-4 of this section have been evaluated in accordance with AC 193. For more detail, see ICC-ES ESR 3027.

Figure 1 — KWIK HUS-EZ I anchor installation details

Reduction Factor for pullout strength	Φ_p	-	0.45	0.65
Characteristic Pullout Strength, Seismic (2500 psi)	$N_{p,eq}$	lb	534[6]	1166[7]
Reduction Factor for pullout strength	Φ_{eq}	-	0.45	0.65
Values for Installation in the underside of Concrete-Filled Profile Steel Deck Assemblies[2]				
Pullout Resistance, (uncracked concrete) - Lower Flute	$N_{p,deck,uncr}$	lb	1210[8]	1875[9]
Pullout Resistance, (uncracked concrete) - Upper Flute	$N_{p,deck,uncr}$	lb	1490[8]	1960[9]
Pullout Resistance, (cracked concrete and seismic loads) - Lower Flute	$N_{p,deck,cr}$	lb	620[8]	930[9]
Pullout Resistance, (cracked concrete and seismic loads) - Upper Flute	$N_{p,deck,cr}$	lb	760[8]	975[9]

1 The data presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D.

2 For installations through the soffit of steel deck into concrete, anchors installed in the lower flute may be installed with a maximum one inch offset in either direction from the center of the flute. See Figure 2.

3 Because of variability in measurement procedures, the published torque of an impact tool may not correlate properly with the above setting torques. Over-torquing can damage the anchor and/or reduce its holding capacity.

4 $T_{inst,max}$ applies to installations using a calibrated torque wrench.

5 Additional combinations for minimum edge distance, c_{min} and minimum spacing distance, s_{min} or $s_{min,cac}$ may be derived by linear interpolation between the given boundary values.

6 The characteristic pullout resistance for concrete compressive strengths greater than 2,500 psi may be increased by multiplying the value in the table by $(f'c/2{,}500)^{0.3}$

7 The characteristic pullout for concrete compressive strengths greater than 2,500 psi may be increased by multiplying the value in the table by $(f'c/2{,}500)^{0.5}$

8 The characteristic pullout resistance for concrete compressive strengths greater than 3,000 psi may be increased by multiplying the value in the table by $(f'c/3{,}000)^{0.3}$

9 The characteristic pullout for concrete compressive strengths greater than 2,500 psi may be increased by multiplying the value in the table by $(f'c/2{,}500)^{0.5}$

3.3.5 KWIK HUS-EZ I (KH-EZ I) Carbon Steel Screw Anchor

Table 2 - Calculated ACI 318-08 Appendix D Strength Design Capacity for Single anchor in Tension[3,4,5,6,7]

Anchor Size (in.)	Internally Threaded Head (in.)	Nominal Embedment Depth (in.)	Normal Weight Concrete						LWCOMD			
			2500 psi[1]			4000 psi			3000 psi[2]			
			Uncracked Concrete	Cracked Concrete	Seismic	Uncracked Concrete	Cracked Concrete	Seismic	Uncracked Concrete		Cracked Concrete	
									Lower Flute	Upper Flute	Lower Flute	Upper Flute
1/4 x 1-5/8	1/4	1-5/8	587	300	240	675	346	277	545	670	280	342
	3/8	1-5/8	587	300	240	675	346	277	545	670	280	342
1/4 x 2-1/2	1/4	2-1/2	1533	758	758	1940	958	958	1218	1275	605	634
	3/8	2-1/2	1533	758	758	1940	958	958	1218	1275	605	634

1 Values for other strengths can be calculated per $(f'c/2500)^{0.3}$ for 1-5/8" embedment and $(f'c/2500)^{0.5}$ for 2-1/2" embedment

2 Values for other strength can be calculated per $(f'c/3000)^{0.3}$ for 1-5/8" embedment and $(f'c/3000)^{0.5}$ for 2-1/2" embedment

