SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor Occupancy Sensor **INTEGRATED SENSORS:** Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

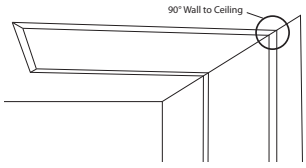
DESCRIPTION



High Performance 4" Aperture Recessed (HP-4 R) is a patented, linear LED luminaire. HP-4 R is the first recessed linear LED luminaire to feature On-Grid™ mounting for standard lengths, making installation quick and easy.

Flush Diffuser (Standard)

DIMENSIONS & DIFFUSER

Glare-free experience is attained with mid-power LEDs and a precise diffuser to eliminate pixilation.

MITERED ANGLES

Fully illuminated corners have internal secondary diffusers to ensure against light leaks. Custom angles are available.

Tailored Lighting
10 working days

TAILORED LIGHTING

Any length greater than 2 feet, in increments down to 1/16th-inch (± 1/32") and 90-degree mitered corners in a single plane.

ORDERING GUIDE

Sample Number: HP-4 R - 32' - S - 8 - 35 - F - 120V - SC - C1 - OBO

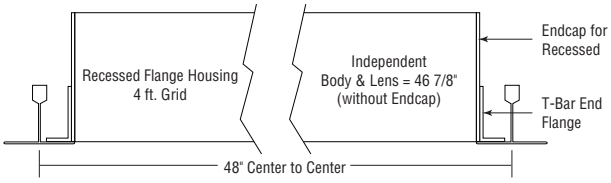
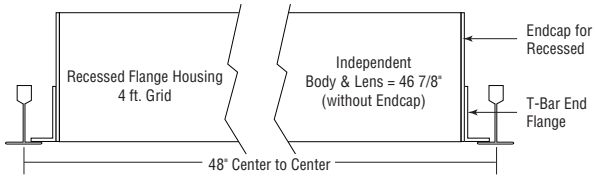
SHEET ROCK INSTALLATION:



Flex conduit is secured to top of luminaire. Support to structure using All-Thread. All-Thread support holes are located on each end of the luminaire.

T-BAR INSTALLATION:



HP-4 R for T-Bar installations comes standard with a splice plate at the end of the luminaire. Mounting brackets (supplied) secure the luminaire to T-Bar and provide support to structure location. All starter/independent luminaires are 1 1/8" shorter than nominal. All joiner/ender luminaire are normal length.

Flush Screw Slot (C3F) | Standard Screw Slot (C3) | Tech Zone (TZ6- C1, C2. C2T, C3, C3F)

MOUNTING TYPES: CUTOUT DIMENSIONS

Spackle Flange (SF) | Visible Flange (VF)

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

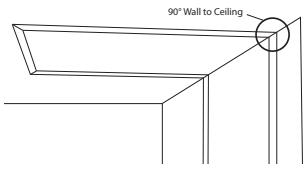
DESCRIPTION



High Performance 4" Aperture Recessed (HP-4 R) is a patented, linear LED luminaire. HP-4 R is the first recessed linear LED luminaire to feature On-Grid™ mounting for standard lengths, making installation quick and easy.

Flush Diffuser (Standard)

DIMENSIONS & DIFFUSER

Glare-free experience is attained with mid-power LEDs and a precise diffuser to eliminate pixilation.

MITERED ANGLES

Fully illuminated corners have internal secondary diffusers to ensure against light leaks. Custom angles are available.

Tailored Lighting
10 working days

TAILORED LIGHTING

Any length greater than 2 feet, in increments down to 1/16th-inch (± 1/32") and 90-degree mitered corners in a single plane.

ORDERING GUIDE

Sample Number: HP-4 R - 32' - S - 8 - 35 - F - 120V - SC - C1 - OBO

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor | Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

High Performance 4" Aperture (HP-4) - Recessed

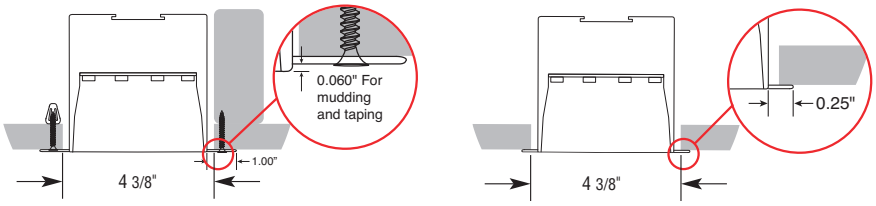
MOUNTING TYPES: T-BAR

Rough-In Dimensions



1" T-Bar (C1) | 9/16" T-Bar (C2) | 1" Tegular (C1T) | 9/16" Tegular (C2T)

Flush Screw Slot (C3F) | Standard Screw Slot (C3) | Tech Zone (TZ6- C1, C2. C2T, C3, C3F)

MOUNTING TYPES: CUTOUT DIMENSIONS

Spackle Flange (SF) | Visible Flange (VF)

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor | Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

CONSISTING OF
(2) TYPE RA24C
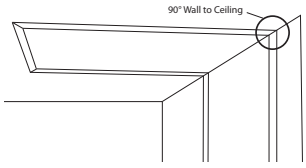
(2) TYPE RA6-8C
AND (4) 90 DEGREE CORNERS

DESCRIPTION



High Performance 4" Aperture Recessed (HP-4 R) is a patented, linear LED luminaire. HP-4 R is the first recessed linear LED luminaire to feature On-Grid™ mounting for standard lengths, making installation quick and easy.

Flush Diffuser (Standard)

DIMENSIONS & DIFFUSER

Glare-free experience is attained with mid-power LEDs and a precise diffuser to eliminate pixilation.

MITERED ANGLES

Fully illuminated corners have internal secondary diffusers to ensure against light leaks. Custom angles are available.

Tailored Lighting
10 working days

TAILORED LIGHTING

Any length greater than 2 feet, in increments down to 1/16th-inch (± 1/32") and 90-degree mitered corners in a single plane.

MOUNTING TYPES: CUTOUT DIMENSIONS

Spackle Flange (SF) | Visible Flange (VF)

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor | Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

High Performance 4" Aperture (HP-4) - Recessed

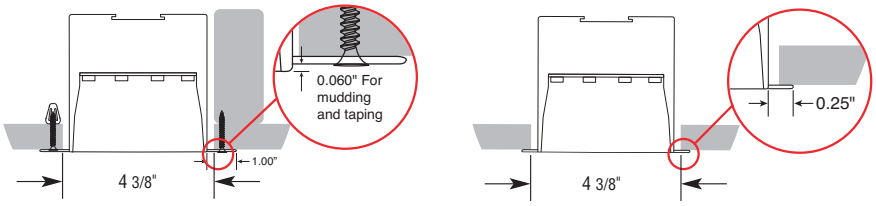
MOUNTING TYPES: T-BAR
Rough-In Dimensions



1" T-Bar (C1) | 9/16" T-Bar (C2) | 1" Tegular (C1T) | 9/16" Tegular (C2T)

Flush Screw Slot (C3F) | Standard Screw Slot (C3) | Tech Zone (TZ6- C1, C2. C2T, C3, C3F)

MOUNTING TYPES: CUTOUT DIMENSIONS

Spackle Flange (SF) | Visible Flange (VF)

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor | Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

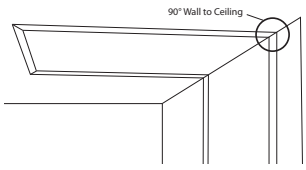
Type

Comments

DESCRIPTION



High Performance 4" Aperture Recessed (HP-4 R) is a patented, linear LED luminaire. HP-4 R is the first recessed linear LED luminaire to feature On-Grid™ mounting for standard lengths, making installation quick and easy.

Flush Diffuser (Standard)

DIMENSIONS & DIFFUSER

Glare-free experience is attained with mid-power LEDs and a precise diffuser to eliminate pixilation.

MITERED ANGLES

Fully illuminated corners have internal secondary diffusers to ensure against light leaks. Custom angles are available.

Tailored Lighting
10 working days

TAILORED LIGHTING

Any length greater than 2 feet, in increments down to 1/16th-inch (± 1/32") and 90-degree mitered corners in a single plane.

ORDERING GUIDE

Sample Number: HP-4 R - 32' - S - 8 - 35 - F - 120V - SC - C1 - OBO

HP-4 R

Finelite Series HP-4 R
Length (Minimum 2', increments accurate to 1/16th" (± 1/32"), standard)
Light Output (S - Standard, B - Boosted Standard, H - High, V - Very High)
LED CRI (8 - 80 CRI min (standard), 9 - 90 CRI min)
LED Color Temperature (30 - 3000K, 35 - 3500K, 40 - 4000K)
Downlight Diffuser Option (F - Flush (standard))
Voltage (120V, 277V)
Circuiting (SC - Single Circuit)
Mounting (C1 - 1" T-Bar, C2 - 9/16" T-Bar, C3 - screw slot, C3F - flush screw slot, VF - Visible Flange, C2T - 9/16" tegular, C1T - 1" tegular, SF - Spackle Flange, TZ6 (C1, C2, C2T, C3, C3T) - tech zone 6")
Integrated Sensor (OBO - Occupancy Sensor, OBD - Daylight)

*Contact factory for switching options.

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor Occupancy Sensor **INTEGRATED SENSORS:** Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

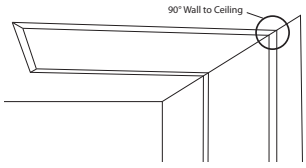
DESCRIPTION



High Performance 4" Aperture Recessed (HP-4 R) is a patented, linear LED luminaire. HP-4 R is the first recessed linear LED luminaire to feature On-Grid™ mounting for standard lengths, making installation quick and easy.

Flush Diffuser (Standard)

DIMENSIONS & DIFFUSER

Glare-free experience is attained with mid-power LEDs and a precise diffuser to eliminate pixilation.

MITERED ANGLES

Fully illuminated corners have internal secondary diffusers to ensure against light leaks. Custom angles are available.

Tailored Lighting
10 working days

TAILORED LIGHTING

Any length greater than 2 feet, in increments down to 1/16th-inch (± 1/32") and 90-degree mitered corners in a single plane.

ORDERING GUIDE

Sample Number: HP-4 R - 32' - S - 8 - 35 - F - 120V - SC - C1 - OBO

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

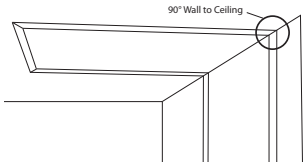
DESCRIPTION



High Performance 4" Aperture Recessed (HP-4 R) is a patented, linear LED luminaire. HP-4 R is the first recessed linear LED luminaire to feature On-Grid™ mounting for standard lengths, making installation quick and easy.

Flush Diffuser (Standard)

DIMENSIONS & DIFFUSER

Glare-free experience is attained with mid-power LEDs and a precise diffuser to eliminate pixilation.

MITERED ANGLES

Fully illuminated corners have internal secondary diffusers to ensure against light leaks. Custom angles are available.

Tailored Lighting
10 working days

TAILORED LIGHTING

Any length greater than 2 feet, in increments down to 1/16th-inch (± 1/32") and 90-degree mitered corners in a single plane.

ORDERING GUIDE

Sample Number: HP-4 R - 32' - S - 8 - 35 - F - 120V - SC - C1 - OBO

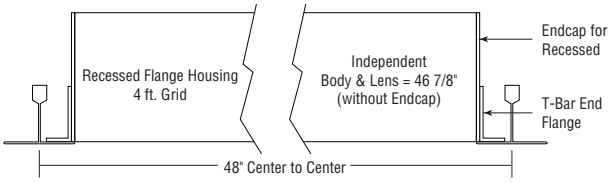
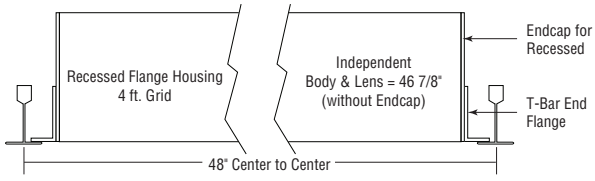
SHEET ROCK INSTALLATION:



Flex conduit is secured to top of luminaire. Support to structure using All-Thread. All-Thread support holes are located on each end of the luminaire.

T-BAR INSTALLATION:



HP-4 R for T-Bar installations comes standard with a splice plate at the end of the luminaire. Mounting brackets (supplied) secure the luminaire to T-Bar and provide support to structure location. All starter/independent luminaires are 1 1/8" shorter than nominal. All joiner/ender luminaire are normal length.

SPECIFICATIONS

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard. Housing is powder coated.

ENDCAPS: Flat endcaps add 0.05" to each end of luminaire.

MITERED CORNERS: Illuminated 90° corners in a single plane, with Flush downlight diffuser, standard. Custom angles are available (90° minimum on inside corners), contact factory.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors are finished in 96 LG high reflectance matte white powder coat paint.

DOWNLIGHT DIFFUSER: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Frost white snap-in diffuser option, 73% transmissive, 99% diffusion.

LIGHT OUTPUT: Four lumen packages available, Standard Output (S), Boosted Standard Output (B), High Output (H), and Very High Output (V). A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

DRIVER: Replaceable 120V/277V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100%. Dimming to 1% available; consult factory. Driver is fully accessible from below the ceiling. Power Factor: 0.9. Total Harmonic Distortion (THD) <20%. Expected driver lifetime: 100,000 hours.

LUTRON DRIVER OPTIONS: Lut3W-3-wire, LutES-EcoSystem, Lut2W-2-wire.

ELECTRICAL: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Chicago Plenum option. Factory-choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack. Bodine BSL722 battery pack also available; 4' minimum luminaire length. Backup battery delivers 1300 lumens. Half of a 4' section will be illuminated in emergency mode.

Daylight Sensor | Occupancy Sensor

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy and/or daylight sensors available with Flush downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

MOUNTING: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets. Connect luminaire to T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. Optional 6' flex conduit whips available.

LENGTHS: Any length, 2-foot minimum, in increments down to 1/16th-inch (± 1/32"). 12-foot maximum section length.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.73 (G), this luminaire contains an internal driver disconnect. Damp Location. IC-Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2002/95/EC.

WEIGHT: 2.8 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

Protected by one or more US Patents: 8915613; D702,391; D702,390; D700,732

Via skim recessed deep

DESCRIPTION

Via Skim is designed to illuminate textured or polished vertical surfaces with a grazing light from the wall/ceiling intersection. Via Skim provides continuous illumination across the wall surface.
The intense light distribution is achieved with our Grazing Reflector Optic (GRO) oriented to project light with maximum luminous intensity at 5° from nadir.
The Via Skim is available with two depth options: shallow and deep. Total recessed depth ranges from 4¾" to 7".

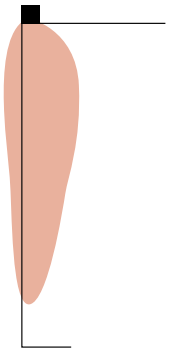
GRAZING REFLECTOR OPTIC (GRO) - The intense light distribution is achieved with our Grazing Reflector Optic oriented to project light with maximum luminous intensity at 5° from nadir.



LIGHT SOURCE - LED

Custom linear array of mid-flux LED's are cartridge-mounted with quick-connect wiring to facilitate service and thermal management. Available in 3000K, 3500K and 4000K with a minimum 80 CRI and an option for 90 CRI with elevated R9 value. Color consistency maintained to within 3 SDCM. LEDs operated at reduced drive current to optimize efficacy and lumen maintenance.
All LEDs have been tested in accordance with IESNA LM-80-08 and the results have shown L80 lumen maintenance greater than 60,000 hours. Absolute product photometry is measured and presented in accordance with IESNA LM-79, unless otherwise indicated.

Via skim recessed deep

PROJECT: _____

TYPE: _____

NOTES: _____

DESCRIPTION

Via Skim is designed to illuminate textured or polished vertical surfaces with a grazing light from the wall/ceiling intersection. Via Skim provides continuous illumination across the wall surface.

The intense light distribution is achieved with our Grazing Reflector Optic (GRO) oriented to project light with maximum luminous intensity at 5° from nadir.

The Via Skim is available with two depth options: shallow and deep. Total recessed depth ranges from 4¾" to 7".

Grid joining

ELECTRICAL

Factory-set adjustable output current electronic driver with 120-277V AC line input. Dimmable from at least 100%-5% with 0-10V control. Rated life (90% survivorship) of 50,000 hours at 50°C max. ambient (and 70°C max. case) temperature. At maximum driver load: Efficiency>84%, PF>0.9, THD<20%. Other specifiable options include Lutron Hi-Lume A (specify 2, 3 or 4 wires), EcoSystem H (100%-1%, fade-to-black) and EcoSystem 5 (100%-5%) dimmable drivers and DALI protocol drivers.

EMERGENCY

Factory installed long life high temperature recyclable Ni-Cad battery pack with test switch and charge indicator, minimum of 90 minutes operation, up to 1000 lumens per 4ft (25°C) emergency lighting output. Recharge time of 24 hours.

DESCRIPTION

Via Skim is designed to illuminate textured or polished vertical surfaces with a grazing light from the wall/ceiling intersection. Via Skim provides continuous illumination across the wall surface.
The intense light distribution is achieved with our Grazing Reflector Optic (GRO) oriented to project light with maximum luminous intensity at 5° from nadir.
The Via Skim is available with two depth options: shallow and deep. Total recessed depth ranges from 4¾" to 7".

Via skim recessed deep

DESCRIPTION

Via Skim is designed to illuminate textured or polished vertical surfaces with a grazing light from the wall/ceiling intersection. Via Skim provides continuous illumination across the wall surface.
The intense light distribution is achieved with our Grazing Reflector Optic (GRO) oriented to project light with maximum luminous intensity at 5° from nadir.
The Via Skim is available with two depth options: shallow and deep. Total recessed depth ranges from 4¾" to 7".

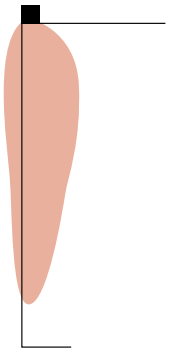
GRAZING REFLECTOR OPTIC (GRO) - The intense light distribution is achieved with our Grazing Reflector Optic oriented to project light with maximum luminous intensity at 5° from nadir.



LIGHT SOURCE - LED

Custom linear array of mid-flux LED's are cartridge-mounted with quick-connect wiring to facilitate service and thermal management. Available in 3000K, 3500K and 4000K with a minimum 80 CRI and an option for 90 CRI with elevated R9 value. Color consistency maintained to within 3 SDCM. LEDs operated at reduced drive current to optimize efficacy and lumen maintenance.
All LEDs have been tested in accordance with IESNA LM-80-08 and the results have shown L80 lumen maintenance greater than 60,000 hours. Absolute product photometry is measured and presented in accordance with IESNA LM-79, unless otherwise indicated.

OPTICS

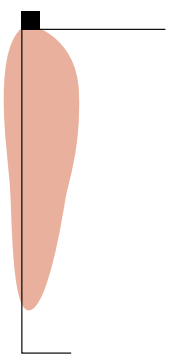
GRAZING REFLECTOR OPTIC (GRO) - The intense light distribution is achieved with our Grazing Reflector Optic oriented to project light with maximum luminous intensity at 5° from nadir.



LIGHT SOURCE - LED

Custom linear array of mid-flux LED's are cartridge-mounted with quick-connect wiring to facilitate service and thermal management. Available in 3000K, 3500K and 4000K with a minimum 80 CRI and an option for 90 CRI with elevated R9 value. Color consistency maintained to within 3 SDCM. LEDs operated at reduced drive current to optimize efficacy and lumen maintenance.
All LEDs have been tested in accordance with IESNA LM-80-08 and the results have shown L80 lumen maintenance greater than 60,000 hours. Absolute product photometry is measured and presented in accordance with IESNA LM-79, unless otherwise indicated.

PERFORMANCE PER 4' AT 4000K

LED output	Color Temp	Watts	Nominal Delivered Lumens	Efficacy LPW
low output	4000K	19	1400	75
medium output	4000K	27	2000	74
high output	4000K	42	3000	71

LIGHT DISTRIBUTION

LUMINAIRE LENGTH

All individual sections are joined together onsite using the joiner kits provided. LumenWerx offers joiner kits that are extremely simple to work with in the field and result in a fixture that appears virtually seamless with no light leak at any connection.

Joining system

Drywall joining

Grid joining

ELECTRICAL

Factory-set adjustable output current electronic driver with 120-277V AC line input. Dimmable from at least 100%-5% with 0-10V control. Rated life (90% survivorship) of 50,000 hours at 50°C max. ambient (and 70°C max. case) temperature. At maximum driver load: Efficiency>84%, PF>0.9, THD<20%. Other specifiable options include Lutron Hi-Lume A (specify 2, 3 or 4 wires), EcoSystem H (100%-1%, fade-to-black) and EcoSystem 5 (100%-5%) dimmable drivers and DALI protocol drivers.

EMERGENCY

Factory installed long life high temperature recyclable Ni-Cad battery pack with test switch and charge indicator, minimum of 90 minutes operation, up to 1000 lumens per 4ft (25°C) emergency lighting output. Recharge time of 24 hours.

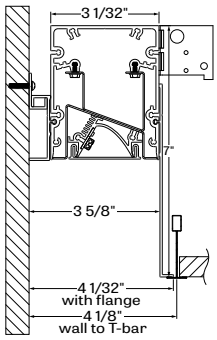
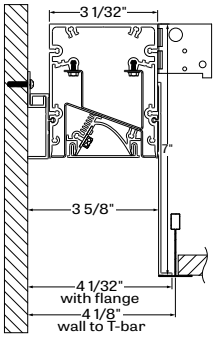
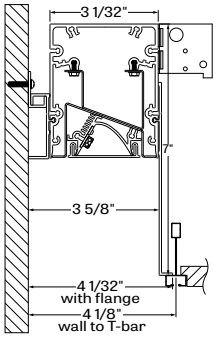
MOUNTING OPTIONS



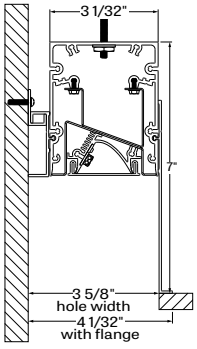
Recess mount into exposed or concealed T-Bar or Tegular grid ceiling, Trimless mounting detail is available for drywall ceilings.



TG9 - tegular 9/16"



TG15 - tegular 15/16"



TB9 - t-bar 9/16"

TB15 - t-bar 15/16"

ST - screw slot t-bar

DTL - drywall trimless

FINISH

Interior - 95%, reflective matte powder coated white paint
Exterior - matte white or silver powder coating.
Custom finishes are also available.

CONSTRUCTION

Housing - Extruded Aluminum (0.095" nominal) up to 90% Recycled Content
Interior brackets - Die formed cold rolled sheet steel 18 gauge thick
Joining system - Die cast Zinc (0.95" nominal) and die Formed galvanized sheet 18 gauge
Reflectors - Extruded Aluminum (0.070" nominal) up to 90% Recycled Content.
Recessed flanges - Extruded Aluminum (0.075" nominal) up to 90% Recycled Content
End plate - Die formed cold rolled sheet steel 18 gauge thick

MAINTENANCE

LED boards are housed in a removable cartridge for easy replacement. Driver is accessible from below.

WEIGHT

Via Skim 3 4ft - 11.23lbs - 5.1kg
Via Skim 3 8ft - 22.47lbs - 10.2kg
Via Skim 3 12ft - 33.70lbs - 15.3kg

CERTIFICATIONS

ETL - Rated for Dry/Damp locations. Conforms to UL Standard 1598 and certified to CAN/CSA Standard C22.2 No. 250.0.
Chicago plenum - City of Chicago Approved (CCEA)
IC rated - suitable for direct contact with insulation.

WARRANTY

LumenWerx provides a five-year limited warranty of electrical and mechanical performance of the luminaires, including the LED boards, drivers, and auxiliary electronics. LumenWerx will repair or replace defective luminaires or components at our discretion, provided they have been installed and operated in accordance with our specifications. Other limitations apply, please refer to the full warranty on our website.

PRESSURE REDUCING VALVES | RD-11, RD-40, RD-50 & HRD-70 | INSTALLATION AND OPERATING INSTRUCTIONS

File No: 11.85
Date: DECEMBER 24, 2015
Supersedes: 11.85
Date: MAY 13, 2008

1.0 INSTALLATION

The pressure reducing valve should be installed with the flow arrow on the body pointing in the direction of the flow. Install the union fittings, supplied with the valve (model RD-11 and C-11), on the inlet side of the valve body, for quick installation and removal if necessary. A shut-off valve should be installed on the city water side of the pressure reducing valve. If the pressure reducing valve is not equipped with a fast fill feature, a by-pass may be used. A three valve by-pass around the pressure reducing valve will also serve as a fast fill option and is recommended for service.

CAUTION

The use of Teflon tape when installing a valve provides lubricity. Care should be taken to avoid over tightening, which may crack the valve body.

2.0 OPERATION

Models RD-11, RD-40 and RD-50 are preset at 12 psi, and the HRD-70 is preset at 45 psi. Open the cold water fill valve and the system will be filled until the boiler gauge indicates the preset valve pressure has been obtained.

Model RD-11 is preset at 12 psi and is equipped with a fast fill feature. When filling the system as noted above, the fast fill thumbscrew should be manually turned in completely. This overrides the pressure regulating function of the valve. The system should be filled until the boiler gauge indicates the preset pressure of the valve and then the fast fill thumbscrew should be backed off completely until it spins freely.

WARNING

The fast fill thumbscrew must never be left in the down position after the system has been filled. The thumbscrew must be placed in the free position to avoid over pressurization and unnecessary relief valve discharge.

3.0 ADJUSTMENT

Allow system water to cool to ambient temperature. If necessary, adjust valve pressure setting as follows: pressure setting can be raised or lowered by loosening the jam nut and turning the slotted adjusting screw clockwise to increase the set pressure or counter-clockwise to lower the set pressure. This should be done slowly until the boiler pressure gauge indicates the required system pressure. A screw driver should be used to hold the adjusting stem stationary while the jam nut is secured.

4.0 SERVICE

If the pressure reducing valve fails to maintain the set cold fill pressure, the sediment strainer may be clogged. To service the strainer, shut off city water supply and the isolation valve on the discharge of the pressure reducing valve. Remove and clean or replace the strainer and replace the strainer gasket and nut. Open both the city water shut-off valve and the isolation valve to resume normal system operation.

1.0 INTRODUCTION

This document contains specific information regarding the safe installation, operating and maintenance of Vertical In-Line pumps and should be read and understood by installing, operating and maintenance personnel. The equipment supplied has been designed and constructed to be safe and without risk to health and safety when properly installed, operated and maintained. The following instructions must be strictly adhered to. If clarification is needed on any point please contact Armstrong quoting the equipment serial number.

WARNING SYMBOLS

Safety instruction where an electrical hazard is involved.

Safety instruction where non-compliance would affect safety risk.

Safety instruction relating to safe operation of the equipment. (ATTENTION)

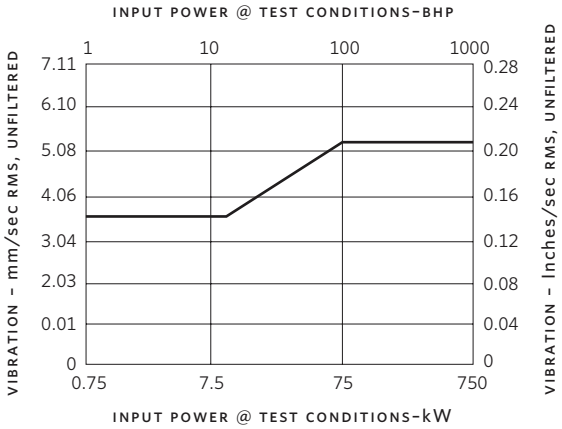
1.1 INSTRUCTIONS FOR SAFE USE

No installation of this equipment should take place unless this document has been studied and understood. Handling, transportation and installation of this equipment should only be undertaken by trained personnel with proper use of lifting equipment. See later diagrams for lifting advice. Refer to the pump nameplate for pump speed, pressure and temperature limitations. The limits stated must not be exceeded without written permission from Armstrong.

1.2 TEMPERATURE

Where under normal operating conditions the limit of 68°C/155°F (restricted zone) for normal touch, or 80°C/176°F (unrestricted zone) for unintentional touch, may be experienced, steps should be taken to minimize contact or warn operators/users that normal operating conditions will be exceeded. In certain cases where the temperature of the pumped liquid exceeds the above stated temperature levels, pump casing temperatures may exceed 100°C/212°F and not withstanding pump insulation techniques appropriate measures must be taken to minimize risk for operating personnel.

1.3 NOISE LEVELS



Typical Pumping Unit Sound Pressure Level, Decibels, A-Weighted, at 1 m (3 ft.) from unit.

1.4 VIBRATION LEVELS

Armstrong Vertical In-Line pumps are designed to meet vibration levels set by Hydraulic Institute Standard HI Pump vibration 9.6.4. standard levels are as detailed below:

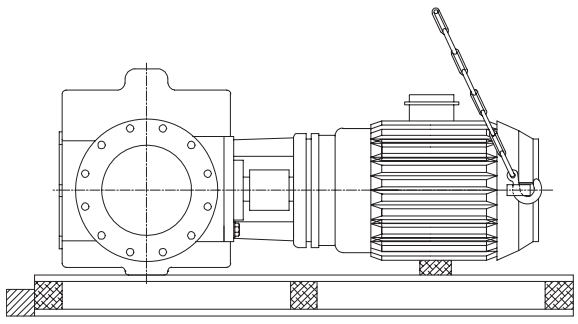
VERTICAL IN–LINE

1.5 STORAGE

Pumps not immediately placed into service, or removed from service and stored, must be properly prepared to prevent excessive rusting. Pump port protection plates must not be removed until the pump is ready to connect to the piping.

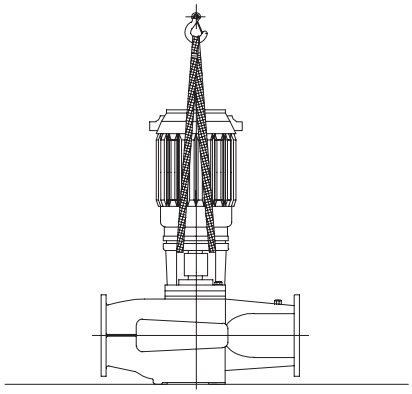
Rotate the shaft periodically (at least monthly) to keep rotating element free and bearings fully functional.

For long term storage (longer than 3 months), the pump must be placed in a vertical position in a dry environment.



Internal rusting can be prevented by removing the plugs at the top and bottom of the casing and drain or air blow out all water to prevent rust buildup or the possibility of freezing. Be sure to reinstall the plugs when the unit is made operational. Rust-proofing or packing the casing with moisture absorbing material and covering the flanges is acceptable. When returning to service be sure to remove the drying agent from the pump.

1.6 UNCRATING



Armstrong Vertical In-Line pumps are thoroughly inspected before shipment to assure they meet with your order requirements. After removing the pump from the crate, make sure the equipment is in good order and that all components are received as called for on the packing list. Any shortages or damage should be reported immediately. Use extreme care in handling the unit, placing slings and hooks carefully so that stress will not be imposed on the pump. **Never place cable slings around the pump shaft.** The eye bolts or lifting lugs on the motor are intended for lifting the motor only and not the complete unit.

1.7 HANDLING LARGE VIL UNITS

One effective way of lifting a large Series 4300 unit from the shipment pallet following uncovering the unit is to place lifting hooks through the motor lifting rings or straps around the upper part of the motor and carefully lift sufficiently to stand the pump vertically. Lift only enough to remove the pallet then lower onto a flat surface. The pump and motor unit will free-stand on the casing ribs. Remove the coupling guard and place (2) lifting straps through the pump/motor pedestal (one on each side of the motor shaft) and secure to the lifting device. With the straps in place, using a spacer bar if necessary to protect the motor fan cover, the whole assembly can now be lifted securely and placed in position in the piping.

Secure pallet and lift pump vertical using motor eye-bolts lift only to clear pallet then sit on the flat surface.

Remove coupling guard and place lifting straps on each side of coupling, use spacer bar if necessary to protect motor fan cover.

IMPORTANT:

Do not run the pump for any length of time under very low flow conditions or with the discharge valve closed. This could cause the water in the casing to reach super heated steam conditions, cause premature failure and cause serious and dramatic damage to the pump and surrounding area.

2.0 INSTALLATION

2.1 LOCATION

In open systems, locate the unit as close as practical to the liquid being pumped, with a short, direct suction pipe. Ensure adequate space is left above and around the unit for operation, maintenance, service and inspection of parts.

In closed systems, where possible, the pumps should be installed immediately downstream of the expansion tank/make-up connection. This is the point of zero pressure change and is necessary for effective pump operation. Do not install more than one expansion tank connection into any closed hydronic system.

Electric motor driven pumps should not be located in damp or dusty locations without special protection.

Airflow into the motor and/or motor fan should not be obstructed.

2.2 INSTALLATION

When installing Vertical In-Line pumps, an important consideration to accrue full added-value from the pump design is to ensure that the pump is pipe-mounted and free to 'float' with any movement, expansion and contraction of the piping. Should any Vertical In-Line pump use supports to the structure it is imperative that no pipe strain is imposed on the pump flanges. Telltale pieces of equipment such as springs or 'waffle' style neoprene isolation pads that distort with pressure to indicate added piping weight, should be used under pump supports should the pump not be truly pipe mounted.

Various installation arrangements are detailed on Pages 6 and 7:

2.2.1
Vertical In-Line pumps may be installed directly in the system piping with no additional support. Pipe hangers are simply sized for the additional weight of the pumping unit. Many pumps are installed in this manner and are mounted at sufficient height to take zero floor space. (Fig. 2.1)

2.2.2
Piping, in many mechanical rooms, is hung close to the ceiling and larger pumps are mounted near ground level for ease of maintenance. Fig 2.2 illustrates such an arrangement with the piping supported at the ceiling and the VIL unit installed with an Armstrong Suction Guide and triple function Flo-Trex valve. Many very large VIL pumps are installed in this manner.

2.2.3
Should additional space saving be required the discharge spool piece and Flo-Trex valve may be replaced by a long-radius elbow and the Flo-Trex valve field converted to a straight-through valve and installed in the vertical discharge pipe. (Fig. 2.3)

2.2.4
Fig 2.4 illustrates a similar arrangement to Fig 2.2 with additional floor mounted pipe-stools isolated from the structure by 'waffle' style neoprene isolation pads under the Armstrong Suction Guide and Flo-Trex valve.

2.2.5
Floor mounted saddle supports (Fig. 2.5) are typical for condenser water pumps where the cooling tower base is near mechanical room elevation.

2.2.6
Where required, additional floor support may be used as shown in Fig. 2.6. Note that the pump should not be rigidly attached to the column. Leave a small gap between pump and column or install a 'waffle' isolation pad under the pump. It is critical that piping be installed in such a manner that the pump does not become a pipe support.

2.2.7
Fig. 2.7 illustrates stanchion plates at the pump inlet and outlet ports that may be supplied for installation convenience. Isolation pads must be used under the legs and monitored as pipe hangers are adjusted to ensure the pump flanges are not supporting the piping. Bolting to the floor or housekeeping pad is not recommended. If the stanchions are bolted down the bolts must be isolated from the stanchion or an inertia base and flexible pipe connectors should be used.

2.2.8
Fig. 2.8 illustrates installations with stanchion plates for seismically active regions. Seismically rated isolation pads or snubbers with bolts isolated from the stanchion plates are installed to restrain the pump during a seismic event. Pipe hangers carry the weight of the equipment as seismic components are designed only to restrain the equipment during a seismic event.

2.2.9
Close coupled in-line units (Series 4360 & 4380) up to 15 hp / 11 kW may be installed with the shaft horizontal. (Fig. 2.9) For horizontal mounting of large units or Series 4300 Split-Coupled style consult the factory. (Fig. 2.9)

2.2.10
Many Vertical In-Line pumps are piped successfully into grooved piping systems. In-line pumps are supported well by grooved piping however flange adapter locking devices or a welded flange at the pump should be used to prevent the possibility of pipe mounted pumps rotating in the piping. Armstrong offers grooved suction guides with cast-in outlet flanges and triple function Flo-Trex valves with inherent locking devices to prevent this possibility. (Fig. 2.10)

2.2.11
Do not support the unit by the motor eye bolts (Fig. 2.11) or by any other part of the motor.

2.2.12
Connecting the pump to a permanent rigid base (Fig. 2.12). is not recommended unless isolated from the piping by flexible connectors and the base isolated from the building structure on an inertia base. (Fig. 2.12 is generally acceptable when using plastic piping).

IMPORTANT:

All Series 4300 pumps contain a tapped hole in the motor bracket above the discharge flange (see Fig. 2.13) for draining the well. Pipe this drain hole to a floor drain to avoid overflow of the cavity caused by collecting chilled water condensate or from seal failure.

2.3 PUMP PIPING – GENERAL

Never connect a pump to piping, unless extra care is taken to measure and align the piping flanges well. Always start piping from pump.

Use as few bends as possible and preferably long radius elbows.

Do not use flexible connectors on the suction or discharge of a Vertical In-Line pump, unless the pump is rigidly mounted to a foundation.

Ensure piping exerts no strain on pump as this could distort the casing causing breakage or early failure due to pump misalignment.

All conecting pipe flanges must be square to the pipework and parallel to the pump flanges.

Suction and discharge pipes may be increased or decreased at pump nozzle to suit pump capacity and particular conditions of installation. Use eccentric reducers on suction connection with flat side uppermost.

Layout the suction line with a continual rise towards the pump without high points, thus eliminating possibility of air pockets that may prevent the pump from operating effectively.

A strainer of three or four times the area of the suction pipe, installed in the suction line, will prevent the entrance of foreign materials into the pump. $^{3}/_{16}$" (5 mm) diameter perforations in the strainer is typical.

In open systems, test suction line for air leaks before starting; this becomes essential with long suction line or static lift. Install, at the pump suction, a straight pipe of a length equivalent to 4 or 6 times its diameter; this becomes essential when handling liquids above 120°F (49°C). Armstrong suction guides may be used in place of the straight pipe run and in-line strainer.

Install an isolation valve in both suction and discharge lines on flooded suction application; these valves are used primarily to isolate the pump for inspection or repair.

Install a non-slam non-return check valve in discharge line between pump and isolation valve to protect pump from excessive back pressure and to prevent water running back through the pump in case of driver failure on open systems. An Armstrong Flo-Trex valve may be used in place of non-return check valve and isolation valve on pump discharge.

CAUTION:

A Only the discharge valve is to be used to throttle pump flow, not the suction valve. Care must be taken in the suction line layout and installation, as it is usually the major source of concern in centrifugal pump applications.

2.4 ALIGNMENT

Alignment is unnecessary on close-coupled pumps, Series 4360 & 4380, as there is no shaft coupling.

Series 4300 units are accurately aligned at the factory prior to being shipped and do not need re-aligning when installed.

Alignment on a Series 4300 unit may be verified by assuring an equal and parallel gap between coupling halves on both sides of the coupling.

OPERATION

2.5 STARTING THE PUMP

Ensure that the pump turns freely by hand, or with some gentle mechanical help such as a strap or Allen key in coupling bolt.

Ensure that all protective guarding is securely fixed in position.

The pump must be fully primed on start up. Fill the pump casing with liquid and rotate the shaft by hand to remove any air trapped in the impeller. On Series 4300 any air trapped in the casing as the system is filled must be removed by the manual air vent in the seal flush line. **Ensure entrained air is removed from series 4300 pumps, prior to starting, through the air vent on the seal flush line. Open vent until clear of air.** Series 4360 & 4380 units are fitted with seal flush/vent lines piped to the pump suction area. When these units operate residual air is drawn out of the pump towards the suction piping.

'Bump' or energize the motor momentarily and check that the rotation corresponds with the directional arrow on the pump casing.

To reverse rotation of a three phase motor, interchange any two power leads.

Start the pump with the discharge valve closed and the suction valve open, then gradually open the discharge valve when the motor is at operating speed. The discharge valve may be open slightly at start up to help eliminate trapped air.

When stopping the pump: Close the discharge valve and de-energize the motor.

Do not run the pump against a closed discharge valve for an extended period of time (a few minutes maximum).

Star-Delta motor starters should be fitted with electronic/mechanical interocks that have a timed period of no more than 40 miliseconds before switching from star (starting) to delta (run) connection yet allow the motor to reach full star (starting) speed before switching to delta (run).

Should the pump be noisy or vibrate on start-up a common reason is overstated system head. Check this by calculating the pump operating head by deducting the suction pressure gauge value from the discharge gauge reading. Convert the result into the units of the pump head as stated on the pump nameplate and compare the values. Should the actual pump operating head be significantly less than the nameplate head value it is typically permissable to throttle the discharge isolation valve until the actual operating head is equal to the nameplate value. Any noise or vibration usually disappears. The system designer or operator should be made aware of this as some adjustment may be required to the pump impeller diameter or drive settings, if applicable, to make the pump suitable for the system as installed.

CAUTION:

Check rotation arrow prior to operating the unit. The rotation of all Armstrong Vertical In-Line units is clockwise when viewed from the drive end. (Looking from on top of/behind the motor).

2.6 GENERAL CARE

Vertical In-Line pumps are built to operate without periodic maintenance, other than motor lubrication on larger units. A systematic inspection made at regular intervals, will ensure years of trouble-free operation, giving special attention to the following:

- Keep unit clean.
- Provide the motor with correctly sized overload protection.
- Keep moisture, refuse, dust or other loose particles away from the pump and ventilating openings of the motor.
- Avoid operating the unit in overheated surroundings (above 100°F/40°C).

WARNING:

Whenever any service work is to be performed on a pumping unit, disconnect the power source from the driver, **lock it off** and tag with the reason. Any possibility of the unit starting while being serviced must be eliminated.

- If mechanical seal environmental accessories are installed, ensure water is flowing through the sight flow indicator and that filter cartridges are replaced as recommended. (See Armstrong files 43.85 & 43.86 for seal environmental instructions).

2.7 LUBRICATION

Pump
Lubrication is not required. There are no bearings in the pump that need external lubrication service.

Large Series 4300 units are installed with a shaft bushing located beneath the impeller that is lubricated from the pump discharge. This bearing is field removable for service on the 20 × 20 × 19 size without disturbing the motor or other major pump components.

Service instructions for the lower bearing is to be found in File no: 43.805.

Motor
Follow the lubrication procedures recommended by the motor manufacturer. Many small and medium sized motors are permanently lubricated and need no added lubrication. Generally if there are grease fittings evident the motor needs periodic lubrication. None if not.

Check the lubrication instructions supplied with the motor for the particular frame size indicated on the motor nameplate.

Mechanical Seal
Mechanical seals require no special attention. The mechanical seal is fitted with a flush line. The seal is flushed from discharge of the pump casing on Series 4300 pumps and is flushed/vented to the suction on close coupled pumps, Series 4360 & 4380.

The Series 4300 pump is flushed from the pump discharge because the mechanical seal chamber is isolated from the liquid in the pump by a throttle bushing. Because the seal chamber is isolated, seal environmental controls such as filters and separators, when installed in the Series 4300 flush line are very effective, as only the seal chamber needs cleansing, and will prolong seal life in HVAC systems.

Do not run the pump unless properly filled with water as the mechanical seals need a film of liquid between the faces for proper operation.

Mechanical seals may 'weep' slightly at start-up. Allow the pump to continue operating for several hours and the mechanical seal to 'seat' properly prior to calling for service personnel.

The following Armstrong files are available for mechanical seal replacement instructions:

- Series 4360 & 4380: File no. 43.81
- Series 4300: P-Base and TCZ Motor Frame – File no. 43.84
  TC Motor Frame – File no. 43.88

2.8 SYSTEM CLEANLINESS

Before starting the pump the system must be thoroughly cleaned, flushed and drained and replenished with clean liquid.

Welding slag and other foreign materials, Stop Leak and cleaning compounds and improper or excessive water treatment are all detrimental to the pump internals and sealing arrangement.

Proper operation cannot be guaranteed if the above conditions are not adhered to.

NOTE:
Particular care must be taken to check the following before the pump is put into operation:

- **A** Pump primed?
- **B** Rotation OK?
- **C** Lubrication OK?
- **D** Pipe work properly supported?
- **E** Voltage supply OK?
- **F** Overload protection OK?
- **G** Is the system clean?
- **H** Is the area around the pump clean?

WARRANTY
Does not cover any damages to the equipment resulting from failure to observe the above precautions. Refer to Armstrong General Terms and Warranty sheet. Contact your local Armstrong representative for full information.

Suction Guides

Installation and operating instructions

File No: 35.82
Date: OCTOBER 03, 2013
Supersedes: 35.82
Date: AUGUST 16, 2013

CONTENTS

1.0	Introduction	4
2.0	Operating limits	4
3.0	Inspection	4
4.0	Installation	4
5.0	Operation	5

1.0 INTRODUCTION

Armstrong Suction Guides are designed for bolting directly onto the suction flange of horizontal or vertical shaft centrifugal pumps.

2.0 OPERATING LIMITS

Armstrong Suction Guides are designed in five series:

SERIES DESIGNATION	INLET CONNECTION	PUMP CONNECTION
SG	ANSI 125 / PN16 flange	ANSI 125 / PN16 flange
SG–TF	NPTF / BSPT	ANSI 125 / PN16 flange
SGG	GROOVED*	ANSI 125 / PN16 flange
SGHH	ANSI 250 / PN25 flange	ANSI 250 / PN25 flange
SGH–TF	NPTF / BSPT	ANSI 250 / PN25 flange

*Suitable for straight cut grooved anvil or victaulic fittings.

Each series is designed to be a four-function fitting. Each Suction Guide is a 90º elbow, a pipe strainer and a flow stabilizer. It may also be used as a reducing elbow, should the suction piping be larger than the pump inlet.

3.0 INSPECTION

Armstrong Suction Guides are thoroughly tested and inspected before shipment to assure they meet with your order requirements. All units must be carefully examined upon arrival for possible damage during transit. Any evidence of mishandling should be reported immediately to the carrier and noted on the freight bill.

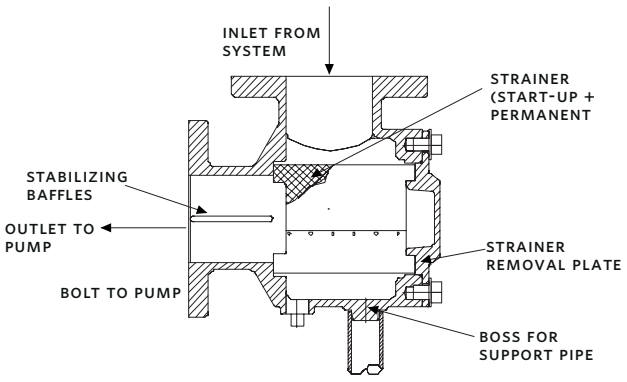

FIG. 1 Armstrong Suction Guide

4.0 INSTALLATION

Install the Suction Guide with the directional arrow, indicated on the body, being aligned with the system flow direction.

Armstrong Suction Guides may be installed in any position, providing the guide vanes are facing the pump inlet flange.

Centrifugal pumps need a minimum of 5 pipe diameters of straight pipe before the pump suction. This length of straight pipe, after the last elbow, tee or fitting, helps to ensure that the flow is stable when entering the pump suction.

Crosspiece guide vanes are fitted into the Armstrong Suction Guide outlet, where it bolts to the pump flange, to stabilize the flow and eliminate the need of long straight suction pipe.

Space must be allowed to remove the end cover and remove the strainer.

A blow–down valve may be installed on the Suction Guide drain connection. Should the Suction Guide be installed with the inlet port facing vertically down: The inlet piping configuration should include a blow–down valve at the lowest point on the down-pipe to exhaust any debris that may fall from the Suction Guide strainer.

The Suction Guide must not be used to support the suction piping. Piping must be supported independently.

On base mounted pumps, a flexible piping connections may allow the Suction Guide to be supported by the pump suction flange. A boss is cast on every SG allowing a supporting pipe-stool to be located under the fitting, thereby removing the weight of the Suction Guide from the pump suction flange.

Suction Guides are supplied with an inlet tapped gauge connection. Monitoring the differential pressure across the fitting, from the suction guide inlet gauge to the pump inlet gauge, will alert the operator should the strainer need to be removed and cleaned.

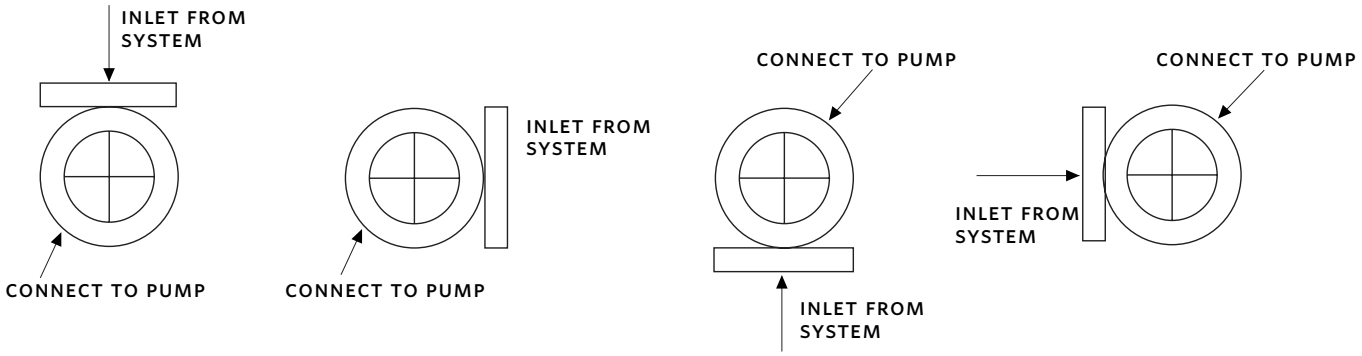

FIG. 2 Armstrong Suction Guide may be installed in any arrangement feasible by pump flange boltholes arrangement.

5.0 OPERATION

No special attention need be paid to the Suction Guide at start-up. The fitting is stationary and will strain the pumped fluid and stabilize the flow into the pump automatically.

Temporary strainer must be removed following system clean up.

After all debris has been removed from the system, or a maximum of 24 running hours, stop the pump and close the pump isolation valves. Drain the Suction Guide by removing the drain plug or opening the blowdown valve, if installed. Remove the Suction Guide cover and remove the strainer assembly from the valve body.

A temporary fine-mesh start-up strainer is tack-welded to the permanent stainless steel strainer. This temporary strainer should now be removed from the permanent strainer. The fine-mesh strainer is designed to remove small particulate from new piping systems and could easily clog with debris if left in place. This will be detrimental to the operation of the pump.

Replace the permanent strainer into the fitting body, once the temporary strainer is removed.

Inspect the cover O-ring and replace if necessary. Replace the cover into the body. Ensuring that the strainer is properly seated, tighten the cover bolts diagonally, evenly and firmly.

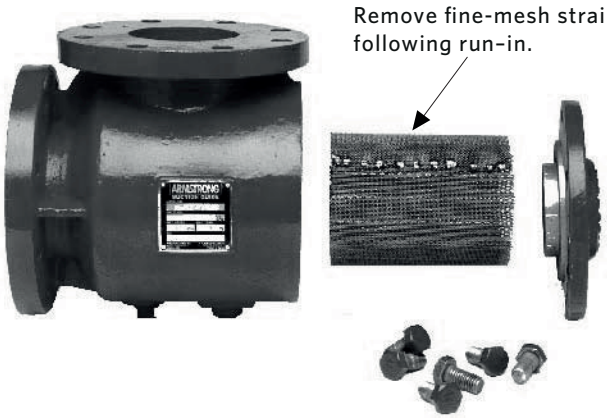

FIG. 3 Remove fine-mesh strainer

READ CAREFULLY BEFORE INSTALLING & OPERATING THE CIRCULATOR

INSTALLER: PLEASE LEAVE THIS MANUAL FOR THE OWNER'S USE

You are about to install an E.2 series circulator – a high-efficiency pump from Armstrong. E.2 series circulators are designed for heating and cooling in hydronic, geothermal or solar systems and circulating water, ethylene or propylene glycol/water solutions. For pumping domestic (potable) water, Armstrong recommends the use of circulators with bronze, or stainless steel body construction.

The E.2 series circulators are extremely efficient and quiet. They utilize a state of the art permanently lubricated bearing system designed for many years of trouble-free operation. They feature a permanent-split capacitor motor with thermal protection.

1.0 OPERATING LIMITS

Maximum operating pressure:
150 psi (1034 kPa)

Maximum operating temperature:
All standard models 230°F (110°C)

Minimum operating temperature:
All standard models 32°F (0°C)

Electrical rating:
For models with ⅙ hp motors (100W): 120 V, 1 phase, 60 Hz or 208/240 V, 1 phase, 60 Hz, or 220-240v, 50Hz

For models with ⅔ hp motors (300W): 120 V, 1 phase, 60 Hz or 208/240/277 V, 1 phase, 60 Hz, or 220-240v, 50Hz

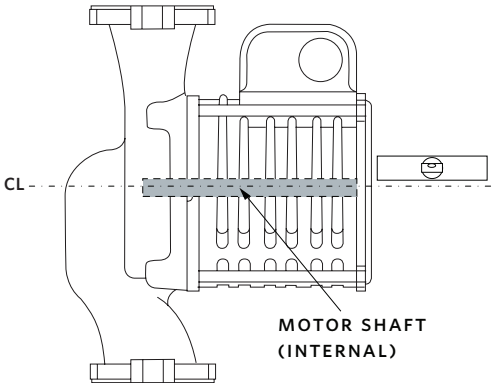
When unpacking the circulator, inspect for any damage that may have occurred during transit. Check for loose, missing or damaged parts.

THIS PUMP IS FOR INDOOR USE ONLY

Before installing the circulator, proper installation practice recommends a thorough flush of the hydronic system, ensuring removal of all foreign materials.

This pump should be installed in a well lit location with good access.

Installation personnel must be qualified for the task.



All personnel performing installation must wear appropriate personal protective equipment

WARNING

Mount with motor shaft horizontal and terminal box above centerline (CL) only!

The circulator is supplied for up-discharge.

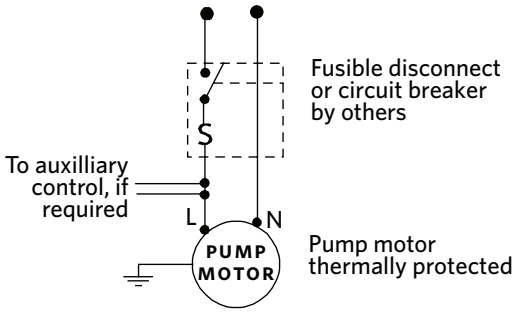
DIAGRAM 1: Installation Orientation

For alternate discharge orientation:

1. Loosen the four motor mounting bolts
2. Rotate the volute to match piping orientation
3. Observe flow direction arrow on volute
4. Ensure volute gasket is properly seated
5. Retighten mounting bolts evenly to 5 lb/ft (6.7 N/m)
6. Ensure the impeller spins freely

2.0 ELECTRICAL WIRING

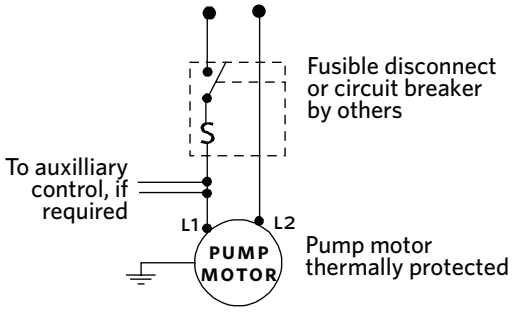
The electrical wiring must be installed in strict accordance with the Canadian Electrical Code (Canada) or the U.S. National Electrical Code (USA),or BS7671 (Europe) as well as local codes and regulations.



1. Electrical installation should be conducted by a qualified electrician. Installers should be equipped with proper personal protective equipment.
2. The motors of E.2 series circulators are designed for 1 phase, 60 Hz, 120 V 60 Hz, 240 V 60 Hz, 220-240 50 Hz service only. (Please refer to the rating label on the circulator's terminal box to determine the correct voltage.)
3. Always make sure the electric power is disconnected and locked out before wiring the circulator.
4. To wire, loosen the screw from the terminal box cover and remove the screw and cover.
5. Install the appropriate size conduit end to one of the holes on either side of the terminal box.

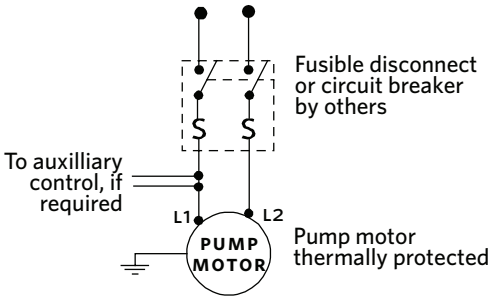
6 For 120 V models: Referring to **DIAGRAM 2** below, connect the black, hot, (L) and white, neutral, (N) leads of the supply wire to the black and white motor leads respectively inside the terminal box. Connect the ground wire to any one of the four green ground screws inside of the terminal box (use a minimum 18 AWG wire size).

For 208/240/277 V models: Referring to **DIAGRAM 3** below, connect the black (L1) and blue (L2) leads of the supply wire to the black and white motor leads respectively inside the terminal box. Connect the ground wire to any one of the four green ground screws inside of the terminal box (use a minimum 18 AWG wire size).



NOTE: For any voltage the brown and yellow wires are hard wired in and should **not** be touched they are for the capacitor only and can stop the motor from running.

DIAGRAM 2 120 V installations



Typical wiring diagram for single phase, 120 V, 60 Hz power source

DIAGRAM 3 208/240/277 V installations

Typical wiring diagram for
A single phase, 240 V, 60 Hz power source
B three phase, 208/277 V, 60 Hz power source

DIAGRAM 4 230 V installations

Typical wiring diagram for single phase, 230 V, 50 Hz power source

7 Replace the terminal box cover.

The motor is thermally protected for your safety so thermal overload protection is not necessary. All that is required is a fused plug or circuit breaker in the power line for short circuit protection.

Electrical information can be found on the nameplate of the motor.

3.0 START UP

1 Before starting up the circulator, proper installation practice recommends a thorough flush and draining of the hydronic system, ensuring removal of all foreign materials. Fill the system with clean water or glycol solution before starting.

2 Air must be completely vented from the system before starting up the circulator. **If the system is not completely vented of air and the circulator is allowed to run dry, the mechanical seal will be damaged.**

3 When the system has been completely filled and vented, only then can the pump be started.

4.0 PREVENTIVE MAINTENANCE – INSPECTION

E.2 series circulators are fitted with permanently lubricated ball bearings and **do not** require lubrication.

Although Armstrong long-life circulators are designed to provide years of worry-free service, it is good maintenance practice to inspect the entire hydronic system periodically – including the E.2 series circulator – for potential problems. If there is any evidence of leakage or damage, repair or replace the pump.

Disconnect and lockout the power before servicing.

5.0 PUMP REPLACEMENT IN AN EXISTING INSTALLATION

5.1 COMPLETE PUMP

1 Ensure that electric power is disconnected and locked out. Loosen the screw from the terminal box cover and remove the cover. Disconnect the supply wires from the circulator only, leaving the capacitor wires connected.

All servicing personnel should be equipped with proper personal protective equipment.

2 If valves have been installed, on the suction and discharge sides of the pump, close them before attempting to remove the circulator from the volute. If no valves have been installed it may be necessary to drain the system.

Allow water to cool to 100°F (40°C) before draining the system. It is best to leave the drain valve open while working on the system.

3 To relieve any residual pressure which may be present in the pump body, loosen the flange bolts and gently move the pump body back and forth to allow the pressurized water to escape.

NOTE: Place a pan under the pump to collect the drain water.

4 If the entire volute is needed to be removed, then remove the flange bolts and nuts. The entire circulator can then be removed from the piping system.

5 Install the E.2 series circulator where there will be sufficient room for inspection and service. It is recommended that isolation valves be installed on both the suction and discharge sides of the circulator for future servicing. This eliminates the need for draining the system when working on the circulator (for example, when replacing the mechanical seal).

6 Install suction and discharge flanges on the pipe ends. The use of Teflon tape sealer or a high quality thread sealant is recommended.

7 Pipe strain can be minimized by the use of pipe hangers near the pump, positioned to support the suction and discharge piping.

To wire the E.2 series circulator, follow steps C through G in the Electrical Wiring section above, noting that electrical supply and grounding wires must be rated for at least 194°F (90°C).

5.2 MOTOR END ONLY

1 Turn off the pump leaving it installed in the line .

2 Ensure electrical power is disconnected and locked out .

3 Close the water supply at the points closest to the pump's inlet and outlet .

4 For safety, allow water to cool to 100°F (40°C) before draining the system. It is best to leave the drain valve open while working on the system.

5 Bleed the water pressure from the pump.

6 Place a pan under the pump to collect the drain water.

7 While holding the motor body, loosen the four bolts that attach the motor to the pump casing (volute). Start with the two bottom bolts first and remove them, then slowly loosen the top two bolts. Allow the water to drain from the bottom of the pump. When the water has finished draining, remove the two top bolts. Remove the motor straight out from the volute being careful of its attached impeller. The motor is heavy, do not drop it.

8 Install new casing gasket .

9 Install new motor end (with impeller and seal kit).

10 Tighten four motor end bolts in a crisscross pattern and tighten evenly to 60 in/lbs.

11 Open isolation flanges or fill the system with water before starting circulator.

12 To wire the E.2 series circulator, follow steps C through G in the Electrical Wiring section above, noting that electrical supply and grounding wires must be rated for at least 194°F (90°C).

6.0 MECHANICAL SEAL REPLACEMENT

1 Follow steps 1 through 4 in section **Existing pump removal from system piping.**

2 While holding the motor body, remove the bottom two bolts that attach the motor to the pump casing (volute), then slowly loosen the top two bolts. Allow the water to drain from the bottom of the pump. When the water has finished draining, remove the two top bolts. Remove the motor straight out from the volute being careful of the attached impeller.

Handle with care
The motor is heavy, and possibly hot,
DO NOT drop it!

3 While holding the rotor very tightly by hand or a gloved hand only, unscrew the impeller nut off the motor shaft by turning it clockwise (i.e. opposite to most bolts and nuts). Place the motor on its back, with the shaft up.

4 Remove the rotary part of the mechanical seal by gently pulling it off the shaft. If it is too tight use two small flat bladed screwdrivers to gently pry it off the shaft by placing the flat side of the blades onto opposite sides of the mechanical seal.

5 Remove the face plate from the motor by gently prying it off of the motor housing extension, and carefully pulling it straight up, avoiding any shaft contact.

6 Remove the stationary part of the seal by gently prying it off the steel faceplate.

7 Remove any corrosion present on the stainless steel motor shaft and face plate (especially the seal seat area) with a non-metallic brush or scrub pad. Do not use a wire brush or steel wool.

8 Remove any dust created during step #7 above and put a few drops of non-petroleum lubricant around the face plate where the stationary seat is to be installed.

9 Install the new stationary seal seat into the faceplate by firmly pressing it down until it bottoms. The disk should be clean. If needed, wipe it with alcohol and a soft lint free cloth.

10 Replace the faceplate on the motor housing extension, being careful to avoid shaft contact. This may need to be gently tapped down until tight to the housing. Be sure to check that the stainless steel plate is flush to the extender plate face.

11 Install the special **installation tool** (item #180212-095) on the top of the shaft making sure it is tight to the flat base of the impeller to protect the seal from sharp edges during seal installation.

12 Apply a liberal amount of non-petroleum based lubricant on the outside of the special plastic **installation tool.**

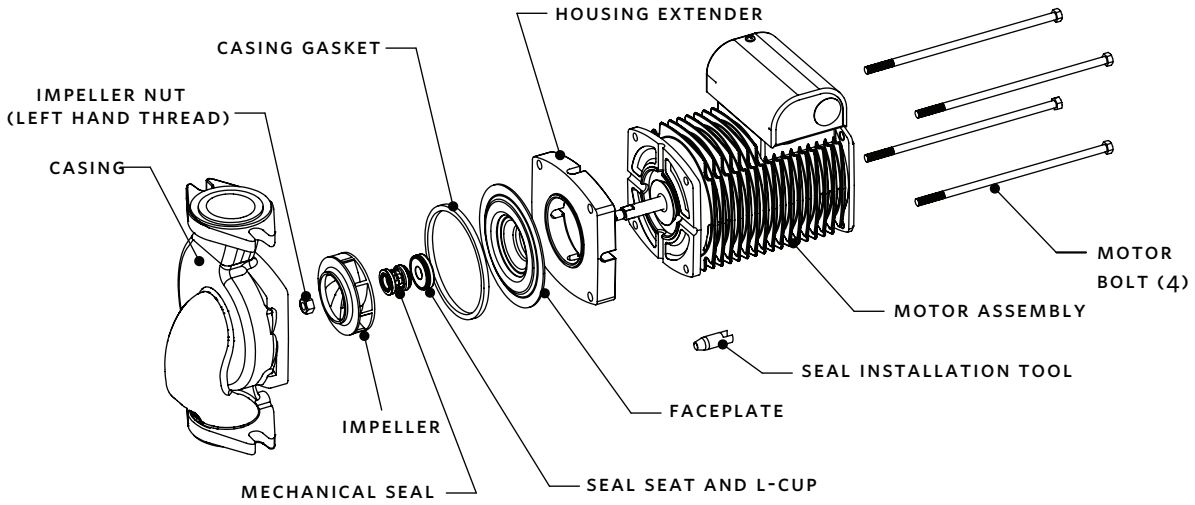
13 Wipe any excess lubricant off of the stationary silicon carbide seal face with a lint free cloth and alcohol to ensure the surface is clean.

14 Install the new rotating seal element and spring assembly by gently pushing it (graphite ring first) over the **installation tool** and onto the shaft until the graphite ring presses tightly against the stationary seal seat. The seal spring may be compressed slightly.

15 Remove the **installation tool** from the shaft.

16 Install the impeller keeping the inlet end up. Make sure to align the flats to the shaft flats and push the impeller down tightly to the seal.

17 Place 2-3 drops of medium strength thread locker liquid on the nut threads.



18 Install the special left hand thread nut on the motor shaft. While holding the motor rotor in place as in step 3, thread the impeller nut on to the shaft in a counter-clockwise direction and tighten the nut to approximately 6ft-lbs (8.1Nm).

19 If the impeller will not spin freely contact Armstrong Technical Support at 1-416-755-2291 or email techsupport@armlink.com.

20 Ensure the gasket is properly seated in the pump casing (volute) gasket groove. Holding the motor body, insert the impeller straight into the volute. Verify the gasket was not dislodged during insertion, and is still seated properly. Hold the motor body steady while fastening the four bolts that attach the motor to the pump casing (volute). Tighten evenly and diagonally. There should be a small, even gap of about 0.02" (0.5 mm) between the motor flange and the pump casing (volute).

21 Follow the **START UP** instructions (File no. 10.84) and check for leaks.

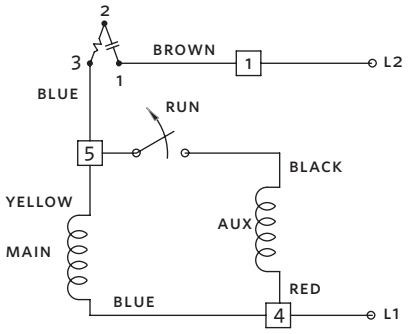
CAUTION

Always disconnect power supply from motor before servicing.

1.0 INSTALLATION

For convenience, Armstrong circulators generally are installed in vertical pipelines, but may be changed easily on the job for horizontal pipelines or for opposite flow directions. To make the change, remove the body capscrews, taking care body gasket is kept in position, and rotate body to desired direction at 90° or 180° from the original position.

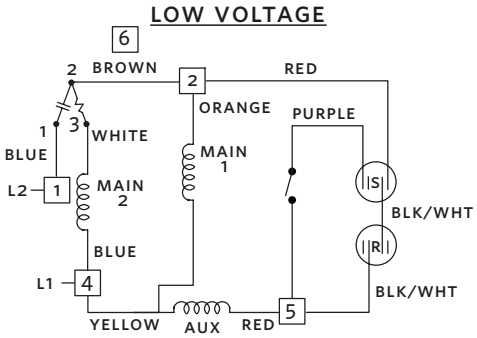
With the arrow on the body pointing in direction of the flow, insert body capscrews and tighten evenly. On models S25 to S57, H32 to H54 and series 1050 (1B to 2B), a gap between the bearing bracket and pump body (volute) is normal. Do no over tighten body capscrews! Turn pump shaft manually at coupler to make sure shaft turns freely and impeller does not rub in body. Always install with motor shaft in a horizontal position with pump oil cups or oil well cover on top.



Models S25 to S46 and H32 to H41 are shipped for downward discharge. All other models are shipped for upward discharge as pumps of this size usually are installed in an upward direction on hydronic systems, so the point of zero pressure change - namely, the compression tank connection - can be made easily to the system on the suction side of the circulator.

The pump should be installed in a position to permit proper lubrication and servicing. Motor and bearing brackets are to be kept free of insulation. Pump and motor unit are designed to be supported by the in-line piping only. Do not support in any other manner. A height of approximately four feet above the floor is recommended. When placing the pump between flanges, tighten flange bolts evenly and do not tighten excessively.

Gate valves should be installed on the discharge and suction side of the pump to facilitate service. On larger pump sizes, a check valve should be located on the discharge side of pump between the pump body and the gate valve to prevent damage due to water hammer.



WIRING DIAGRAMS

LOW STD	1,3,8	2,4,5	—
LOW OPP	1,3,5	2,4,8	—

NOTE: Standard rotation is ccw facing end opposite shaft extension

THREE PHASE MOTOR ANY SIZE

Interchange any two lead wires to reverse rotation

2.0 SYSTEM CLEANLINESS

Before starting the pump, the system must be thoroughly cleaned, flushed and drained, then replenished with clean liquid. Welding slag and other foreign materials, 'stopleak' and cleaning compounds, excessive or improper water treatment - all are detrimental to the pump. Warranty will be void if any of these conditions are allowed to exist. (Refer to **File no. 6090.645** design and care of closed hydronic systems.)

3.0 STARTING UP

The pump must be fully primed on start-up. Fill system piping and pump body with liquid and vent complete system, turning pump by hand to dislodge air from body. Make sure fittings and drain valves are airtight, then add any additional fill required.

Check motor against available electric supply, then start pump making sure rotation is correct. When viewed from motor end, rotation is counter-clockwise on models S25 to S46 and H32 to H41. On all other models, rotation is clockwise. If pressure does not develop, stop pump, re-check, vent and fill. Never attempt to fill the system when the pump is running

4.0 LUBRICATION

CAUTION:
Do not put oil in the **maintenance free** circulators. These models contain MF in their item numbers and are labelled: 'THIS BEARING ASSEMBLY CONTAINS PERMANENTLY LUBRICATED BEARINGS AND DOES NOT NEED ANY OILING OR GREASING'.

Stop motor before lubricating, do not over-oil or spill oil on resilient motor rings. Do not force oil into cups, and stop if cup fills before addition of specified amount.

Pump lubrication: Only applicable for pumps those are with sleeve bearing SBA and have oil cup for lubrication.

Immediately after pump is installed and before running, slowly add the oil (SAE 30 non-detergent regular, supplied with pump) to pump oil cup, located on top of bearing bracket:

S25 to S57, H32 to H54 and series 1050 (1B to 2B)	¼ oz.
S69, H63 to H68, series 1060 (1½D to 3D)	2 oz.

At the start of each following heating season, lubricate with SAE 30 oil for models S25 to S57, H32 to H54 and series 1050 (1B to 2B), add approximately ¼ oz. Lubricate every six months for high temperature or constant operation. On models S69, H63 to H68 and series 1060 (1½D to 3D), be sure oil is visible at the top and center of window on side of bracket and maintain this level at all times.

Motor lubrication

CAUTION

Stop motor before lubricating. Do not over-oil or spill oil on resilient motor rings.

This motor has been lubricated properly at the factory. At the start of each following heating season, however, on motors with oil cups, add 15 drops SAE 30 non-detergent oil to each motor cup.

If the motor is fitted with grease fittings, follow the motor manufacturer's recommended procedure. Motors without oil cups or grease fittings are custom-greased for several years operation and require little or no attention.

5.0 SEAL REPLACEMENT

Remove the pump bracket from the body. Remove the impeller, damaged seal assembly, ceramic insert and rubber cup. Clean the recess in bearing bracket coverplate and install a new retainer cup and ceramic insert. Check the condition of the shaft sleeve. If scored, replace the shaft assembly. Otherwise, clean shaft extension and polish sleeve with a fine crocus cloth, using a rotating motion, if required.

Press against the coupler end of the shaft to take up play while pressing new seal firmly against the stationary face. A slight amount of clean vaseline may be put on shaft sleeve to assist installation. Press down firmly and evenly, using two screwdrivers and pushing against the four ears of driving band (the metal ring around rubber bellows), or around top outer edge of driving band on models S25 to S57, H32 to H54 and series 1050 (1B to 2B).

Do not use spring washer on models S25, S35 and H32 current style circulators, where recess to locate spring is provided on impeller hub.

Continue pressing against coupler end of shaft, re-mount impeller and re-assemble the seal bearing assembly into body. If necessary, install a new body gasket and clean gasket surface of both volute and bracket.

CAUTION

Before operating pump, carefully check:

1. Is the pump primed?
2. Is rotation correct?
3. Is pump properly lubricated?
4. Does the power supply agree with data on motor name plate?
5. Is overload protection provided?
6. Is the system clean?

For domestic water systems use bronze body pumps.

ATTENTION

Toujours couper l'alimentation électrique avant de procéder à l'entretien d'un moteur.

1.0 INSTALLATION

Pour des raisons pratiques, les circulateurs Armstrong sont généralement installés sur des conduites verticales, mais peuvent être facilement modifiés sur place pour des conduites horizontales ou pour changer la direction du liquide en circulation. Pour procéder au changement, retirer les boulons de fixation et, en prenant soin de maintenir en place le joint d'étanchéité, tourner le corps suivant l'angle désiré, 90° ou 180°, par rapport à la position originale.

La flèche sur le corps pointant dans la direction de la circulation du liquide, insérer les boulons de fixation et les visser uniformément. Sur les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), il est normal qu'il y ait un espace entre la chaise de palier et le corps de la pompe (volute). Ne pas trop serrer les boulons ! À la jonction, faire tourner l'arbre de la pompe à la main pour vous assurer qu'il tourne librement et que l'impulseur ne frotte pas l'intérieur du corps. Toujours installer de manière à ce que l'arbre du moteur soit en position horizontale, les godets à huile et le couvercle du réservoir d'huile étant placés sur le dessus.

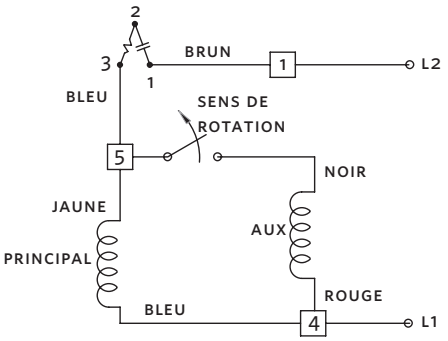
Les modèles S25 à S46 et H32 à H41 sont livrés en prévision d'une évacuation vers le bas. Tous les autres modèles sont livrés en prévision d'une évacuation vers le haut, puisque les pompes de cette taille sont habituellement installées sur les systèmes hydroniques pour pomper vers le haut, de sorte que le point de changement de pression nul, c'est-à-dire la connexion au vase d'expansion, puisse facilement se trouver du côté aspiration du circulateur.

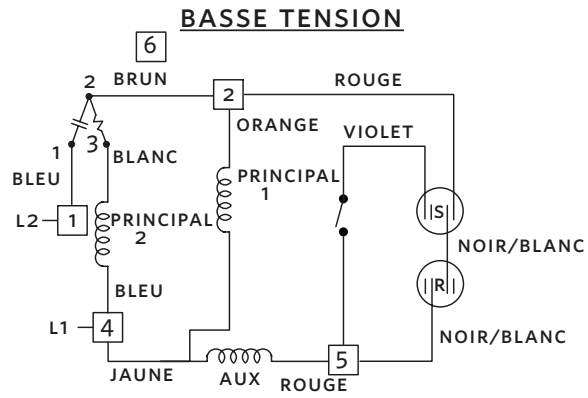
La pompe doit être installée à un endroit qui permet l'entretien et la lubrification. Le moteur et la chaise de palier doivent être exempts d'isolant. La pompe et le moteur sont conçus pour être soutenus uniquement par la tuyauterie en ligne. Ne pas les supporter d'aucune autre façon. Il est recommandé de les placer à environ 4 pi au-dessus du sol. Au moment de fixer la pompe par ses brides, serrer les boulons uniformément et sans excès.

Des robinets-vannes devraient être installés du côté évacuation et du côté aspiration de la pompe pour faciliter l'entretien. Sur les pompes plus grosses, un clapet antiretour devrait être placé du côté évacuation de la pompe, entre cette dernière et le robinet-vanne, pour prévenir les dommages causés par les coups de bélier.

SHÉMAS DE CÂBLAGE

MONOPHASÉ MOINS DE 0.5HP





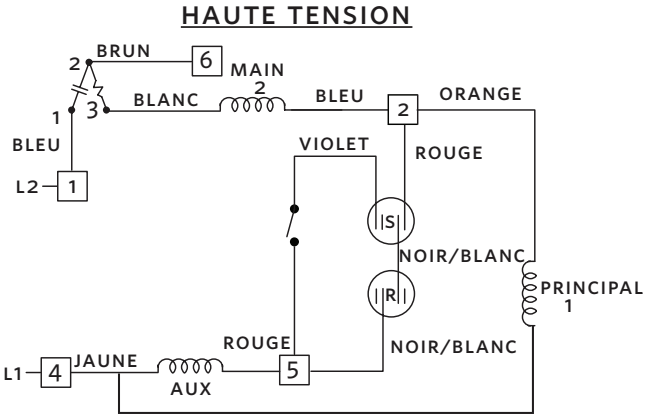


Schéma ci dessus à suivre dans le sens contraire des aiguilles d'une montre.

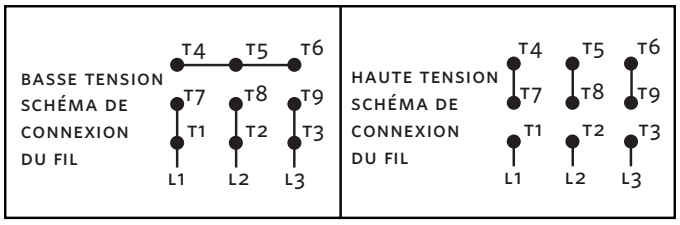
Pour une rotation dans le sens des aiguilles d'une montre, inverser les fils jaune et bleu des bornes 5 & 4.

MONOPHASÉ MOINS DE 1HP (avec un numéro de référence commençant par 811757-...)



MONOPHASÉ 1HP-1.5HP (seulement pour un numéro de référence ne commençant pas par 811757-...)

	LIGNE A	LIGNE B	JONCTION
HAUTE TENSION ROTATION STD	1	4,5	2,3,8
HAUTE TENSION ROTATION OPP	1	4,8	2,3,5
BASSE TENSION ROTATION STD	1,3,8	2,4,5	—
BASSE TENSION ROTATION OPP	1,3,5	2,4,8	—

NOTE: Le sens de rotation standard est dans le sens contraire des aiguilles d'une montre en faisant face à l'extrémité opposée de l'extension de l'arbre

MOTEUR TRIPHASÉ DE TOUTE TAILLE

Permuter deux des fils de sorties pour inverser le sens de rotation

2.0 PROPRETÉ DU SYSTÈME

Avant de démarrer la pompe, le système doit être entièrement nettoyé, vidangé et rincé, puis rempli de nouveau d'un liquide propre. Les scories de soudage et autres matières étrangères, les composés de colmatage de fuites et de nettoyage, les produits de traitement excessifs ou inappropriés de l'eau, peuvent tous endommager les composantes internes de la pompe. La garantie sera nulle si l'une ou l'autre de ces conditions est permise.(Consulter le **dossier n° 6090.645** conception et entretien des systèmes hydroniques fermés.)

3.0 DÉMARRAGE

La pompe doit être parfaitement amorcée avant le démarrage. Remplir la tuyauterie du système et le corps de la pompe de liquide, ventiler complètement le système, faire tourner la pompe à la main pour déloger les bulles d'air qui y seraient emprisonnées. Vous assurer que les raccords et les robinets de vidange sont étanches et ajouter le liquide qu'il faut pour remplir.

Comparer les exigences électriques aux conditions d'alimentation, puis faire démarrer la pompe et vous assurer qu'elle tourne correctement. Vue de l'extrémité moteur de la pompe, la rotation se fait dans le sens contraire des aiguilles d'une montre sur les modèles S25 à S46 et H32 à H41. Sur tous les autres modèles, la rotation se fait dans le sens des aiguilles d'une montre. Si la pression ne grimpe pas, arrêter la pompe, vérifier de nouveau, ventiler et remplir. Ne jamais essayer de remplir le système lorsque la pompe est en marche.

4.0 LUBRIFICATION

ATTENTION:
NE PAS verser d'huile dans les Circulateurs ne nécessitant aucun entretien. Les modèles mentionnant **MF** dans leur référencesont étiquetés : '**CE SYSTÈME À ROULEMENT EST ÉQUIPÉ DE ROULEMENTS À GRAISSAGE PERMANENT ET NE NÉCESSITE AUCUN AJOUT D'HUILE NI DE GRAISSAGE'.**

Arrêter le moteur avant de lubrifier. Ne pas mettre trop d'huile ni en renverser sur les bagues souples du moteur. Ne pas faire entrer l'huile de force dans les godets et arrêter le remplissage si un godet se remplit avant d'avoir ajouté la quantité spécifiée.

Lubrification de la pompe : Applicable seulement pour les pompes à paliers à douille et ayant un godet pour la lubrification

Immédiatement après l'installation de la pompe et avant de la démarrer, ajouter lentement de l'huile (SAE 30 non détergente régulière, fournie avec la pompe) dans le godet situé sur le dessus de la chaise de palier :

S25 à S57, H32 à H54 et série 1050 (1B à 2B)	¼ oz.
S69, H63 à H68, série 1060 (1½D à 3D)	2 oz.

Par la suite, au début de chaque saison de chauffage, lubrifier la pompe en utilisant de l'huile SAE 30. Pour les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), ajouter environ ½oz. Lubrifier à tous les six mois si la pompe fonctionne tout le temps ou à haute température. Sur les modèles S69, H63 à H68, série 1060 (1½D à 3D), vous assurer que l'huile est visible en haut et au centre de la lunette sur le côté de la chaise de palier et maintenir ce niveau en tout temps.

Lubrification du moteur

ATTENTION

Arrêter le moteur avant de le lubrifier. Ne pas ajouter trop d'huile ni en renverser sur les bagues souples du moteur.

Ce moteur a été lubrifié correctement en usine. Au début de chaque saison de chauffage, toutefois, sur les moteurs munis de godets d'huile, ajouter 15 gouttes d'huile non détergente SAE 30 dans chaque godet.

Si le moteur est équipé d'embouts de graissage, respecter la procédure recommandée par le fabricant. Les moteurs à godets d'huile ou à embouts de graissage sont graissés individuellement en prévision de plusieurs années d'utilisation et exigent peu ou pas d'attention.

5.0 REMPLACEMENT DES JOINTS D'ÉTANCHÉITÉ

Retirer la portion pompe du corps. Retirer l'impulseur, le joint d'étanchéité endommagé, la pièce de céramique et le godet de caoutchouc. Nettoyer le compartiment du joint dans la chaise de palier et installer un nouveau godet et une nouvelle céramique. Vérifier l'état de la chemise de l'arbre. Si elle est marquée, remplacer l'ensemble de l'arbre. Autrement, nettoyer le prolongement de l'arbre et, au besoin, polir la chemise à l'aide d'une toile à polir fine suivant un mouvement rotatif.

Pousser sur l'extrémité accouplement de l'arbre pour réduire le jeu tout en pressant fermement le nouveau joint d'étanchéité sur la face fixe. On peut mettre une petite quantité de vaseline sur la chemise de l'arbre pour aider à l'installation. Pousser fermement et uniformément en utilisant deux tournevis contre les quatre oreillettes du collet (l'anneau de métal autour des soufflets de caoutchouc) ou sur le pourtour extérieur du collet dans le cas des modèles S25 à S57, H32 à H54 et de la série 1050 (1B à 2B).

Ne pas utiliser de rondelle à ressort sur les circulateurs de modèles courants S25, S35 et H32 lorsque la dépression prévue pour le ressort se trouve sur le moyeu de l'impulseur. Continuer d'appuyer sur l'extrémité accouplement de l'arbre. Remonter l'impulseur et l'ensemble porteur du joint d'étanchéité dans le corps. Au besoin, installer un nouveau joint pour le corps et nettoyer la surface du joint de la volute et de la chaise de palier.

ATTENTION

Avant de faire fonctionner la pompe, vous assurer que :

1. La pompe a été amorcée?
2. Le sens de la rotation est le bon?
3. La pompe est correctement lubrifiée?
4. L'alimentation correspond aux données sur la plaque d'identification?
5. La pompe est protégée contre les surcharges?
6. Le système est propre?

Pour les systèmes domestiques de distribution d'eau, utiliser des pompes à corps de bronze.

INSTALLATION AND OPERATING INSTRUCTIONS

Series DAS
Dirt & Air Separator

VESSEL DESCRIPTION
Armstrong Series DAS Dirt & Air Separators are designed to eliminate entrained air and separate debris associated with start-up and maintenance of any hydronic system. The design incorporates a removable end cover (optional) for coalescing medium access and an air vent (optional) to automatically release air from the separator. The design and construction conforms to ASME Section VIII, Div. 1 (excluding DAS-Q and DASH-Q models).

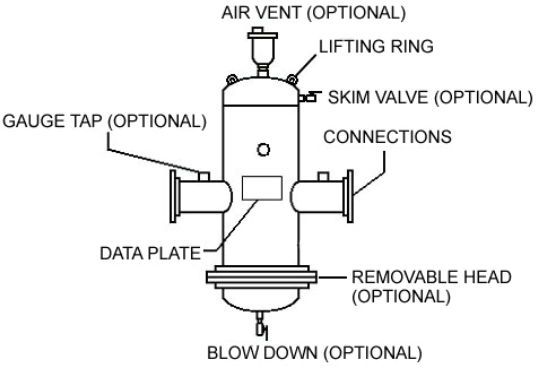

Fig. 1

FACTORY TESTING AND SHIPPING
The Series DAS has been factory tested and inspected prior to shipment. Upon receipt of the unit, carefully inspect the unit for damage that may have occurred during shipment. If the DAS has been damaged, it should be noted on the freight bill and reported to the carrier.

INSTALLATION
Ideally the installation of the DAS is at the point in the system where full water flow is at the lowest pressure and highest temperature. For optimum air elimination, it is at this point where free system air (bubbles) is at its highest concentration. Complete elimination of the free air at this location insures that dissolved air (air in solution) is at its lowest concentration. As the fluid leaves the DAS, and travels throughout the piping system, it will absorb a portion of any free-air that it contacts. This air-saturated water will then circulate back to the DAS where the low pressure/high temperature condition will drive this air back out of solution. This continuous air absorption and subsequent release and elimination by the DAS will ensure an air-free system.

It is recommended that the DAS be installed in the system piping prior to the primary system circulator/pump. For high-rise systems where static pressures are high, placement of the DAS should be as high in the system as practical.

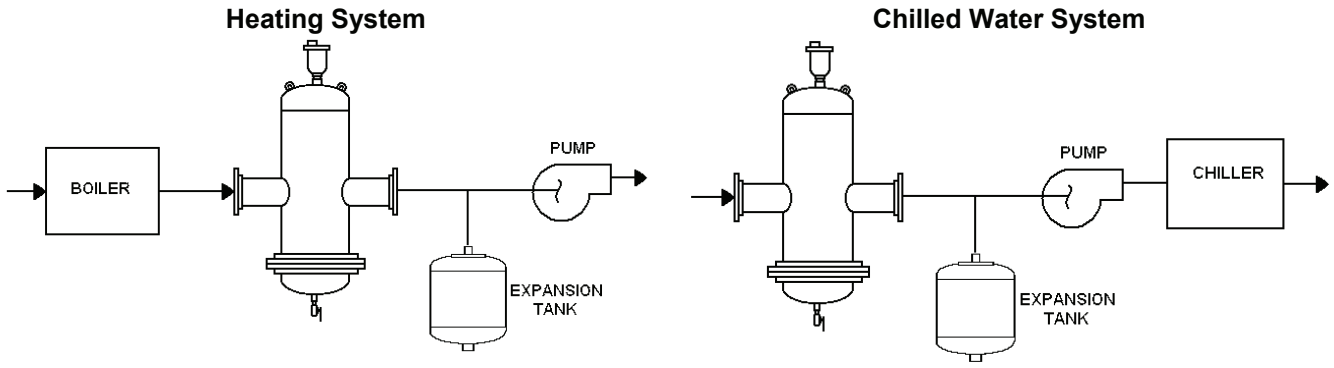

Fig. 2 Recommended Installations

Note: 100% of system flow should pass through the DAS to ensure all particles can be filtered.