3 Based on single anchor with edge and spacing values greater than those given as critical values in Table 1.

4 Based on lower value of concrete breakout or pullout strength

5 These loads are factored resistance loads in accordance with Chapter 9 of ACI 318-08 (ΦN_n).

6 Interpolation of values for other embedments is not permitted

7 Minimum concrete thickness and edge distance must comply with Table 1.

Table 3 – KWIK HUS-EZ I (KH-EZ I) Allowable Stress Design Values for Illustrative Purposes[1,2,3,4,5,6,7,8,9,10,11]

Internal Thread Diameter of Head (in.)	Nominal Anchor Diameter (in.)	Embedment Depth, h_{nom} (in.) (mm)	Effective Embedment Depth, h_{ef} (in.) (mm)	Allowable Tension Load lb (kN)
1/4 or 3/8	1/4	1-5/8 (41)	1.18 (30)	470 (2.1)
		2-1/2 (64)	1.92 (49)	1340 (6.0)

For SI: 1 inch = 25.4 mm, 1 lbf = 4.45 N.

1 Single anchor with static tension load only.

2 Concrete determined to remain uncracked for the life of the anchorage.

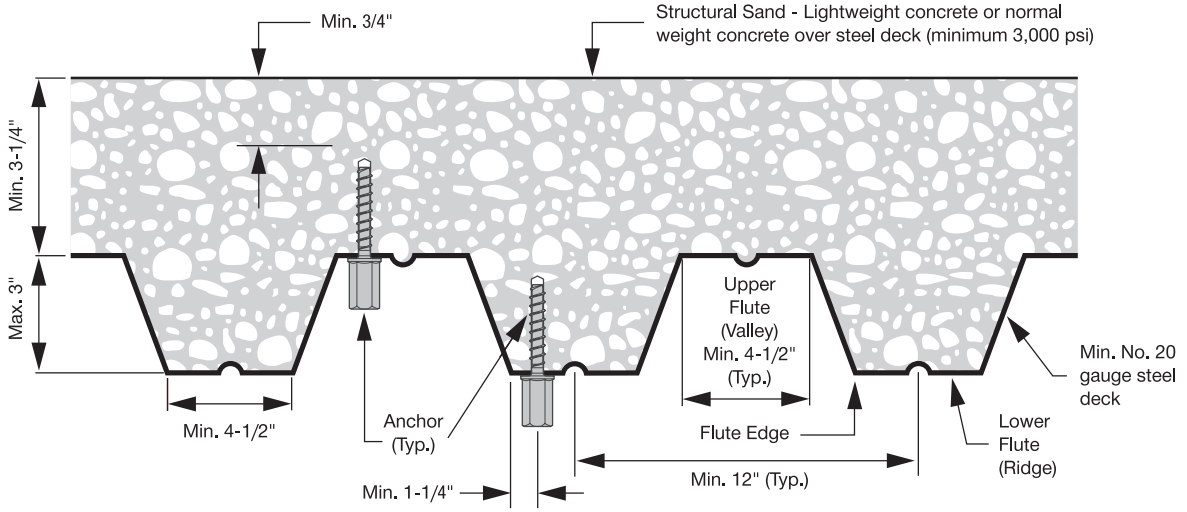
3 Load combinations are taken from ACI 318 Section 9.2 (no seismic loading).

4 40% dead load and 60% live load, controlling load combination 1.2D + 1.6L.

5 Calculation of weighted average for conversion factor α = 1.2(0.4) + 1.6(0.6) = 1.44.

6 f'_c = 4,000 psi (27.6 MPa) (normal weight concrete).

7 $c_{a1} = c_{a2} \geq c_{ac}$, see Table 1.



8 $h \geq h_{min}$, see Table 1.

9 Values are for Condition B where supplementary reinforcement in accordance with ACI 318 D.4.4 is not provided.

10 Allowable Tension Load = factored Load (Lesser of N_p or Concrete Breakout from Table 1) ÷ 1.44

11 Values are for single anchors installed without influence of base material edge distance or adjacent anchors.

Figure 2 – Installation of KWIK HUS-EZ I (KH-EZ I) in Soffit of Concrete Over Steel Deck Floor and Roof Assemblies

1 Anchors may be placed in the upper or lower flute of the steel deck profile provided the minimum concrete cover above the drilled hole is satisfied. Anchors in the lower flute may be installed with a maximum 1-inch offset in either direction from the center of the flute. The offset distance may be increased proportionally for profiles with lower flute widths greater than those shown provided the minimum lower flute edge distance is also satisfied.