OPERATION

All systems contain air in a dissolved state or as free air bubbles. Dirt particles, from multiple sources (piping fabrication, boiler or pump castings, welding beads, rust, etc.) also flow with the system water. As system fluid enters the DAS, air bubbles will rise to the top of the vessel to the vent location. Small, or sometimes referred to as micro-bubbles, will become trapped by the coalescing stainless steel media. With time, these bubbles will combine to form larger bubbles that will, over time as buoyancy overcomes surface tension, float to the top of the vessel to the vent location. Dirt particles are strained out by the enhanced surface stainless screen and collect at the vessel bottom. The debris is then periodically flushed out of the vessel through a blow-down valve. In removable base designs, the coalescing media can be removed and cleaned periodically.

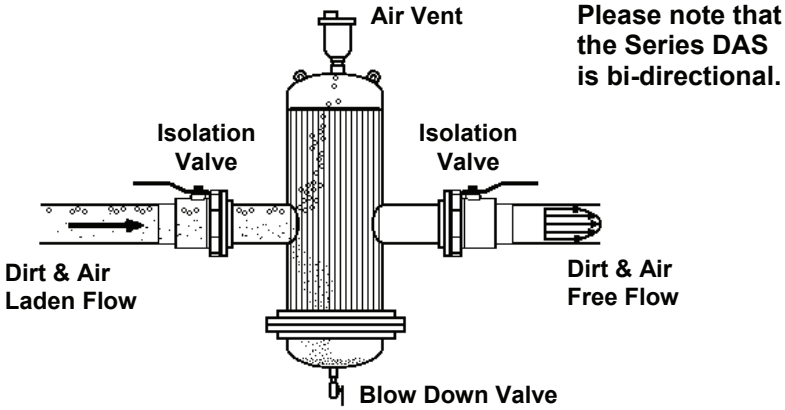

Fig. 3 DAS Working Configuration

MAINTENANCE

Air is eliminated automatically through the float-style vent. The vent should be periodically inspected to ensure optimum performance. If the vent used shows signs of continuous or intermittent leakage, or corrosion, it should be serviced or replaced.

During start up procedures, sediment should be removed frequently. The amount of sediment and the time of each blow-down should be recorded. As the amount of debris from blow-down diminishes, set a routine schedule to periodically blow-down the debris. If sediment builds on the coalescing screen, as evidenced though increased pressure drop, the screen can be removed. Inspect the screen cartridge periodically. Clean or replace if necessary.

WARNING: Standard units are not for use with potable water. Please consult factory for stainless steel option. For support recommendations, please reference local building code requirements

WARNING: The internal coalescing tubes are supported by the removable head. These tubes are not supported when the head bolts are removed.

INSTALLATION AND OPERATING INSTRUCTIONS

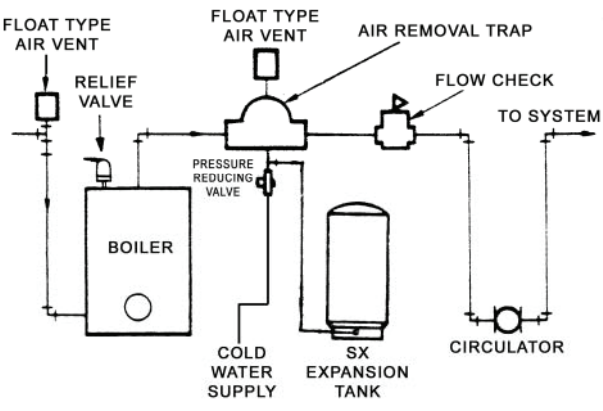
SX Series
Diagphragm Expansion Tanks

SX SERIES Expansion Tanks
This line of expansion tanks is specifically designed for use in hydronic heating systems.

The unique proven design of these tanks incorporates a flexible diaphragm that separates system water from the tank air charge (12 psig) resulting in more positive system protection.

HOW THEY WORK:
Heated water expands, and in a closed hot water heating system, provision must be made for this expansion. The captive air volume separated by the flexible diaphragm in the expansion tank provides for water expansion without permitting absorption of the air cushion by the water.

ATTACHING ACCEPTANCE FITTINGS:
SX tanks are equipped with a convenient bottom outlet elbow for connection to the system. Models SX-30V, SX-40V and SX-60V use a 1" NPTF fitting and models SX-90V, SX-110V and SX-160V use 1¼ " NPTF fitting. The air valve is located on top to provide accessibility no matter how the unit is positioned.



PROPER LOCATION AND INSTALLATION:
The SX Series tank may be located at any convenient point on a hot water heating system on the suction side of the pump. It may be installed into a tee or any other suitable tapping. The preferred installation is to pipe the SX tank into the system piping between the pressure reducing valve (in the water supply line) and the air removal trap / air vent, as shown in Figure 1. Conversely, the SX tank may be piped directly into the Armstrong Air Removal Trap. Regardless of installation, both offer continuous automatic air removal and complete pressure control protection.

ADJUSTING SX EXPANSION TANK PRECHARGE TO SYSTEM REQUIREMENTS:
All SX Series tanks are shipped with a standard precharge of 12 psi. This precharge can be adjusted if necessary. The following steps should be taken:

1. Remove red air charge valve cap and, using a suitable pressure gauge, check precharge pressure.
2. Release or add air as necessary to make precharge pressure equal to the desired fill pressure.
3. Replace protective air valve cap and seal with the air valve label provided. This will enable you to determine if valve has been tampered with on possible future service calls.

SYSTEM CONNECTION:
1. Locate SX Series expansion tank in final desired location.
2. Level as necessary.
3. Connect to heating system.
4. All piping should be in accordance with prevailing local codes and standards.

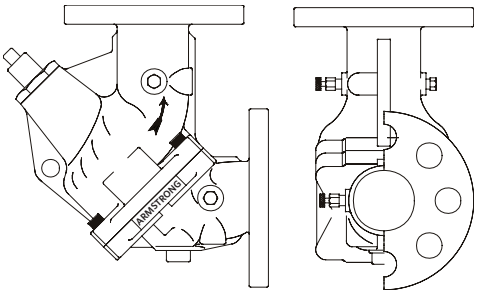
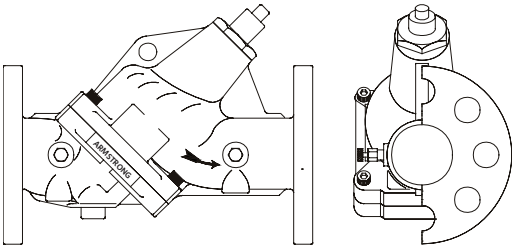
4.0	Flange bolt tightening	5
5.0	Pressure-temperature limits	5
6.0	Field conversion	6
7.0	Flow measurement	6
8.0	Operation	7
9.0	Repacking of FTV valve under full system pressure	7
10.0	Maximum number of turns (full open valve)	7
11.0	Seat replacement	7

1.0 INTRODUCTION



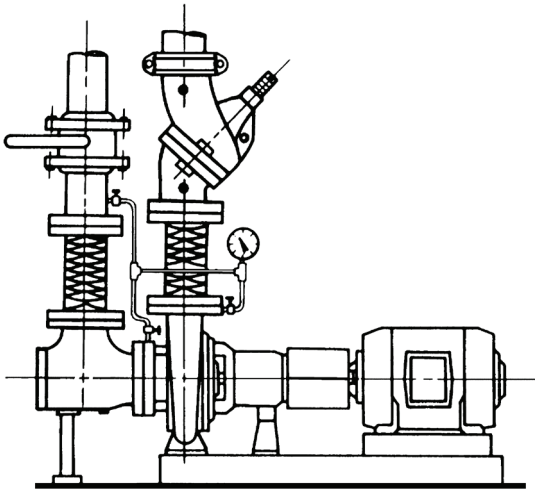
The Armstrong model FTV Flo-Trex combination valves are designed for installation on the discharge side of centrifugal pumps. The Armstrong combination valve incorporates three functions in one valve:

- Drip-tight, shut-off valve
- Spring closure design, non-slam check valve
- Flow throttling valve

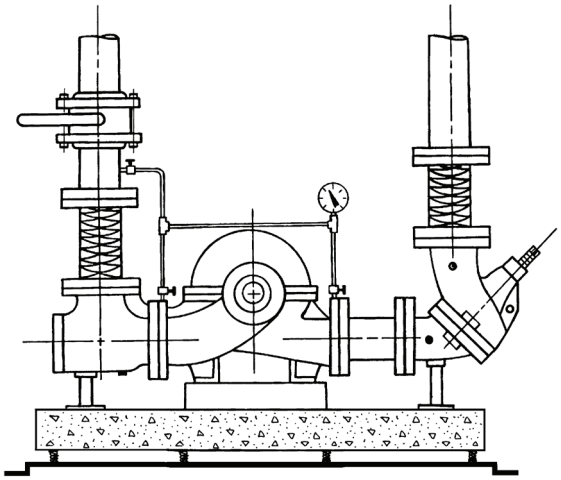


Armstrong model FTV-AF Flo-Trex combination valve

Angle pattern model FTV-AF

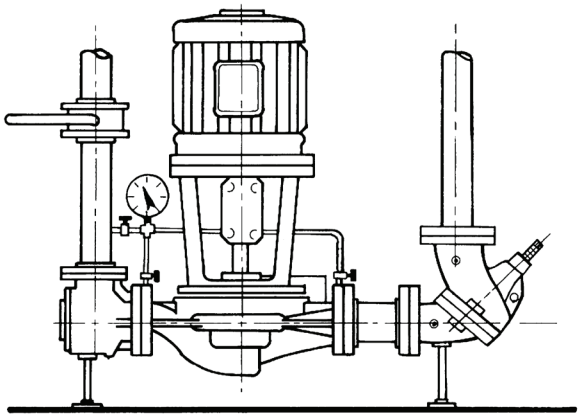


Angle pattern model FTV-SF



2.0 INSTALLATION

1. The valve should be mounted to a spool piece on the discharge side of the pump. Spool piece required is based on a minimum recommended space of 12" for pump sizes 2 × 2 to 6 × 6 and 24" for pump sizes 8 × 8 to 12 × 12.
2. It is not recommended to mount a valve directly to the pump as this could cause undesirable noise in the system.
3. Sufficient clearance around the valve should be left for valve removal or repair.
4. Install valve in the direction of the flow arrows on the valve body.
5. The valve body has been designed to handle the weight of the pump on vertical in-line installations. The body is not designed to support the piping weight. It is recommended that the piping be supported by hangers. Pipe supports are not required under the valve and strainer bodies but may be used if desired.
6. Ensure that the FTV is installed with the valve stem in the upright position. Valve slam may occur if installed in any other configuration



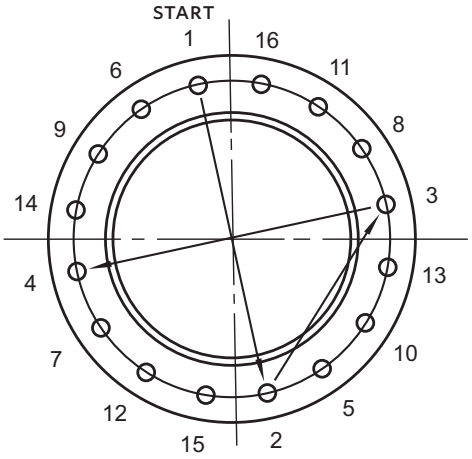
3.0 TYPICAL INSTALLATIONS

Base-mounted single suction

Base-mounted double suction

Vertical in-line

4.0 FLANGE BOLT TIGHTENING



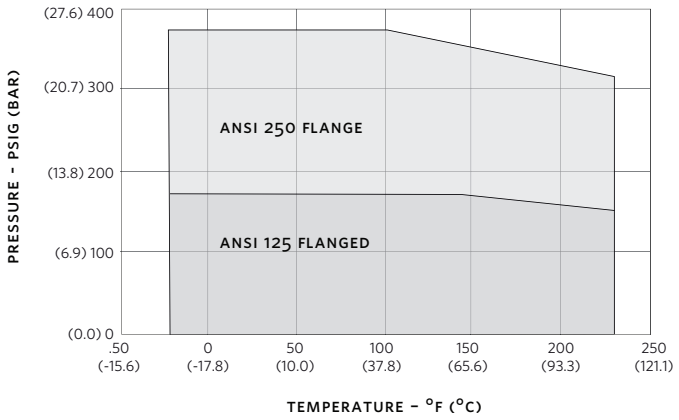


FIG 1: Recommended bolt tightening procedure

VALVE SIZE	125 PSI/150 PSI CAST IRON BOLT	
	BOLT NO.	SIZE
2½	4	⅝
3	4	⅝
4	8	⅝
5	8	¾
6	8	¾

TABLE 1

Tighten nuts evenly, following bolting instructions (**FIG 1**) so that the flange faces remain parallel. Flange bolts should be tightened to 70 ft/lbs. Torque minimum to assure firm metal-to-metal contact. When raised face flanges are used, there will be a gap between the faces of the outer diameter.

5.0 PRESSURE-TEMPERATURE LIMITS

6.0 FIELD CONVERSION (straight to angle pattern valve)

Open valve at least one complete turn.

Remove the body bolts from valve body using allen key.

Rotate one half of the valve body 180° making sure the lower valve seat and o-ring stay in position. Inspect the o-ring for any cuts or nicks and replace if necessary.

Replace body bolts and torque evenly to 70 ft/lbs.

7.0 FLOW MEASUREMENT

Where approximate indication of flow is acceptable the Armstrong Flo-Trex valve can be used.

Measure the flow with valve in fully open position.

1 Measure and record the differential pressure across the valve using an Armstrong CompuFlo with high pressure range transducer, or CBDM- 135/60 meter, or pressure gauges with PMP adapters.

Caution: Safety glasses should be used and the probe should not be left inserted into fittings for prolonged periods of time (overnight, etc), as leakage from the PMP may occur when probe is removed.

2 Refer to Flo-Trex performance curves with valve in full open position (**FIG 2**).

Locate Pressure Differential on left hand side of chart and extend line horizontally across to valve size being used. Drop line vertically down and read flow rate from bottom of chart.

Determining flow rate with valve in throttled position

FLO-TREX PERFORMANCE CURVE WITH VALVE IN FULL OPEN POSITION

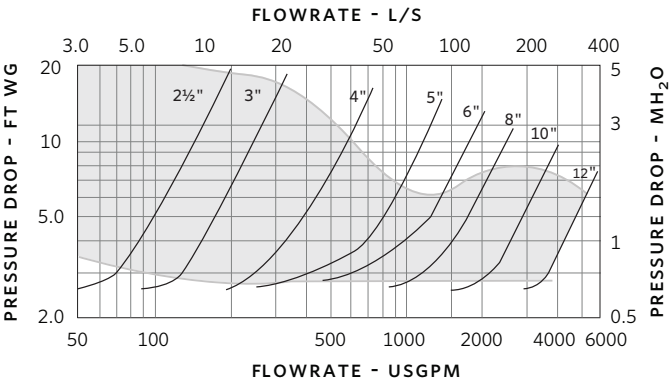

FIG: 5

INHERENT FLOW CHARACTERISTIC CURVE WITH VALVE IN THROTTLED POSITION

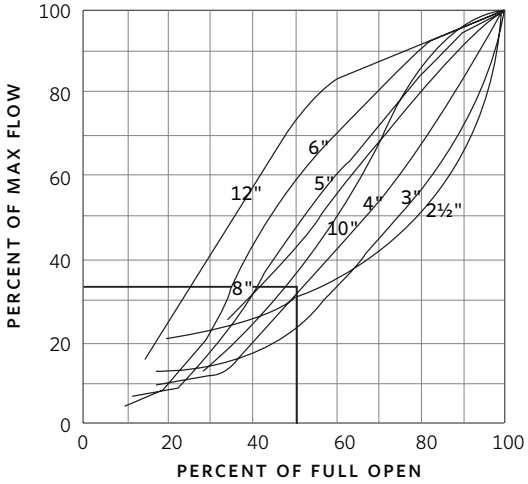

FIG: 6

1 Record the size of valve and stem position using the flow indicator scale (page 7). Calculate percentage of valve opening referring to table below:

VALVE SIZE	NUMBER OF RINGS (VALVE FULL OPEN)
2½	5
3	5
4	6
5	9
6	10
8	12
10	18
12	28

2 Measure and record the differential pressure across the valve in the throttled position.

3 Locate percentage of valve opening on the bottom scale of Flow characteristic curve (**FIG 3**). Project line vertically up to intersect with the valve characteristic curve and from this point project line horizontally across to the left of the chart and record the percentage of maximum flow rate.

4 On the Flo-Trex performance curve (**FIG. 2**) locate the differential pressure obtained in **STEP 2** and project line horizontally across to intercept with valve performance curve. Drop a line vertically down to read the flow rate at the bottom of the chart.

5 To calculate flow rate of valve in the throttled position, multiply the flow rate from **STEP 4** by the percentage flow rate from **STEP 2** divided by 100.

Example: Valve size 4 inch.

Differential Pressure is 5.4 ft. (1.65 m).

Number of rings open = 3. Therefore: 3 rings ÷ 6 rings x 100 = 50% throttled.

From the Flo-Trex Performance Curve (**FIG 2**), a 4 inch, valve with 5.4 ft. pressure drop (1.65 m) represents a flow of 400 USgpm (25.2 L/s).

From Flow Characteristic Curve (**FIG 3**), a 4 inch valve 50% open, represents 34% of maximum flow.

Approximate flow of a 4 inch valve, with a 5.4 ft (1.65 m) pressure drop when 50% throttled is:

$$\frac{400x34}{100} = 136USgpm \left(\frac{25.2x34}{100} = 8.57L/s \right)$$

Note: To prevent premature valve failure it is not recommended that the valve operate in the throttled position with more than 25 ft pressure differential. Instead the pump impeller should be trimmed or valves located elsewhere in the system be used to partially throttle the flow.

FLOW INDICATOR SCALE

The valve stem with its grooved rings and positioning sleeve indicates the throttled position of the valve. The quarter turn graduations on the sleeve, with the scribed line on the stem, provide for approximate flow measurement.

Note: The valve is shipped in the closed position. The indicator on the plastic sleeve is aligned with the vertical scribed line on the stem.

8.0 OPERATION

To assure tight shut off, the valve must be closed using a wrench with 25 to 30 ft/lbs of torque.

To assure trouble-free check valve operation and shut off operation, the valve should be periodically opened and closed to keep valve seat and valve disc guide stem free of build up of system contaminants.

9.0 REPACKING OF FTV VALVE UNDER FULL SYSTEM PRESSURE

1. Should it be necessary, stem o-ring can be changed under full system pressure.
   Caution: Safety glasses should be worn.
2. Record the valve setting.
3. Turn the valve stem counter-clockwise until the valve is fully open and will not turn any further. Torque to a maximum force of 45 ft/lbs. This will ensure good metal-to-metal contact and minimum leakage.
4. The valve bonnet may now be removed. There may be slight leakage, as the metal-to-metal back seating does not provide a drip-tight seal.
5. Clean exposed portion of valve stem (do not scratch).
6. Remove and replace the o-ring and gasket.
7. Install the valve bonnet.
8. Tightening valve bonnet is necessary to stop any leaks.
9. Open valve to balance set point as recorded in **STEP 2**.

10.0 MAXIMUM NUMBER OF TURNS (FULL OPEN VALVE)

Note: On valve sizes 2½" and 3", full open position of valve is 5 turns. However valve will open to 5½ turns which is just back of seating of valve.

11.0 SEAT REPLACEMENT

1. Drain system and remove valve from piping.
2. Remove the body bolts from the body using an allen key.
3. Remove seat and o-ring. O-ring is not used on valves 8" and larger.
4. Inspect and clean o-ring cavity and install new o-ring and seat. Valve disc stem also should be inspected and replaced if worn. Valve stem o-ring should be replaced at this time. Refer to section **8.0**.

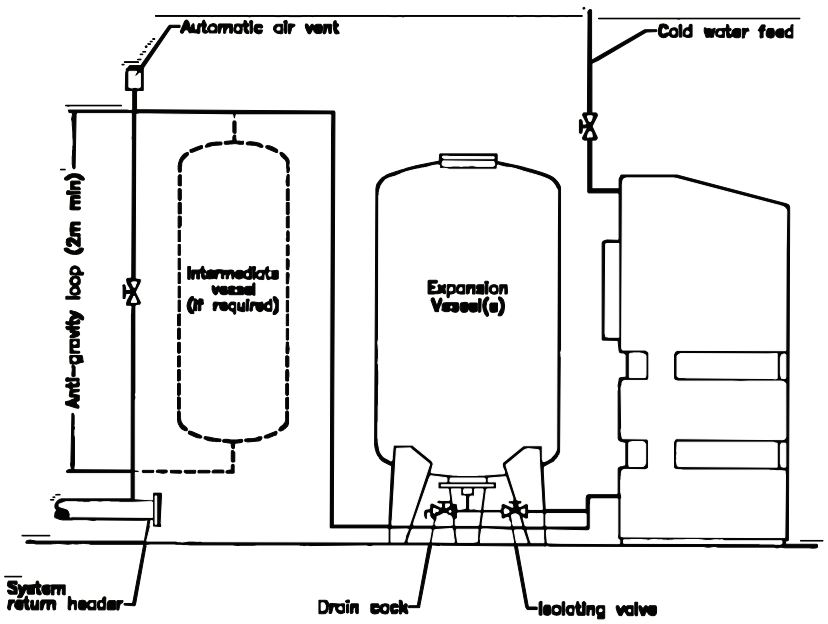
GLA - Glycol Make-up Units



ESSENTIAL SAFETY REQUIREMENTS

1) **Glycol** is toxic and the glycol supplier's safety instructions must be adhered to. In critical areas a retaining wall should be used to contain any spillage or leakage. Overflows should be arranged not to contaminate drainage systems.
2) It is recommended that initial commissioning be carried out with water.
3) The flow rates from the unit are designed for make-up rates. It is therefore suggested that the system is back-filled with due precautions taken to avoid contamination.
4) Glycol is sometimes subject to bacterial attack and can become slimy as a result. We recommend the addition of a suitable biocide. The dosage should be calculated on the amount of water glycol mixture added and not the total tank contents. If bacterial attack occurs on untreated mixtures the unit should be drained, flushed and refilled with fresh mixture and dosed with biocide.
5) Locate units in a well-ventilated environment and ensure that ventilation fans and apertures are not obstructed.
6) Check that the supply voltage and overload protection is correct.
7) A competent electrician should perform the electrical installation.
8) Guards and covers must not be removed during operation.

Expansion Vessel Installation and Commissioning

Refer to separate Armstrong publication for Armstrong vessels.

Install the **GLA** unit as indicated in the diagram below.

NOTES:

1) The pipework from the system to the expansion vessels should not be insulated.
2) For systems operating above 200 degrees F (93 C), an anti-gravity loop with a minimum height of 6 feet, (or an intermediate vessel) should be installed to provide thermal protection to the expansion tanks.
3) For hot water systems, the connections to the intermediate vessel should be reversed, i.e. top to system, and bottom to expansion vessel.
4) The GLA unit is suitable for floor mounting.
5) The ball float valve is fitted with a low-pressure seat; a high-pressure seat is attached to the float valve and should be fitted if required.
6) The pipework to the expansion vessels should be sized according to the size and number of vessels and should be at least the same size as the vessel connection.
7) Where multiple expansion vessels are required it is recommended that each vessel be installed with its own isolating valve and drain cock.

Pressure Switch Adjustment

1) Low system pressure – PS1
2) High system pressure – PS2
3) Duty pump control switch – PS3
4) Standby pump control switch (where fitted) – PS4

For each switch, set the delivery to the required pressure. Then very slowly turn the adjusting screw on the switch until the contacts change.
The high system pressure switch should first be set higher than the required pressure by turning the screw clockwise, and the setting then made by turning the screw anti-clockwise until the switch contacts change-over. The other switches should first be set lower than the required pressure by turning the screw anti-clockwise, and the setting then made by turning the screw clockwise until the switch contacts changeover.
A pipe plug is provided on the outlet to allow connection of a test pump to simulate differing system pressures to check switch settings.
The Ultra versions of the GLA have the capability of controlling duty and standby pumps from a single pressure switch.

GLA Ultra Settings

The extra functionality of Ultra units is integral. The only selectable option is Manual or Automatic reset of alarm conditions. DIP switch 1, on the display board should be set to OFF for auto reset (Factory setting), and ON for manual reset. On alarm conditions, the MUTE switch will mute the buzzer. In manual reset mode this MUTE switch will reset the alarms after the fault condition has been cleared. Other switches change the mode of the printed circuit board for use with other Armstrong products. For GLA application, all switches except 1 and 7 must be set to OFF.

Priming the make-up pumps

1. Close suction isolating valve.
2. Fill the glycol-mixing tank.
3. Remove the upper vent plug from the make-up pump.
4. Open suction isolation valve until water flows out of this tapping.
5. Close valve and replace plug.
6. Repeat for standby pump (where fitted).
7. Close the system-isolating valve.
8. Open suction isolating valve.
9. Switch on unit, initially both pumps will run. As the pressure reaches the pump control switch threshold, the pumps will switch off.
10. Check all piping for leaks following shipping.
11. Crack open system valve. The pressure will fall and the pump will start and maintain pressure.

Powered agitation (Ultra model only)

A solenoid valve is fitted to provide powered agitation of the mixture. Automatically this valve is periodically opened and the duty pump starts creating circulation through the pump and mixing tank. Automatic mixing is inhibited when there is a system demand for make-up.

A switch is provided for manual agitation when adding glycol to the mixing tank.

Topping up with glycol

The mixing tank is calibrated in liters and US gallons. The normal top up level is 53 US gallons (200 liters).

1. Calculate the amount of water needed and add or drain to the correct level.
2. Add the required amount of glycol.
3. Operate the manual-agitating switch.
4. Check the mixture percentage.

The unit is now ready for service.

5.0	Remplacement des joints d'étanchéité	6

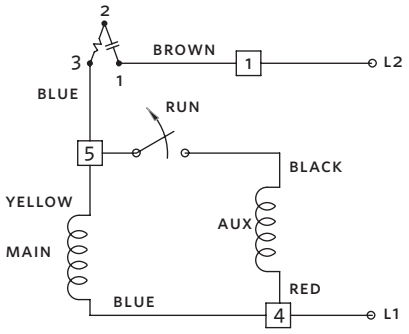
CAUTION

Always disconnect power supply from motor before servicing.

1.0 INSTALLATION

For convenience, Armstrong circulators generally are installed in vertical pipelines, but may be changed easily on the job for horizontal pipelines or for opposite flow directions. To make the change, remove the body capscrews, taking care body gasket is kept in position, and rotate body to desired direction at 90° or 180° from the original position.

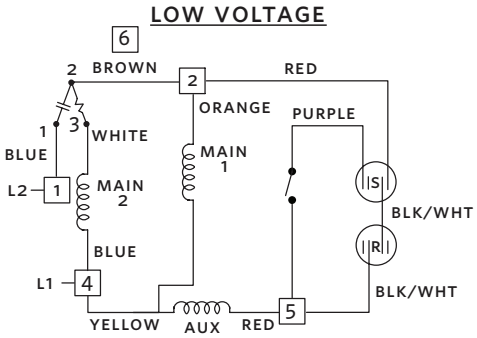
With the arrow on the body pointing in direction of the flow, insert body capscrews and tighten evenly. On models S25 to S57, H32 to H54 and series 1050 (1B to 2B), a gap between the bearing bracket and pump body (volute) is normal. Do no over tighten body capscrews! Turn pump shaft manually at coupler to make sure shaft turns freely and impeller does not rub in body. Always install with motor shaft in a horizontal position with pump oil cups or oil well cover on top.



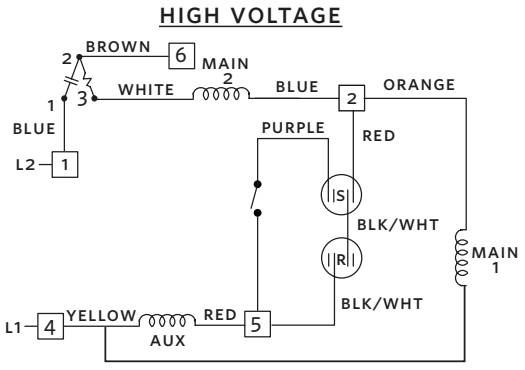
Models S25 to S46 and H32 to H41 are shipped for downward discharge. All other models are shipped for upward discharge as pumps of this size usually are installed in an upward direction on hydronic systems, so the point of zero pressure change - namely, the compression tank connection - can be made easily to the system on the suction side of the circulator.

The pump should be installed in a position to permit proper lubrication and servicing. Motor and bearing brackets are to be kept free of insulation. Pump and motor unit are designed to be supported by the in-line piping only. Do not support in any other manner. A height of approximately four feet above the floor is recommended. When placing the pump between flanges, tighten flange bolts evenly and do not tighten excessively.

Gate valves should be installed on the discharge and suction side of the pump to facilitate service. On larger pump sizes, a check valve should be located on the discharge side of pump between the pump body and the gate valve to prevent damage due to water hammer.



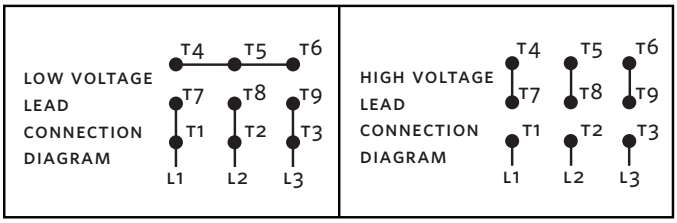
WIRING DIAGRAMS



SINGLE PHASE LESS THAN 0.5HP

C.C.W. rotation shown
For C.W. Rotation interchange yellow and blue leads on term 5 & 4

SINGLE PHASE LESS THAN 1HP (with with part number beginning with 811757-...)



SINGLE PHASE 1HP - 1.5HP (**only** for part number not beginning with 811757-...)

	LINE A	LINE B	JOIN
HIGH STD	1	4,5	2,3,8
HIGH OPP	1	4,8	2,3,5
LOW STD	1,3,8	2,4,5	—
LOW OPP	1,3,5	2,4,8	—

NOTE: Standard rotation is ccw facing end opposite shaft extension

THREE PHASE MOTOR ANY SIZE

Interchange any two lead wires to reverse rotation

2.0 SYSTEM CLEANLINESS

Before starting the pump, the system must be thoroughly cleaned, flushed and drained, then replenished with clean liquid. Welding slag and other foreign materials, 'stopleak' and cleaning compounds, excessive or improper water treatment - all are detrimental to the pump. Warranty will be void if any of these conditions are allowed to exist. (Refer to **File no. 6090.645** design and care of closed hydronic systems.)

3.0 STARTING UP

The pump must be fully primed on start-up. Fill system piping and pump body with liquid and vent complete system, turning pump by hand to dislodge air from body. Make sure fittings and drain valves are airtight, then add any additional fill required.

Check motor against available electric supply, then start pump making sure rotation is correct. When viewed from motor end, rotation is counter-clockwise on models S25 to S46 and H32 to H41. On all other models, rotation is clockwise. If pressure does not develop, stop pump, re-check, vent and fill. Never attempt to fill the system when the pump is running

4.0 LUBRICATION

CAUTION:
Do not put oil in the **maintenance free** circulators. These models contain MF in their item numbers and are labelled: 'THIS BEARING ASSEMBLY CONTAINS PERMANENTLY LUBRICATED BEARINGS AND DOES NOT NEED ANY OILING OR GREASING'.

Stop motor before lubricating, do not over-oil or spill oil on resilient motor rings. Do not force oil into cups, and stop if cup fills before addition of specified amount.

Pump lubrication: Only applicable for pumps those are with sleeve bearing SBA and have oil cup for lubrication.

Immediately after pump is installed and before running, slowly add the oil (SAE 30 non-detergent regular, supplied with pump) to pump oil cup, located on top of bearing bracket:

S25 to S57, H32 to H54 and series 1050 (1B to 2B)	¼ oz.
S69, H63 to H68, series 1060 (1½D to 3D)	2 oz.

At the start of each following heating season, lubricate with SAE 30 oil for models S25 to S57, H32 to H54 and series 1050 (1B to 2B), add approximately ¼ oz. Lubricate every six months for high temperature or constant operation. On models S69, H63 to H68 and series 1060 (1½D to 3D), be sure oil is visible at the top and center of window on side of bracket and maintain this level at all times.

Motor lubrication

CAUTION

Stop motor before lubricating. Do not over-oil or spill oil on resilient motor rings.

This motor has been lubricated properly at the factory. At the start of each following heating season, however, on motors with oil cups, add 15 drops SAE 30 non-detergent oil to each motor cup.

If the motor is fitted with grease fittings, follow the motor manufacturer's recommended procedure. Motors without oil cups or grease fittings are custom-greased for several years operation and require little or no attention.

5.0 SEAL REPLACEMENT

Remove the pump bracket from the body. Remove the impeller, damaged seal assembly, ceramic insert and rubber cup. Clean the recess in bearing bracket coverplate and install a new retainer cup and ceramic insert. Check the condition of the shaft sleeve. If scored, replace the shaft assembly. Otherwise, clean shaft extension and polish sleeve with a fine crocus cloth, using a rotating motion, if required.

Press against the coupler end of the shaft to take up play while pressing new seal firmly against the stationary face. A slight amount of clean vaseline may be put on shaft sleeve to assist installation. Press down firmly and evenly, using two screwdrivers and pushing against the four ears of driving band (the metal ring around rubber bellows), or around top outer edge of driving band on models S25 to S57, H32 to H54 and series 1050 (1B to 2B).

Do not use spring washer on models S25, S35 and H32 current style circulators, where recess to locate spring is provided on impeller hub.

Continue pressing against coupler end of shaft, re-mount impeller and re-assemble the seal bearing assembly into body. If necessary, install a new body gasket and clean gasket surface of both volute and bracket.

CAUTION

Before operating pump, carefully check:

1. Is the pump primed?
2. Is rotation correct?
3. Is pump properly lubricated?
4. Does the power supply agree with data on motor name plate?
5. Is overload protection provided?
6. Is the system clean?

For domestic water systems use bronze body pumps.

ATTENTION

Toujours couper l'alimentation électrique avant de procéder à l'entretien d'un moteur.

1.0 INSTALLATION

Pour des raisons pratiques, les circulateurs Armstrong sont généralement installés sur des conduites verticales, mais peuvent être facilement modifiés sur place pour des conduites horizontales ou pour changer la direction du liquide en circulation. Pour procéder au changement, retirer les boulons de fixation et, en prenant soin de maintenir en place le joint d'étanchéité, tourner le corps suivant l'angle désiré, 90° ou 180°, par rapport à la position originale.

La flèche sur le corps pointant dans la direction de la circulation du liquide, insérer les boulons de fixation et les visser uniformément. Sur les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), il est normal qu'il y ait un espace entre la chaise de palier et le corps de la pompe (volute). Ne pas trop serrer les boulons ! À la jonction, faire tourner l'arbre de la pompe à la main pour vous assurer qu'il tourne librement et que l'impulseur ne frotte pas l'intérieur du corps. Toujours installer de manière à ce que l'arbre du moteur soit en position horizontale, les godets à huile et le couvercle du réservoir d'huile étant placés sur le dessus.

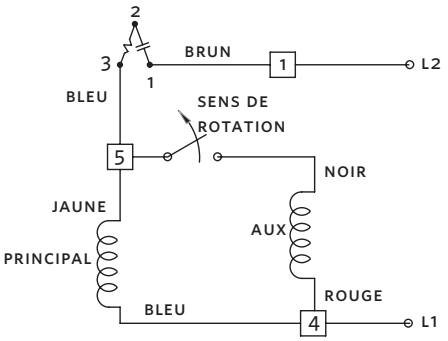
Les modèles S25 à S46 et H32 à H41 sont livrés en prévision d'une évacuation vers le bas. Tous les autres modèles sont livrés en prévision d'une évacuation vers le haut, puisque les pompes de cette taille sont habituellement installées sur les systèmes hydroniques pour pomper vers le haut, de sorte que le point de changement de pression nul, c'est-à-dire la connexion au vase d'expansion, puisse facilement se trouver du côté aspiration du circulateur.

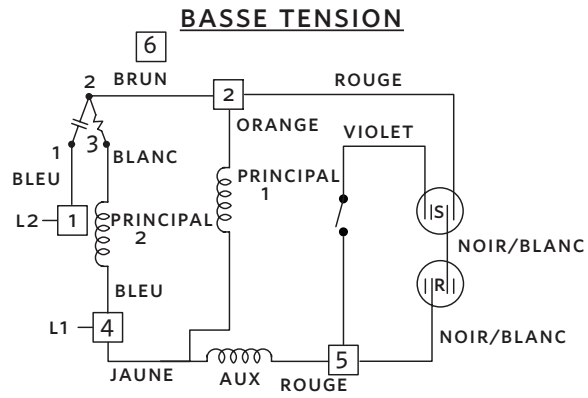
La pompe doit être installée à un endroit qui permet l'entretien et la lubrification. Le moteur et la chaise de palier doivent être exempts d'isolant. La pompe et le moteur sont conçus pour être soutenus uniquement par la tuyauterie en ligne. Ne pas les supporter d'aucune autre façon. Il est recommandé de les placer à environ 4 pi au-dessus du sol. Au moment de fixer la pompe par ses brides, serrer les boulons uniformément et sans excès.

Des robinets-vannes devraient être installés du côté évacuation et du côté aspiration de la pompe pour faciliter l'entretien. Sur les pompes plus grosses, un clapet antiretour devrait être placé du côté évacuation de la pompe, entre cette dernière et le robinet-vanne, pour prévenir les dommages causés par les coups de bélier.

SHÉMAS DE CÂBLAGE

MONOPHASÉ MOINS DE 0.5HP





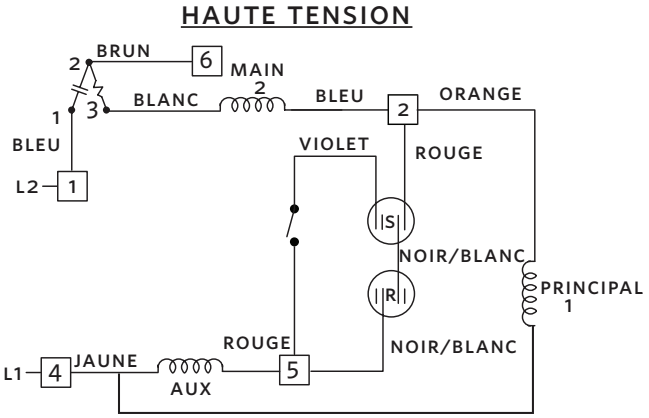


Schéma ci dessus à suivre dans le sens contraire des aiguilles d'une montre.

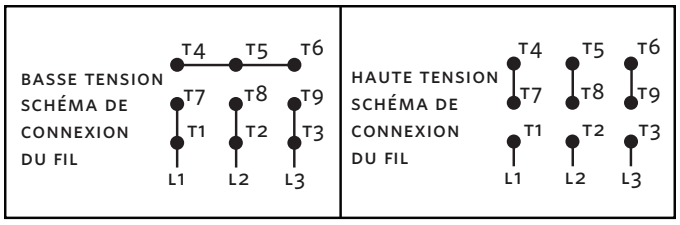
Pour une rotation dans le sens des aiguilles d'une montre, inverser les fils jaune et bleu des bornes 5 & 4.

MONOPHASÉ MOINS DE 1HP (avec un numéro de référence commençant par 811757-...)



MONOPHASÉ 1HP-1.5HP (seulement pour un numéro de référence ne commençant pas par 811757-...)

	LIGNE A	LIGNE B	JONCTION
HAUTE TENSION ROTATION STD	1	4,5	2,3,8
HAUTE TENSION ROTATION OPP	1	4,8	2,3,5
BASSE TENSION ROTATION STD	1,3,8	2,4,5	—
BASSE TENSION ROTATION OPP	1,3,5	2,4,8	—

NOTE: Le sens de rotation standard est dans le sens contraire des aiguilles d'une montre en faisant face à l'extrémité opposée de l'extension de l'arbre

MOTEUR TRIPHASÉ DE TOUTE TAILLE

Permuter deux des fils de sorties pour inverser le sens de rotation

2.0 PROPRETÉ DU SYSTÈME

Avant de démarrer la pompe, le système doit être entièrement nettoyé, vidangé et rincé, puis rempli de nouveau d'un liquide propre. Les scories de soudage et autres matières étrangères, les composés de colmatage de fuites et de nettoyage, les produits de traitement excessifs ou inappropriés de l'eau, peuvent tous endommager les composantes internes de la pompe. La garantie sera nulle si l'une ou l'autre de ces conditions est permise.(Consulter le **dossier n° 6090.645** conception et entretien des systèmes hydroniques fermés.)

3.0 DÉMARRAGE

La pompe doit être parfaitement amorcée avant le démarrage. Remplir la tuyauterie du système et le corps de la pompe de liquide, ventiler complètement le système, faire tourner la pompe à la main pour déloger les bulles d'air qui y seraient emprisonnées. Vous assurer que les raccords et les robinets de vidange sont étanches et ajouter le liquide qu'il faut pour remplir.

Comparer les exigences électriques aux conditions d'alimentation, puis faire démarrer la pompe et vous assurer qu'elle tourne correctement. Vue de l'extrémité moteur de la pompe, la rotation se fait dans le sens contraire des aiguilles d'une montre sur les modèles S25 à S46 et H32 à H41. Sur tous les autres modèles, la rotation se fait dans le sens des aiguilles d'une montre. Si la pression ne grimpe pas, arrêter la pompe, vérifier de nouveau, ventiler et remplir. Ne jamais essayer de remplir le système lorsque la pompe est en marche.

4.0 LUBRIFICATION

ATTENTION:
NE PAS verser d'huile dans les Circulateurs ne nécessitant aucun entretien. Les modèles mentionnant **MF** dans leur référencesont étiquetés : '**CE SYSTÈME À ROULEMENT EST ÉQUIPÉ DE ROULEMENTS À GRAISSAGE PERMANENT ET NE NÉCESSITE AUCUN AJOUT D'HUILE NI DE GRAISSAGE'.**

Arrêter le moteur avant de lubrifier. Ne pas mettre trop d'huile ni en renverser sur les bagues souples du moteur. Ne pas faire entrer l'huile de force dans les godets et arrêter le remplissage si un godet se remplit avant d'avoir ajouté la quantité spécifiée.

Lubrification de la pompe : Applicable seulement pour les pompes à paliers à douille et ayant un godet pour la lubrification

Immédiatement après l'installation de la pompe et avant de la démarrer, ajouter lentement de l'huile (SAE 30 non détergente régulière, fournie avec la pompe) dans le godet situé sur le dessus de la chaise de palier :

S25 à S57, H32 à H54 et série 1050 (1B à 2B)	¼ oz.
S69, H63 à H68, série 1060 (1½D à 3D)	2 oz.

Par la suite, au début de chaque saison de chauffage, lubrifier la pompe en utilisant de l'huile SAE 30. Pour les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), ajouter environ ½oz. Lubrifier à tous les six mois si la pompe fonctionne tout le temps ou à haute température. Sur les modèles S69, H63 à H68, série 1060 (1½D à 3D), vous assurer que l'huile est visible en haut et au centre de la lunette sur le côté de la chaise de palier et maintenir ce niveau en tout temps.

Lubrification du moteur

ATTENTION

Arrêter le moteur avant de le lubrifier. Ne pas ajouter trop d'huile ni en renverser sur les bagues souples du moteur.

Ce moteur a été lubrifié correctement en usine. Au début de chaque saison de chauffage, toutefois, sur les moteurs munis de godets d'huile, ajouter 15 gouttes d'huile non détergente SAE 30 dans chaque godet.

Si le moteur est équipé d'embouts de graissage, respecter la procédure recommandée par le fabricant. Les moteurs à godets d'huile ou à embouts de graissage sont graissés individuellement en prévision de plusieurs années d'utilisation et exigent peu ou pas d'attention.

5.0 REMPLACEMENT DES JOINTS D'ÉTANCHÉITÉ

Retirer la portion pompe du corps. Retirer l'impulseur, le joint d'étanchéité endommagé, la pièce de céramique et le godet de caoutchouc. Nettoyer le compartiment du joint dans la chaise de palier et installer un nouveau godet et une nouvelle céramique. Vérifier l'état de la chemise de l'arbre. Si elle est marquée, remplacer l'ensemble de l'arbre. Autrement, nettoyer le prolongement de l'arbre et, au besoin, polir la chemise à l'aide d'une toile à polir fine suivant un mouvement rotatif.

Pousser sur l'extrémité accouplement de l'arbre pour réduire le jeu tout en pressant fermement le nouveau joint d'étanchéité sur la face fixe. On peut mettre une petite quantité de vaseline sur la chemise de l'arbre pour aider à l'installation. Pousser fermement et uniformément en utilisant deux tournevis contre les quatre oreillettes du collet (l'anneau de métal autour des soufflets de caoutchouc) ou sur le pourtour extérieur du collet dans le cas des modèles S25 à S57, H32 à H54 et de la série 1050 (1B à 2B).

Ne pas utiliser de rondelle à ressort sur les circulateurs de modèles courants S25, S35 et H32 lorsque la dépression prévue pour le ressort se trouve sur le moyeu de l'impulseur. Continuer d'appuyer sur l'extrémité accouplement de l'arbre. Remonter l'impulseur et l'ensemble porteur du joint d'étanchéité dans le corps. Au besoin, installer un nouveau joint pour le corps et nettoyer la surface du joint de la volute et de la chaise de palier.

ATTENTION

Avant de faire fonctionner la pompe, vous assurer que :

1. La pompe a été amorcée?
2. Le sens de la rotation est le bon?
3. La pompe est correctement lubrifiée?
4. L'alimentation correspond aux données sur la plaque d'identification?
5. La pompe est protégée contre les surcharges?
6. Le système est propre?

Pour les systèmes domestiques de distribution d'eau, utiliser des pompes à corps de bronze.

10. CAUTION FOR REFRIGERANT LEAKS 17

1. SAFETY CONSIDERATIONS

Read these "SAFETY CONSIDERATIONS for Installation" carefully before installing air conditioning equipment. After completing the installation, make sure that the unit operates properly during the startup operation.
Instruct the customer on how to operate and maintain the unit. Inform customers that they should store this Installation Manual with the Operation Manual for future reference.
Always use a licensed installer or contractor to install this product. Improper installation can result in water or refrigerant leakage, electrical shock, fire, or explosion.
Meanings of **DANGER**, **WARNING**, **CAUTION**, and **NOTE** Symbols:

⚠ **DANGER**..... Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ **WARNING**..... Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

⚠ **CAUTION**..... Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

⚠ **NOTE**..... Indicates situations that may result in equipment or property-damage accidents only.

⚠ DANGER

- **Refrigerant gas is heavier than air and replaces oxygen. A massive leak can lead to oxygen depletion, especially in basements, and an asphyxiation hazard could occur leading to serious injury or death.**
- **Do not ground units to water pipes, gas pipes, telephone wires, or lightning rods as incomplete grounding can cause a severe shock hazard resulting in severe injury or death. Additionally, grounding to gas pipes could cause a gas leak and potential explosion causing severe injury or death.**
- **If refrigerant gas leaks during installation, ventilate the area immediately. Refrigerant gas may produce toxic gas if it comes in contact with fire. Exposure to this gas could cause severe injury or death.**
- **After completing the installation work, check that the refrigerant gas does not leak throughout the system.**
- **Do not install unit in an area where flammable materials are present due to risk of explosions that can cause serious injury or death.**
- **Safely dispose all packing and transportation materials in accordance with federal/state/local laws or ordinances. Packing materials such as nails and other metal or wood parts, including plastic packing materials used for transportation may cause injuries or death by suffocation.**

⚠ WARNING

- **Only qualified personnel must carry out the installation work. Installation must be done in accordance with this installation manual. Improper installation may result in water leakage, electric shock, or fire.**
- **When installing the unit in a small room, take measures to keep the refrigerant concentration from exceeding allowable safety limits. Excessive refrigerant leaks, in the event of an accident in a closed ambient space, can lead to oxygen deficiency.**
- **Use only specified accessories and parts for installation work. Failure to use specified parts may result in water leakage, electric shocks, fire, or the unit falling.**
- **Install the air conditioner on a foundation strong enough that it can withstand the weight of the unit. A foundation of insufficient strength may result in the unit falling and causing injuries.**
- **Take into account strong winds, typhoons, or earthquakes when installing. Improper installation may result in the unit falling and causing accidents.**
- **Make sure that a separate power supply circuit is provided for this unit and that all electrical work is carried out by qualified personnel according to local, state, and national regulations. An insufficient power supply capacity or improper electrical construction may lead to electric shocks or fire.**
- **Make sure that all wiring is secured, that specified wires are used, and that no external forces act on the terminal connections or wires. Improper connections or installation may result in fire.**

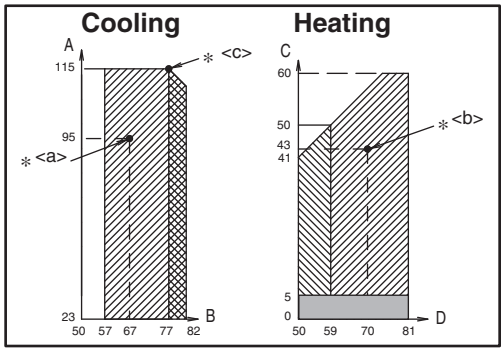
- When wiring, position the wires so that the control box cover can be securely fastened. Improper positioning of the control box cover may result in electric shocks, fire, or the terminals overheating.
- Before touching electrical parts, turn off the unit.
- Be sure to install a ground fault circuit interrupter if one is not already available. This helps prevent electrical shocks or fire.
- Securely fasten the outdoor unit terminal cover (panel). If the terminal cover/panel is not installed properly, dust or water may enter the outdoor unit causing fire or electric shock.
- When installing or relocating the system, keep the refrigerant circuit free from substances other than the specified refrigerant (R410A) such as air. Any presence of air or other foreign substance in the refrigerant circuit can cause an abnormal pressure rise or rupture, resulting in injury.
- Do not change the setting of the protection devices. If the pressure switch, thermal switch, or other protection device is shorted and operated forcibly, or parts other than those specified by Daikin are used, fire or explosion may occur.

⚠ CAUTION

- Do not touch the switch with wet fingers. Touching a switch with wet fingers can cause electric shock.
- Do not allow children to play on or around the unit to prevent injury.
- Do not touch the refrigerant pipes during and immediately after operation as the refrigerant pipes may be hot or cold, depending on the condition of the refrigerant flowing through the refrigerant piping, compressor, and other refrigerant cycle parts. Your hands may suffer burns or frostbite if you touch the refrigerant pipes. To avoid injury, give the pipes time to return to normal temperature or, if you must touch them, be sure to wear proper gloves.
- Heat exchanger fins are sharp enough to cut.
  To avoid injury wear glove or cover the fins when working around them.
- Install drain piping to proper drainage. Improper drain piping may result in water leakage and property damage.
- Insulate piping to prevent condensation.
- Be careful when transporting the product.
- Do not turn off the power immediately after stopping operation. Always wait for at least 5 minutes before turning off the power. Otherwise, water leakage may occur.
- Do not use a charging cylinder. Using a charging cylinder may cause the refrigerant to deteriorate.
- Refrigerant R410A in the system must be kept clean, dry, and tight.
  (a) Clean and Dry -- Foreign materials (including mineral oils such as SUNISO oil or moisture) should be prevented from getting into the system.
  (b) Tight -- R410A does not contain any chlorine, does not destroy the ozone layer, and does not reduce the earth's protection again harmful ultraviolet radiation. R410A can contribute to the greenhouse effect if it is released. Therefore take proper measures to check for the tightness of the refrigerant piping installation. Read the chapter Refrigerant Piping Work and follow the procedures.
- Since R410A is a blend, the required additional refrigerant must be charged in its liquid state. If the refrigerant is charged in a state of gas, its composition can change and the system will not work properly.
- The indoor unit is for R410A. See the catalog for indoor models that can be connected. Normal operation is not possible when connected to other units.
- Remote controller (wireless kit) transmitting distance can be shorter than expected in rooms with electronic fluorescent lamps (inverter or rapid start types). Install the indoor unit far away from fluorescent lamps as much as possible.
- Indoor units are for indoor installation only. Outdoor units can be installed either outdoors or indoors.
- Do not install the air conditioner in the following locations:
  (a) Where a mineral oil mist or oil spray or vapor is produced, for example, in a kitchen.
  Plastic parts may deteriorate and fall off or result in water leakage.
  (b) Where corrosive gas, such as sulfurous acid gas, is produced.
  Corroding copper pipes or soldered parts may result in refrigerant leakage.
  (c) Near machinery emitting electromagnetic waves.
  Electromagnetic waves may disturb the operation of the control system and cause the unit to malfunction.
  (d) Where flammable gas may leak, where there is carbon fiber, or ignitable dust suspension in the air, or where volatile flammables such as thinner or gasoline are handled. Operating the unit in such conditions can cause a fire.
- Take adequate measures to prevent the outdoor unit from being used as a shelter by small animals. Small animals making contact with electrical parts can cause malfunctions, smoke, or fire. Instruct the customer to keep the area around the unit clean.

⚠ NOTE

- Install the power supply and control wires for the indoor and outdoor units at least 3.5 feet away from televisions or radios to prevent image interference or noise. Depending on the radio waves, a distance of 3.5 feet may not be sufficient to eliminate the noise.
- Dismantling the unit, treatment of the refrigerant, oil and additional parts must be done in accordance with the relevant local, state, and national regulations.
- Do not use the following tools that are used with conventional refrigerants: gauge manifold, charge hose, gas leak detector, reverse flow check valve, refrigerant charge base, vacuum gauge, or refrigerant recovery equipment.
- If the conventional refrigerant and refrigeration oil are mixed in R410A, the refrigerant may deteriorate.



- **This air conditioner is an appliance that should not be accessible to the general public.**
- **The wall thickness of field-installed pipes should be selected in accordance with the relevant local, state, and national regulations.**

〈**Safety Precaution**〉
The PCI Data Station is a class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

2. INTRODUCTION

2-1 Standard operation limit

The figures below assume following operating conditions for indoor and outdoor units:
Equivalent pipe length.....25 ft.
Level difference.....0 ft.

A Outdoor temperature (°FDB)
B Indoor temperature (°FWB)
C Outdoor temperature (°FWB)
D Indoor temperature (°FDB)
Range for continuous operation
Range for pull down operation
Range for warming up operation
Range for operation

2-2 Technical specifications

(∗<a> and ∗<b> in the table indicate the operating condition (shown in the left figure).)

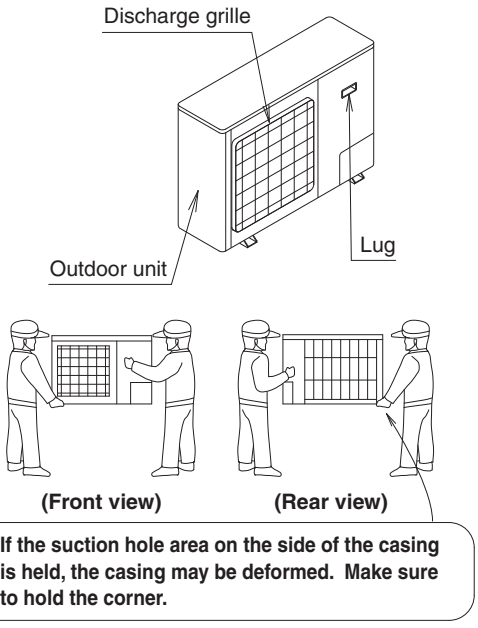
			• Installation manual
(1 pc.)	(2 pcs.)	(2 pcs.)	



2-5 Main components

For main components and function of the main components, refer to the Engineering Data Book.

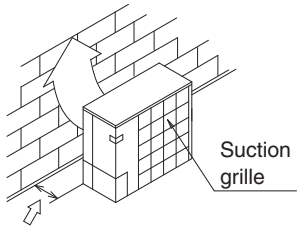
3. BEFORE INSTALLATION

〈**Bringing-in**〉

Bring in the outdoor unit slowly by holding the lugs provided on the left and right sides as shown in the figures below.
(Take care so that hands and objects do not touch the fin on the rear.)

If the suction hole area on the side of the casing is held, the casing may be deformed. Make sure to hold the corner.

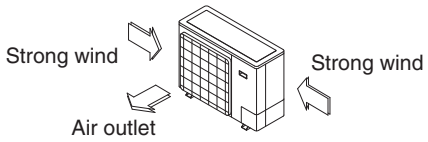
◎ Make sure to use accessories and specified specification parts in the installation work.



4. SELECTION OF INSTALLATION LOCATION

The refrigerant R410A itself is nontoxic, nonflammable and safe. If the refrigerant should leak however, its concentration may exceed the allowable limit depending on room size. Due to this it could be necessary to take measures against leakage. Refer to the chapter "Caution for refrigerant leaks".

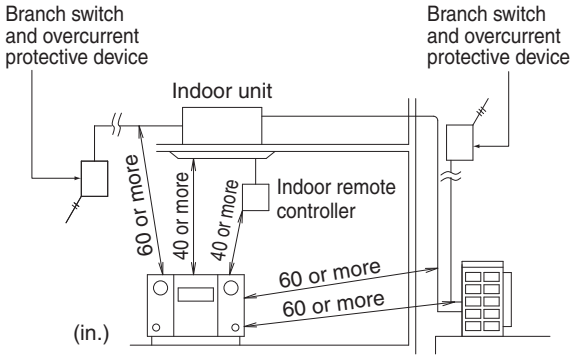
(1) Select a proper location satisfying the following requirements with approval of the customer.
- Sufficient ventilation is secured.
- Adjacent houses are not annoyed.
- The foundation is strong enough to support the weight and withstand vibrations of the outdoor unit, and the location is safe and allows horizontal installation.
- The outdoor unit is exposed to rain as less as possible.
- The space for installation and servicing is secured around the outdoor unit.
- The indoor/outdoor piping length and wiring length are within the allowable range.



(2) When installing the outdoor unit in a location affected by strong wind, pay special attention to the following items.
- If strong wind whose velocity is 11 mph or more blows to the outdoor unit from the air outlet side, the air flow rate of the outdoor unit is reduced, the outlet air is sucked again (short-circuit), and the following effect may be caused:
  - The capacity is deteriorated.
  - The adhered frost increases during heating operation.
  - The operation is stopped by pressure rise.
- If excessive strong wind continuously blows from the air outlet side of the outdoor unit, the fan may rotate in the reverse direction at high speed, and lead to damage. Install the outdoor unit in reference to the following figures.

• Position the air outlet side toward the building wall, fence or windbreak screen.

(Secure the space for installation and servicing.)



• Let the air outlet direction face be at right angles to the wind direction.

(3) When installing the outdoor unit in a location with heavy snowfall, pay special attention to the following items:
- Prepare strong foundation.
- Attach the snow hood (optional accessory).
- Remove the suction grill on the rear so that snow will not be accumulated in the rear fin.

(4) When there is a possibility of short-circuit depending on the ambient situation, use the wind direction adjusting plate (optional accessory).

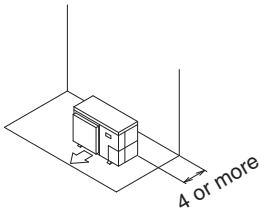
(5) The inverter type air conditioner may cause noise in electric products.
When selecting an installation location, keep sufficient distance from the air conditioner units and wiring to radios, personal computers, stereos, etc. as shown in the figure below.
In areas with weak electric waves, keep a distance of 120 in. or more from the indoor remote controller, etc., put the power cables and connection cables in conduit tubes, and ground the conduit tubes.

⚠ DANGER

- Do not install unit in an area where flammable materials are present due to risk of explosion resulting in serious injury or death.
- Refrigerant is heavier than air and replaces oxygen. A massive leak could lead to oxygen depletion , especially in basements, and an asphyxiation hazard could occur leading to serious injury or death.

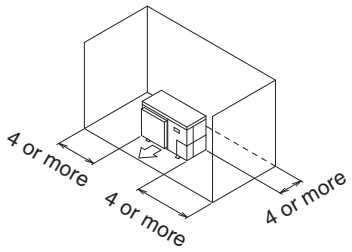
Installation place (unit: inch)

〈**Cautions on continuous installation**〉



- The connection piping outlet direction in the continuous installation shown in the figures below is frontward or downward.
- When routing the piping rearward, secure space of 10 in. or more on the right side of the outdoor unit. (The unit of numeric values below is “inch”.)
- Make some space for wiring with conduit and servicing between the units.

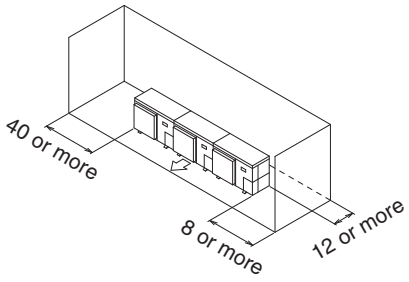
(A) When an obstruction is present on the air inlet side



- **When the upward area is open**

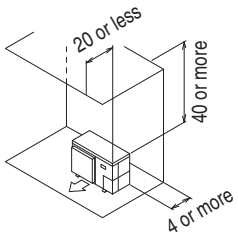
(1) When one outdoor unit is installed individually

- When an obstruction is present only on the air inlet side

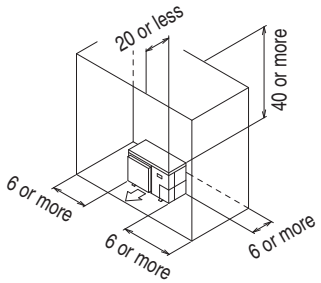


- When an obstruction is present on the both sides

(2) When two or more outdoor units are installed side by side



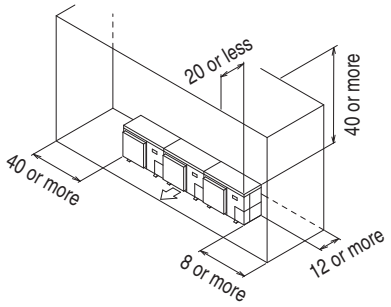
- When an obstruction is present on the both sides



- **When an obstruction is present also in the upward area**

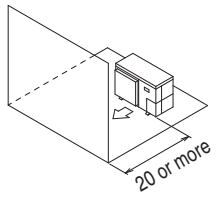
(1) When one outdoor unit is installed individually

- When an obstruction is present also on the air inlet side

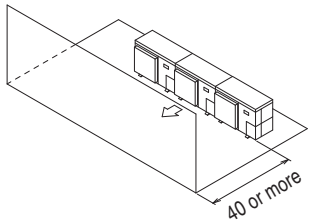


- When an obstruction is present also on the air inlet side and both sides

(2) When two or more outdoor units are installed side by side



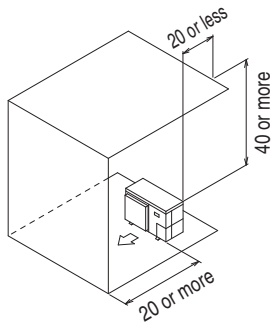
- When an obstruction is present also on the air inlet side and both sides



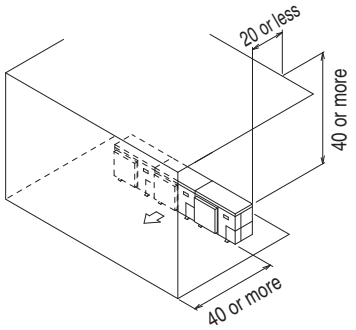
(B) When an obstruction is present on the air outlet side

- **When the upward area is open**

(1) When one outdoor unit is installed individually



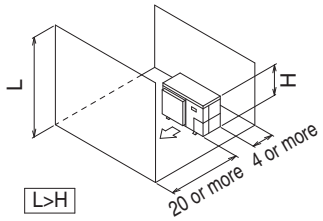
(2) When two or more outdoor units are installed side by side



- **When an obstruction is present also in the upward area**

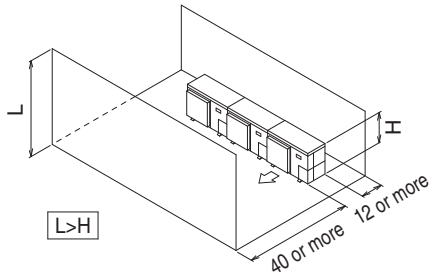
(1) When one outdoor unit is installed individually

(2) When two or more outdoor units are installed side by side



(C) When an obstruction is present on both the air inlet and air outlet sides

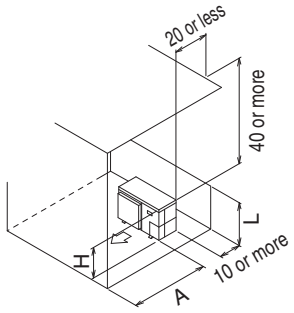
<Pattern 1>



When an obstruction on the air outlet side is higher than the outdoor unit (There is no restriction in the height of obstruction on the air inlet side.)

- **When the upward area is open**

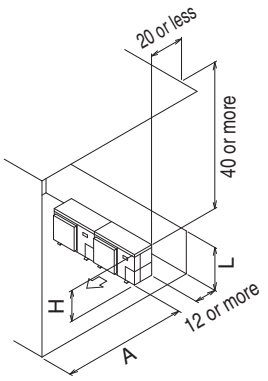
(1) When one outdoor unit is installed individually



(2) When two or more outdoor units are installed side by side

- **When an obstruction is present also in the upward area**

(1) When one outdoor unit is installed individually



The dimensional relationship between H, L and A is as shown in the table below.

	L	A
L ≤ H	0 < L ≤ 1/2H	30
	1/2H < L ≤ H	40
H < L	**Install the frame to achieve "L ≤ H".**	

⚠ NOTE

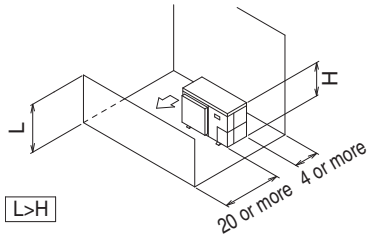
- Close the area under the frame so that the outlet air does not bypass there.

(2) When only two outdoor units are installed side by side

The dimensional relationship between H, L and A is as shown in the table below.

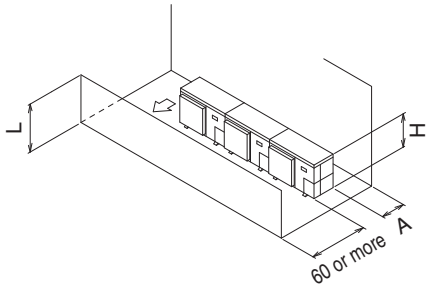
	L	A
L ≤ H	0 < L ≤ 1/2H	40
	1/2H < L ≤ H	50
H < L	**Install the frame to achieve "L ≤ H".**	

NOTE



1. Close the area under the frame so that the outlet air does not bypass there.
2. Only two outdoor units can be installed side by side.

<Pattern 2>

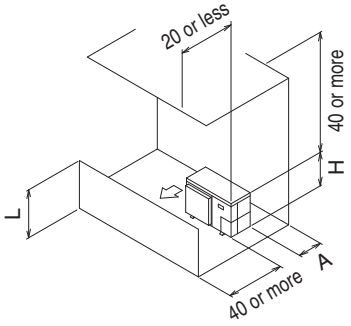


When an obstruction on the air outlet side is lower than the outdoor unit (There is no restriction in the height of obstruction on the air inlet side.)

- **When the upward area is open**

(1) When one outdoor unit is installed individually

(2) When two or more outdoor units are installed side by side

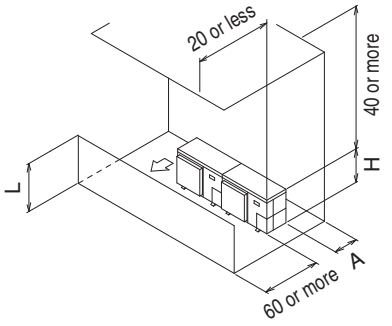


The dimensional relationship between H, L and A is as shown in the table below.

L	A
0 < L ≤ 1/2H	10
1/2H < L ≤ H	12

- **When an obstruction is present also in the upward area**

(1) When one outdoor unit is installed individually



The dimensional relationship between H, L and A is as shown in the table below.

	L	A
L ≤ H	0 < L ≤ 1/2H	4
	1/2H < L ≤ H	8
H < L	**Install the frame to achieve "L ≤ H".**	

NOTE

- Close the area under the frame so that the outlet air does not bypass there.

(2) When only two outdoor units are installed side by side

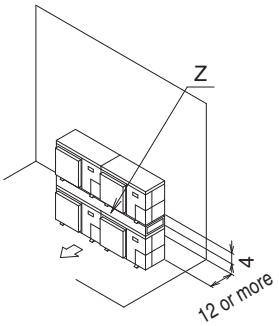
The dimensional relationship between H, L and A is as shown in the table below.

	L	A
L ≤ H	0 < L ≤ 1/2H	10
	1/2H < L ≤ H	12
H < L	**Install the frame to achieve "L ≤ H".**	

NOTE

1. Close the area under the frame so that the outlet air does not bypass there.
2. Only two outdoor units can be installed side by side.

(D) When outdoor units are stacked

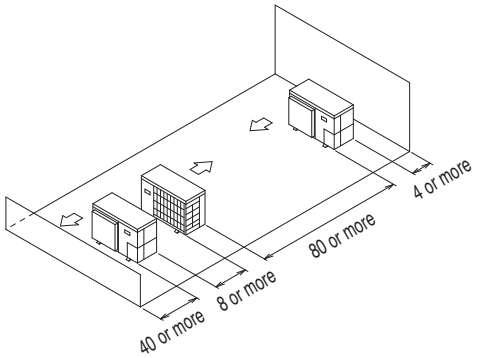


(1) When an obstruction is present on the air outlet side

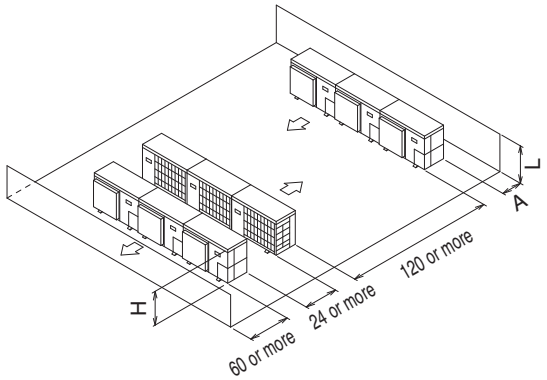
NOTE

1. Only two outdoor units can be stacked.
2. About 4 in. is required as the drain piping size for the upper outdoor unit.
3. Close the area Z (gap between the upper outdoor unit and the lower outdoor unit) so that the outlet air does not by-pass there.

(2) When an obstruction is present on the air inlet side



NOTE

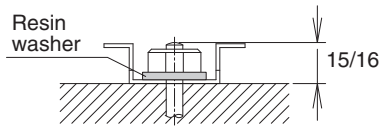


1. Only two outdoor units can be stacked.
2. About 4 in. is required as the drain piping size for the upper outdoor unit.
3. Close the area Z (gap between the upper outdoor unit and the lower outdoor unit) so that the outlet air does not by-pass there.

(E) When outdoor units are installed in rows (on the rooftop, etc.)

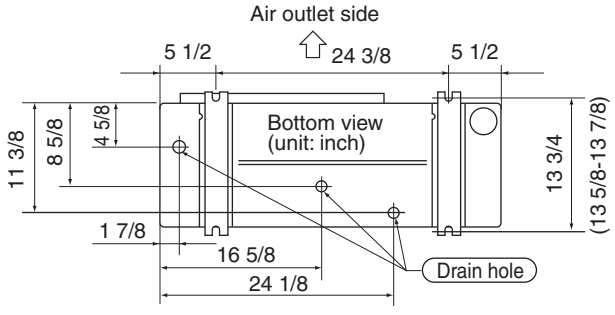
(1) When one outdoor unit is installed in each row

(2) When two or more outdoor units are installed side by side



The dimensional relationship between H, L and A is as shown in the table below.

	L	A
L ≤ H	0 < L ≤ 1/2H	10
	1/2H < L ≤ H	12
H < L	**Installation is not allowed.**	



5. CAUTIONS ON INSTALLATION

- Before installation, confirm the strength and levelness of the foundation so that vibrations and noise are not generated.
- Fix the outdoor unit securely on a rigid base with foundation bolts as shown in the foundation drawing below.
  (Prepare 4 sets of commercially available M12-type or equivalent foundation bolts, nuts and washers.)
- Use resin washers to prevent the paint from being scratched off and rusting.
- The foundation bolts should be protruded by 15/16 in.
  (Refer to figure)

〈〈**Drain treatment**〉〉

- In a location where drain from the outdoor unit may cause troubles (for example, where drainage may splash on general passersby), perform the drain piping work using the drain plug (optional).
- For drain treatment, space of at least 4 in. is required under the bottom frame of the outdoor unit.
- In the drain piping work, make sure that drainage is discharged securely.
  (When routing the piping downward, check for water leakage.)

6. REFRIGERANT PIPING WORK

⚠ CAUTION

<To piping technician>

- **Make sure to open the stop valves after finishing the piping work. (Refer to the table shown in " 6-7 Additional refrigerant charge".)**
  (Operating the air conditioner with the stop valve shut may damage the compressor.)
- Use R410A to add refrigerant. (The R410A refrigerant cylinder has a pink stripe painted around it.)
  All field piping must be installed by a licensed refrigeration technician and must comply with relevant local and national regulations.
- **BRAZING REFRIGERANT PIPING**
  Do not use flux when brazing copper-to copper refrigerant piping.
  (Particularly for the HFC refrigerant piping) Therefore, use the phosphor copper brazing filler metal (BCuP) which does not require flux.
  (Flux has an extremely negative effect on refrigerant piping systems. For instance, if chlorine based flux is used, it will cause pipe corrosion. Flux containing fluorine will damage refrigeration oil.)

⚠ NOTE

- Maximum piping length between the outdoor and indoor unit:

Indoor unit	FAQ FCQ FHQ	FTQ
Max. piping length	164 ft.	98 ft.

- Installation tools:
  Make sure to use installation tools (gauge manifold charge hose, etc.) that are exclusively used for R410A installations to withstand the pressure and to prevent foreign materials (e.g. mineral oils such as SUNISO and moisture) from mixing into the system.
  (The screw specifications differ for R410A and R407C.)
  Vacuum pump (use a 2-stage vacuum pump with a non-return valve):
  1. Make sure the pump oil does not flow oppositely into the system while the pump is not working.
  2. Use a vacuum pump which can evacuate to –14.6 psi.

6-1 Selection of piping material

1. Foreign materials inside pipes (including oils for fabrication) must be 0.14gr/10ft. or less.
2. Use the following material specification for refrigerant pipping:
   - Construction material: Phosphoric acid deoxidized seamless copper for refrigerant.
   - Size: liquid pipe: ϕ3/8"
     gas pipe: ϕ5/8"

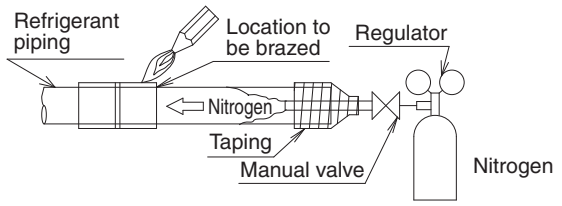
6-2 Protection of piping

- Protect the piping to prevent moisture and dusts from coming into the piping.
- Especially, pay attention when passing the piping through a hole or connecting the end of piping to the outdoor.

Location	Working period	Protection method
Outdoor	1 month or more	Pinch pipes
	Less than 1 month	Pinch or tape pipes
Indoor	Regardless of period	

6-3 Piping connection

- **For handling of stop valves, refer to "Stop valve operation method" in "6-7 Additional refrigerant charge".**
- **Only use the flare nuts attached to the stop valves. Using different flare nuts may cause the refrigerant to leak.**
- **Be sure to perform a nitrogen blow when brazing.**



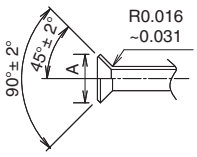
(Brazing without performing nitrogen replacement or releasing nitrogen into the piping will create large quantities of oxidized film inside the pipes, adversely affecting valves and compressor in the refrigerating system and preventing normal operation.)

⚠ DANGER

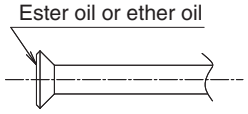
- Use of oxygen could cause an explosion resulting in severe injury or death. Only use nitrogen gas.
- Refrigerant gas may produce toxic gas if it comes in contact with fire such as from a fan heater, stove or cooking device. Exposure to this gas could cause severe injury or death.

⚠ NOTE

- When brazing with blowing nitrogen, set the nitrogen pressure to 2.9 psi or less by using a pressure reducing valve.



⚠ CAUTION



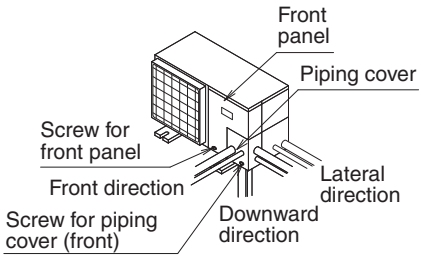
- Do not use anti-oxidants when brazing.
  Residue can clog pipes and break the unit.

◎ Do not let any refrigerant other than the specified refrigerant enter the refrigerant system.
◎ Do not let any gas such as air enter the refrigerant system.

〈**Precautions when connecting the piping**〉

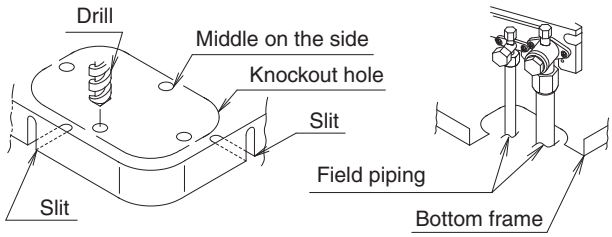
- See the following table for flare dimensions.
- When connecting the flare nuts, apply refrigeration oil to the inside of the flares and turn them three or four times at first. (Use ester oil or ether oil.)
- See the following table for tightening torque. (Applying too much torque may cause the flares to crack.)
- After connecting all the piping perform a gas leak check by using nitrogen.

Pipe size	Tightening torque (ft·lbf)	Flare dimension A (in.)	Flare shape (in.)
ϕ3/8”	24.1 - 29.4	0.504 - 0.520	
ϕ5/8”	45.6 - 55.6	0.760 - 0.776	



- If you are obliged to install the unit without a torque wrench, you may follow the installation method mentioned below. After the work is finished, make sure to check that there is no gas leak.
- When you keep on tightening the flare nut with a spanner, there is a point where the tightening torque suddenly increases.
  From that position, further tighten the flare nut the angle shown below.

Pipe size	Tightening angle (Guideline)	Recommended arm length of tool (in.)
ϕ3/8”	60°~90°	Approx. 7 7/8
ϕ5/8”	30°~60°	Approx. 11 13/16

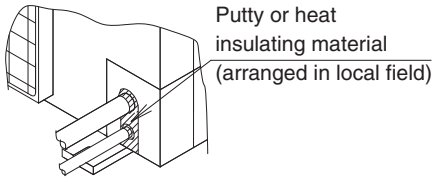


Disposal requirements
Dismantling of the unit, treatment of the refrigerant, oil and eventual other parts should be comply the relevant local and national regulations.

6-4 Refrigerant piping work procedure

◎ The field piping can be connected in three directions.

◎ When connecting the piping downward, remove the knockout hole by making four holes in the middle on the each side of the knockout hole with a drill.



Then cut out the corner of the bottom frame along the slits (in two positions) by using a hacksaw.
◎ After removing the parts, it is recommended to apply repair paint on the edges, to prevent rusting.

Cautions on connecting the connection piping

- When it is expected that water condensed in the stop valve will reach the indoor unit through the gap between the heat insulating material and the piping (for example, when the outdoor unit is installed in a higher position than the indoor unit), take proper action such as caulking the connection area.

[Measures to prevent invasion of small creatures and litter]

- Block all gaps in the piping penetration areas with putty or heat insulating material (arranged in the local field) as shown in the figure below.
  (If small creatures such as insects or litter enter the outdoor unit, a short-circuit may be caused inside the control box.)

6-5 Heat insulation of piping

- Make sure to insulate the field piping (on both the liquid line and gas line) and refrigerant branching kit.
  (If they are not insulated, water leakage may be caused.)

  (The maximum temperature of the piping on the gas line is about 248 °F during heating operation. Use an insulation sufficiently resistant to this temperature.)

- Reinforce the refrigerant piping according to the installation environment. If it is not reinforced, condensate may form on the surface of the insulation.

⚠ WARNING

- Make sure to insulate the field piping up to the piping connection area inside the unit. If the piping is exposed, dew condensation and burn by contact may be caused.

6-6 Airtight test and vacuum drying

The unit has been checked for leaks by the manufacturer. Confirm that the valves are firmly closed before airtight test or vacuumdrying.
To prevent entry of any impurities and insure sufficient pressure resistance, always use the special tools dedicated for R410A.

Perform the following inspections securely after the piping work.

- **Airtight test** - Make sure to use nitrogen gas. (For the service port position, refer to the figure in “**Stop valve operation method**”.)
  [Procedure] Pressurize the air conditioner from the liquid pipe and gas pipe up to 450 psi (Make sure not to exceed 450 psi). When the pressure does not drop for 24 hours, the piping work shall be accepted.
  If the pressure drops, check for leakage positions. (Confirm that there is no leakage, then release nitrogen.)

- **Vacuum drying** - Use a vacuum pump which can evacuate up to –14.6 psi or less.
  [Procedure] Operate the vacuum pump for evacuation for 2 hours or more using both liquid pipe and gas pipe until the vacuum pressure reaches –14.6 psi or less. Leave the air conditioner at –14.6 psi or less for 1 hour or more, and confirm that the vacuum pressure indicated by the vacuum gage does not increase.
  (If the vacuum pressure increases, the system may contain moisture or have leakage.)

If there is a possibility of moisture remaining in the piping (for example, when there is a possibility of dew condensation inside the piping because the piping work was performed in the rainy season or over a long period of time, or when rainwater may have entered the piping during the work)
Perform evacuation described above for 2 hours (vacuum drying), pressurize the air conditioner up to 7 psi (vacuum break) with nitrogen gas, then evacuate the air conditioner using the vacuum pump for 1 hour to achieve –14.6 psi or less (vacuum drying).
(If the vacuum pressure does not reach –14.6 psi or less even after evacuation for 2 hours or more, repeat vacuum break and vacuum drying.) Leave the air conditioner in the vacuum status for 1 hour or more, and confirm that the vacuum pressuree indicated by the vacuum gauge does not increase.

6-7 Additional refrigerant charge

⚠ WARNING

- To avoid injury always use protective gloves and eye protection when charging refrigerant.
- To avoid injury do not charge with unsuitable substances. Use only the appropriate refrigerant.

⚠ NOTE

- Refrigerant cannot be charged until field wiring has been completed.
  Refrigerant may only be charged after performing the airtight test and the vacuum drying (see above).
  When charging refrigerant into the system, take care that its maximum allowable charge is never exceeded, in view of the danger of liquid hammer.
  Refrigerant containers shall be opened slowly.
  To avoid compressor breakdown, do not charge the refrigerant more than the specifed amount to raise the condensing pressure.

- This outdoor unit is factory charged with refrigerant.
- Charge the additional refrigerant calculated by the formula below.

Additional charging amount	=	Liquid piping length × 0.036	+	Additional charging depended on type of indoor unit
(lb.)		(ft.)×0.036		A (lb.)

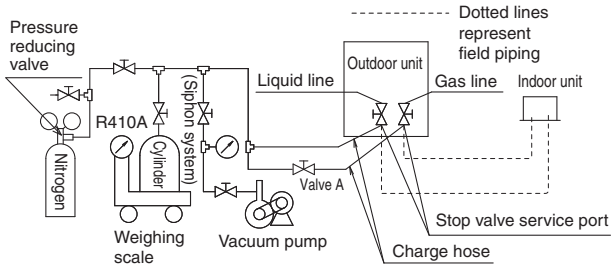
Indoor unit	FAQ FCQ FHQ	FTQ
Additional charging A (lb.)	0	1.54

Record the additional amount to the label stuck on the back of front panel.

- Charge the refrigerant to the liquid pipe in its liquid state. Since R410A is a mixed refrigerant, its composition changes if charged in a state of gas and normal system operation would no longer be assured.
- Before filling, check whether the tank has a siphon attached or not.

How to fill a tank with a siphon attached.

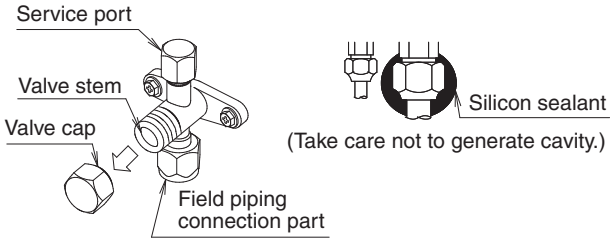
Fill with the tank upright.
(There is a siphon tube inside, so there is no need to turn the tank upside-down.)



Other ways of filling the tank

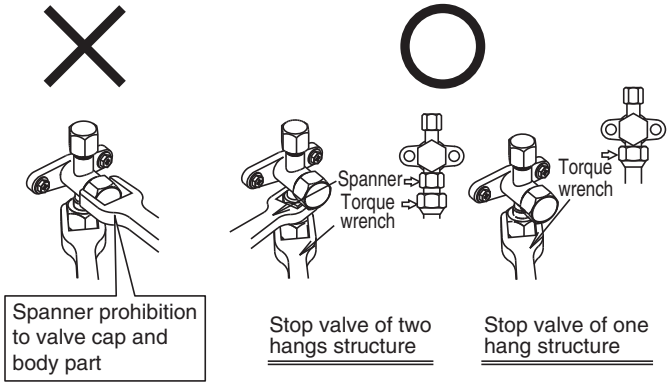
Fill with the tank upside-down.

- After the vacuum drying is finished, charge the additional refrigerant in its liquid state through the liquid stop valve service port.
  Taking into account following instructions:
  1. Check that gas and liquid stop valves are closed.
  2. Charge the specified amount of refrigerant.
- If the outdoor unit is not in operation and the total amount cannot be charged, follow the procedures for additional refrigerant charge shown below.
- Make sure to use installation tools you exclusively use on R410A installations to withstand the pressure and to prevent foreign materials from mixing into the system.
- Procedures for charging additional refrigerant.



See the “Cautions on service” label on the back of the front panel for the settings for operation after replenishing refrigerant.

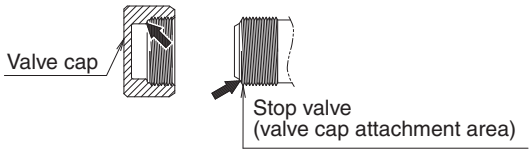
1. Open the gas line stop valve (leaving the liquid line stop valve, valve A in the diagram above, close) and perform the operation to add the refrigerant.
2. Once the appropriate amount of refrigerant is in, press the confirmation button (BS3) on the outdoor unit PC board (A2P), and stop operation.
3. Open the stop valves quickly (both liquid and gas line valves).
   (This must be done quickly to avoid the possibility that the pipe might burst.)



Stop valve operation

Cautions on handling the stop valve

- The figure below shows the name of each part required in handling the stop valve. At the time of shipment, the stop valve is closed.



- If only a torque wrench is used to loosen or tighten the flare nut, the side plate may be distorted. Make sure to fix the stop valve with a spanner, then loosen or tighten the flare nut with a torque wrench.

- When it is expected that the operating pressure will be low (for example, when cooling will be performed while the outside air temperature is low), seal sufficiently the flare nut in the stop valve on the gas line with silicon sealant to prevent freezing.

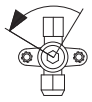
Cautions on handling the valve cap

- The valve is sealed in the arrow area. Take care not to damage the arrow area.

- After handling the valve, make sure to tighten the valve cap securely.

Liquid line	Gas line
10.0~12.2 ft·lbf	16.6~20.3 ft·lbf

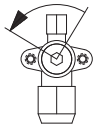
Cautions on handling the service port



- Use charge hose equipped with push in the work.
- After the work, make sure to tighten the valve cap securely. Tightening torque.....8.5~10.3 ft·lbf

[Stop valve operation method]
Prepare hexagon wrenches (whose size is 4 mm and 6 mm).