KWIK HUS-EZ I (KH-EZ I) Carbon Steel Screw Anchor 3.3.5

Table 4 - KWIK HUS EZ I (KH-EZ I) Allowable Stress Design Tension Values for Installations in Soffit of Concrete Over Steel Deck Floor and Roof Assemblies

302

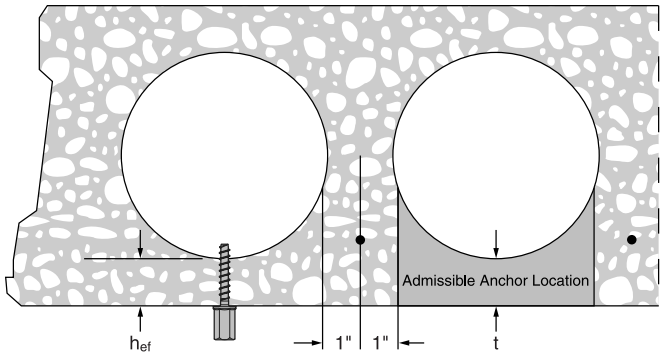
Internal Thread Diameter of Head (in.)	Nominal Anchor Diameter (in.)	Embedment Depth (in.) (mm)	Effective Embedment Depth (in.) (mm)	Allowable Tension Load lb (kN)	
				Upper Flute	Lower Flute
1/4 or 3/8	1/4	1-5/8 (41)	1.18 (30)	466 (2.1)	378 (1.7)
		2-1/2 (64)	1.92 (49)	885 (3.9)	846 (3.7)

For SI: 1 inch = 25.4 mm, 1 lbf = 4.45 N.

1 Single anchor with static tension load only.
2 Concrete determined to remain uncracked for the life of the anchorage.
3 Load combinations are taken from ACI 318 Section 9.2 (no seismic loading).
4 40% dead load and 60% live load, controlling load combination 1.2D + 1.6L.
5 Calculation of weighted average for conversion factor α = 1.2(0.4) + 1.6(0.6) = 1.44.
6 f'_c = 3,000 psi (27.6 MPa) (light weight concrete).
7 $c_{a1} = c_{a2} \geq c_{ac}$, see Table 1.
8 $h \geq h_{min}$, see Table 1.
9 Values are for Condition B where supplementary reinforcement in accordance with ACI 318 D.4.4 is not provided.
10 Allowable Tension Load = factored Load (Lesser of N_p or Concrete Breakout from Table 1) ÷ 1.44
11 Values are for single anchors installed without influence of base material edge distance or adjacent anchors.

Table 5 - Kwik HUS-EZ I (KH-EZ) Tested Load Values for FM Approval for Automatic Sprinkler Systems

Hanger Rod Size (in.)	Screw Length (in.)	FM Test Load Tension lb (kN))	FM Maximum Pipe Diameter (in.)
3/8	1 5/8	1475 (6.6)	4
	2 1/2		



1 Tested in accordance with FM Approval Standard for Pipe Hanger Components for Automatic Sprinklers Systems Class Numbers 1951, 1952 and 1953.

Table 6 - Kwik HUS-EZ I (KH-EZ I) Allowable Stress Design Values for Installations into Hollow Core Concrete Panels[1,2]

Hanger Rod Size (in.)	Min. Effective Embedment h_{ef} (in.)	Allowable Load[3]		Ultimate Load	
		Tension lb (kN)	Shear lb (kN)[4,5]	Tension lb (kN)	Shear lb (kN)[4,5]
1/4	1 3/8	455 (2.0)	485 (2.2)	1810 (8.1)	1,930 (8.6)
3/8			755 (3.4)		3,025 (13.5)

1 The Admissible Anchor Location must be established to prevent damage to the prestressed cable during the drilling process. Verify the location and height of the cable with the hollow core plank supplier to confirm Admissible Anchor Location.
2 Minimum compressive strength of prestressed concrete is 7,000 psi. Published ultimate loads represent the average results conducted in local base materials. Due to variations in materials and dimensionl configurations, on-site testing is required to determine the actual performance.
3 Allowable loads calculated with a 4:1 factor of safety.
4 The bottom of the shear plane adjacent to the top of the coupler.
5 Shear values controlled by the steel strength of ASTM A193, Grade B7 (min. tensile strength 125 ksi) screws used to fasten the shear fixturing. Shear values should consider the screw or threaded rod strength.

Figure 3 – Installation of KWIK HUS–EZ I (KH-EZ I) in Hollow Core Concrete

3.3.5.4 Installation Instructions

Use the installation instructions that are including with the Kwik HUS-EZ I packaging box. To obtain a digital copy of the Installation Instructions, visit www.us.hilti.com, www.hilti.ca or contact Hilti Technical Support.

3.3.5 KWIK HUS-EZ I (KH-EZ I) Carbon Steel Screw Anchor

302

The data below is developed from testing performed in accordance with ACI 355.2. It is intended for applications designed according to CSA A23.3-04 Update No. 3 (August 2009) Design Of Concrete Structures Annex D and is generally suitable for the conditions described in the introduction of Annex D.

Table 7 – KWIK HUS-EZ I (KH-EZ I)

Design Guidelines For KWIK HUS-EZ I[1]				
Values for Normal Weight and Lightweight Concrete				
Characteristic	Symbol	Units	Value	
Internal Thread Diameter of Head		in.	1/4 or 3/8	
Wrench Socket Size		in.	3/8 or 1/2	
Nominal Diameter	d_a	in.	1/4	
Drill Bit Diameter	d_{bit}	in.	1/4	
Maximum Installation Torque[4]	$T_{inst,max}$	ft-lbf (Nm)	18 (24)	
Maximum Impact Wrench Torque Rating[3]	$T_{impact,max}$	ft-lbf (Nm)	114 (154)	137 (186)
Minimum Nominal Embedment Depth	h_{nom}	mm	41	64
Concrete material resistance factor	Φ_c	-	0.65	
Steel material resistance factor	Φ_s	-	0.85	
Ultimate Strength of anchor steel	f_{ut}	MPa	924	
Effective cross-sectional area of anchor	A_{se}	mm^2	29.0	
Minimum Hole Depth	h_{hole}	mm	51	73
Minimum Spacing at Critical Edge Distance	$s_{min,cac}$[5]	mm	38	
Minimum Edge Distance	c_{min}[5]	mm	38	
Minimum Spacing at Minimum Edge Distance	s_{min}[5]	mm	76	
Minimum Concrete Thickness	h_{min}	mm	83	105
Anchor Category			3	1
Steel Strength in Tension (CSA A23.3 D.6.1)				
Factored Steel Resistance in Tension	N_{sr}	kN	15.9	
Reduction Factor for Steel Strength	R	-	0.70	
Concrete Breakout Strength in Tension (CSA A23.3 D.6.2)				
Effective Embedment Depth	h_{ef}	mm	30	49
Critical Edge Distance[2]	c_{ac}[5]	mm	51	71
Effectiveness Factor - Uncracked Concrete	K_{uncr}	-	10	
Effectiveness Factor - Cracked Concrete	K_{cr}	-	7	
Modification Factor for cracked and uncracked concrete	$\Psi_{c,N}$	-	1.4	
Reduction Factor for Concrete Breakout Strength	R	-	0.70	1.00
Pullout Strength in Tension - Non Seismic Applications (CSA A23.3 D.6.3}				
Factored Pullout Resistance, uncracked concrete (17.23 MPa)	$N_{pr,uncr}$	kN	2.6[6]	6.8[7]
Factored Pullout Resistance, cracked concrete (17.23 MPa)	$N_{pr,cr}$	kN	1.3[6]	3.4[7]
Concrete Resistance Factor for pullout strength	$\Phi_{c,pull}$	-	0.65	
Factored Pullout Strength, Seismic (17.23 MPa)	$N_{pr,eq}$	kN	1.1[6]	3.4[7]
Concrete Resistance Factor for pullout strength	$\Phi_{c,seis}$	-	0.65	
Values for Installation in the underside of Concrete-Filled Profile Steel Deck Assemblies[2]				
Factored Pullout Resistance, (uncracked concrete 20.68 MPa) - Lower Flute	$N_{pr,deck,uncr}$	kN	2.4[8]	5.4[9]
Factored Pullout Resistance, (uncracked concrete 20.68 MPa) - Upper Flute	$N_{pr,deck,uncr}$	kN	3.0[8]	5.7[9]
Factored Pullout Resistance, (cracked concrete and seismic loads 20.68 MPa) - Lower Flute	$N_{pr,deck,cr}$	kN	1.3[8]	2.7[9]
Factored Pullout Resistance, (cracked concrete and seismic loads 20.68 MPa) - Upper Flute	$N_{pr,deck,cr}$	kN	1.5[8]	2.8[9]