How to open the stop valve
1. Insert a hexagon wrench into the valve stem, and turn the valve stem counterclockwise.
2. When the valve stem cannot be turned any more, stop turning. Now, the valve is open.



How to close the stop valve
1. Insert a hexagon wrench into the valve stem, and turn the valve stem clockwise.
2. When the valve stem cannot be turned any more, stop turning. Now, the valve is closed.

Opening direction

<Liquid line>

Opening direction

<Gas line>

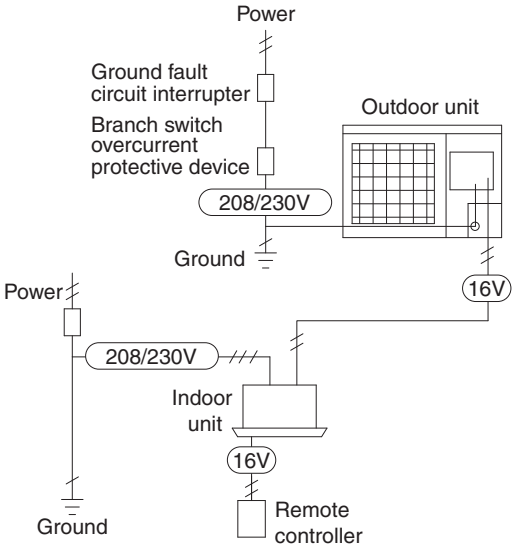
7. ELECTRIC WIRING WORK

⚠ DANGER

- Do not ground units to water pipes, telephone wires or lightning rods because incomplete grounding could cause a severe shock hazard resulting in severe injury or death, and to gas pipes because a gas leak could result in an explosion which could lead to severe injury or death.

⚠ WARNING

- Disconnect all power to unit to avoid possible electric shock during installation.
- Use only specified wire and connect wires to terminals tightly. Be careful that wires do not place external stress on terminals. Keep wires in neat order so as to not to obstruct other equipment. Incomplete connections could result in overheating, and in worse cases, electric shock or fire. For the details, refer to "**7-3 Power supply wiring connection procedure**".

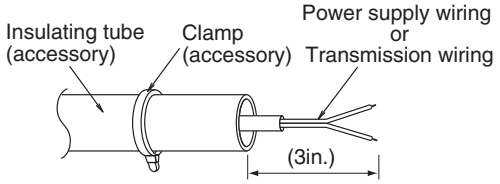


⚠ CAUTION

<To electrician>
- Do not operate the air conditioner until the refrigerant piping work is completed. (Operating the air conditioner before the refrigerant piping work is completed may damage the compressor.)
- Install a ground fault circuit interrupter. (The inverter is provided in the air conditioner. In order to prevent malfunction of the ground fault circuit interrupter itself, use a breaker resistant to higher harmonics.)

- Electricians having sufficient knowledge should perform the electric wiring work. All wiring must comply with local electrical codes and National Electrical Code (NEC).

- Perform the electric wiring work in accordance with the "electric wiring diagram label".
  Make sure to turn OFF the branch switch and overcurrent protective device before starting the work.
- Perform grounding to the indoor unit and outdoor unit.
- Use only copper wires.
- Make sure to turn the power off before starting the electric wiring work.
  Do not turn ON any switch until the work is completed.
- The outdoor unit has an inverter which generates noise and charges the outer casing with the leakage current. The outdoor unit should be grounded so that the effect of the generated noise on other equipment can be reduced, and that the outer casing can be discharged.
- As this unit is equipped with an inverter, installing a phase advancing capacitor will not only reduce the power factor improvement factor, but may also cause the capacitor to overheat due to high-frequency waves. Therefore, never install a phase advancing capacitor.
- Never push excessive electric wires into the units.
- Protect electric wires with conduit tubes or vinyl tubes so that they will not be damaged by edges of knockout holes.
- Fix electric wires with clamps as accessories so that they will not come to contact with pipes and stop valves.
  (Refer to "**7-3 Power supply wiring connection procedure**".)



7-1 Connection example of whole system wiring

7-2 Routing power supply wiring and transmission wiring

Let the power supply wiring with a conduit pass through one of the knockout holes on the front or side cover, and let the transmission wiring with a conduit pass through another knockout hole.

- For protection from uninsulated live parts, thread the power supply wiring or the transmission wiring through the included insulating tube and secure it with the included clamp.

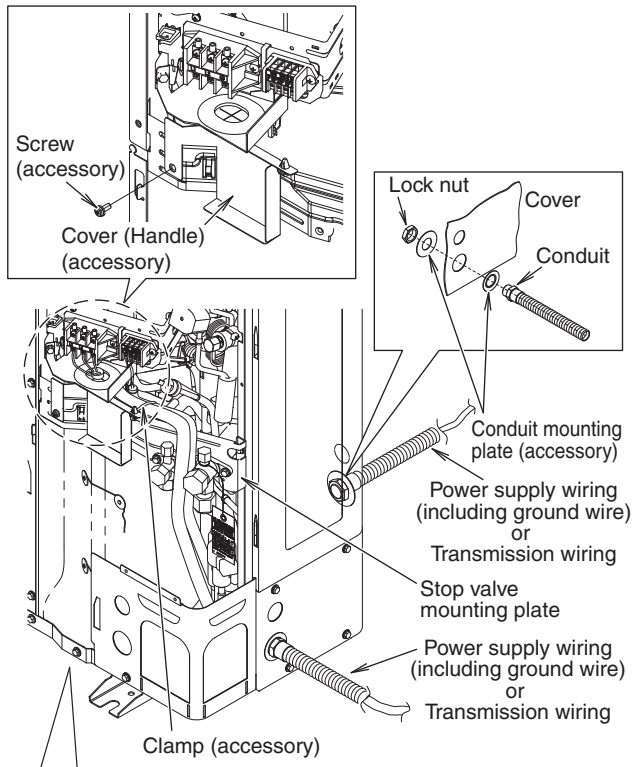
〈**Precautions when knocking out knockout holes**〉

- To punch the knockout hole, hit it with a hammer.
- After removing the knockout hole, it is recommended that the edges should be painted to prevent rusting.

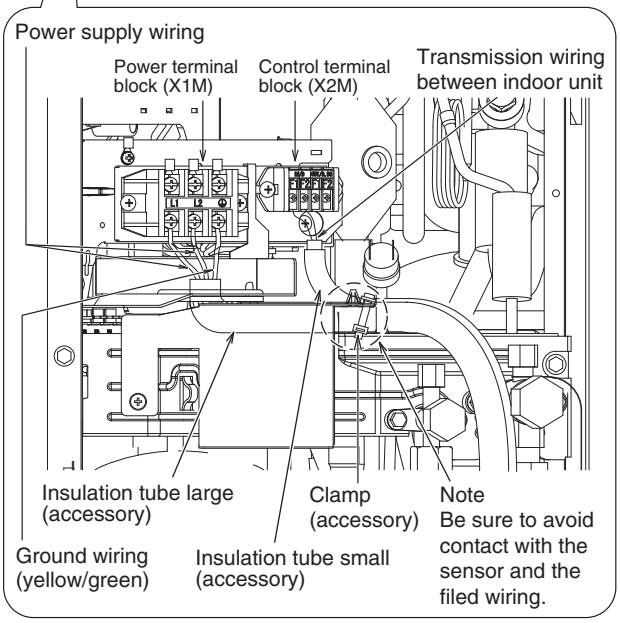
⚠ CAUTION

- Use conduit for both the power supply wiring and transmission wiring.
- Outside the unit, make sure to keep the wirings 5 inches away.
  Otherwise, the outdoor unit may be affected by electrical noise (external noise), and malfunction or fail.
- Be sure to connect the power supply wiring to the terminal block and secure it as described in "7-3 Power supply wiring connection procedure".
- Fix the wiring between the units in accordance with "7-4 Transmission wiring connection procedure".
- Secure the wirings with the clamps (accessory) so that do not touch the piping.
- Make sure the wirings will not be pinched by the front panel, and close the panel firmly.
- Route the conduit along the unit by using a elbow socket and so on to prevent it from being stepped on.

7-3 Power supply wiring connection procedure



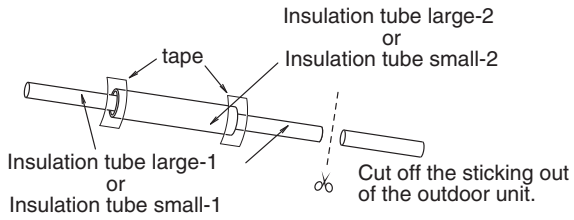
⚠ WARNING



- Never connect power supply wiring to the terminal block for remote controller wiring as this could damage the entire system.

Install a ground fault circuit interrupter.

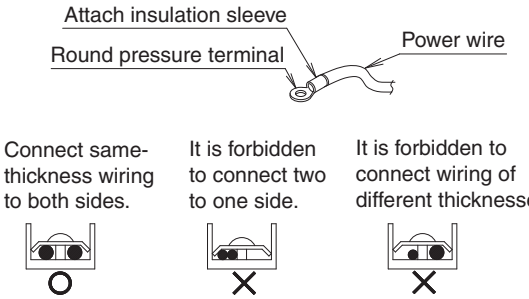
- It is obliged to install a ground fault circuit interrupter to prevent electric shock and fire accident.



Model	Phase and frequency	Voltage	Max.Overcurrent Protective Device	Min. Circuit Amps.
RZQ18PVJU RZR18PVJU	~ 60Hz	208/230V	20A	16.5A
RZQ24PVJU RZR24PVJU				
RZQ30PVJU RZR30PVJU				

How to Insulation tube.

- Use the insulation tube large to cover the power supply wiring.
  Use the insulation tube small to cover the transmission wiring.
- Joint the insulation tube with the tape and cut off the tube sticking out of the outdoor unit.

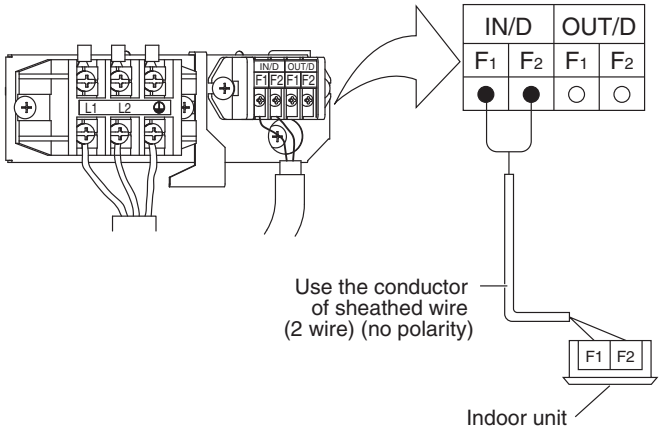


⚠ CAUTION

- After finishing the electric wiring work, confirm that all the wirings are connected securely.

〈〈**Precautions when laying power wiring**〉〉

- Two electric wires of different thickness cannot be connected to the power terminal block.
  (Slack in the electric wires may generate abnormal heat.)
- Use round pressure terminals with insulting sleeve for connection to the power terminal block.
  If such terminals are not available for unavoidable reasons, connect an electric wire of the same thickness to each side as shown in the figure.



Make sure to observe the following items. If they are not observed, abnormal heat may be generated by slack in electric wires, etc.

- For wiring, use the designated power wire and connect firmly, then secure to prevent outside pressure being exerted on the terminal board.
- Use an appropriate screwdriver for tightening the terminal screws.
  A screwdriver with a small head will strip the head and make proper tightening impossible.
- Over-tightening the terminal screws may break them.
- See the table below for tightening torque for the terminal screws.

Tightening torque (ft·lbf)		
M5	(Power supply and ground terminal block)	1.76 ~ 2.15
M4	(Shielded ground)	0.87 ~ 1.06
M3.5	(Transmission wiring terminal block)	0.58 ~ 0.72

7-4 Transmission wiring connection procedure

- **If an excessive force is applied while connecting a cable to the terminal block on the PC board, the PC board may be damaged.**

⚠ CAUTION

- For low-noise operation, it is necessary to install the optional "External control adaptor for outdoor unit".
  For details, see the installation manual attached to the adaptor.

Caution on the wiring length between units

Make sure to observe the restrictions below. If they are not observed, transmission error may occur.
Maximum wiring length: 3280 ft.

Cautions on the wiring between units

- Never connect 208/230V to the terminal block for the transmission wiring.
  Doing so will break the entire system.
- The transmission wiring from the indoor unit must be connected to the F1/F2 (TO IN/D UNIT) terminals on the PC board in the outdoor unit.

∗ Make sure to use sheathed two-core cables of AWG18-16 in the wiring shown above.

∗ **All cables used in the wiring between the units should be procured on the site.**

8. CHECKS AFTER COMPLETION OF WORK

After completing the work, make sure to confirm the following items:

1. Connection of drain piping and removal of transport fittings:
   Refer to "**5. CAUTIONS ON INSTALLATION**".
2. Connection of power supply wiring and tightening of screws:
   Refer to "**7-3 Power supply wiring connection procedure**".
3. Connection of transmission wiring and tightening of screws:
   Refer to "**7-4 Transmission wiring connection procedure**".
4. Freezing connection of refrigerant piping
   Refer to "**6. REFRIGERANT PIPING WORK**".
5. Piping size and heat insulation:
   Refer to "**6-1 Selection of piping material**", "**6-5 Heat insulation of piping**".
6. Check of stop valve:
   Confirm that the stop valve is open on both the liquid line and gas line.
7. Record of amount of additional refrigerant:
   Record the amount on the label stuck on the back of the front panel.
8. Measurement of insulation in main power circuit:
   - Use the megatester for 500 V.
   - Do not use any megatester for low voltage electric circuits except 230 V.
     (Wiring between the outdoor unit and the indoor unit)

⚠ CAUTION

<To piping technician>

- Make sure to open the stop valve after finishing the piping work.
  (Operating the air conditioner with the stop valve shut may damage the compressor.)

9. TEST RUN PROCEDURE

A crankcase heater is mounted for smooth startup. Make sure to turn on the power 6 hours before starting operation for supplying the power to the crankcase heater.

⚠ WARNING

- Make sure to close the front panel before leaving the outdoor unit in the power ON status.
- To avoid injury, always make sure that the overcurrent protective device on the power supply panel of the installation is switched off before doing any work.

Cautions before turning on the power

- **Put the insulating cover securely onto the control box.**
- **After turning on the power, check the settings and LED indicators on the PC board (A1P) in the outdoor unit through the opening of the insulating cover.**

9-1 Power on and check operation

- Make sure to perform the check operation after installation.
  (If the air conditioner is operated using the indoor remote controller without performing the check operation, the malfunction code "U3" is displayed in the indoor remote controller, and normal operation is disabled.)

- In the check operation, the status of the outdoor unit is checked, and incorrect wiring is checked for.

(1) • Close the front panel of the outdoor unit.
• Turn ON the power to the outdoor unit and indoor unit.

⚠ Caution Make sure to turn on the power 6 hours before starting operation for supplying the power to the crankcase heater.

(2) • Open the front panel of the outdoor unit.
• Check the LED on the PC board (A1P and A2P) in the outdoor unit to see if the data transmission is performed normally.

The power is supplied to the outdoor unit. Take due care during the work to prevent electric shock.

	A1P	A2P						
LED display (Default status before delivery)	SERVICE MONITOR	MODE	TEST/HWL	IND	MASTER	SLAVE	L.N.O.P.	DEMAND
	HAP	**H1P**	**H2P**	**H3P**	**H4P**	**H5P**	**H6P**	**H7P**
Outdoor unit installed	◑	●	●	○	●	●	●	●

LED display: ● OFF ○ ON ◑ Blinking

(3) • When performing the low-noise operation (L.N.O.P.) or demand (DEMAND) operation upon request from the customer, perform the setting using the pushbutton switches (BS1 to BS5) on the PC board (A2P) in the outdoor unit.
• Press each pushbutton switch from the opening of the insulation cover. (Do not remove the insulation cover.)

- The power is supplied to the outdoor unit. Take due care during the work to prevent electric shock.
- Before using the pushbutton switches (BS1 to BS5) for setting, confirm that the microcomputer (SERVICE) monitor is lit.
- For the setting method, refer to the [Cautions on service] label attached on the back of the front panel of the outdoor unit. (Make sure to write the contents of setting on the [Cautions on service] label.)

(4) Confirm that the stop valves are open on both the liquid and gas lines. If they are closed, open them.

⚠ Caution Do not leave any stop valve closed. Otherwise the compressor will fail.

(5) Press and hold the test run button (BS4) for 5 seconds or more to start the check operation. For the details, refer to the **Check operation procedure** on the [Cautions on service] label.

- When leaving the outdoor unit during the check operation for unavoidable reasons, ask another installation worker to watch the outdoor unit, or close the front panel.
- The system operates the check operation for about 15 minutes (30 minutes maximum), then stops automatically. The system can start normal operation about 5 minutes after the check operation if the remote controller does not display any malfunction code.
- During the check operation, the status under execution is indicated on the remote controller.

(6) After the check operation, make sure to close the front panel of the outdoor unit.

<Cautions on check operation>

- If the air conditioner is started within about 12 minutes after the power of the indoor/outdoor unit is turned on, the H2P indicator lights and the compressor does not run. Confirm that the LED status is as shown in the table in (2) in "**9-1 Power on and check operation**" before starting the air conditioner.
- The air conditioner may require about 10 minutes maximum until it can start the compressor after start of operation. This period of time is required to homogenize the refrigerant status, and does not indicate any failure.
- The check operation does not provide any means of checking the indoor unit individually. For that purpose, perform the normal operation using the remote controller after finishing the check operation.
- The check operation is not available in any other mode such as the recovery mode.
- Before running a check on the unit, changing the indoor remote controller settings might cause the error code "UF" to be displayed and prevent a proper check to be run.

9-2 Checks in normal operation

- After finishing the check operation, operate the air conditioner normally. (Heating is not available if the outside air temperature is 75 °F or more. Refer to the operation manual supplied together with the unit.) (Heating is only available for RZQ-P models.)
- Confirm that the indoor and outdoor units are operating normally. (If a knocking sound is heard in the liquid compression of the compressor, stop the air conditioner immediately and energize the crankcase heater for a sufficient period of time, then start the operation again.)
- Check to see if cold (or hot) air is coming out of the indoor unit.
- Press the fan direction button and fan speed control button on the remote controller to see if the fan is operating normally.

<Cautions for normal operation check>

- Once stopped, the compressor will not start for about 5 minutes even if the "**ON/OFF**" button on the remote controller is pressed.
- When the system operation is stopped by the remote control, the outdoor unit may continue to operate for a further 3 minutes.
- If the system has not undergone the check operation by the test run button since it was first installed, a malfunction code "U3" is displayed. In this case, perform the check operation by referring to "**9-1 Power on and check operation**".

When a malfunction code is displayed in the remote controller

(Check a malfunction code in the remote controller connected to the indoor unit.)

Malfunction code	Cause	Solution
E3	The stop valves in the outdoor unit remain closed.	Open the stop valve on both the gas and liquid lines.
	The refrigerant is overcharged.	Calculate again the required amount of refrigerant to be charged based on the piping length, recover the refrigerant using the refrigerant recovery device, then achieve proper amount of refrigerant.
E4 F3	The stop valves in the outdoor unit remain closed.	Open the stop valve on both the gas side and liquid side.
	The operation mode on the remote controller was changed before the check operation.	Set the operation mode on all indoor unit remote controllers to “cooling.”
	The refrigerant is insufficient.	• Check whether additional refrigerant charge has been finished correctly. • Calculate again the required amount of refrigerant to be charged based on the piping length, then charge additionally proper amount of refrigerant.
F6	The refrigerant is overcharged.	Calculate again the required amount of refrigerant to be charged based on the piping length, recover the refrigerant using the refrigerant recovery device, then achieve proper amount of refrigerant.
U3	The check operation has not performed.	Perform the check operation.
U4	The power is not supplied to the outdoor unit.	Connect correctly the power supply wiring of the outdoor unit.
UA	Improper type of indoor unit is connected.	Check the type of indoor unit currently connected. If it is not proper, replace it with proper one.
UF	The stop valves in the outdoor unit remain closed.	Open the stop valve on both the gas and liquid lines.
	The piping and wiring of the indoor unit are not connected correctly to the outdoor unit.	Confirm that the piping and wiring of the indoor unit are connected correctly to the outdoor unit.
	The operation mode on the remote controller was changed before the check operation.	Set the operation mode on indoor unit remote controller to “cooling.”
UH	The transmission wiring is not connected correctly.	Connect correctly the transmission wiring to the F1 and F2 (TO IN/D UNIT) terminals on the PC board (A1P) in the outdoor unit.

When nothing is displayed in the remote controller

- There might be a problem with the connection or transmission between the indoor unit and the remote controller. Check connections, and check for wire breakage.

⚠ CAUTION

<To piping technician>
<To electrician>
- **After finishing the test run and before using the unit by customer, confirm that the front panel and screws are attached securely to the unit.**

10. CAUTION FOR REFRIGERANT LEAKS

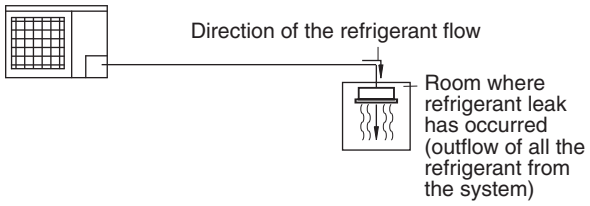
⚠ DANGER

- Refrigerant gas is heavier than air and replaces oxygen. A massive leak could lead to oxygen depletion, especially in basements, and an asphyxiation hazard could occur leading to serious injury or death.

(Points to note in connection with refrigerant leaks)

Introduction

The installer and system specialist shall secure safety against leakage according to local regulations or standards. The following standards may be applicable if local regulations are not available.



The Split System, like other air conditioning systems, uses R410A as refrigerant. R410A itself is an entirely safe non-toxic, non-combustible refrigerant. Nevertheless care must be taken to ensure that air conditioning facilities are installed in a room which is sufficiently large. This assures that the maximum concentration level of refrigerant gas is not exceeded, in the unlikely event of major leak in the system and this in accordance to the local applicable regulations and standards.

Maximum concentration level

The maximum charge of refrigerant and the calculation of the maximum concentration of refrigerant is directly related to the humanly occupied space in to which it could leak.

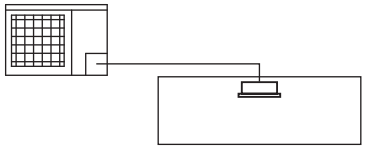
The unit of measurement of the concentration is lb./ft³ (the weight in lb. of the refrigerant gas in 1ft³ volume of the occupied space).

Compliance to the local applicable regulations and standards for the maximum allowable concentration level is required.

Pay a special attention to the place, such as a basement, etc. where refrigerant can stay, since refrigerant is heavier than air.

Procedure for checking maximum concentration

Check the maximum concentration level in accordance with steps 1 to 4 below and take whatever action is necessary to comply.



1. Calculate the amount of refrigerant (lb.) charged to each system separately.

amount of refrigerant in the unit (amount of refrigerant with which the system is charged before leaving the factory)	+	additional charging amount (amount of refrigerant added locally in accordance with the length or diameter of the refrigerant piping and type of indoor unit)	=	total amount of refrigerant (lb.) in the system

⚠ NOTE

- Where a single refrigerant facility is divided into 2 entirely independent refrigerant systems then use the amount of refrigerant with which each separate system is charged.

2. Calculate a room volume (ft^3)

3. Calculate the refrigerant concentration by using the results of the calculations in steps 1 and 2 above.

$$\frac{\text{total amount of refrigerant in the system}}{\text{volume } (ft^3) \text{ of the room in which there is an indoor unit installed}} \leq \text{maximum concentration level } (lb./ft^3)$$

4. Deal with the situations where the result exceeds the maximum concentration level.
Where the installation of a facility results in a concentration in excess of the maximum concentration level then it will be necessary to revise the system.
Please consult your dealer.

4. INDOOR UNIT INSTALLATION.....7
5. REFRIGERANT PIPING WORK 10
6. DRAIN PIPING WORK 13
7. ELECTRIC WIRING WORK 14
8. WIRING EXAMPLE AND HOW TO SET THE REMOTE CONTROLLER 15
9. FIELD SETTINGS 20
10. TEST OPERATION 21

1. SAFETY CONSIDERATIONS

Please read these “SAFETY CONSIDERATIONS” carefully before installing air conditioning equipment and be sure to install it correctly. After completing the installation, make sure that the unit operates properly during the start-up operation.
Please instruct the customer on how to operate the unit and keep it maintained.
Also, inform customers that they should store this installation manual along with the operation manual for future reference.
This air conditioner comes under the term “appliances not accessible to the general public”.
Meaning of danger, warning, caution and note symbols.

DANGER .....Indicates an imminently hazardous situation which,if not avoided, will result in death or serious injury.

WARNING .....Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION .....Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be sued to alert against unsafe practices.

NOTE .....Indicates situation that may result in equipment or property-damage-only accidents.

⚠ DANGER

- **Do not ground the unit to water pipes, telephone wires or lightning rods as incomplete grounding could cause a severe shock hazard resulting in severe injury or death, and to gas pipes because a gas leak could result in an explosion which could lead to severe injury or death.**
- **Do not install unit in an area where flammable materials are present due to risk of explosion resulting in serious injury or death.**
- **Refrigerant gas is heavier than air and displaces oxygen. A massive leak could lead to oxygen depletion, especially in basements, and an asphyxiation hazard could occur leading to serious injury or death.**
- **If the refrigerant gas leaks during installation, ventilate the area immediately.**
  Refrigerant gas may produce toxic gas if it comes in contact with fire such as from a fan, heater, stove or cooking device. Exposure to this gas could result in severe injury or death.
- **After completing the installation work, check that the refrigerant gas does not leak.**
  Refrigerant gas may produce toxic gas if it comes in contact with fire such as from a fan, heater, stove or cooking device. Exposure to this gas could result in severe injury or death.
- **Safely dispose of the packing materials.**
  Packing materials, such as nails and other metal or wooden parts, may cause stabs or other injuries. Tear apart and throw away plastic packaging bags so that children will not play with them. Children playing with plastic bags face the danger of death by suffocation.

⚠ WARNING

- **Ask your dealer or an authorized personnel to carry out installation work. Do not try to install the unit by yourself.**
  Improper installation may result in water leakage, electric shocks or fire.
- **Perform installation work in accordance with this installation manual.**
  Improper installation may result in water leakage, electric shocks or fire.
- **Be sure to use only the specified accessories and parts for installation work.**
  Failure to use the specified parts may result in water leakage, electric shocks, fire or the unit falling.
- **Install the air conditioner on a foundation strong enough to withstand the weight of the unit.**
  A foundation of insufficient strength may result in the equipment falling and causing injuries.
- **Carry out the specified installation work after taking account of strong winds, typhoons or earthquakes.**
  Improper installation work may result in the equipment falling and causing accidents.
- **Make sure that a separate power supply circuit is provided for this unit and that all electrical work is carried out by an authorized personnel according to local laws and regulations and this installation manual.**
  An insufficient power supply capacity or improper electrical construction may lead to electric shocks or fire.
- **Make sure that all wiring is secured, the specified wires are used, and no external forces act on the terminal connections or wires.**
  Improper connections or installation may result in fire.
- **When wiring the power supply and connecting the remote controller wiring and transmission wiring, position the wires so that the electric parts box lid can be securely fastened.**
  Improper positioning of the electric parts box lid may result in electric shocks, fire or the terminals overheating.
- **Before touching electrical parts, turn off the unit.**
- **Do not touch the switch with wet fingers.**
  Touching a switch with wet fingers can cause electric shock.
- **Be sure to install an earth leakage breaker.**
  Failure to install an earth leakage breaker may result in electric shocks, or fire.
- **Do not install the air conditioner in the following locations:**
  (a) where a mineral oil mist or an oil spray or vapor is produced, for example in a kitchen. Plastic parts may deteriorate and fall off or result in water leakage.

(b) where corrosive gas, such as sulfurous acid gas, is produced. Corroding copper pipes or soldered parts may result in refrigerant leakage.
(c) near machinery emitting electromagnetic waves. Electromagnetic waves may disturb the operation of the control system and result in a malfunction of the equipment.
(d) where flammable gases may leak, where there are carbon fiber or ignitable dust suspensions in the air, or where volatile liquids such as thinner or gasoline are handled.
Operating the unit in such conditions may result in fire.

- **Heat exchanger fins are sharp enough to cut.**
  To avoid injury wear gloves to cover the fins when working around them.
- **Refrigerant pipes may be very hot or very cold during or immediately after operation.**
  Touching them could result in burns or frostbite. To avoid injury give the pipes time to return to normal temperature or, if you must touch them, be sure to wear proper gloves.

⚠ CAUTION

- **While following the instructions in this installation manual, insulate piping in order to prevent condensation.**
  Improper piping insulation may result in water leakage and property damage.
- **Be very careful about product transportation.**
  Some products use PP bands for packaging. Do not use any PP bands for a means of transportation. It is dangerous.
- **Do not turn off the power immediately after stopping operation.**
  Always wait at least five minutes before turning off the power. Otherwise, water leakage and trouble may occur.
- **Make sure to provide for adequate measures in order to prevent that the outdoor unit be used as a shelter by small animals.**
  Small animals making contact with electrical parts can cause malfunctions, smoke or fire. Please instruct the customer to keep the area around the unit clean.

⚠ NOTE

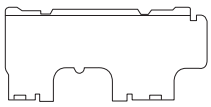
- **Install the indoor and outdoor units, power supply wiring and connecting wires at least 3.5ft. away from televisions or radios in order to prevent image interference or noise.**
  (Depending on the radio waves, a distance of 3.5ft. may not be sufficient enough to eliminate the noise.)
- **Remote controller (wireless kit) transmitting distance can result shorter than expected in rooms with electronic fluorescent lamps. (inverter or rapid start types)**
  Install the indoor unit as far away from fluorescent lamps as possible.
- **Dismantling of the unit, treatment of the refrigerant, oil and eventual other parts, should be done in accordance with the relevant local and national regulations.**

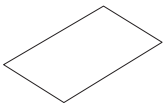
2. BEFORE INSTALLATION

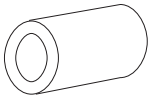
- **When moving the unit while removing it from the packing case, be sure to lift it by the four hanger brackets. Aboid putting any pressure on other parts, especially, holizontal flaps, the refrigerant piping, drain piping, and other resin parts.**
- Be sure to remove a cushion (corrugated paper) located between the heat exchanger and the right air filter.
- Be sure to check the type of R410A refrigerant to be used before installing the unit. (Using an incorrect refrigerant will prevent normal operation of the unit.)
- The accessories needed for installation must be retained in your custody until the installation work is completed. Do not discard them!
- Decide upon a line of transport.
- Leave the unit inside its packaging while moving, until reaching the installation site. Where unpacking is unavoidable, use a sling of soft material or protective plates together with a rope when lifting, to avoid damage or scratches to the unit.

- For the installation of an outdoor unit, refer to the installation manual attached to the outdoor unit.
- When using the wireless remote controller, refer to the installation manual attached to the wireless remote controller.
- Do not install or operate the unit in rooms mentioned below.
  - **Laden with mineral oil, or filled with oil vapor or spray like in kitchens. (Plastic parts may deteriorate which could eventually cause the unit to fall out of place, or could lead to leaks.)**
  - **Where corrosive gas like sulfurous gas exists. (Copper tubing and brazed spots may corrode which could eventually lead to refrigerant leaks.)**
  - **Where machines can generate electromagnetic waves. (Control system may malfunction.)**
  - **Where the air contains high levels of salt such as that near the ocean and where voltage fluctuates greatly such as that in factories.**
    Also in vehicles or vessels.
- This unit, both indoor and outdoor, is suitable for installation in a commercial and light industrial environment. If installed as a household appliance it could cause electromagnetic interference.

⚠ WARNING







- Entrust installation to the place of purchase or an authorized serviceman. Improper installation could lead to leaks and, in worse cases, electric shock of fire.
- Use of unspecified parts could lead to the unit falling, leaks and, in worse cases, electric shock or fire.

⚠ NOTE

- Be sure to read this manual before installing the indoor unit.

2-1 ACCESSORIES

Check the following accessories are included with your unit.

Name	(1) Installation panel	(2) Attachment screws for the installation panel	(3) Paper pattern for installation	(4) Insulating tape
Quantity	1 set	9 pcs.	1 pc.	1 pc.
Shape		 M4 × 25L		

Name	(5) Clamp	(6) Securing screws	(7) Insulating tube	
Quantity	1 large 4 small	2 pcs.	1 long 1 short	
Shape		 M4 × 12L		(Other) • Operation manual • Installation manual

2-2 OPTIONAL ACCESSORIES

Remote controller type	Model
Wired type	BRC1C71
Wireless type	BRC7E818

FOR THE FOLLOWING ITEMS, TAKE SPECIAL CARE DURING CONSTRUCTION AND CHECK AFTER INSTALLATION IS FINISHED.

1. Items to be checked after completion of work

Items to be checked	If not properly done, what is likely to occur	Check
Are the indoor and outdoor unit fixed firmly?	The units may drop, vibrate or make noise.	
Is the gas leak test finished?	It may result in insufficient cooling.	
Is the unit fully insulated?	Condensate water may drip.	
Does drainage flow smoothly?	Condensate water may drip.	
Does the power supply voltage correspond to that shown on the name plate?	The unit may malfunction or the components burn out.	
Are wiring and piping correct?	The unit may malfunction or the components burn out.	
Is the unit safely grounded?	It may be dangerous at electric leakage.	
Is wiring size according to specifications?	The unit may malfunction or the components burn out.	
Is something blocking the air outlet or inlet of either the indoor or outdoor units?	It may result in insufficient cooling.	
Are refrigerant piping length and additional refrigerant charge noted down?	The refrigerant charge in the system is not clear.	

2. Items to be checked at time of delivery

* Also review the “SAFETY CONSIDERATIONS”

Items to be checked	Check
Did you explain about operations while showing the operation manual to your customer?	
Did you hand the operation manual over to your customer?	

2-3 NOTE TO THE INSTALLER

Be sure to instruct customers how to properly operate the unit (especially cleaning filters, operating different functions, and adjusting the temperature) by having them carry out operations themselves while looking at the manual.

3. SELECTING INSTALLATION SITE

(1) Select an installation site where the following conditions are fulfilled and that meets with your customer's approval.

- In the upper space (including the back of the ceiling) of the indoor unit where there is no possible dripping of water from the refrigerant pipe, drain pipe, water pipe, etc.
- Where the wall is strong enough to bear the indoor unit weight.
- Where sufficient clearance for installation and maintenance can be ensured. **(Refer to Fig. 1 and Fig. 2)**
- Where optimum air distribution can be ensured.
- Where nothing blocks the air passage.
- Where condensate can be properly drained.

- Where the wall is not significantly tilted.
- Where piping between indoor and outdoor units is possible within the allowable limit.
  (Refer to the installation manual of the outdoor unit.)
- Install the indoor and outdoor units, power supply wiring and connecting wires at least 3.5ft. away from televisions or radios in order to prevent image interference or noise.
  (Depending on the radio waves, a distance of 3.5ft. may not be sufficient enough to eliminate the noise.)
- Where the cool (warm) air reaches all across the room.

[Space required for installation (in.)]

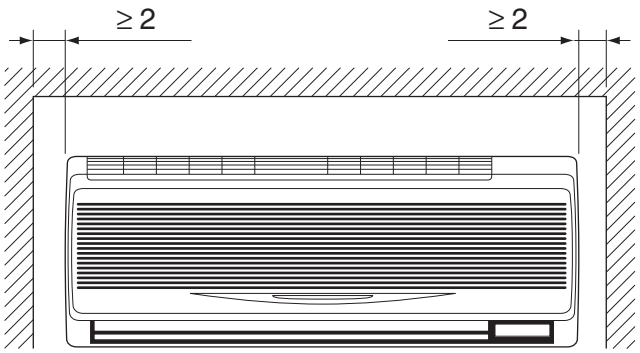


Fig. 1

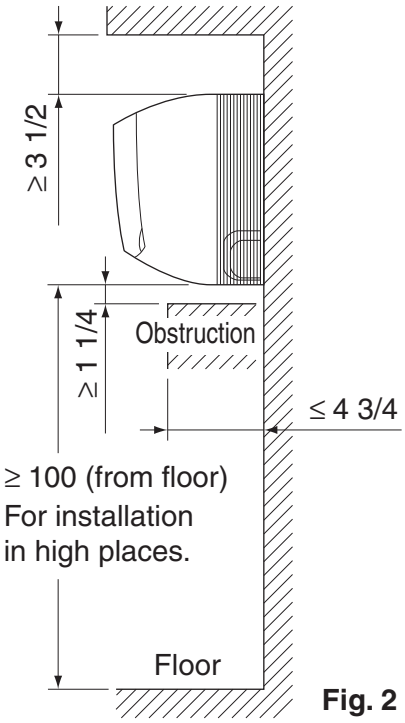

Fig. 2

(2) Consider whether the place where the unit will be installed can support the full weight of the unit, and reinforce it with boards and beams, etc. if needed before proceeding with the installation. Also, reinforce the place to prevent vibration and noise before installing.
(The installation pitch can be found on the paper pattern for installation (3), so refer to it when considering the necessity for reinforcing the location.)

(3) The indoor unit may not be directly installed on the wall. Use the attached installation panel (1) before installing the unit.

⚠ DANGER

- Do not install unit in an area where flammable materials are present due to risk of explosion resulting in serious injury or death.

⚠ WARNING

- If the supporting structural members are not strong enough to take the unit's weight, the unit could fall out of place and cause serious injury.

4. INDOOR UNIT INSTALLATION

• Use only accessories and parts which are of the designated specification when installing.

⚠ CAUTION

• Install so that the unit does not tilt to either side or forward.
• Do not hold the unit by the horizontal flaps when lifting it. (This may damage the horizontal flaps.)

(1) Open the piping through-hole.

• The refrigerant pipe and drain pipe can be passed out in one of 5 directions: left, bottom-left, back-left, bottom-right, and back-right. **(Refer to Fig. 3)**
• Using the paper pattern for installation (3), choose where to pass the piping out and open a through-hole (ϕ3 1/8") in the wall.
Open the hole so that there is a downward slope for the drain piping. (See " 6.DRAIN PIPING WORK ")

(2) Remove the installation panel (1) from the unit and attach to the wall.

(The installation panel is temporarily attached to the unit with a screw. (In case of 12 type))
(Refer to Fig. 3)

(a) Check the location for the hole using the included paper pattern for installation (3).
• Choose a location so that there is at least a 3 1/2" gap between the ceiling and the main unit.

(b) Temporarily attach the installation panel (1) at the temporary-securing position on the paper pattern for installation (3) and use a level to make sure the drain hose is either level or tilted slightly downward.

(c) Secure the installation panel (1) to the wall using either screws or bolts.
• If using the attachment screws for the installation panel (2), attach using at least 4 screws on either side (for a total of 9 screws) of the recommended installation cleat position on the included paper pattern for installation (3).
• If using bolts, attach using a M8 - M10 bolt or equivalent (for a total of 2 bolts) on either side.
• If dealing with concrete, use commercially available foundation bolts (M8 - M10 or equivalent).

(3) If using the left, bottom-left, or bottom-right positions for the piping, cut out the through-hole for the piping in the front grill. (Refer to Fig. 4)

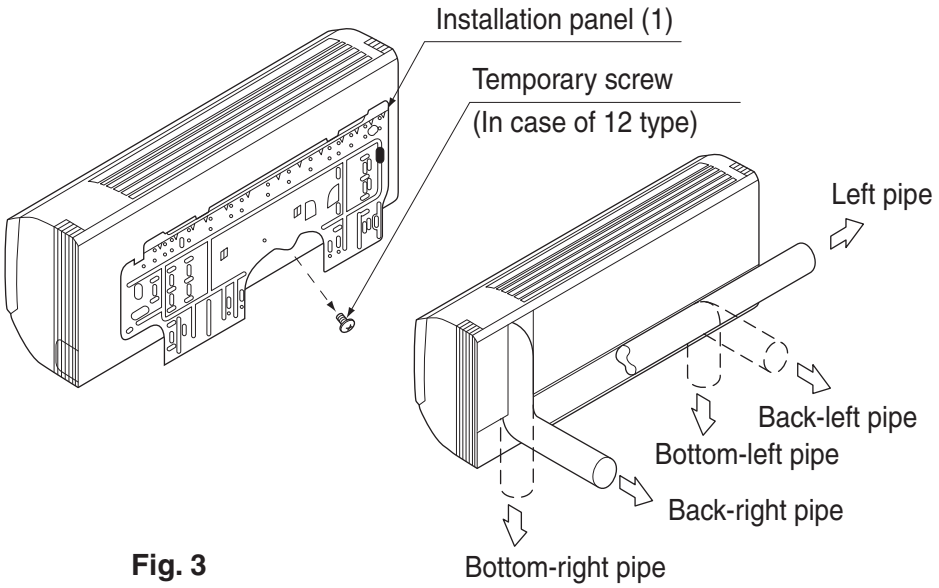

Fig. 3

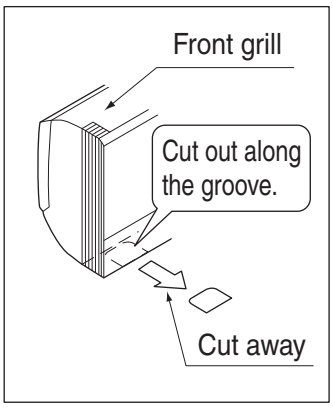

Fig. 4

(4) Remove the front panel and the service lid. (Refer to Fig. 5)

< How to remove the front panel and service lid >

(1) Open the front panel to the point where it stops.

(2) Push the axes on either side of the front panel towards the center of the main unit and remove. (You can also remove it by sliding the front panel either to the left or right and pulling it forward.)

(3) Remove the screw from the service lid and pull the handle forward.

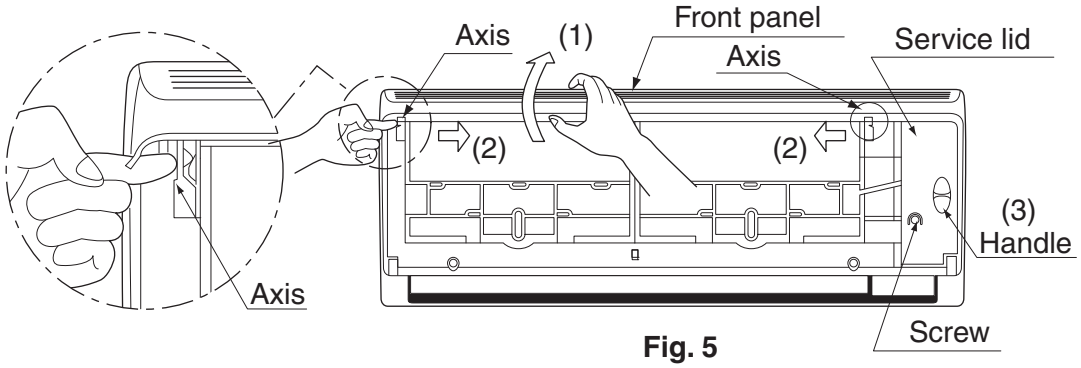

Fig. 5

(5) Point the pipe in the direction it will be passed out.

For bottom-right and back-right piping (Refer to Fig. 6)

• Wrap the drain hose and the refrigerant piping together with the insulating tape (4) so that the drain hose is below the refrigerant piping.

For left, bottom-left, and back-left piping

• Remove the front grill. **(Refer to Fig. 7)**

< How to remove the front grill >

Remove the front grill as described below when securing the indoor unit with screws or when attaching Optional Accessories (wireless remote controller, adapter PC board, etc.).

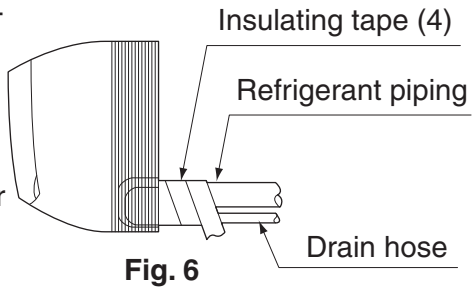

Fig. 6

(1) Remove the front panel.

(2) Remove the screws (3 places) securing the front grill.

(3) Remove the tabs (3 places) securing the front grill by pushing them in the direction of the arrows.

(4) Making sure not to catch the horizontal flaps, remove the front grill by pulling in the direction of the arrow.