1 The data presented in this table is to be used in conjunction with the design criteria of CSA A23.3-04.

2 For installations through the soffit of steel deck into concrete, anchors installed in the lower flute may be installed with a maximum one inch offset in either direction from the center of the flute.

3 Because of variability in measurement procedures, the published torque of an impact tool may not correlate properly with the above setting torques. Over-torquing can damage the anchor and/or reduce its holding capacity.

4 $T_{inst,max}$ applies to installations using a calibrated torque wrench.

5 Additional combinations for minimum edge distance, c_{min} and minimum spacing distance, $s_{min\ or\ smin,cac}$ may be derived by linear interpolation between the given boundary values.

6 The characteristic pullout resistance for concrete compressive strengths greater than 17.23 MPa may be increased by multiplying the value in the table by $(f'c/17.23)^{0.3}$

7 The characteristic pullout for concrete compressive strengths greater than 17.23MPa may be increased by multiplying the value in the table by $(f'c/17.23)^{0.5}$

8 The characteristic pullout resistance for concrete compressive strengths greater than 20.68 MPa may be increased by multiplying the value in the table by $(f'c/20.68)^{0.3}$

9 The characteristic pullout for concrete compressive strengths greater than 20.68 MPa may be increased by multiplying the value in the table by $(f'c/20.68)^{0.5}$

KWIK HUS-EZ I (KH-EZ I) Carbon Steel Screw Anchor 3.3.5

3.3.5.6 Ordering Information

302

Order Information

Description	Internal Thread Diameter	Internal Thread Length	Hole Diameter	Minimum Embedment	Qty (pcs) / Box
**KH-EZ 1/4"x1-5/8"	1/4"**	1/4"	3/8"	1/4"	1-5/8"	100

RISER CLAMPS

FUNCTION: Designed for supporting and stabilizing vertical pipe runs. The PVC coating on Fig. 553 protects the pipe from the metal surface of the clamp. This product is not intended for use with hanger rods. Clamp is designed for standard iron pipe O.D. and must be considered when sizing other types of piping.

APPROVALS: Underwriters' Laboratories Listed in the U.S. (UL) and Factory Mutual Approved for sizes 3/4" (20mm) to 8" (200mm) only. Complies with Federal Specifications A-A-1192A (Type 8) and Manufacturers' Standardization Society ANSI/SP-69 and SP-58 (Type 8).

MATERIAL: Low carbon steel

ORDERING: Specify pipe size and figure number.

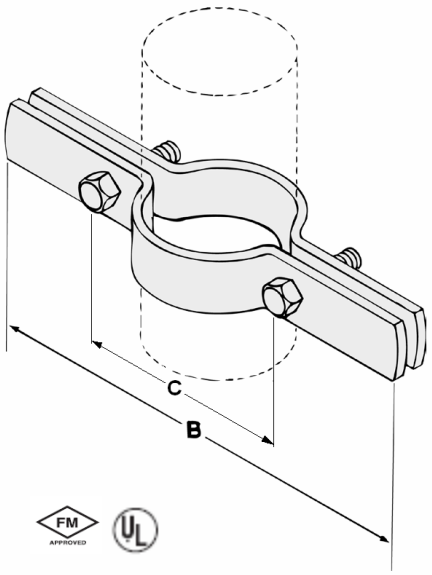

Fig. 550, 551 & 553 RISER CLAMP

Fig. 550* PLAIN

Fig. 551 ELECTRO-GALVANIZED

Fig. 553 PLAIN WITH PVC COATING

*Available in stainless steel. To order, specify 304 or 316 and add suffix SS to figure number. Price on request.

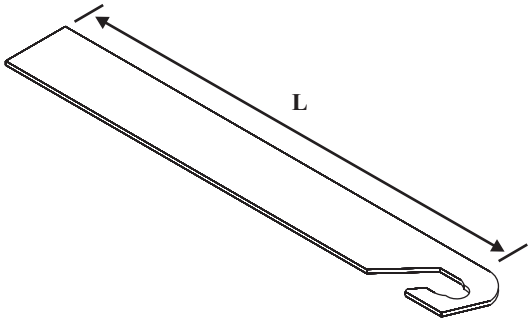
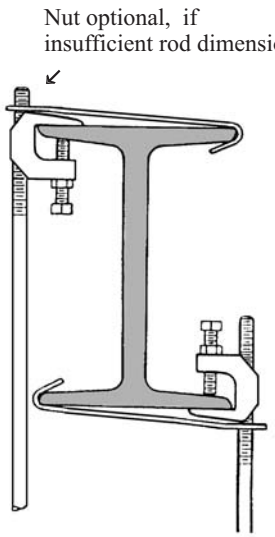
Installation practice for Model 550 Riser Clamps

When possible the clamp should be placed under a coupling, hub or welded lugs on steel pipe. Bolt torques should be per industry standards.

Recommended Torque For Pipe Clamp Hardware



Bolt Size	1/4"-20	5/16"-18	3/8"-16	1/2"-13	5/8"-11	3/4"-10 & Larger
ft/lbs	6	11	19	50	65	75
N/m	(8)	(15)	(26)	(68)	(88)	(102)



Unless otherwise specified, all dimensions on drawings and in charts are in inches and dimensions shown in parentheses are in millimeters.

162

UNIVERSAL RESTRAINING STRAP

SIZE- One size fits both 3/8" and 1/2" rod or set screw.
Available lengths 4" and longer.
MATERIAL - Carbon Steel.
FINISH - Mil. Galvanized.
LISTINGS -
c UL us **203-EX 2551**
PATENT - No. 5,897,088
FUNCTION - To enhance hanger attachment in areas subject to Earthquakes.
INSTALLATION - Install tight to structure and component parts
Minimum return on strap: 1”
L-dimension is measured from hanger rod center to the strap end.
FEATURES
* Fast installation for new construction or retrofit.
* Requires no hanger disassembly to install.
IMPORTANT NOTE: **“No Nut Is Required”**
When installed tight to structure and component parts. (See drawings provided)
ORDERING - Part # and L-dimension.

CAD

Pipe Clamps

B3140 - Standard Pipe Clamp (TOLCO Fig. 4)
B3140F - Standard Pipe Clamp Felt Lined for Copper Tubing (TOLCO Fig. 4F)
B3140C - Standard Pipe Clamp PVC Coated (TOLCO Fig. 4PVC)

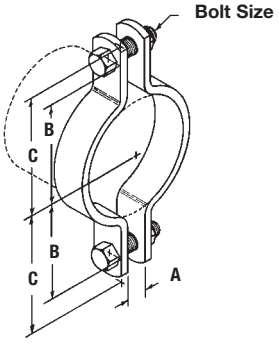
Component of State of California OSHPD Approved Seismic Restraints System

Size Range: B3140/B3140C Size 1/2" (15mm) thru 30" (750mm) pipe. B3140F Size 1/2" (15mm) thru 2 1/2" (65mm) copper tubing

Material: Steel

Function: Recommended for the suspension of non-insulated pipe or insulated pipe with B3151 shields. (Use B3200 weldless eye nut, B3210 eye rod or B3211 welded eye rod.) B3140F and B3140C are designed to reduce noise and vibration and/or prevent electrolysis.