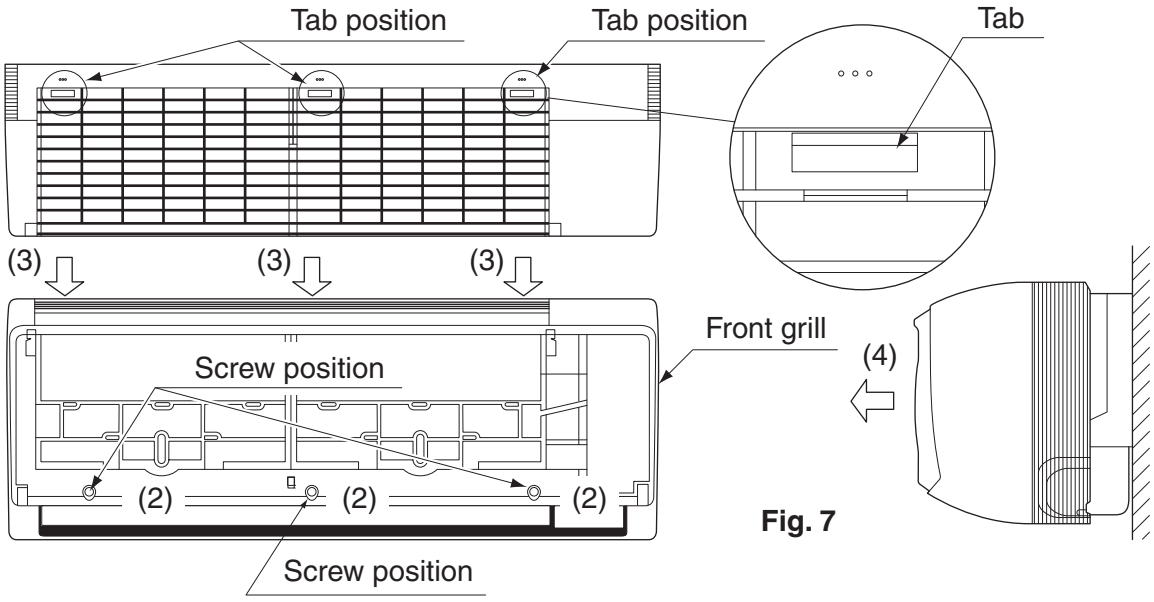

Fig. 7

• Remove the drain plug, the insulation tube, and the drain hose from the drain pan and replace. **(Refer to Fig. 8)**
• Connect the local refrigerant piping ahead of time, matching it to the liquid pipe and gas pipe marks engraved on the installation panel (accessory) (1).

< Replacing the drain hose and drain plug >

(1) Remove the drain plug and insulation tube.
(2) Remove the drain hose and replace onto the left side.
(3) Replace the drain plug and the insulation tube onto the right side.

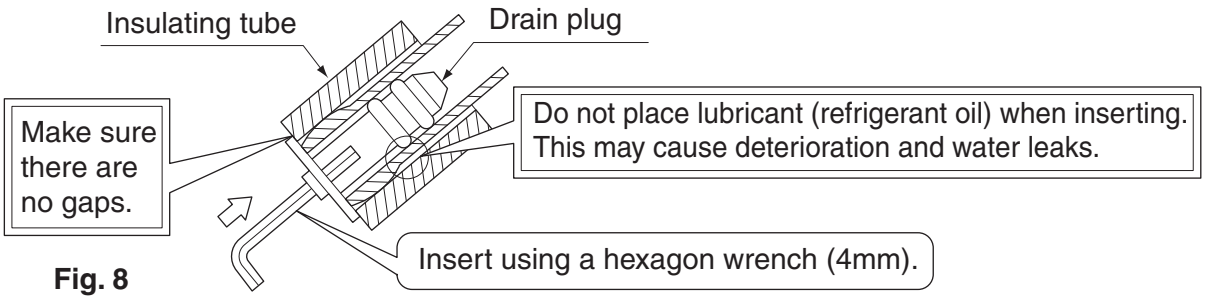

Fig. 8

(6) Hook the indoor unit onto the installation panel. (Refer to Fig. 9)

• Placing buffering material between the wall and the indoor unit at this time will make work easier.

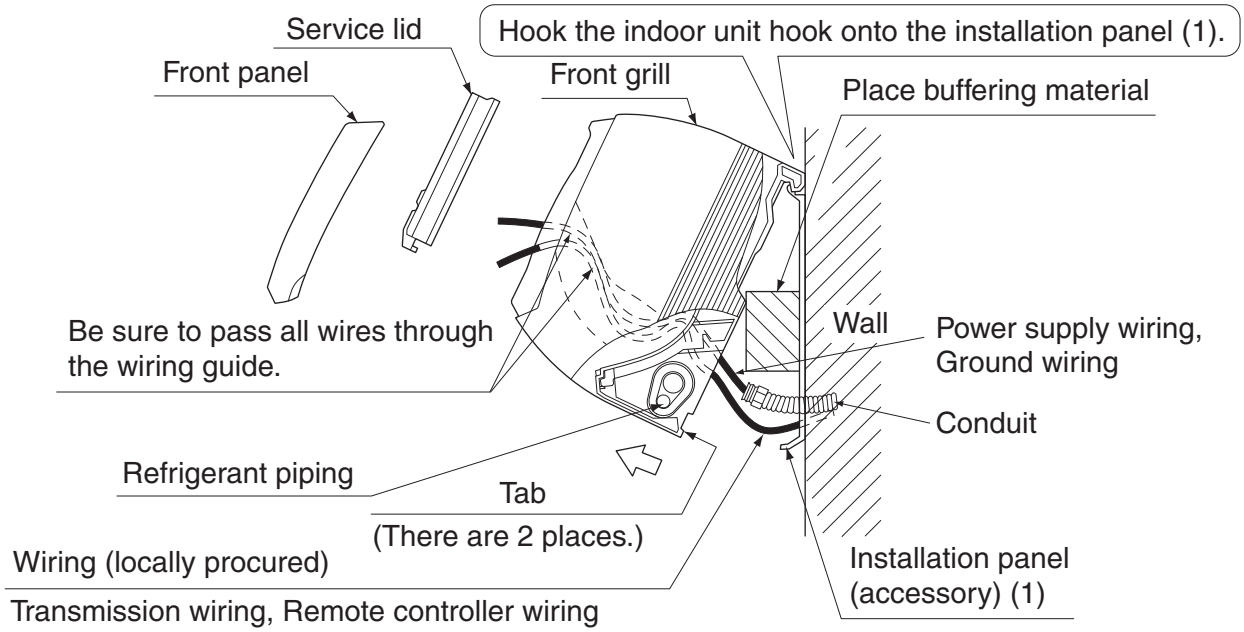

Fig. 9

For bottom-right and back-right piping

• Pass the drain hose and the refrigerant piping to the wall.

(7) Pass power supply wiring and ground wiring threaded through conduit (For connecting the conduit to the unit, see "8-1 HOW TO CONNECT WIRINGS"), and remote controller wiring through the wiring guide in through the back of the indoor unit and to the front.

(8) Connect the piping. (See "5.REFRIGERANT PIPING WORK" and Fig. 10)

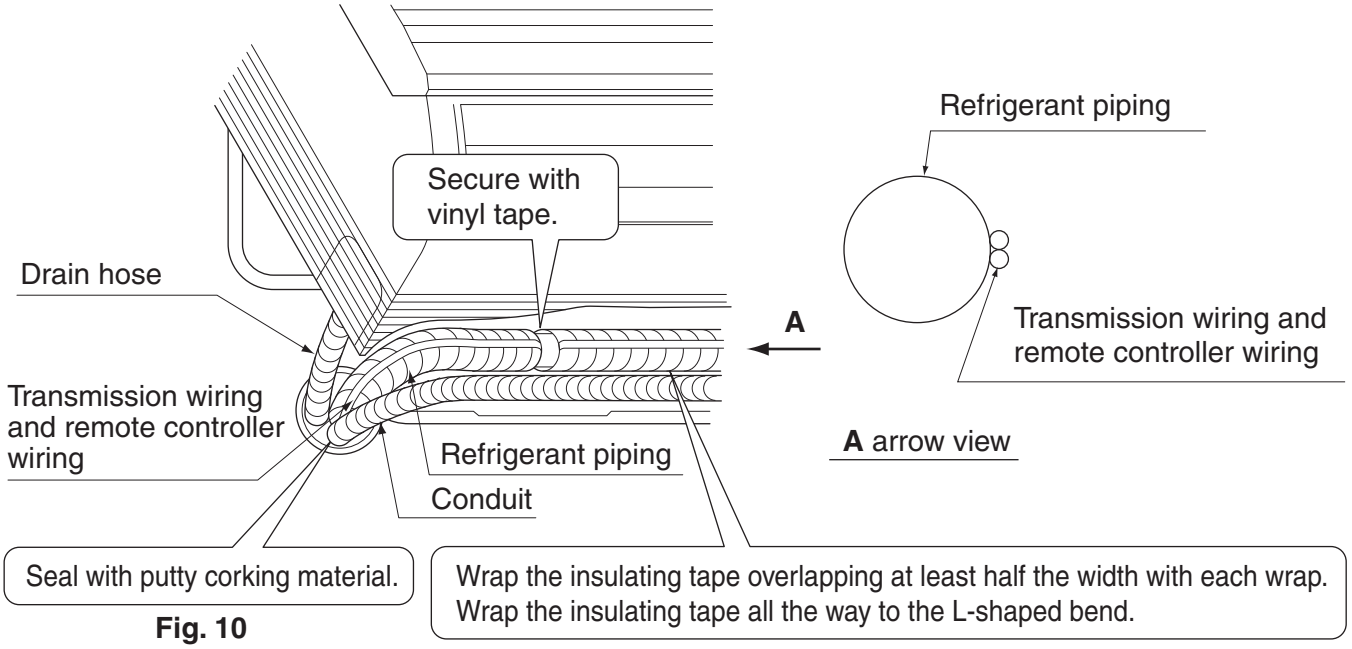

Fig. 10

- Seal the piping through-hole with putty corking material.

(9) Push on both bottom edges of the indoor unit using both hands and hook the tab on the back of the indoor unit onto the installation panel (1). (Refer to Fig. 9)

- At this time remove the buffering material placed in step (6).
- Make sure power supply wiring, transmission wiring, ground wiring and remote controller wiring are not caught inside the indoor unit.

■ **When screwing in the indoor unit**

- Remove the front grill. **(Refer to Fig. 7)**
- Secure the indoor unit to the installation panel (1) with the securing screws (6). **(Refer to Fig. 11)**

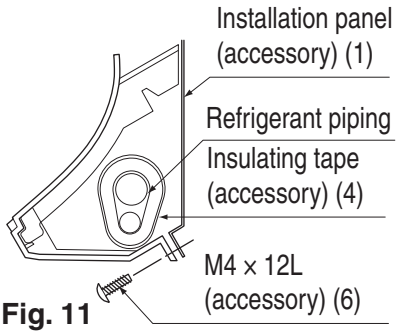

Fig. 11

5. REFRIGERANT PIPING WORK

〈**For refrigerant piping of outdoor units, see the installation manual attached to the outdoor unit.**〉
〈**Execute heat insulation work completely on both sides of the gas piping and the liquid piping. Otherwise, a water leakage can result sometimes.**〉
(When using a heat pump, the temperature of the gas piping can reach up to approximately 250°F, so use insulation which is sufficiently resistant.)
〈**Also, in cases where the temperature and humidity of the refrigerant piping sections might exceed 86ºF or RH80 %, reinforce the refrigerant insulation. (13/16" or thicker) Condensation may form on the surface of the insulating material.**〉
〈**Before refrigerant piping work, check which type of refrigerant is used. Proper operation is not possible if the types of refrigerant are not the same.**〉

⚠ DANGER

- Refrigerant gas may produce toxic gas if it comes in contact with fire such as from a fan, heater, stove or cooking device. Exposure to this gas could result in severe injury or death.

NOTE

- Use a pipe cutter and flare suitable for the type of refrigerant.
- To prevent dust, moisture or other foreign matter from infiltrating the tube, either pinch the end or cover it with tape.
- Do not allow anything other than the designated refrigerant to get mixed into the refrigerant circuit, such as air, etc.
- If any refrigerant gas leaks while working on the unit, ventilate the room thoroughly right away.

- The outdoor unit is charged with refrigerant.
- Use copper alloy seamless pipes.
- Be sure to use both a spanner and torque wrench together, as shown in the drawing, when connecting or disconnecting pipes to/from the unit. **(Refer to Fig. 12)**
- Refer to “Table 1” for the dimensions of flare.
- When connecting the flare nut, coat the flare section with ester oil or ether oil, rotate three or four times first, then screw in. **(Refer to Fig. 13)**

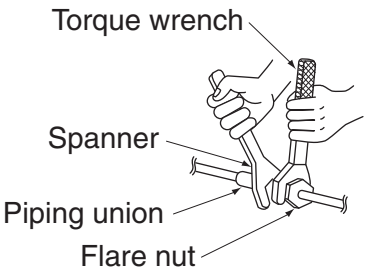

Fig. 12

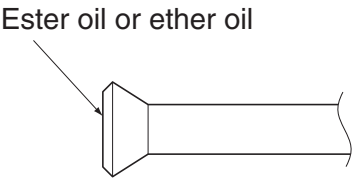
CAUTION

- Over-tightening may cause the flare nuts to crack or the refrigerant to leak.
- Use the flare nut included with the unit.



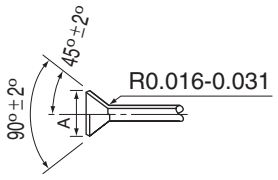


Fig. 13

- Refer to Table 1 for tightening torque.

Table 1

Pipe size	Tightening torque (ft-lbf)	Flare dimensions A (in.)	Flare shape (in.)
ϕ 3/8”	24.1 – 29.4	0.504 – 0.520	
ϕ 5/8”	45.6 – 55.6	0.760 – 0.776	

Not recommended but in case of emergency

You must use a torque wrench but if you are obliged to install the unit without a torque wrench, you may follow the installation method mentioned below.

After the work is finished, make sure to check that there is no gas leak.

When you keep on tightening the flare nut with a spanner, there is a point where the tightening torque suddenly increases. From that position, further tighten the flare nut the angle shown below:

Table 2

Pipe size (in.)	Further tightening angle	Recommended arm length of tool (in.)
ϕ 3/8”	60 to 90 degrees	Approx. 7 7/8”
ϕ 5/8”	30 to 60 degrees	Approx. 11 13/16”

⚠ CAUTION

- CAUTION TO BE TAKEN WHEN BRAZING REFRIGERANT PIPING
  "Do not use flux when brazing refrigerant piping. Therefore, use the phosphor copper brazing filter metal (BCuP) which does not require flux."
  (Flux has an extremely negative effect on refrigerant piping systems. For instance, if chlorine based flux is used, it will cause pipe corrosion. If the flux contains fluorine, it will damage the refrigerant oil.)

- When brazing the refrigerant piping, only begin brazing after having carried out nitrogen substitution (NOTE 1) or while inserting nitrogen into the refrigerant piping (NOTE 2). Once this is done, connect the indoor unit with a flared or a flanged connection.

⚠ DANGER

- Use of oxygen may cause an explosion resulting in serious injury or death. Only use nitrogen gas.

⚠ NOTE

1. Refer to the "Manual for Multi Installation for Buildings" for directions on how to carry out nitrogen substitution. (Inquire with your dealer.)
2. Nitrogen should be set to 2.9 psi with a pressure-reducing valve if brazing while inserting nitrogen into the piping. **(Refer to Fig. 14)**

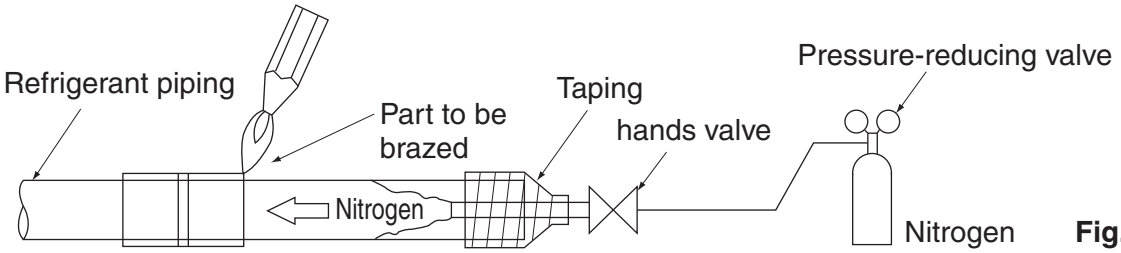

Fig. 14

- After checking for gas leaks, be sure to insulate the pipe connections using the supplementary piping insulation tubing and insulating tape (4). The insulating tape (4) should be wrapped from the L-shaped bend all the way to the end inside the unit. **(Refer to Fig. 15)**

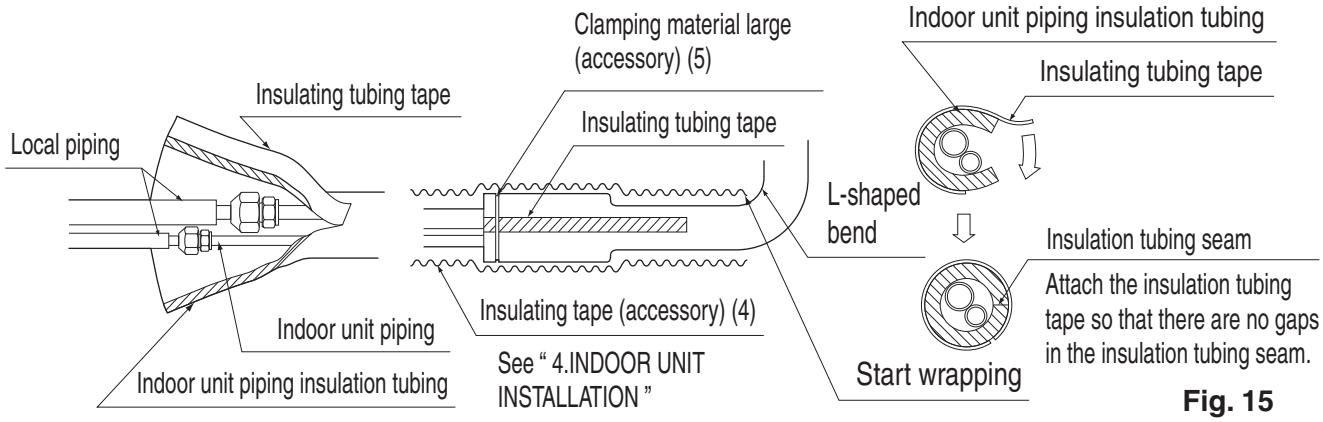

Fig. 15

⚠ CAUTION

- Be sure to insulate any field piping all the way to the piping connection inside the unit. Any exposed piping may cause condensate or burns if touched.

6. DRAIN PIPING WORK

(1) Install the drain piping. (Refer to Fig. 16)

- The drain pipe should be short with a downward slope and should prevent air pockets from forming.
- Watch out for the points in the figure 16 when performing drain work.

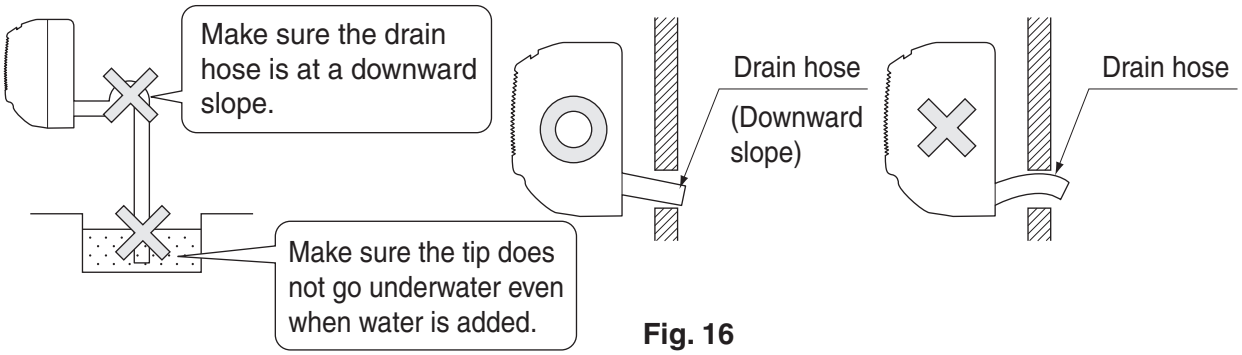

Fig. 16

- When extending the drain hose, use a commercially available drain extension hose, and be sure to insulate the extended section of the drain hose which is indoors. **(Refer to Fig. 17)**

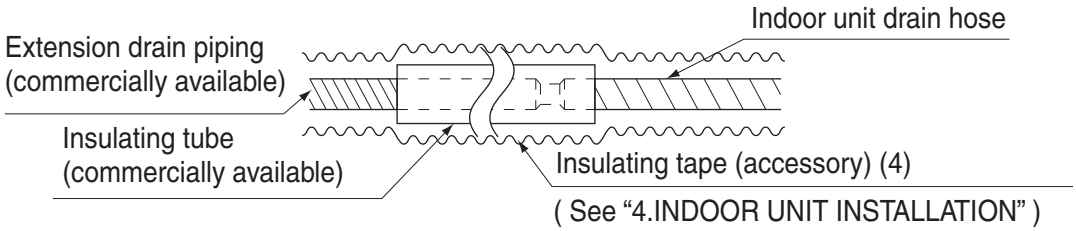

Fig. 17

- Make sure the diameter of the extension drain piping is the same as the indoor unit drain hose (hard vinyl chloride, I.D. 9/16”) or bigger.
- In case of converging multiple drain pipes, install them referring to Fig. 18.
- Select diameter of drain piping which adapts to the capacity of the unit connected.

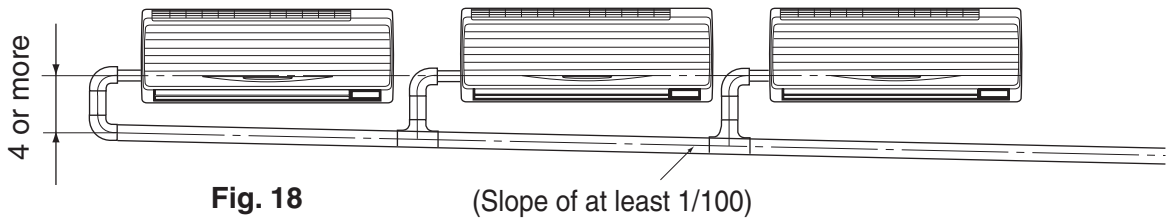

Fig. 18

(2) Make sure the drain works properly.

- After drain work is complete, perform a drain check by opening the front panel, **removing the air filter**, pouring water into the drain pan, and making sure water flows smoothly out of the drain hose. **(Refer to Fig. 19)**

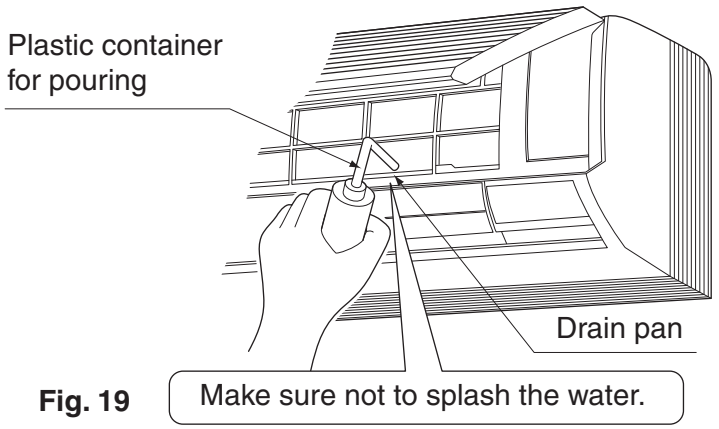

Fig. 19

⚠ CAUTION

- Drain piping connections
  Do not connect the drain piping directly to sewage pipes that smell of ammonia. The ammonia in the sewage might enter the indoor unit through the drain pipes and corrode the heat exchanger.
  Keep in mind that it will become the cause of getting drain pipe blocked if water collects on drain pipe.

7. ELECTRIC WIRING WORK

7-1 GENERAL INSTRUCTIONS

- All field supplied parts and materials and electric works must conform to local codes.
- Use copper wire only.
- For electric wiring work, refer to also “WIRING DIAGRAM” attached to the unit.
- For remote controller wiring details, refer to the installation manual attached to the remote controller.
- All wiring must be performed by an authorized electrician.
- This system consists of multiple indoor units. Mark each indoor unit as unit A, unit B..., and be sure the terminal block wiring to the outdoor unit and BS unit is properly matched. If wiring and piping between the outdoor unit and indoor unit are mismatched, the system may cause a malfunction.
- A circuit breaker capable of shutting down power supply to the entire system must be installed.
- Refer to the installation manual attached to the outdoor unit for the size of power supply wiring connected to the outdoor unit, the capacity of the circuit breaker and switch, and wiring instructions.
- Be sure to ground the air conditioner.

⚠ DANGER

- Do not ground units to water pipes, telephone wires or lightning rods because incomplete grounding could cause a severe shock hazard resulting in severe injury or death, and to gas pipes because a gas leak could result in an explosion which could lead to severe injury or death.

7-2 ELECTRICAL CHARACTERISTICS

Units				Power supply		Fan motor	
Model	Hz	Volts	Voltage range	MCA	MFA	W	FLA
FAQ18PVJU	60	208-230	Max. 253 Min. 187	0.4	15	43	0.3
FAQ24PVJU				0.6	15	43	0.5

MCA: Min. Circuit Amps (A); MFA: Max. Fuse Amps (A)
W: Fan Motor Rated Output (W); FLA: Full Load Amps (A)

7-3 SPECIFICATIONS FOR FIELD SUPPLIED FUSES AND WIRE

Model	Power supply wiring		Remote controller wiring Transmission wiring	
	Field fuses ⊣⊢	Size	Wire	Size
FAQ18PVJU	15A	Size must comply with local codes.	Sheathed wire (2 wire)	AWG18-16
FAQ24PVJU				

- Allowable length of transmission wiring and remote controller wiring are as follows.
  (1) Outdoor unit - Indoor unit:Max.3280ft. (Total wiring length: 6560ft.)
  (2) Indoor unit - Remote controller:Max.1640ft.
- Insulated thickness: 1/16” or more.

8. WIRING EXAMPLE AND HOW TO SET THE REMOTE CONTROLLER

8-1 HOW TO CONNECT WIRINGS

• Conduit for power supply wiring
Unscrew and remove the conduit mounting plate from the electric parts box. **(Refer to Fig. 20)**
Fix a conduit to the plate with a lock nut and reattach them at original position.

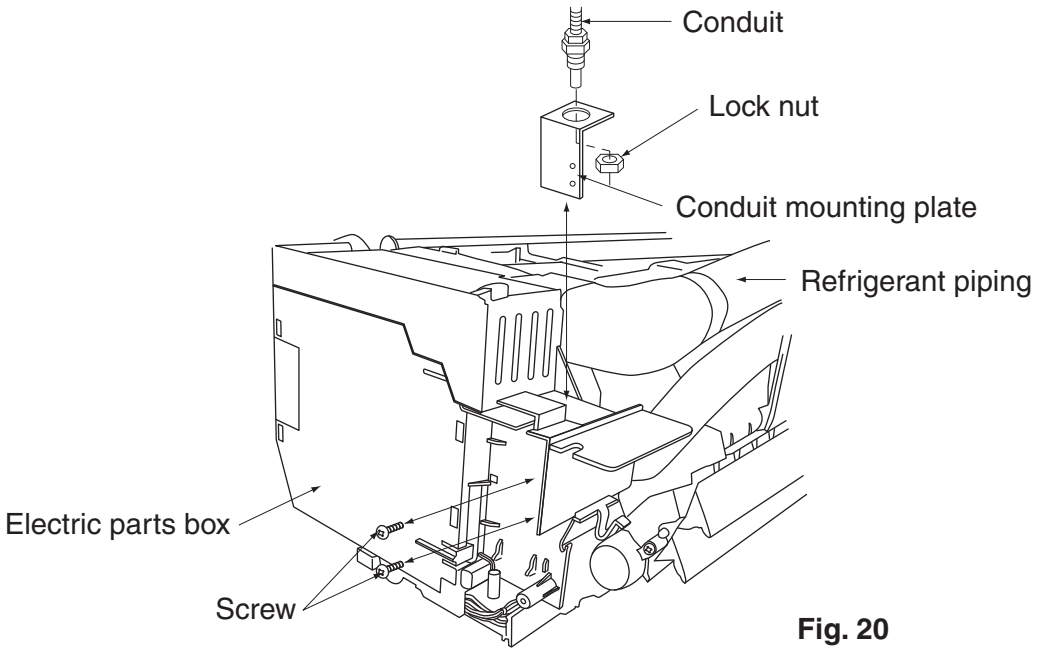

Fig. 20

• Power supply wiring and ground wiring
Unscrew and remove the service lid.
Thread the power supply wiring and ground wiring through the included insulating tube (short) (7) and secure them with the included clamp (small) (5). **(Refer to Fig. 21)**
Connect the power supply wiring and ground wiring to the power supply terminal block (3P).
When doing this, firmly secure using the included clamp (small) (5) according to the figure.
(Refer to Fig. 22)

• Transmission wiring and remote controller wiring
Unscrew and remove the service lid.
Thread the remote controller wiring and transmission wiring through the included insulating tube (long) (7) and secure them with the included clamp (small) (5). **(Refer to Fig. 21)**
Connect the remote controller wiring and the transmission wiring to the terminal block (6P).
When doing this, tie the remote controller wiring and the transmission wiring using the included clamp (small) (5) and then firmly secure using the included clamp (small) (5) according to the figure. **(Refer to Fig. 22)**

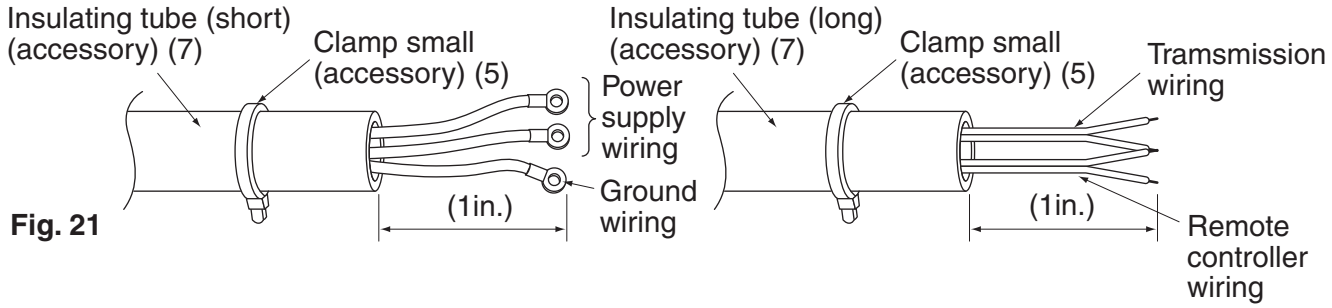

Fig. 21

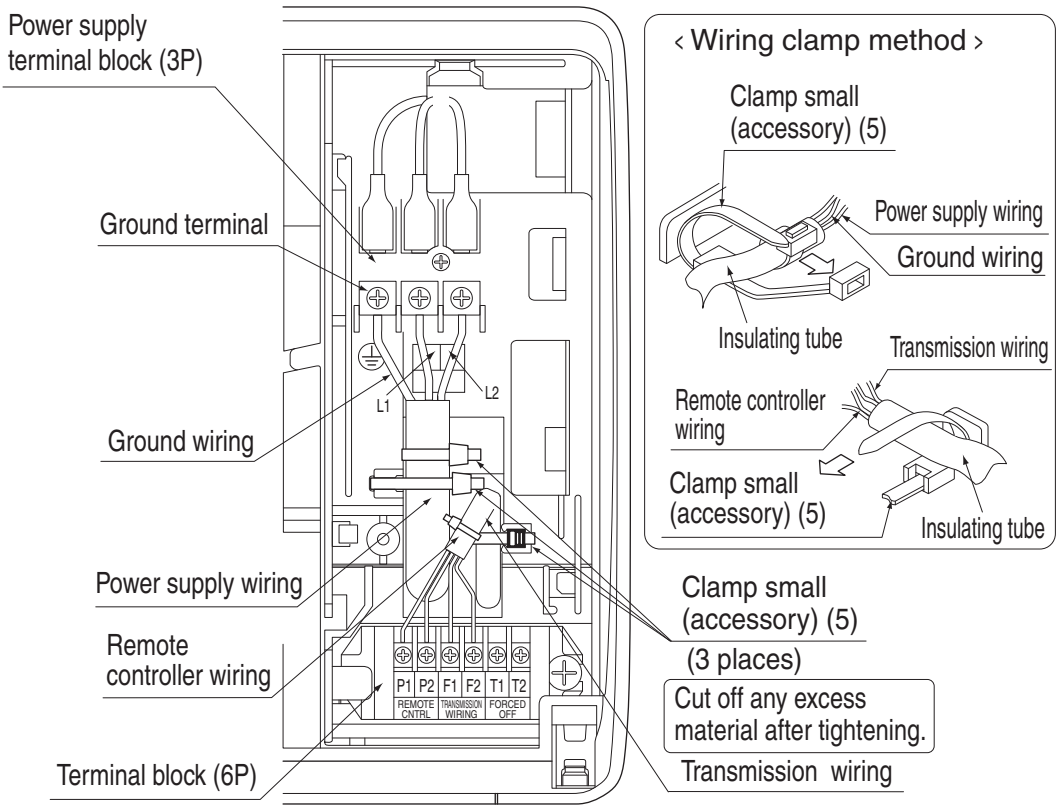

Fig. 22

⚠ WARNING

- Never connect power supply wiring to the terminal block for remote controller wiring as this could damage the entire system.
- Use only specified wire and connect wires to the terminal tightly. Be careful wires do not place external stress on terminals. Keep wires in neat order so as not to obstruct other equipment. Make sure that the electric box lid fits tightly. Incomplete connections could result in overheating and, in worse case, result in electric shock or fire.
- To avoid a short circuit in the electric parts box, be sure to apply sealing material or putty (not included) to the wiring hole to prevent the infiltration of water as well as insects or other small creatures. Otherwise a short-circuit may occur inside the electric parts box.

⚠ CAUTION

- When clamping the wirings, be sure no tension is applied to the wire connections by using the included clamp. Also, when wiring, make sure the lid on the electric parts box fits snugly by arranging the wirings neatly and attaching the service lid firmly. When attaching the service lid, make sure no wirings get caught in the edges. Pass wiring through holes to prevent damage to them.
- Make sure the remote controller wiring and transmission wiring between the units, and other electrical wiring do not pass through the same locations outside the unit, separating them by at least 5”, otherwise electrical noise (external static) could cause incorrect operation or breakage.
  Use only specified wire and tightly connect wires to terminals. Be careful wires do not place external stress on terminals. Keep wiring in neat order and so as not to obstruct other equipment such as popping open the service cover. Make sure the cover closes tight. Incomplete connections could result in overheating, and in worse case, electric shock or fire.

[PRECAUTIONS]

1. Use round crimp-style terminals for connecting wires to the power supply terminal block. **(Refer to Fig. 23)**

   If unavailable, observe the following points when wiring.
   - Do not connect wires of different gauge to the same power supply terminal. (Looseness in the connection may cause overheating.)
   - Use the specified electric wire. Connect the wire securely to the terminal. Lock the wire down without applying excessive force to the terminal. (Tightening torque: 0.97ft.lbf ±10 %)

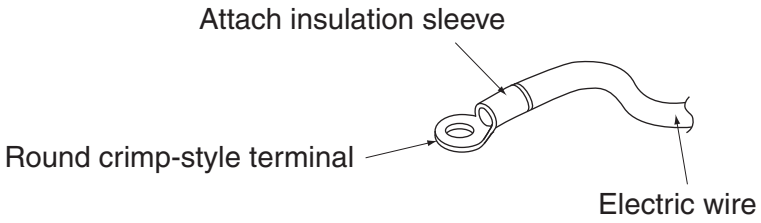

Fig. 23

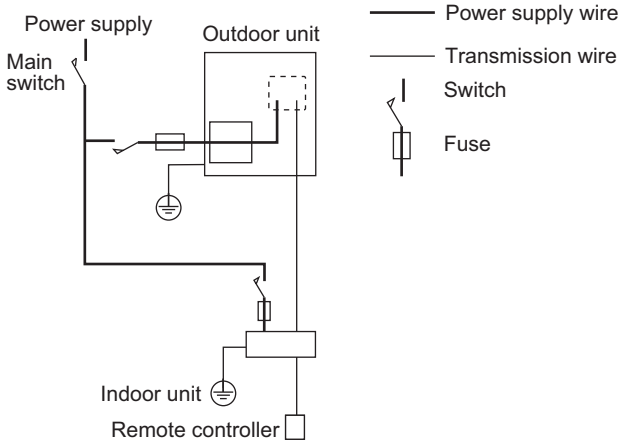
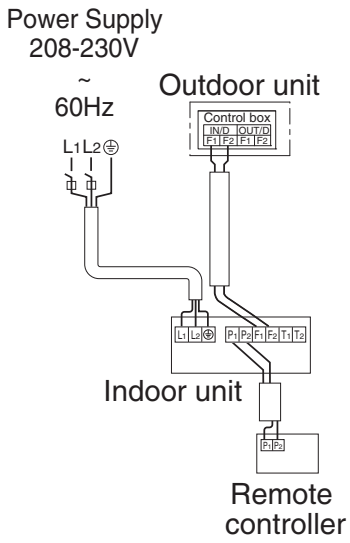
2. **Tightening torque for the terminal screws.**
   - Use the correct screwdriver for tightening the terminal screws. If the blade of screwdriver is too small, the head of the screw might be damaged, and the screw will not be properly tightened.
   - If the terminal screws are tightened too hard, screws might be damaged.
   - Refer to the table below for the tightening torque of the terminal screws.



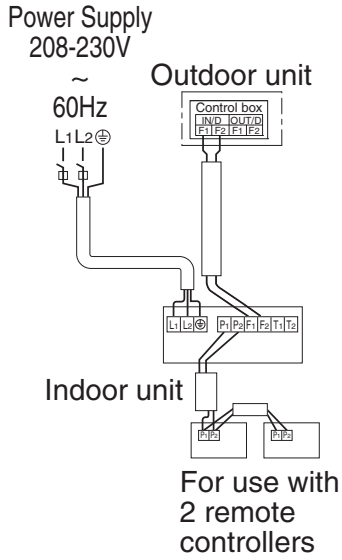
Terminal	Size	Tightening torque (ft-lbf)
Remote controller, Transmission wiring and Forced off terminal block (6P)	M3.5	0.58 – 0.72
Power supply and Ground terminal block (3P)	M4	0.87 – 1.06

3. Do not connect wires of different gauge to the same ground terminal. Looseness in the connection may lessen protection.
4. Keep transmission wiring at least 5” away from power supply wiring. The equipment may malfunction if subjected to electrical (external) noise.
5. For remote controller wiring, refer to the “INSTALLATION MANUAL OF REMOTE CONTROLLER” attached to the remote controller.



8-2 WIRING EXAMPLE

- Fit the power supply wire of each unit with a switch and fuse as shown in the drawing.



COMPLETE SYSTEM EXAMPLE

1. When using 1 remote controller for 1 indoor unit. (Normal operation)

2. When using 2 remote controllers for 1 indoor unit.

NOTE

1. A single switch can be used to supply power to units on the same system. However, branch switches and branch circuit breakers must be selected carefully.
2. Do not ground the equipment on gas pipes, water pipes or lightning rods, or crossground with telephones. Improper grounding could result in electric shock.

8-3 CONTROL BY 2 REMOTE CONTROLLERS (CONTROLLING 1 INDOOR UNIT BY 2 REMOTE CONTROLLERS)

• When using 2 remote controllers, one must be set to “MAIN” and the other to “SUB”.

MAIN/SUB CHANGEOVER

(1) Insert a ⊖ screwdriver into the recess between the upper and lower part of remote controller, and working from the 2 positions, pry off the upper part. The remote controller PC board is attached to the upper part of the remote controller. **(Refer to Fig. 28)**

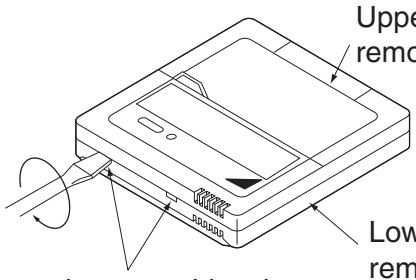


Fig. 28

(2) Turn the **MAIN/SUB changeover** switch on one of the two remote controller PC boards to “S”. (Leave the switch of the other remote controller set to “M”.) **(Refer to Fig. 29)**

Wiring Method (See “7.ELECTRIC WIRING WORK”)

(3) Remove the service lid.

(4) Add remote control 2 (slave) to the terminal block (6P) for remote controller (P1, P2) in the electric parts box.
(There is no polarity.) (Refer to Fig. 26 and section 7-3 for the wiring size.)

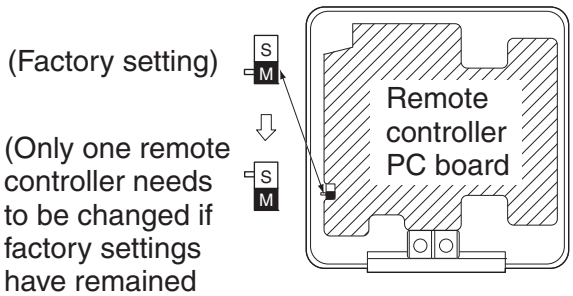

Fig. 29

8-4 COMPUTERISED CONTROL (FORCED OFF AND ON/OFF OPERATION)

(1) Wire specifications and how to perform wiring

• Connect the input from outside to terminals T1 and T2 of the terminal block (6P).

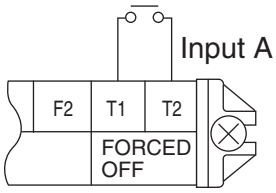

Fig. 30

Wire specification	Sheathed vinyl cord or cable (2 wire)
Gauge	AWG18-16
Length	Max. 328 ft.
External terminal	Contact that can ensure the minimum applicable load of 15V DC, 10 mA.

(2) Actuation

• The following table explains FORCED OFF and ON/OFF OPERATIONS in response to Input A.

FORCED OFF	ON/OFF OPERATION
Input “ON” stops operation (impossible by remote controllers).	Input OFF → ON turns ON unit.
Input OFF enables control by remote controller.	Input ON → OFF turns OFF unit.

(3) How to select FORCED OFF and ON/OFF OPERATION
- Turn the power on and then use the remote controller to select operation.
- Set the remote controller to the field set mode. For details, refer to the “HOW TO SET IN THE FIELD”, in the remote controller manual.
- When in the field set mode, select mode No. 12, then set the first code (switch) No. to “1”. Then set second code (position) No. to “01” for FORCED OFF and “02” for ON/OFF OPERATION.
  (FORCED OFF at factory set) **(Refer to Fig. 31)**

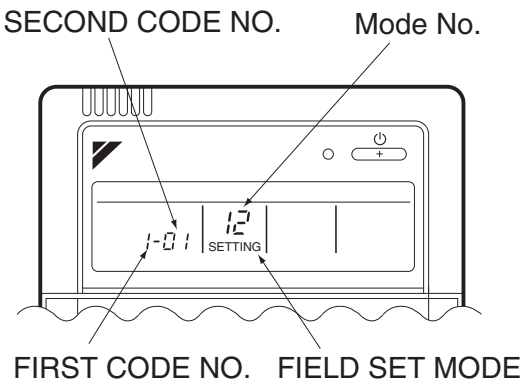

Fig. 31

8-5 CENTRALIZED CONTROL
- For centralized control, it is necessary to designate the group No. For details, refer to the manual of each optional controllers for centralized control.

9. FIELD SETTINGS
(1) Make sure the service lids are closed on the indoor and outdoor units.
(2) Field settings must be made from the remote controller in accordance with installation conditions.
- Settings can be made by changing the “Mode No”, “FIRST CODE NO.” and “SECOND CODE NO.”. Refer to the installation manual attached to the remote controller.
- The “Field Settings” included with the remote controller lists the order of the settings and method of operation.
  *Setting is made in all units in a group. To set for individual indoor units or to check the setting, use the mode Nos. (with “2” in upper digit) in parentheses ( ).

9-1 SETTING AIR FILTER SIGN
- Remote controllers are equiped with liquid crystal display air filter signs to display the time to clean air filters.
- Change the SECOND CODE NO. according to Table 3 depending on the amount of dirt or dust in the room. (SECOND CODE NO. is factory set to “01” for air filter contamination-light)

Table 3

Setting	Spacing time of display air filter sign	Mode No.	FIRST CODE NO.	SECOND CODE NO.
Air filter contamination-light	Approx. 200 hrs	10 (20)	0	01
Air filter contamination-heavy	Approx. 100 hrs			02

9-2 SETTING AIR FLOWRATE INCREASE MODE

- It is possible to raise set air flow (HIGH and LOW) from the field. Change the SECOND CODE NO. as shown in Table 4 to suit your needs.
  (SECOND CODE NO. is factory set to “01” for Standard.)

Table 4

Setting	Mode No.	FIRST CODE NO.	SECOND CODE NO.
Standard	13 (23)	0	01
A little increase			02
Increase			03

〈**When using wireless remote controllers**〉

- When using wireless remote controllers, wireless remote controller address setting is necessary. Refer to the installation manual attached to the wireless remote controller for setting instructions.

10. TEST OPERATION

Make sure the service lids are closed on the indoor and outdoor units.
Refer to the installation manual of the outdoor unit.

- The operation lamp of the remote controller will flash when a malfunction occurs. Check the malfunction code on the liquid crystal display to identify the point of trouble. An explanation of malfunction codes and the corresponding trouble is provided in the installation manual of the outdoor unit.
  If any of the items in Table 5 are displayed, there may be a problem with the wiring or power, so check the wiring again.

  Table 5

Remote controller display	Content
“ ” (under centralized control) is lit up	• There is a short circuit at the FORCED OFF terminals (T1, T2).
“U4” is lit up “UH” is lit up	• The power on the outdoor unit is off. • The outdoor unit has not been wired for power supply. • Incorrect wiring for the transmission wiring and/or FORCED OFF wiring. • The transmission wiring is cut.
No display	• The power on the indoor unit is off. • The indoor unit has not been wired for power supply. • Incorrect wiring for the remote controller wiring, the transmission wiring, and/or the FORCED OFF wiring. • The remote controller wiring is cut.

- If “U3” is lit up, the malfunction code shows the test operation has not been performed yet.

1.0 INTRODUCTION

This document contains specific information regarding the safe installation, operating and maintenance of Vertical In-Line pumps and should be read and understood by installing, operating and maintenance personnel. The equipment supplied has been designed and constructed to be safe and without risk to health and safety when properly installed, operated and maintained. The following instructions must be strictly adhered to. If clarification is needed on any point please contact Armstrong quoting the equipment serial number.

WARNING SYMBOLS

Safety instruction where an electrical hazard is involved.

Safety instruction where non-compliance would affect safety risk.

Safety instruction relating to safe operation of the equipment. (ATTENTION)

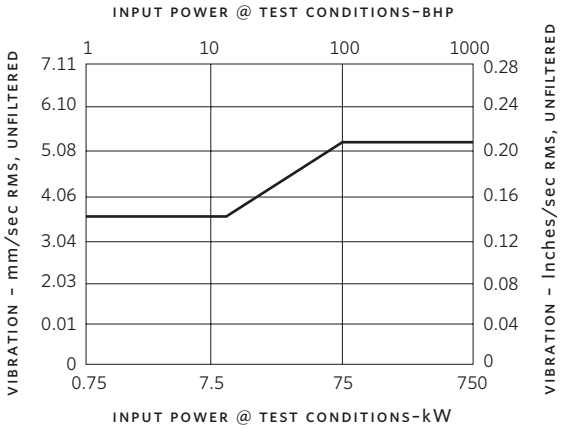
1.1 INSTRUCTIONS FOR SAFE USE

No installation of this equipment should take place unless this document has been studied and understood. Handling, transportation and installation of this equipment should only be undertaken by trained personnel with proper use of lifting equipment. See later diagrams for lifting advice. Refer to the pump nameplate for pump speed, pressure and temperature limitations. The limits stated must not be exceeded without written permission from Armstrong.

1.2 TEMPERATURE

Where under normal operating conditions the limit of 68°C/155°F (restricted zone) for normal touch, or 80°C/176°F (unrestricted zone) for unintentional touch, may be experienced, steps should be taken to minimize contact or warn operators/users that normal operating conditions will be exceeded. In certain cases where the temperature of the pumped liquid exceeds the above stated temperature levels, pump casing temperatures may exceed 100°C/212°F and not withstanding pump insulation techniques appropriate measures must be taken to minimize risk for operating personnel.

1.3 NOISE LEVELS



Typical Pumping Unit Sound Pressure Level, Decibels, A-Weighted, at 1 m (3 ft.) from unit.

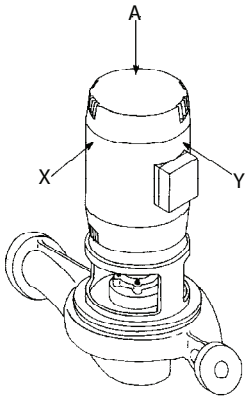


FIG. 1 Noise levels.

	1200 RPM				1800 RPM				3600 RPM

1.4 VIBRATION LEVELS

Armstrong Vertical In-Line pumps are designed to meet vibration levels set by Hydraulic Institute Standard HI Pump vibration 9.6.4. standard levels are as detailed below:

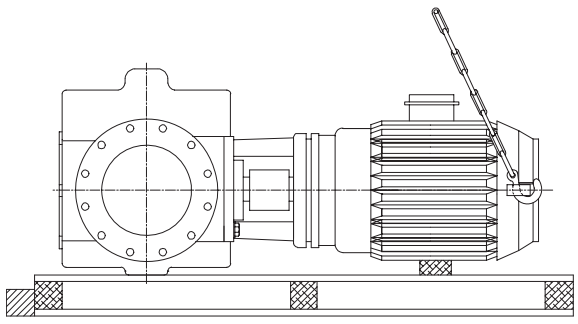
VERTICAL IN–LINE

1.5 STORAGE

Pumps not immediately placed into service, or removed from service and stored, must be properly prepared to prevent excessive rusting. Pump port protection plates must not be removed until the pump is ready to connect to the piping.

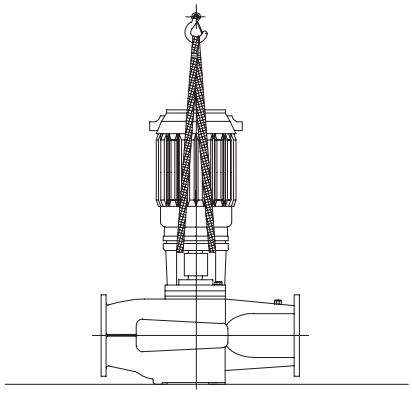
Rotate the shaft periodically (at least monthly) to keep rotating element free and bearings fully functional.

For long term storage (longer than 3 months), the pump must be placed in a vertical position in a dry environment.



Internal rusting can be prevented by removing the plugs at the top and bottom of the casing and drain or air blow out all water to prevent rust buildup or the possibility of freezing. Be sure to reinstall the plugs when the unit is made operational. Rust-proofing or packing the casing with moisture absorbing material and covering the flanges is acceptable. When returning to service be sure to remove the drying agent from the pump.

1.6 UNCRATING



Armstrong Vertical In-Line pumps are thoroughly inspected before shipment to assure they meet with your order requirements. After removing the pump from the crate, make sure the equipment is in good order and that all components are received as called for on the packing list. Any shortages or damage should be reported immediately. Use extreme care in handling the unit, placing slings and hooks carefully so that stress will not be imposed on the pump. **Never place cable slings around the pump shaft.** The eye bolts or lifting lugs on the motor are intended for lifting the motor only and not the complete unit.

1.7 HANDLING LARGE VIL UNITS

One effective way of lifting a large Series 4300 unit from the shipment pallet following uncovering the unit is to place lifting hooks through the motor lifting rings or straps around the upper part of the motor and carefully lift sufficiently to stand the pump vertically. Lift only enough to remove the pallet then lower onto a flat surface. The pump and motor unit will free-stand on the casing ribs. Remove the coupling guard and place (2) lifting straps through the pump/motor pedestal (one on each side of the motor shaft) and secure to the lifting device. With the straps in place, using a spacer bar if necessary to protect the motor fan cover, the whole assembly can now be lifted securely and placed in position in the piping.

Secure pallet and lift pump vertical using motor eye-bolts lift only to clear pallet then sit on the flat surface.

Remove coupling guard and place lifting straps on each side of coupling, use spacer bar if necessary to protect motor fan cover.

IMPORTANT:

Do not run the pump for any length of time under very low flow conditions or with the discharge valve closed. This could cause the water in the casing to reach super heated steam conditions, cause premature failure and cause serious and dramatic damage to the pump and surrounding area.

2.0 INSTALLATION

2.1 LOCATION

In open systems, locate the unit as close as practical to the liquid being pumped, with a short, direct suction pipe. Ensure adequate space is left above and around the unit for operation, maintenance, service and inspection of parts.

In closed systems, where possible, the pumps should be installed immediately downstream of the expansion tank/make-up connection. This is the point of zero pressure change and is necessary for effective pump operation. Do not install more than one expansion tank connection into any closed hydronic system.

Electric motor driven pumps should not be located in damp or dusty locations without special protection.

Airflow into the motor and/or motor fan should not be obstructed.

2.2 INSTALLATION

When installing Vertical In-Line pumps, an important consideration to accrue full added-value from the pump design is to ensure that the pump is pipe-mounted and free to 'float' with any movement, expansion and contraction of the piping. Should any Vertical In-Line pump use supports to the structure it is imperative that no pipe strain is imposed on the pump flanges. Telltale pieces of equipment such as springs or 'waffle' style neoprene isolation pads that distort with pressure to indicate added piping weight, should be used under pump supports should the pump not be truly pipe mounted.

Various installation arrangements are detailed on Pages 6 and 7:

2.2.1
Vertical In-Line pumps may be installed directly in the system piping with no additional support. Pipe hangers are simply sized for the additional weight of the pumping unit. Many pumps are installed in this manner and are mounted at sufficient height to take zero floor space. (Fig. 2.1)

2.2.2
Piping, in many mechanical rooms, is hung close to the ceiling and larger pumps are mounted near ground level for ease of maintenance. Fig 2.2 illustrates such an arrangement with the piping supported at the ceiling and the VIL unit installed with an Armstrong Suction Guide and triple function Flo-Trex valve. Many very large VIL pumps are installed in this manner.

2.2.3
Should additional space saving be required the discharge spool piece and Flo-Trex valve may be replaced by a long-radius elbow and the Flo-Trex valve field converted to a straight-through valve and installed in the vertical discharge pipe. (Fig. 2.3)

2.2.4
Fig 2.4 illustrates a similar arrangement to Fig 2.2 with additional floor mounted pipe-stools isolated from the structure by 'waffle' style neoprene isolation pads under the Armstrong Suction Guide and Flo-Trex valve.

2.2.5
Floor mounted saddle supports (Fig. 2.5) are typical for condenser water pumps where the cooling tower base is near mechanical room elevation.

2.2.6
Where required, additional floor support may be used as shown in Fig. 2.6. Note that the pump should not be rigidly attached to the column. Leave a small gap between pump and column or install a 'waffle' isolation pad under the pump. It is critical that piping be installed in such a manner that the pump does not become a pipe support.

2.2.7
Fig. 2.7 illustrates stanchion plates at the pump inlet and outlet ports that may be supplied for installation convenience. Isolation pads must be used under the legs and monitored as pipe hangers are adjusted to ensure the pump flanges are not supporting the piping. Bolting to the floor or housekeeping pad is not recommended. If the stanchions are bolted down the bolts must be isolated from the stanchion or an inertia base and flexible pipe connectors should be used.

2.2.8
Fig. 2.8 illustrates installations with stanchion plates for seismically active regions. Seismically rated isolation pads or snubbers with bolts isolated from the stanchion plates are installed to restrain the pump during a seismic event. Pipe hangers carry the weight of the equipment as seismic components are designed only to restrain the equipment during a seismic event.

2.2.9
Close coupled in-line units (Series 4360 & 4380) up to 15 hp / 11 kW may be installed with the shaft horizontal. (Fig. 2.9) For horizontal mounting of large units or Series 4300 Split-Coupled style consult the factory. (Fig. 2.9)

2.2.10
Many Vertical In-Line pumps are piped successfully into grooved piping systems. In-line pumps are supported well by grooved piping however flange adapter locking devices or a welded flange at the pump should be used to prevent the possibility of pipe mounted pumps rotating in the piping. Armstrong offers grooved suction guides with cast-in outlet flanges and triple function Flo-Trex valves with inherent locking devices to prevent this possibility. (Fig. 2.10)

2.2.11
Do not support the unit by the motor eye bolts (Fig. 2.11) or by any other part of the motor.

2.2.12
Connecting the pump to a permanent rigid base (Fig. 2.12). is not recommended unless isolated from the piping by flexible connectors and the base isolated from the building structure on an inertia base. (Fig. 2.12 is generally acceptable when using plastic piping).

IMPORTANT:

All Series 4300 pumps contain a tapped hole in the motor bracket above the discharge flange (see Fig. 2.13) for draining the well. Pipe this drain hole to a floor drain to avoid overflow of the cavity caused by collecting chilled water condensate or from seal failure.

2.3 PUMP PIPING – GENERAL

Never connect a pump to piping, unless extra care is taken to measure and align the piping flanges well. Always start piping from pump.

Use as few bends as possible and preferably long radius elbows.

Do not use flexible connectors on the suction or discharge of a Vertical In-Line pump, unless the pump is rigidly mounted to a foundation.

Ensure piping exerts no strain on pump as this could distort the casing causing breakage or early failure due to pump misalignment.

All conecting pipe flanges must be square to the pipework and parallel to the pump flanges.

Suction and discharge pipes may be increased or decreased at pump nozzle to suit pump capacity and particular conditions of installation. Use eccentric reducers on suction connection with flat side uppermost.

Layout the suction line with a continual rise towards the pump without high points, thus eliminating possibility of air pockets that may prevent the pump from operating effectively.

A strainer of three or four times the area of the suction pipe, installed in the suction line, will prevent the entrance of foreign materials into the pump. $^{3}/_{16}$" (5 mm) diameter perforations in the strainer is typical.

In open systems, test suction line for air leaks before starting; this becomes essential with long suction line or static lift. Install, at the pump suction, a straight pipe of a length equivalent to 4 or 6 times its diameter; this becomes essential when handling liquids above 120°F (49°C). Armstrong suction guides may be used in place of the straight pipe run and in-line strainer.

Install an isolation valve in both suction and discharge lines on flooded suction application; these valves are used primarily to isolate the pump for inspection or repair.

Install a non-slam non-return check valve in discharge line between pump and isolation valve to protect pump from excessive back pressure and to prevent water running back through the pump in case of driver failure on open systems. An Armstrong Flo-Trex valve may be used in place of non-return check valve and isolation valve on pump discharge.

CAUTION:

A Only the discharge valve is to be used to throttle pump flow, not the suction valve. Care must be taken in the suction line layout and installation, as it is usually the major source of concern in centrifugal pump applications.

2.4 ALIGNMENT

Alignment is unnecessary on close-coupled pumps, Series 4360 & 4380, as there is no shaft coupling.

Series 4300 units are accurately aligned at the factory prior to being shipped and do not need re-aligning when installed.

Alignment on a Series 4300 unit may be verified by assuring an equal and parallel gap between coupling halves on both sides of the coupling.

OPERATION

2.5 STARTING THE PUMP

Ensure that the pump turns freely by hand, or with some gentle mechanical help such as a strap or Allen key in coupling bolt.

Ensure that all protective guarding is securely fixed in position.

The pump must be fully primed on start up. Fill the pump casing with liquid and rotate the shaft by hand to remove any air trapped in the impeller. On Series 4300 any air trapped in the casing as the system is filled must be removed by the manual air vent in the seal flush line. **Ensure entrained air is removed from series 4300 pumps, prior to starting, through the air vent on the seal flush line. Open vent until clear of air.** Series 4360 & 4380 units are fitted with seal flush/vent lines piped to the pump suction area. When these units operate residual air is drawn out of the pump towards the suction piping.

'Bump' or energize the motor momentarily and check that the rotation corresponds with the directional arrow on the pump casing.

To reverse rotation of a three phase motor, interchange any two power leads.

Start the pump with the discharge valve closed and the suction valve open, then gradually open the discharge valve when the motor is at operating speed. The discharge valve may be open slightly at start up to help eliminate trapped air.

When stopping the pump: Close the discharge valve and de-energize the motor.

Do not run the pump against a closed discharge valve for an extended period of time (a few minutes maximum).

Star-Delta motor starters should be fitted with electronic/mechanical interocks that have a timed period of no more than 40 miliseconds before switching from star (starting) to delta (run) connection yet allow the motor to reach full star (starting) speed before switching to delta (run).

Should the pump be noisy or vibrate on start-up a common reason is overstated system head. Check this by calculating the pump operating head by deducting the suction pressure gauge value from the discharge gauge reading. Convert the result into the units of the pump head as stated on the pump nameplate and compare the values. Should the actual pump operating head be significantly less than the nameplate head value it is typically permissable to throttle the discharge isolation valve until the actual operating head is equal to the nameplate value. Any noise or vibration usually disappears. The system designer or operator should be made aware of this as some adjustment may be required to the pump impeller diameter or drive settings, if applicable, to make the pump suitable for the system as installed.

CAUTION:

Check rotation arrow prior to operating the unit. The rotation of all Armstrong Vertical In-Line units is clockwise when viewed from the drive end. (Looking from on top of/behind the motor).

2.6 GENERAL CARE

Vertical In-Line pumps are built to operate without periodic maintenance, other than motor lubrication on larger units. A systematic inspection made at regular intervals, will ensure years of trouble-free operation, giving special attention to the following:

- Keep unit clean.
- Provide the motor with correctly sized overload protection.
- Keep moisture, refuse, dust or other loose particles away from the pump and ventilating openings of the motor.
- Avoid operating the unit in overheated surroundings (above 100°F/40°C).

WARNING:

Whenever any service work is to be performed on a pumping unit, disconnect the power source from the driver, **lock it off** and tag with the reason. Any possibility of the unit starting while being serviced must be eliminated.

- If mechanical seal environmental accessories are installed, ensure water is flowing through the sight flow indicator and that filter cartridges are replaced as recommended. (See Armstrong files 43.85 & 43.86 for seal environmental instructions).

2.7 LUBRICATION

Pump
Lubrication is not required. There are no bearings in the pump that need external lubrication service.

Large Series 4300 units are installed with a shaft bushing located beneath the impeller that is lubricated from the pump discharge. This bearing is field removable for service on the 20 × 20 × 19 size without disturbing the motor or other major pump components.

Service instructions for the lower bearing is to be found in File no: 43.805.

Motor
Follow the lubrication procedures recommended by the motor manufacturer. Many small and medium sized motors are permanently lubricated and need no added lubrication. Generally if there are grease fittings evident the motor needs periodic lubrication. None if not.

Check the lubrication instructions supplied with the motor for the particular frame size indicated on the motor nameplate.

Mechanical Seal
Mechanical seals require no special attention. The mechanical seal is fitted with a flush line. The seal is flushed from discharge of the pump casing on Series 4300 pumps and is flushed/vented to the suction on close coupled pumps, Series 4360 & 4380.

The Series 4300 pump is flushed from the pump discharge because the mechanical seal chamber is isolated from the liquid in the pump by a throttle bushing. Because the seal chamber is isolated, seal environmental controls such as filters and separators, when installed in the Series 4300 flush line are very effective, as only the seal chamber needs cleansing, and will prolong seal life in HVAC systems.

Do not run the pump unless properly filled with water as the mechanical seals need a film of liquid between the faces for proper operation.

Mechanical seals may 'weep' slightly at start-up. Allow the pump to continue operating for several hours and the mechanical seal to 'seat' properly prior to calling for service personnel.

The following Armstrong files are available for mechanical seal replacement instructions:

- Series 4360 & 4380: File no. 43.81
- Series 4300: P-Base and TCZ Motor Frame – File no. 43.84
  TC Motor Frame – File no. 43.88

2.8 SYSTEM CLEANLINESS

Before starting the pump the system must be thoroughly cleaned, flushed and drained and replenished with clean liquid.

Welding slag and other foreign materials, Stop Leak and cleaning compounds and improper or excessive water treatment are all detrimental to the pump internals and sealing arrangement.

Proper operation cannot be guaranteed if the above conditions are not adhered to.

NOTE:
Particular care must be taken to check the following before the pump is put into operation:

- **A** Pump primed?
- **B** Rotation OK?
- **C** Lubrication OK?
- **D** Pipe work properly supported?
- **E** Voltage supply OK?
- **F** Overload protection OK?
- **G** Is the system clean?
- **H** Is the area around the pump clean?

WARRANTY
Does not cover any damages to the equipment resulting from failure to observe the above precautions. Refer to Armstrong General Terms and Warranty sheet. Contact your local Armstrong representative for full information.

2.9 INSTALLATION LAYOUTS

FIG. 2.1 Hanger supported pipe mounted.

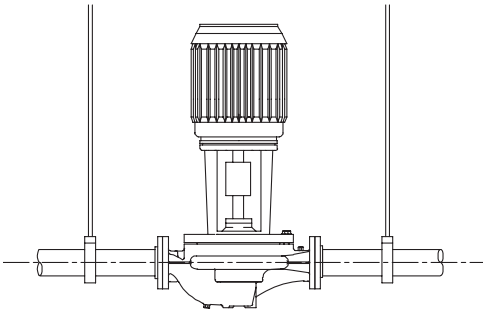


FIG. 2.2 Pipe mounted supported at ceiling.

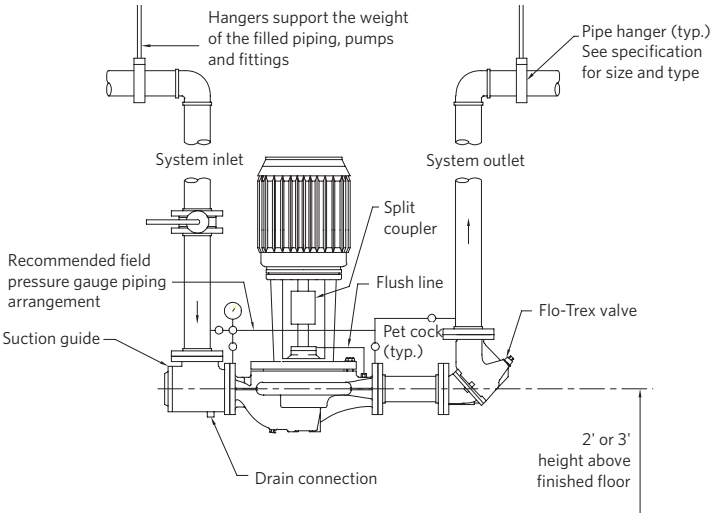

FIG. 2.3 Discharge elbow for minimum footprint.

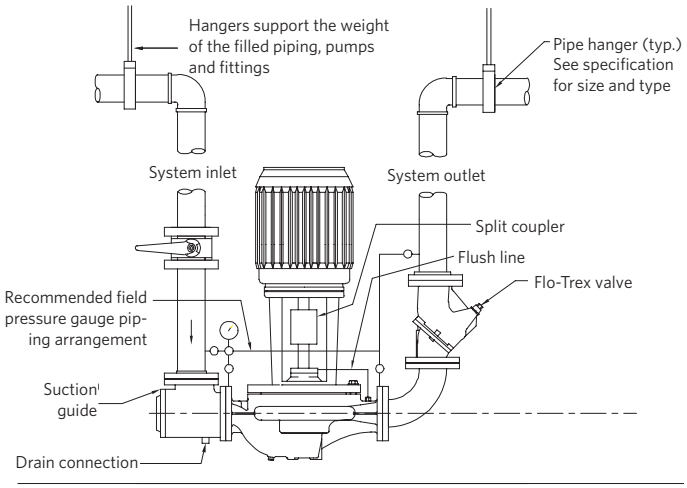

FIG. 2.4 With additional pipe supports.

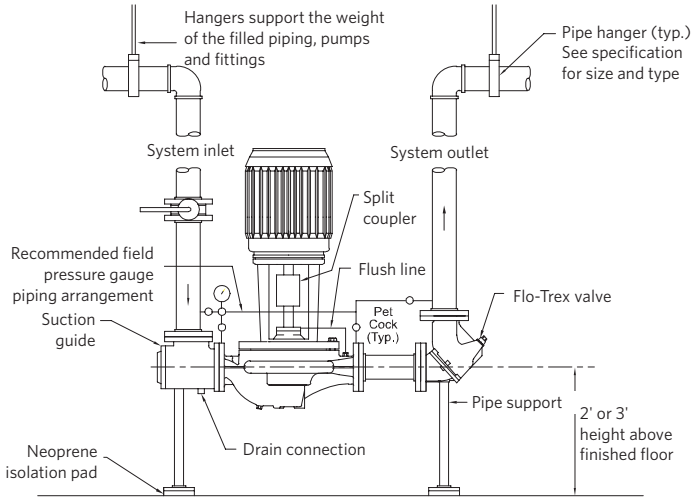

FIG. 2.5 Floor saddle support.

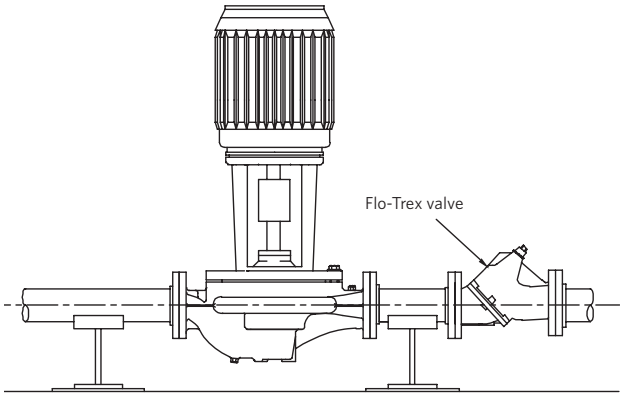

FIG. 2.6 Additional floor support.

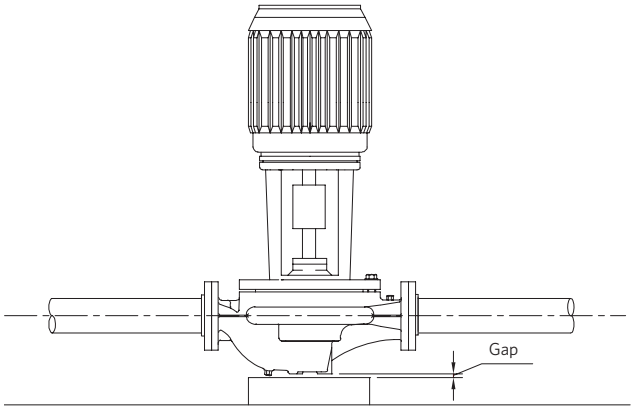

FIG. 2.7 With stanchion plates.

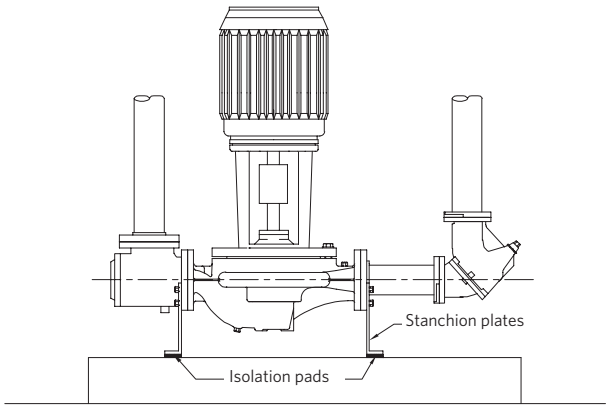

FIG. 2.8 Seismic region installation.

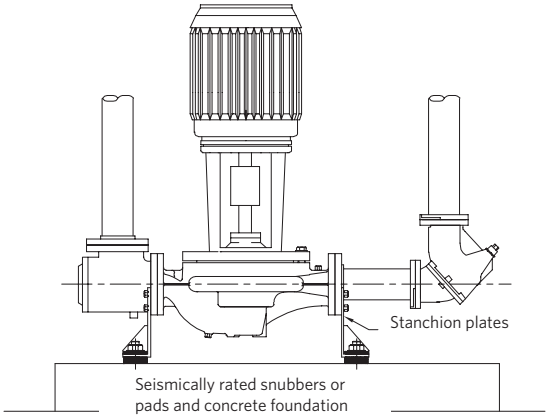

FIG. 2.9 Horizontal mounting – 4360/4380 only to 15 hp (11 kW).

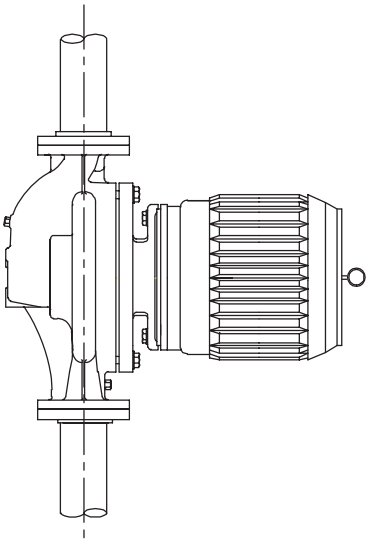

FIG. 2.10 Mounting in grooved pipe systems.

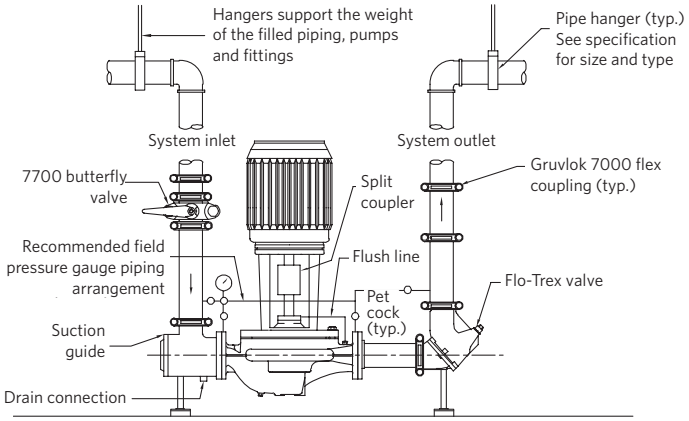

FIG. 2.11 Motor lifting hook supported.

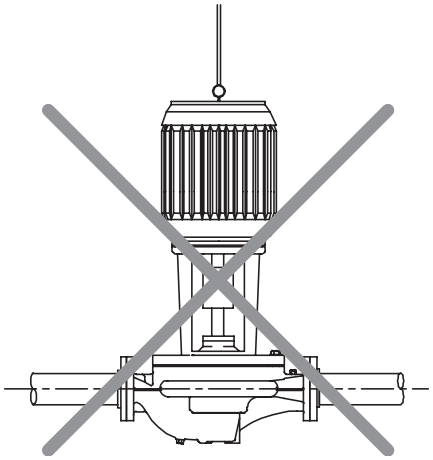

FIG. 2.12 Mounted on rigid base without flexible connectors.

5.0	Remplacement des joints d'étanchéité	6

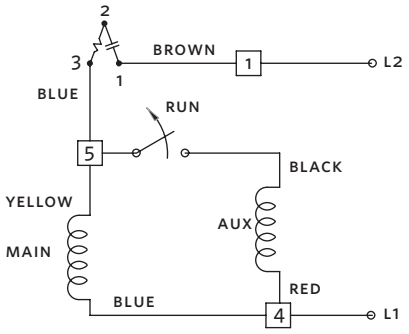
CAUTION

Always disconnect power supply from motor before servicing.

1.0 INSTALLATION

For convenience, Armstrong circulators generally are installed in vertical pipelines, but may be changed easily on the job for horizontal pipelines or for opposite flow directions. To make the change, remove the body capscrews, taking care body gasket is kept in position, and rotate body to desired direction at 90° or 180° from the original position.

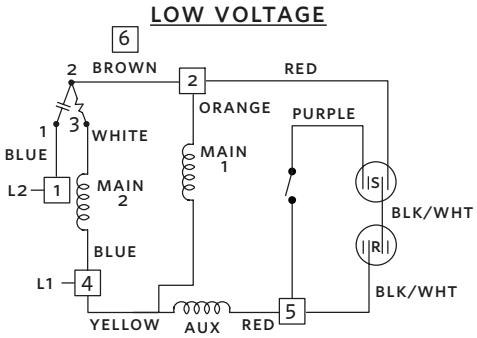
With the arrow on the body pointing in direction of the flow, insert body capscrews and tighten evenly. On models S25 to S57, H32 to H54 and series 1050 (1B to 2B), a gap between the bearing bracket and pump body (volute) is normal. Do no over tighten body capscrews! Turn pump shaft manually at coupler to make sure shaft turns freely and impeller does not rub in body. Always install with motor shaft in a horizontal position with pump oil cups or oil well cover on top.



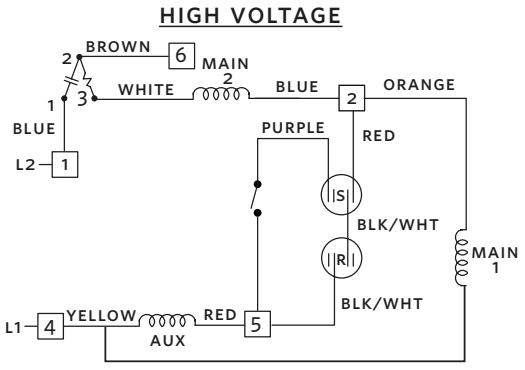
Models S25 to S46 and H32 to H41 are shipped for downward discharge. All other models are shipped for upward discharge as pumps of this size usually are installed in an upward direction on hydronic systems, so the point of zero pressure change - namely, the compression tank connection - can be made easily to the system on the suction side of the circulator.

The pump should be installed in a position to permit proper lubrication and servicing. Motor and bearing brackets are to be kept free of insulation. Pump and motor unit are designed to be supported by the in-line piping only. Do not support in any other manner. A height of approximately four feet above the floor is recommended. When placing the pump between flanges, tighten flange bolts evenly and do not tighten excessively.

Gate valves should be installed on the discharge and suction side of the pump to facilitate service. On larger pump sizes, a check valve should be located on the discharge side of pump between the pump body and the gate valve to prevent damage due to water hammer.



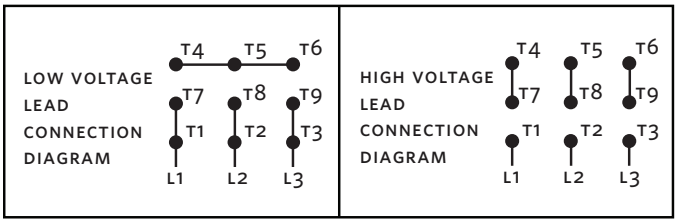
WIRING DIAGRAMS



SINGLE PHASE LESS THAN 0.5HP

C.C.W. rotation shown
For C.W. Rotation interchange yellow and blue leads on term 5 & 4

SINGLE PHASE LESS THAN 1HP (with with part number beginning with 811757-...)



SINGLE PHASE 1HP - 1.5HP (**only** for part number not beginning with 811757-...)

	LINE A	LINE B	JOIN
HIGH STD	1	4,5	2,3,8
HIGH OPP	1	4,8	2,3,5
LOW STD	1,3,8	2,4,5	—
LOW OPP	1,3,5	2,4,8	—

NOTE: Standard rotation is ccw facing end opposite shaft extension

THREE PHASE MOTOR ANY SIZE

Interchange any two lead wires to reverse rotation

2.0 SYSTEM CLEANLINESS

Before starting the pump, the system must be thoroughly cleaned, flushed and drained, then replenished with clean liquid. Welding slag and other foreign materials, 'stopleak' and cleaning compounds, excessive or improper water treatment - all are detrimental to the pump. Warranty will be void if any of these conditions are allowed to exist. (Refer to **File no. 6090.645** design and care of closed hydronic systems.)

3.0 STARTING UP

The pump must be fully primed on start-up. Fill system piping and pump body with liquid and vent complete system, turning pump by hand to dislodge air from body. Make sure fittings and drain valves are airtight, then add any additional fill required.

Check motor against available electric supply, then start pump making sure rotation is correct. When viewed from motor end, rotation is counter-clockwise on models S25 to S46 and H32 to H41. On all other models, rotation is clockwise. If pressure does not develop, stop pump, re-check, vent and fill. Never attempt to fill the system when the pump is running

4.0 LUBRICATION

CAUTION:
Do not put oil in the **maintenance free** circulators. These models contain MF in their item numbers and are labelled: 'THIS BEARING ASSEMBLY CONTAINS PERMANENTLY LUBRICATED BEARINGS AND DOES NOT NEED ANY OILING OR GREASING'.

Stop motor before lubricating, do not over-oil or spill oil on resilient motor rings. Do not force oil into cups, and stop if cup fills before addition of specified amount.

Pump lubrication: Only applicable for pumps those are with sleeve bearing SBA and have oil cup for lubrication.

Immediately after pump is installed and before running, slowly add the oil (SAE 30 non-detergent regular, supplied with pump) to pump oil cup, located on top of bearing bracket:

S25 to S57, H32 to H54 and series 1050 (1B to 2B)	¼ oz.
S69, H63 to H68, series 1060 (1½D to 3D)	2 oz.

At the start of each following heating season, lubricate with SAE 30 oil for models S25 to S57, H32 to H54 and series 1050 (1B to 2B), add approximately ¼ oz. Lubricate every six months for high temperature or constant operation. On models S69, H63 to H68 and series 1060 (1½D to 3D), be sure oil is visible at the top and center of window on side of bracket and maintain this level at all times.

Motor lubrication

CAUTION

Stop motor before lubricating. Do not over-oil or spill oil on resilient motor rings.

This motor has been lubricated properly at the factory. At the start of each following heating season, however, on motors with oil cups, add 15 drops SAE 30 non-detergent oil to each motor cup.

If the motor is fitted with grease fittings, follow the motor manufacturer's recommended procedure. Motors without oil cups or grease fittings are custom-greased for several years operation and require little or no attention.

5.0 SEAL REPLACEMENT

Remove the pump bracket from the body. Remove the impeller, damaged seal assembly, ceramic insert and rubber cup. Clean the recess in bearing bracket coverplate and install a new retainer cup and ceramic insert. Check the condition of the shaft sleeve. If scored, replace the shaft assembly. Otherwise, clean shaft extension and polish sleeve with a fine crocus cloth, using a rotating motion, if required.

Press against the coupler end of the shaft to take up play while pressing new seal firmly against the stationary face. A slight amount of clean vaseline may be put on shaft sleeve to assist installation. Press down firmly and evenly, using two screwdrivers and pushing against the four ears of driving band (the metal ring around rubber bellows), or around top outer edge of driving band on models S25 to S57, H32 to H54 and series 1050 (1B to 2B).

Do not use spring washer on models S25, S35 and H32 current style circulators, where recess to locate spring is provided on impeller hub.

Continue pressing against coupler end of shaft, re-mount impeller and re-assemble the seal bearing assembly into body. If necessary, install a new body gasket and clean gasket surface of both volute and bracket.

CAUTION

Before operating pump, carefully check:

1. Is the pump primed?
2. Is rotation correct?
3. Is pump properly lubricated?
4. Does the power supply agree with data on motor name plate?
5. Is overload protection provided?
6. Is the system clean?

For domestic water systems use bronze body pumps.

ATTENTION

Toujours couper l'alimentation électrique avant de procéder à l'entretien d'un moteur.

1.0 INSTALLATION

Pour des raisons pratiques, les circulateurs Armstrong sont généralement installés sur des conduites verticales, mais peuvent être facilement modifiés sur place pour des conduites horizontales ou pour changer la direction du liquide en circulation. Pour procéder au changement, retirer les boulons de fixation et, en prenant soin de maintenir en place le joint d'étanchéité, tourner le corps suivant l'angle désiré, 90° ou 180°, par rapport à la position originale.

La flèche sur le corps pointant dans la direction de la circulation du liquide, insérer les boulons de fixation et les visser uniformément. Sur les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), il est normal qu'il y ait un espace entre la chaise de palier et le corps de la pompe (volute). Ne pas trop serrer les boulons ! À la jonction, faire tourner l'arbre de la pompe à la main pour vous assurer qu'il tourne librement et que l'impulseur ne frotte pas l'intérieur du corps. Toujours installer de manière à ce que l'arbre du moteur soit en position horizontale, les godets à huile et le couvercle du réservoir d'huile étant placés sur le dessus.

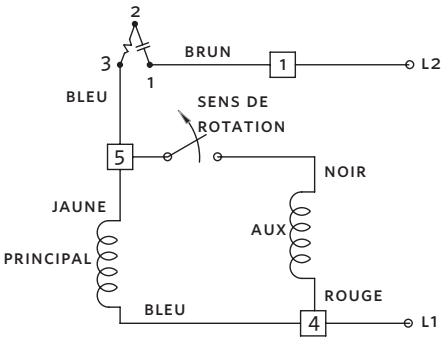
Les modèles S25 à S46 et H32 à H41 sont livrés en prévision d'une évacuation vers le bas. Tous les autres modèles sont livrés en prévision d'une évacuation vers le haut, puisque les pompes de cette taille sont habituellement installées sur les systèmes hydroniques pour pomper vers le haut, de sorte que le point de changement de pression nul, c'est-à-dire la connexion au vase d'expansion, puisse facilement se trouver du côté aspiration du circulateur.

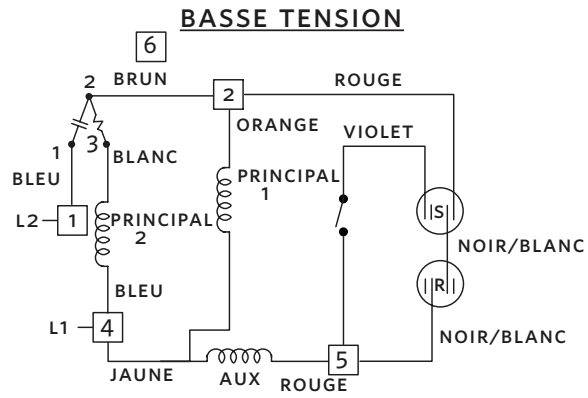
La pompe doit être installée à un endroit qui permet l'entretien et la lubrification. Le moteur et la chaise de palier doivent être exempts d'isolant. La pompe et le moteur sont conçus pour être soutenus uniquement par la tuyauterie en ligne. Ne pas les supporter d'aucune autre façon. Il est recommandé de les placer à environ 4 pi au-dessus du sol. Au moment de fixer la pompe par ses brides, serrer les boulons uniformément et sans excès.

Des robinets-vannes devraient être installés du côté évacuation et du côté aspiration de la pompe pour faciliter l'entretien. Sur les pompes plus grosses, un clapet antiretour devrait être placé du côté évacuation de la pompe, entre cette dernière et le robinet-vanne, pour prévenir les dommages causés par les coups de bélier.

SHÉMAS DE CÂBLAGE

MONOPHASÉ MOINS DE 0.5HP





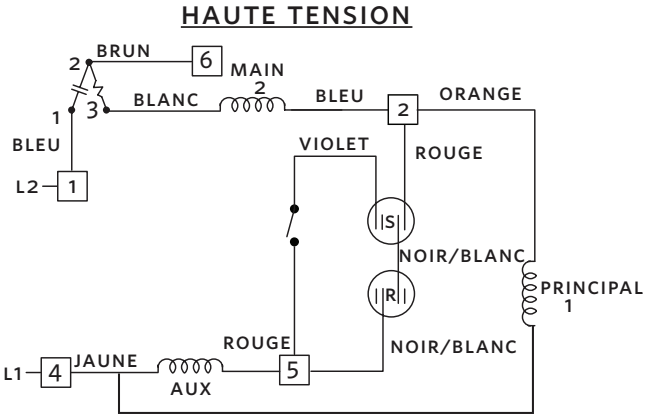


Schéma ci dessus à suivre dans le sens contraire des aiguilles d'une montre.

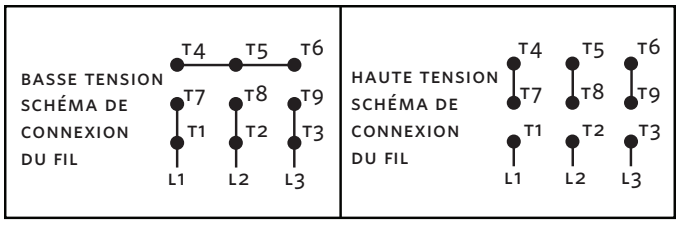
Pour une rotation dans le sens des aiguilles d'une montre, inverser les fils jaune et bleu des bornes 5 & 4.