Approvals: Underwriters Laboratories Listed in the USA **(UL)**, Canada **(cUL)** 3/4" (20mm) - 12" (300mm), and approved by Factory Mutual Engineering **(FM)**, 3/4" (20mm) - 8" (200mm). Federal Specification WW-H-171E & A-A-1192A, Type 4, and Manufacturers Standardization Society ANSI/MSS SP-69 & SP-58, Type 4. Included in our Seismic Restraints Catalog approved by the State of California Office of Statewide Health Planning and Development **(OSHPD)**. For additional load, spacing and placement information relating to OSHPD projects, please refer to the Seismic Restraint Systems Guidelines.



Note: For piping that requires sway bracing refer to Fig. 4A.

Maximum Temperature: — 750°F (399°C)

Finish: Plain. Contact B-Line for alternative finishes and materials.

Order By: Part number, pipe size and finish.

Order Note: When ordering B3140F allow for 3/16" (4.8mm) felt on each half of clamp.

Lok-Bolt™ *Sleeve Expansion Anchor*

PRODUCT DESCRIPTION

The Lok-Bolt is a pre-assembled single unit sleeve anchor available in carbon steel and stainless steel which can be used in concrete, block, brick, and stone. The Lok-Bolt is designed to draw the fixture into full bearing against the base material through the action of its unique and flexible compression ring. This helps to increase the resistance of the anchor to loosening when subjected to vibratory loads. As the anchor is being tightened, the nylon compression ring will compress if necessary, so that the fixture is tightly secured against the face of the base material. Under load, the specially tapered plow bolt is drawn further into the expansion sleeve to develop increased locking action against the walls of the hole. Extension sleeves are added for longer lengths.

GENERAL APPLICATIONS AND USES

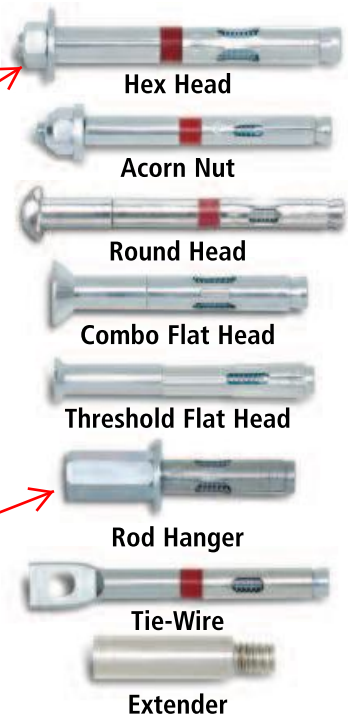
- Door and Window Frame Installations
- Mounting fixtures on walls
- Mounting of Handrails and Fencing
- Shelving and Storage
- Masonry Applications
- Electrical and Mechanical Attachments

FEATURES AND BENEFITS

- Multiple head styles for multiple applications and finished appearance
- Fits standard fixture holes – No need to undersize anchors for proper fit
- Immediate Loading – Minimizes downtime
- Sleeve has 360° contact area and reduces concrete stress
- Versatile and ideal for concrete, or masonry
- Available in carbon steel and Type 304 stainless steel

APPROVALS AND LISTINGS

Factory Mutual Research Corporation (FM Approvals) Serial No. 26692, J.I. OJ8A1.AH, J.I. OJ9A9.AH



Underwriters Laboratory (UL Listed) File No. EX 1289 (N) See listing for applicable sizes and styles.

GUIDE SPECIFICATIONS

CSI Divisions: *03151-Concrete Anchoring, 04081-Masonry Anchorage* and *05090-Metal Fastenings.* Sleeve Anchors shall be Lok-Bolt anchors as supplied by Powers Fasteners, Inc., Brewster, NY.

HEAD STYLES

Hex Head
Acorn Nut
Round Head
Combo Flat Head
Threshold Flat Head
Rod Hanger
Tie-Wire

ANCHOR MATERIALS

Zinc Plated Carbon Steel
Type 304 Stainless Steel

ANCHOR SIZE RANGE (TYP.)

1/4" diameter x 5/8" length to
3/4" diameter x 7-1/2" length

SUITABLE BASE MATERIALS

Normal-Weight Concrete
Structural Lightweight Concrete
Grouted Concrete Masonry
Hollow Concrete Masonry

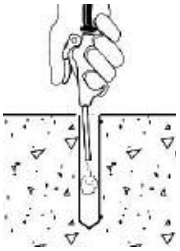
Rod Hanger Lok-Bolt

Dimension	Anchor Size, *d*		
	1/4"	3/8"	1/2"
ANSI Drill Bit Size, d_{bit} (in.)	1/4	3/8	1/2
Plow Bolt Size (UNC)	1/4-20	5/16-18	3/8-16
Coupling Height (in.)	7/8	1	1 1/4
Washer O.D., d_w (in.)	5/8	13/16	1
Coupling Wrench Size (in.)	7/16	1/2	11/16

Threshold Lok-Bolt

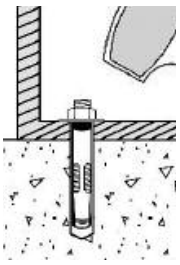
Dimension	Anchor Size, *d*
	1/4"
ANSI Drill Bit Size, d_{bit} (in.)	1/4
Fixture Clearance Hole, d_h (in.)	5/16
Plow Bolt Size (UNC)	10-24
Head Height (in.)	5/64
Head Width, d_{hd} (in.)	23/64

Tire-Wire Lok-Bolt

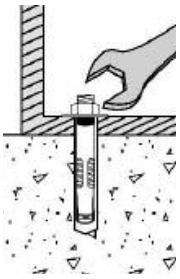


Dimension	Anchor Size, *d*
	5/16"
ANSI Drill Bit Size, d_{bit} (in.)	5/16
Fixture Clearance Hole, d_h (in.)	1/4
Plow Bolt Size (UNC)	1/4-20
Head Height (in.)	1 9/16
Head Width, d_{hd} (in.)	31/64

Installation Guidelines



Using the proper diameter bit, drill a hole into the base material to a depth of at least 1/2" or one anchor diameter deeper than the embedment required. The tolerances of the drill bit used should meet the requirements of ANSI Standard B212.15.



Blow the hole clean of dust and other material. Do not expand the anchor prior to installation.

Drive the anchor through the fixture into the anchor hole until the head is firmly seated against the fixture. Be sure the anchor is driven to the required embedment depth.

Tighten the anchor by turning the nut of head 3 to 5 turns past finger tight or by applying the guide installation torque from the finger tight position.

MATERIAL SPECIFICATIONS

General Lok-Bolt Components

Anchor Component	Component Material	
	Carbon Steel	Stainless Steel
Plow Bolt	AISI 1010 / 1018	Type 18-8 SS
Expansion Sleeve	AISI 1010 / 1020	Type 304 SS
Extension Sleeve	AISI 1010 / 1020	Type 304 SS
Compression Ring	Nylon	Nylon
Zinc Plating	ASTM B633, SC1, Type III (Fe/Zn 5)	N/A

Lok-Bolt Head Components

Anchor Component	Component Material	
	Carbon Steel	Stainless Steel
Hex Nut	ASTM A 563, Grade A	Type 304 SS
Acorn Nut	AISI 1010 / 1018	Type 304 SS
Washer	ASTM F 844	Type 18-8 SS
Round Head	AISI 1010 / 1018	Type 304 SS
Flat Head	AISI 1010 / 1018	Type 304 SS
Rod Coupling	AISI 12L14	Type 18-8 SS
Threshold	AISI 1010 / 1018	N/A
Tie-Wire	AISI 1010 / 1018	N/A
Zinc Plating	ASTM B 633, SC1, Type III (Fe/Zn 5)	N/A