MONOPHASÉ MOINS DE 1HP (avec un numéro de référence commençant par 811757-...)



MONOPHASÉ 1HP-1.5HP (seulement pour un numéro de référence ne commençant pas par 811757-...)

	LIGNE A	LIGNE B	JONCTION
HAUTE TENSION ROTATION STD	1	4,5	2,3,8
HAUTE TENSION ROTATION OPP	1	4,8	2,3,5
BASSE TENSION ROTATION STD	1,3,8	2,4,5	—
BASSE TENSION ROTATION OPP	1,3,5	2,4,8	—

NOTE: Le sens de rotation standard est dans le sens contraire des aiguilles d'une montre en faisant face à l'extrémité opposée de l'extension de l'arbre

MOTEUR TRIPHASÉ DE TOUTE TAILLE

Permuter deux des fils de sorties pour inverser le sens de rotation

2.0 PROPRETÉ DU SYSTÈME

Avant de démarrer la pompe, le système doit être entièrement nettoyé, vidangé et rincé, puis rempli de nouveau d'un liquide propre. Les scories de soudage et autres matières étrangères, les composés de colmatage de fuites et de nettoyage, les produits de traitement excessifs ou inappropriés de l'eau, peuvent tous endommager les composantes internes de la pompe. La garantie sera nulle si l'une ou l'autre de ces conditions est permise.(Consulter le **dossier n° 6090.645** conception et entretien des systèmes hydroniques fermés.)

3.0 DÉMARRAGE

La pompe doit être parfaitement amorcée avant le démarrage. Remplir la tuyauterie du système et le corps de la pompe de liquide, ventiler complètement le système, faire tourner la pompe à la main pour déloger les bulles d'air qui y seraient emprisonnées. Vous assurer que les raccords et les robinets de vidange sont étanches et ajouter le liquide qu'il faut pour remplir.

Comparer les exigences électriques aux conditions d'alimentation, puis faire démarrer la pompe et vous assurer qu'elle tourne correctement. Vue de l'extrémité moteur de la pompe, la rotation se fait dans le sens contraire des aiguilles d'une montre sur les modèles S25 à S46 et H32 à H41. Sur tous les autres modèles, la rotation se fait dans le sens des aiguilles d'une montre. Si la pression ne grimpe pas, arrêter la pompe, vérifier de nouveau, ventiler et remplir. Ne jamais essayer de remplir le système lorsque la pompe est en marche.

4.0 LUBRIFICATION

ATTENTION:
NE PAS verser d'huile dans les Circulateurs ne nécessitant aucun entretien. Les modèles mentionnant **MF** dans leur référencesont étiquetés : '**CE SYSTÈME À ROULEMENT EST ÉQUIPÉ DE ROULEMENTS À GRAISSAGE PERMANENT ET NE NÉCESSITE AUCUN AJOUT D'HUILE NI DE GRAISSAGE'.**

Arrêter le moteur avant de lubrifier. Ne pas mettre trop d'huile ni en renverser sur les bagues souples du moteur. Ne pas faire entrer l'huile de force dans les godets et arrêter le remplissage si un godet se remplit avant d'avoir ajouté la quantité spécifiée.

Lubrification de la pompe : Applicable seulement pour les pompes à paliers à douille et ayant un godet pour la lubrification

Immédiatement après l'installation de la pompe et avant de la démarrer, ajouter lentement de l'huile (SAE 30 non détergente régulière, fournie avec la pompe) dans le godet situé sur le dessus de la chaise de palier :

S25 à S57, H32 à H54 et série 1050 (1B à 2B)	¼ oz.
S69, H63 à H68, série 1060 (1½D à 3D)	2 oz.

Par la suite, au début de chaque saison de chauffage, lubrifier la pompe en utilisant de l'huile SAE 30. Pour les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), ajouter environ ½oz. Lubrifier à tous les six mois si la pompe fonctionne tout le temps ou à haute température. Sur les modèles S69, H63 à H68, série 1060 (1½D à 3D), vous assurer que l'huile est visible en haut et au centre de la lunette sur le côté de la chaise de palier et maintenir ce niveau en tout temps.

Lubrification du moteur

ATTENTION

Arrêter le moteur avant de le lubrifier. Ne pas ajouter trop d'huile ni en renverser sur les bagues souples du moteur.

Ce moteur a été lubrifié correctement en usine. Au début de chaque saison de chauffage, toutefois, sur les moteurs munis de godets d'huile, ajouter 15 gouttes d'huile non détergente SAE 30 dans chaque godet.

Si le moteur est équipé d'embouts de graissage, respecter la procédure recommandée par le fabricant. Les moteurs à godets d'huile ou à embouts de graissage sont graissés individuellement en prévision de plusieurs années d'utilisation et exigent peu ou pas d'attention.

5.0 REMPLACEMENT DES JOINTS D'ÉTANCHÉITÉ

Retirer la portion pompe du corps. Retirer l'impulseur, le joint d'étanchéité endommagé, la pièce de céramique et le godet de caoutchouc. Nettoyer le compartiment du joint dans la chaise de palier et installer un nouveau godet et une nouvelle céramique. Vérifier l'état de la chemise de l'arbre. Si elle est marquée, remplacer l'ensemble de l'arbre. Autrement, nettoyer le prolongement de l'arbre et, au besoin, polir la chemise à l'aide d'une toile à polir fine suivant un mouvement rotatif.

Pousser sur l'extrémité accouplement de l'arbre pour réduire le jeu tout en pressant fermement le nouveau joint d'étanchéité sur la face fixe. On peut mettre une petite quantité de vaseline sur la chemise de l'arbre pour aider à l'installation. Pousser fermement et uniformément en utilisant deux tournevis contre les quatre oreillettes du collet (l'anneau de métal autour des soufflets de caoutchouc) ou sur le pourtour extérieur du collet dans le cas des modèles S25 à S57, H32 à H54 et de la série 1050 (1B à 2B).

Ne pas utiliser de rondelle à ressort sur les circulateurs de modèles courants S25, S35 et H32 lorsque la dépression prévue pour le ressort se trouve sur le moyeu de l'impulseur. Continuer d'appuyer sur l'extrémité accouplement de l'arbre. Remonter l'impulseur et l'ensemble porteur du joint d'étanchéité dans le corps. Au besoin, installer un nouveau joint pour le corps et nettoyer la surface du joint de la volute et de la chaise de palier.

ATTENTION

Avant de faire fonctionner la pompe, vous assurer que :

1. La pompe a été amorcée?
2. Le sens de la rotation est le bon?
3. La pompe est correctement lubrifiée?
4. L'alimentation correspond aux données sur la plaque d'identification?
5. La pompe est protégée contre les surcharges?
6. Le système est propre?

Pour les systèmes domestiques de distribution d'eau, utiliser des pompes à corps de bronze.

7.0 E.2 product family specifications 8

READ CAREFULLY BEFORE INSTALLING & OPERATING THE CIRCULATOR

INSTALLER: PLEASE LEAVE THIS MANUAL FOR THE OWNER'S USE

You are about to install an E.2 series circulator – a high-efficiency pump from Armstrong. E.2 series circulators are designed for heating and cooling in hydronic, geothermal or solar systems and circulating water, ethylene or propylene glycol/water solutions. For pumping domestic (potable) water, Armstrong recommends the use of circulators with bronze, or stainless steel body construction.

The E.2 series circulators are extremely efficient and quiet. They utilize a state of the art permanently lubricated bearing system designed for many years of trouble-free operation. They feature a permanent-split capacitor motor with thermal protection.

1.0 OPERATING LIMITS

Maximum operating pressure:
150 psi (1034 kPa)

Maximum operating temperature:
All standard models 230°F (110°C)

Minimum operating temperature:
All standard models 32°F (0°C)

Electrical rating:
For models with ⅙ hp motors (100W): 120 V, 1 phase, 60 Hz or 208/240 V, 1 phase, 60 Hz, or 220-240v, 50Hz

For models with ⅔ hp motors (300W): 120 V, 1 phase, 60 Hz or 208/240/277 V, 1 phase, 60 Hz, or 220-240v, 50Hz

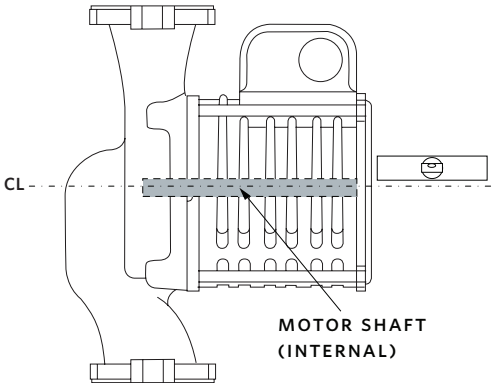
When unpacking the circulator, inspect for any damage that may have occurred during transit. Check for loose, missing or damaged parts.

THIS PUMP IS FOR INDOOR USE ONLY

Before installing the circulator, proper installation practice recommends a thorough flush of the hydronic system, ensuring removal of all foreign materials.

This pump should be installed in a well lit location with good access.

Installation personnel must be qualified for the task.



All personnel performing installation must wear appropriate personal protective equipment

WARNING

Mount with motor shaft horizontal and terminal box above centerline (CL) only!

The circulator is supplied for up-discharge.

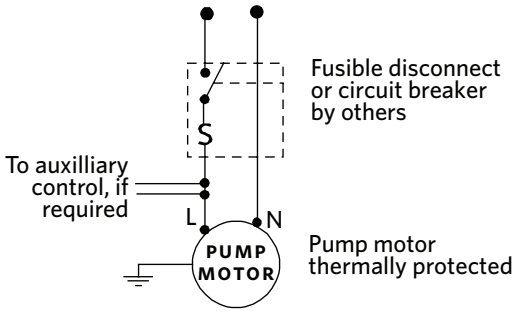
DIAGRAM 1: Installation Orientation

For alternate discharge orientation:

1. Loosen the four motor mounting bolts
2. Rotate the volute to match piping orientation
3. Observe flow direction arrow on volute
4. Ensure volute gasket is properly seated
5. Retighten mounting bolts evenly to 5 lb/ft (6.7 N/m)
6. Ensure the impeller spins freely

2.0 ELECTRICAL WIRING

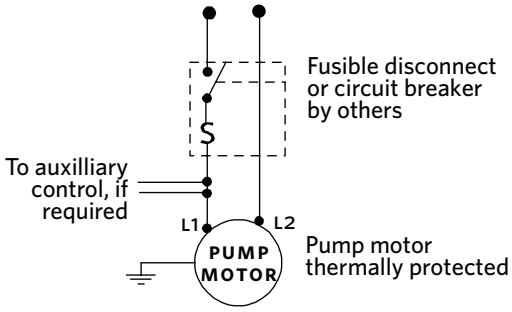
The electrical wiring must be installed in strict accordance with the Canadian Electrical Code (Canada) or the U.S. National Electrical Code (USA),or BS7671 (Europe) as well as local codes and regulations.



1. Electrical installation should be conducted by a qualified electrician. Installers should be equipped with proper personal protective equipment.
2. The motors of E.2 series circulators are designed for 1 phase, 60 Hz, 120 V 60 Hz, 240 V 60 Hz, 220-240 50 Hz service only. (Please refer to the rating label on the circulator's terminal box to determine the correct voltage.)
3. Always make sure the electric power is disconnected and locked out before wiring the circulator.
4. To wire, loosen the screw from the terminal box cover and remove the screw and cover.
5. Install the appropriate size conduit end to one of the holes on either side of the terminal box.

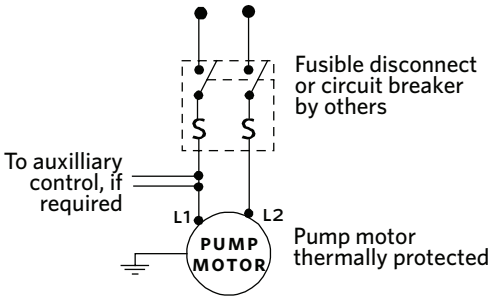
6 For 120 V models: Referring to **DIAGRAM 2** below, connect the black, hot, (L) and white, neutral, (N) leads of the supply wire to the black and white motor leads respectively inside the terminal box. Connect the ground wire to any one of the four green ground screws inside of the terminal box (use a minimum 18 AWG wire size).

For 208/240/277 V models: Referring to **DIAGRAM 3** below, connect the black (L1) and blue (L2) leads of the supply wire to the black and white motor leads respectively inside the terminal box. Connect the ground wire to any one of the four green ground screws inside of the terminal box (use a minimum 18 AWG wire size).



NOTE: For any voltage the brown and yellow wires are hard wired in and should **not** be touched they are for the capacitor only and can stop the motor from running.

DIAGRAM 2 120 V installations



Typical wiring diagram for single phase, 120 V, 60 Hz power source

DIAGRAM 3 208/240/277 V installations

Typical wiring diagram for
A single phase, 240 V, 60 Hz power source
B three phase, 208/277 V, 60 Hz power source

DIAGRAM 4 230 V installations

Typical wiring diagram for single phase, 230 V, 50 Hz power source

7 Replace the terminal box cover.

The motor is thermally protected for your safety so thermal overload protection is not necessary. All that is required is a fused plug or circuit breaker in the power line for short circuit protection.

Electrical information can be found on the nameplate of the motor.

3.0 START UP

1 Before starting up the circulator, proper installation practice recommends a thorough flush and draining of the hydronic system, ensuring removal of all foreign materials. Fill the system with clean water or glycol solution before starting.

2 Air must be completely vented from the system before starting up the circulator. **If the system is not completely vented of air and the circulator is allowed to run dry, the mechanical seal will be damaged.**

3 When the system has been completely filled and vented, only then can the pump be started.

4.0 PREVENTIVE MAINTENANCE – INSPECTION

E.2 series circulators are fitted with permanently lubricated ball bearings and **do not** require lubrication.

Although Armstrong long-life circulators are designed to provide years of worry-free service, it is good maintenance practice to inspect the entire hydronic system periodically – including the E.2 series circulator – for potential problems. If there is any evidence of leakage or damage, repair or replace the pump.

Disconnect and lockout the power before servicing.

5.0 PUMP REPLACEMENT IN AN EXISTING INSTALLATION

5.1 COMPLETE PUMP

1 Ensure that electric power is disconnected and locked out. Loosen the screw from the terminal box cover and remove the cover. Disconnect the supply wires from the circulator only, leaving the capacitor wires connected.

All servicing personnel should be equipped with proper personal protective equipment.

2 If valves have been installed, on the suction and discharge sides of the pump, close them before attempting to remove the circulator from the volute. If no valves have been installed it may be necessary to drain the system.

Allow water to cool to 100°F (40°C) before draining the system. It is best to leave the drain valve open while working on the system.

3 To relieve any residual pressure which may be present in the pump body, loosen the flange bolts and gently move the pump body back and forth to allow the pressurized water to escape.

NOTE: Place a pan under the pump to collect the drain water.

4 If the entire volute is needed to be removed, then remove the flange bolts and nuts. The entire circulator can then be removed from the piping system.

5 Install the E.2 series circulator where there will be sufficient room for inspection and service. It is recommended that isolation valves be installed on both the suction and discharge sides of the circulator for future servicing. This eliminates the need for draining the system when working on the circulator (for example, when replacing the mechanical seal).

6 Install suction and discharge flanges on the pipe ends. The use of Teflon tape sealer or a high quality thread sealant is recommended.

7 Pipe strain can be minimized by the use of pipe hangers near the pump, positioned to support the suction and discharge piping.

To wire the E.2 series circulator, follow steps C through G in the Electrical Wiring section above, noting that electrical supply and grounding wires must be rated for at least 194°F (90°C).

5.2 MOTOR END ONLY

1 Turn off the pump leaving it installed in the line .

2 Ensure electrical power is disconnected and locked out .

3 Close the water supply at the points closest to the pump's inlet and outlet .

4 For safety, allow water to cool to 100°F (40°C) before draining the system. It is best to leave the drain valve open while working on the system.

5 Bleed the water pressure from the pump.

6 Place a pan under the pump to collect the drain water.

7 While holding the motor body, loosen the four bolts that attach the motor to the pump casing (volute). Start with the two bottom bolts first and remove them, then slowly loosen the top two bolts. Allow the water to drain from the bottom of the pump. When the water has finished draining, remove the two top bolts. Remove the motor straight out from the volute being careful of its attached impeller. The motor is heavy, do not drop it.

8 Install new casing gasket .

9 Install new motor end (with impeller and seal kit).

10 Tighten four motor end bolts in a crisscross pattern and tighten evenly to 60 in/lbs.

11 Open isolation flanges or fill the system with water before starting circulator.

12 To wire the E.2 series circulator, follow steps C through G in the Electrical Wiring section above, noting that electrical supply and grounding wires must be rated for at least 194°F (90°C).

6.0 MECHANICAL SEAL REPLACEMENT

1 Follow steps 1 through 4 in section **Existing pump removal from system piping.**

2 While holding the motor body, remove the bottom two bolts that attach the motor to the pump casing (volute), then slowly loosen the top two bolts. Allow the water to drain from the bottom of the pump. When the water has finished draining, remove the two top bolts. Remove the motor straight out from the volute being careful of the attached impeller.

Handle with care
The motor is heavy, and possibly hot,
DO NOT drop it!

3 While holding the rotor very tightly by hand or a gloved hand only, unscrew the impeller nut off the motor shaft by turning it clockwise (i.e. opposite to most bolts and nuts). Place the motor on its back, with the shaft up.

4 Remove the rotary part of the mechanical seal by gently pulling it off the shaft. If it is too tight use two small flat bladed screwdrivers to gently pry it off the shaft by placing the flat side of the blades onto opposite sides of the mechanical seal.

5 Remove the face plate from the motor by gently prying it off of the motor housing extension, and carefully pulling it straight up, avoiding any shaft contact.

6 Remove the stationary part of the seal by gently prying it off the steel faceplate.

7 Remove any corrosion present on the stainless steel motor shaft and face plate (especially the seal seat area) with a non-metallic brush or scrub pad. Do not use a wire brush or steel wool.

8 Remove any dust created during step #7 above and put a few drops of non-petroleum lubricant around the face plate where the stationary seat is to be installed.

9 Install the new stationary seal seat into the faceplate by firmly pressing it down until it bottoms. The disk should be clean. If needed, wipe it with alcohol and a soft lint free cloth.

10 Replace the faceplate on the motor housing extension, being careful to avoid shaft contact. This may need to be gently tapped down until tight to the housing. Be sure to check that the stainless steel plate is flush to the extender plate face.

11 Install the special **installation tool** (item #180212-095) on the top of the shaft making sure it is tight to the flat base of the impeller to protect the seal from sharp edges during seal installation.

12 Apply a liberal amount of non-petroleum based lubricant on the outside of the special plastic **installation tool.**

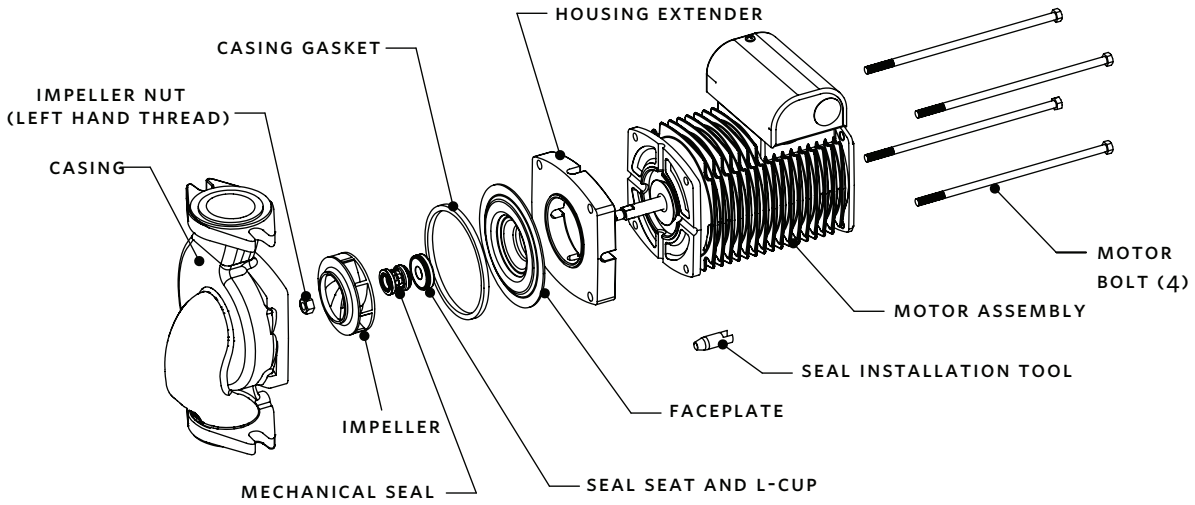
13 Wipe any excess lubricant off of the stationary silicon carbide seal face with a lint free cloth and alcohol to ensure the surface is clean.

14 Install the new rotating seal element and spring assembly by gently pushing it (graphite ring first) over the **installation tool** and onto the shaft until the graphite ring presses tightly against the stationary seal seat. The seal spring may be compressed slightly.

15 Remove the **installation tool** from the shaft.

16 Install the impeller keeping the inlet end up. Make sure to align the flats to the shaft flats and push the impeller down tightly to the seal.

17 Place 2-3 drops of medium strength thread locker liquid on the nut threads.



18 Install the special left hand thread nut on the motor shaft. While holding the motor rotor in place as in step 3, thread the impeller nut on to the shaft in a counter-clockwise direction and tighten the nut to approximately 6ft-lbs (8.1Nm).

19 If the impeller will not spin freely contact Armstrong Technical Support at 1-416-755-2291 or email techsupport@armlink.com.

20 Ensure the gasket is properly seated in the pump casing (volute) gasket groove. Holding the motor body, insert the impeller straight into the volute. Verify the gasket was not dislodged during insertion, and is still seated properly. Hold the motor body steady while fastening the four bolts that attach the motor to the pump casing (volute). Tighten evenly and diagonally. There should be a small, even gap of about 0.02" (0.5 mm) between the motor flange and the pump casing (volute).

21 Follow the **START UP** instructions (File no. 10.84) and check for leaks.

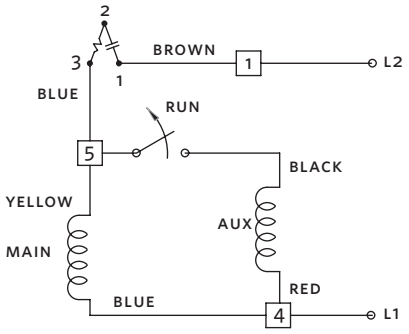
CAUTION

Always disconnect power supply from motor before servicing.

1.0 INSTALLATION

For convenience, Armstrong circulators generally are installed in vertical pipelines, but may be changed easily on the job for horizontal pipelines or for opposite flow directions. To make the change, remove the body capscrews, taking care body gasket is kept in position, and rotate body to desired direction at 90° or 180° from the original position.

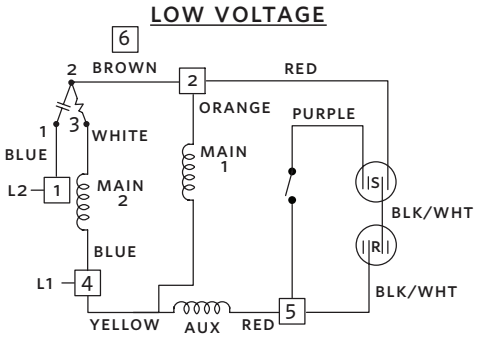
With the arrow on the body pointing in direction of the flow, insert body capscrews and tighten evenly. On models S25 to S57, H32 to H54 and series 1050 (1B to 2B), a gap between the bearing bracket and pump body (volute) is normal. Do no over tighten body capscrews! Turn pump shaft manually at coupler to make sure shaft turns freely and impeller does not rub in body. Always install with motor shaft in a horizontal position with pump oil cups or oil well cover on top.



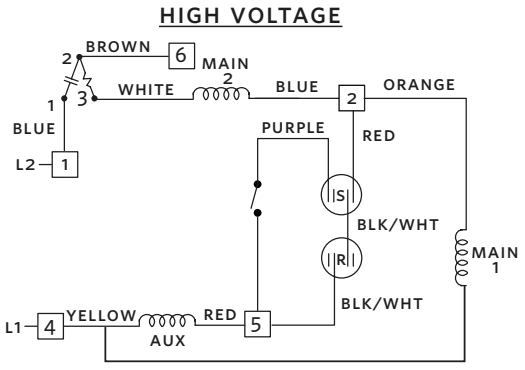
Models S25 to S46 and H32 to H41 are shipped for downward discharge. All other models are shipped for upward discharge as pumps of this size usually are installed in an upward direction on hydronic systems, so the point of zero pressure change - namely, the compression tank connection - can be made easily to the system on the suction side of the circulator.

The pump should be installed in a position to permit proper lubrication and servicing. Motor and bearing brackets are to be kept free of insulation. Pump and motor unit are designed to be supported by the in-line piping only. Do not support in any other manner. A height of approximately four feet above the floor is recommended. When placing the pump between flanges, tighten flange bolts evenly and do not tighten excessively.

Gate valves should be installed on the discharge and suction side of the pump to facilitate service. On larger pump sizes, a check valve should be located on the discharge side of pump between the pump body and the gate valve to prevent damage due to water hammer.



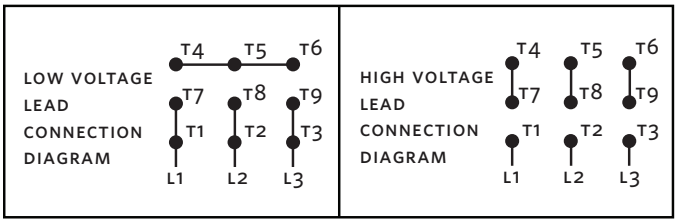
WIRING DIAGRAMS



SINGLE PHASE LESS THAN 0.5HP

C.C.W. rotation shown
For C.W. Rotation interchange yellow and blue leads on term 5 & 4

SINGLE PHASE LESS THAN 1HP (with with part number beginning with 811757-...)



SINGLE PHASE 1HP - 1.5HP (**only** for part number not beginning with 811757-...)

	LINE A	LINE B	JOIN
HIGH STD	1	4,5	2,3,8
HIGH OPP	1	4,8	2,3,5
LOW STD	1,3,8	2,4,5	—
LOW OPP	1,3,5	2,4,8	—

NOTE: Standard rotation is ccw facing end opposite shaft extension

THREE PHASE MOTOR ANY SIZE

Interchange any two lead wires to reverse rotation

2.0 SYSTEM CLEANLINESS

Before starting the pump, the system must be thoroughly cleaned, flushed and drained, then replenished with clean liquid. Welding slag and other foreign materials, 'stopleak' and cleaning compounds, excessive or improper water treatment - all are detrimental to the pump. Warranty will be void if any of these conditions are allowed to exist. (Refer to **File no. 6090.645** design and care of closed hydronic systems.)

3.0 STARTING UP

The pump must be fully primed on start-up. Fill system piping and pump body with liquid and vent complete system, turning pump by hand to dislodge air from body. Make sure fittings and drain valves are airtight, then add any additional fill required.

Check motor against available electric supply, then start pump making sure rotation is correct. When viewed from motor end, rotation is counter-clockwise on models S25 to S46 and H32 to H41. On all other models, rotation is clockwise. If pressure does not develop, stop pump, re-check, vent and fill. Never attempt to fill the system when the pump is running

4.0 LUBRICATION

CAUTION:
Do not put oil in the **maintenance free** circulators. These models contain MF in their item numbers and are labelled: 'THIS BEARING ASSEMBLY CONTAINS PERMANENTLY LUBRICATED BEARINGS AND DOES NOT NEED ANY OILING OR GREASING'.

Stop motor before lubricating, do not over-oil or spill oil on resilient motor rings. Do not force oil into cups, and stop if cup fills before addition of specified amount.

Pump lubrication: Only applicable for pumps those are with sleeve bearing SBA and have oil cup for lubrication.

Immediately after pump is installed and before running, slowly add the oil (SAE 30 non-detergent regular, supplied with pump) to pump oil cup, located on top of bearing bracket:

S25 to S57, H32 to H54 and series 1050 (1B to 2B)	¼ oz.
S69, H63 to H68, series 1060 (1½D to 3D)	2 oz.

At the start of each following heating season, lubricate with SAE 30 oil for models S25 to S57, H32 to H54 and series 1050 (1B to 2B), add approximately ¼ oz. Lubricate every six months for high temperature or constant operation. On models S69, H63 to H68 and series 1060 (1½D to 3D), be sure oil is visible at the top and center of window on side of bracket and maintain this level at all times.

Motor lubrication

CAUTION

Stop motor before lubricating. Do not over-oil or spill oil on resilient motor rings.

This motor has been lubricated properly at the factory. At the start of each following heating season, however, on motors with oil cups, add 15 drops SAE 30 non-detergent oil to each motor cup.

If the motor is fitted with grease fittings, follow the motor manufacturer's recommended procedure. Motors without oil cups or grease fittings are custom-greased for several years operation and require little or no attention.

5.0 SEAL REPLACEMENT

Remove the pump bracket from the body. Remove the impeller, damaged seal assembly, ceramic insert and rubber cup. Clean the recess in bearing bracket coverplate and install a new retainer cup and ceramic insert. Check the condition of the shaft sleeve. If scored, replace the shaft assembly. Otherwise, clean shaft extension and polish sleeve with a fine crocus cloth, using a rotating motion, if required.

Press against the coupler end of the shaft to take up play while pressing new seal firmly against the stationary face. A slight amount of clean vaseline may be put on shaft sleeve to assist installation. Press down firmly and evenly, using two screwdrivers and pushing against the four ears of driving band (the metal ring around rubber bellows), or around top outer edge of driving band on models S25 to S57, H32 to H54 and series 1050 (1B to 2B).

Do not use spring washer on models S25, S35 and H32 current style circulators, where recess to locate spring is provided on impeller hub.

Continue pressing against coupler end of shaft, re-mount impeller and re-assemble the seal bearing assembly into body. If necessary, install a new body gasket and clean gasket surface of both volute and bracket.

CAUTION

Before operating pump, carefully check:

1. Is the pump primed?
2. Is rotation correct?
3. Is pump properly lubricated?
4. Does the power supply agree with data on motor name plate?
5. Is overload protection provided?
6. Is the system clean?

For domestic water systems use bronze body pumps.

ATTENTION

Toujours couper l'alimentation électrique avant de procéder à l'entretien d'un moteur.

1.0 INSTALLATION

Pour des raisons pratiques, les circulateurs Armstrong sont généralement installés sur des conduites verticales, mais peuvent être facilement modifiés sur place pour des conduites horizontales ou pour changer la direction du liquide en circulation. Pour procéder au changement, retirer les boulons de fixation et, en prenant soin de maintenir en place le joint d'étanchéité, tourner le corps suivant l'angle désiré, 90° ou 180°, par rapport à la position originale.

La flèche sur le corps pointant dans la direction de la circulation du liquide, insérer les boulons de fixation et les visser uniformément. Sur les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), il est normal qu'il y ait un espace entre la chaise de palier et le corps de la pompe (volute). Ne pas trop serrer les boulons ! À la jonction, faire tourner l'arbre de la pompe à la main pour vous assurer qu'il tourne librement et que l'impulseur ne frotte pas l'intérieur du corps. Toujours installer de manière à ce que l'arbre du moteur soit en position horizontale, les godets à huile et le couvercle du réservoir d'huile étant placés sur le dessus.

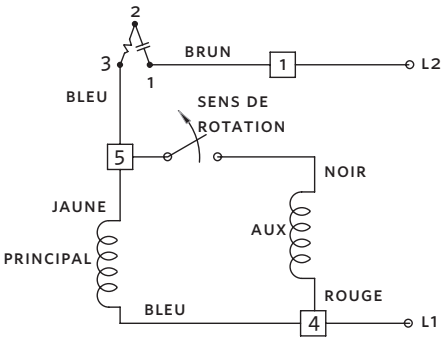
Les modèles S25 à S46 et H32 à H41 sont livrés en prévision d'une évacuation vers le bas. Tous les autres modèles sont livrés en prévision d'une évacuation vers le haut, puisque les pompes de cette taille sont habituellement installées sur les systèmes hydroniques pour pomper vers le haut, de sorte que le point de changement de pression nul, c'est-à-dire la connexion au vase d'expansion, puisse facilement se trouver du côté aspiration du circulateur.

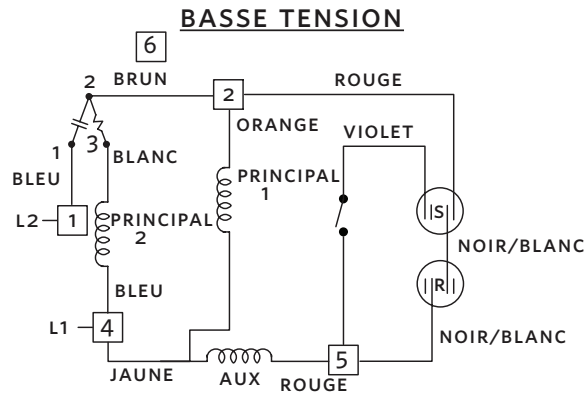
La pompe doit être installée à un endroit qui permet l'entretien et la lubrification. Le moteur et la chaise de palier doivent être exempts d'isolant. La pompe et le moteur sont conçus pour être soutenus uniquement par la tuyauterie en ligne. Ne pas les supporter d'aucune autre façon. Il est recommandé de les placer à environ 4 pi au-dessus du sol. Au moment de fixer la pompe par ses brides, serrer les boulons uniformément et sans excès.

Des robinets-vannes devraient être installés du côté évacuation et du côté aspiration de la pompe pour faciliter l'entretien. Sur les pompes plus grosses, un clapet antiretour devrait être placé du côté évacuation de la pompe, entre cette dernière et le robinet-vanne, pour prévenir les dommages causés par les coups de bélier.

SHÉMAS DE CÂBLAGE

MONOPHASÉ MOINS DE 0.5HP





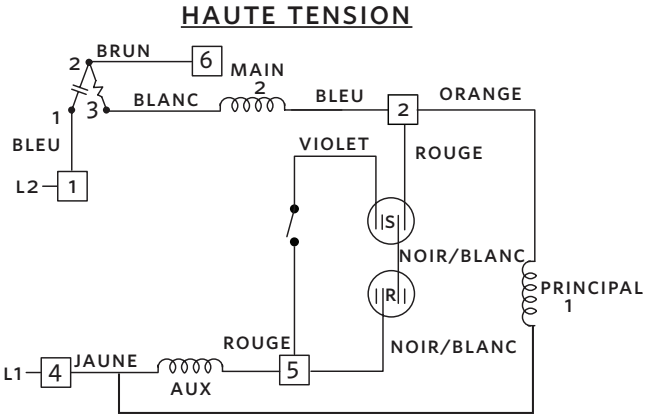


Schéma ci dessus à suivre dans le sens contraire des aiguilles d'une montre.

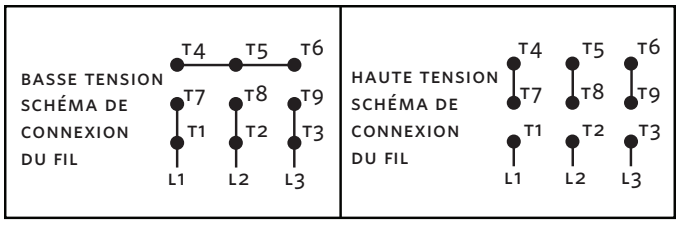
Pour une rotation dans le sens des aiguilles d'une montre, inverser les fils jaune et bleu des bornes 5 & 4.

MONOPHASÉ MOINS DE 1HP (avec un numéro de référence commençant par 811757-...)



MONOPHASÉ 1HP-1.5HP (seulement pour un numéro de référence ne commençant pas par 811757-...)

	LIGNE A	LIGNE B	JONCTION
HAUTE TENSION ROTATION STD	1	4,5	2,3,8
HAUTE TENSION ROTATION OPP	1	4,8	2,3,5
BASSE TENSION ROTATION STD	1,3,8	2,4,5	—
BASSE TENSION ROTATION OPP	1,3,5	2,4,8	—

NOTE: Le sens de rotation standard est dans le sens contraire des aiguilles d'une montre en faisant face à l'extrémité opposée de l'extension de l'arbre

MOTEUR TRIPHASÉ DE TOUTE TAILLE

Permuter deux des fils de sorties pour inverser le sens de rotation

2.0 PROPRETÉ DU SYSTÈME

Avant de démarrer la pompe, le système doit être entièrement nettoyé, vidangé et rincé, puis rempli de nouveau d'un liquide propre. Les scories de soudage et autres matières étrangères, les composés de colmatage de fuites et de nettoyage, les produits de traitement excessifs ou inappropriés de l'eau, peuvent tous endommager les composantes internes de la pompe. La garantie sera nulle si l'une ou l'autre de ces conditions est permise.(Consulter le **dossier n° 6090.645** conception et entretien des systèmes hydroniques fermés.)

3.0 DÉMARRAGE

La pompe doit être parfaitement amorcée avant le démarrage. Remplir la tuyauterie du système et le corps de la pompe de liquide, ventiler complètement le système, faire tourner la pompe à la main pour déloger les bulles d'air qui y seraient emprisonnées. Vous assurer que les raccords et les robinets de vidange sont étanches et ajouter le liquide qu'il faut pour remplir.

Comparer les exigences électriques aux conditions d'alimentation, puis faire démarrer la pompe et vous assurer qu'elle tourne correctement. Vue de l'extrémité moteur de la pompe, la rotation se fait dans le sens contraire des aiguilles d'une montre sur les modèles S25 à S46 et H32 à H41. Sur tous les autres modèles, la rotation se fait dans le sens des aiguilles d'une montre. Si la pression ne grimpe pas, arrêter la pompe, vérifier de nouveau, ventiler et remplir. Ne jamais essayer de remplir le système lorsque la pompe est en marche.

4.0 LUBRIFICATION

ATTENTION:
NE PAS verser d'huile dans les Circulateurs ne nécessitant aucun entretien. Les modèles mentionnant **MF** dans leur référencesont étiquetés : '**CE SYSTÈME À ROULEMENT EST ÉQUIPÉ DE ROULEMENTS À GRAISSAGE PERMANENT ET NE NÉCESSITE AUCUN AJOUT D'HUILE NI DE GRAISSAGE'.**

Arrêter le moteur avant de lubrifier. Ne pas mettre trop d'huile ni en renverser sur les bagues souples du moteur. Ne pas faire entrer l'huile de force dans les godets et arrêter le remplissage si un godet se remplit avant d'avoir ajouté la quantité spécifiée.

Lubrification de la pompe : Applicable seulement pour les pompes à paliers à douille et ayant un godet pour la lubrification

Immédiatement après l'installation de la pompe et avant de la démarrer, ajouter lentement de l'huile (SAE 30 non détergente régulière, fournie avec la pompe) dans le godet situé sur le dessus de la chaise de palier :

S25 à S57, H32 à H54 et série 1050 (1B à 2B)	¼ oz.
S69, H63 à H68, série 1060 (1½D à 3D)	2 oz.

Par la suite, au début de chaque saison de chauffage, lubrifier la pompe en utilisant de l'huile SAE 30. Pour les modèles S25 à S57, H32 à H54 et la série 1050 (1B à 2B), ajouter environ ½oz. Lubrifier à tous les six mois si la pompe fonctionne tout le temps ou à haute température. Sur les modèles S69, H63 à H68, série 1060 (1½D à 3D), vous assurer que l'huile est visible en haut et au centre de la lunette sur le côté de la chaise de palier et maintenir ce niveau en tout temps.

Lubrification du moteur

ATTENTION

Arrêter le moteur avant de le lubrifier. Ne pas ajouter trop d'huile ni en renverser sur les bagues souples du moteur.

Ce moteur a été lubrifié correctement en usine. Au début de chaque saison de chauffage, toutefois, sur les moteurs munis de godets d'huile, ajouter 15 gouttes d'huile non détergente SAE 30 dans chaque godet.

Si le moteur est équipé d'embouts de graissage, respecter la procédure recommandée par le fabricant. Les moteurs à godets d'huile ou à embouts de graissage sont graissés individuellement en prévision de plusieurs années d'utilisation et exigent peu ou pas d'attention.

5.0 REMPLACEMENT DES JOINTS D'ÉTANCHÉITÉ

Retirer la portion pompe du corps. Retirer l'impulseur, le joint d'étanchéité endommagé, la pièce de céramique et le godet de caoutchouc. Nettoyer le compartiment du joint dans la chaise de palier et installer un nouveau godet et une nouvelle céramique. Vérifier l'état de la chemise de l'arbre. Si elle est marquée, remplacer l'ensemble de l'arbre. Autrement, nettoyer le prolongement de l'arbre et, au besoin, polir la chemise à l'aide d'une toile à polir fine suivant un mouvement rotatif.

Pousser sur l'extrémité accouplement de l'arbre pour réduire le jeu tout en pressant fermement le nouveau joint d'étanchéité sur la face fixe. On peut mettre une petite quantité de vaseline sur la chemise de l'arbre pour aider à l'installation. Pousser fermement et uniformément en utilisant deux tournevis contre les quatre oreillettes du collet (l'anneau de métal autour des soufflets de caoutchouc) ou sur le pourtour extérieur du collet dans le cas des modèles S25 à S57, H32 à H54 et de la série 1050 (1B à 2B).

Ne pas utiliser de rondelle à ressort sur les circulateurs de modèles courants S25, S35 et H32 lorsque la dépression prévue pour le ressort se trouve sur le moyeu de l'impulseur. Continuer d'appuyer sur l'extrémité accouplement de l'arbre. Remonter l'impulseur et l'ensemble porteur du joint d'étanchéité dans le corps. Au besoin, installer un nouveau joint pour le corps et nettoyer la surface du joint de la volute et de la chaise de palier.

ATTENTION

Avant de faire fonctionner la pompe, vous assurer que :

1. La pompe a été amorcée?
2. Le sens de la rotation est le bon?
3. La pompe est correctement lubrifiée?
4. L'alimentation correspond aux données sur la plaque d'identification?
5. La pompe est protégée contre les surcharges?
6. Le système est propre?

Pour les systèmes domestiques de distribution d'eau, utiliser des pompes à corps de bronze.

INSTALLATION AND OPERATING INSTRUCTIONS

Series DAS
Dirt & Air Separator

VESSEL DESCRIPTION
Armstrong Series DAS Dirt & Air Separators are designed to eliminate entrained air and separate debris associated with start-up and maintenance of any hydronic system. The design incorporates a removable end cover (optional) for coalescing medium access and an air vent (optional) to automatically release air from the separator. The design and construction conforms to ASME Section VIII, Div. 1 (excluding DAS-Q and DASH-Q models).

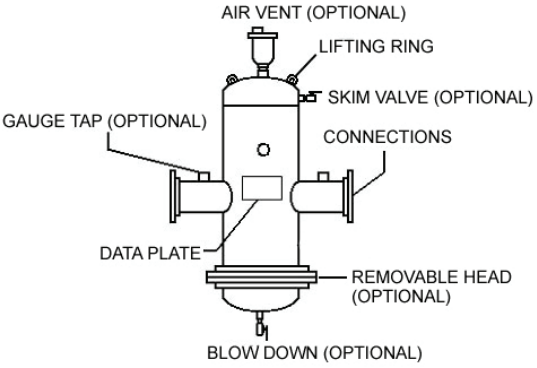

Fig. 1

FACTORY TESTING AND SHIPPING
The Series DAS has been factory tested and inspected prior to shipment. Upon receipt of the unit, carefully inspect the unit for damage that may have occurred during shipment. If the DAS has been damaged, it should be noted on the freight bill and reported to the carrier.

INSTALLATION
Ideally the installation of the DAS is at the point in the system where full water flow is at the lowest pressure and highest temperature. For optimum air elimination, it is at this point where free system air (bubbles) is at its highest concentration. Complete elimination of the free air at this location insures that dissolved air (air in solution) is at its lowest concentration. As the fluid leaves the DAS, and travels throughout the piping system, it will absorb a portion of any free-air that it contacts. This air-saturated water will then circulate back to the DAS where the low pressure/high temperature condition will drive this air back out of solution. This continuous air absorption and subsequent release and elimination by the DAS will ensure an air-free system.

It is recommended that the DAS be installed in the system piping prior to the primary system circulator/pump. For high-rise systems where static pressures are high, placement of the DAS should be as high in the system as practical.

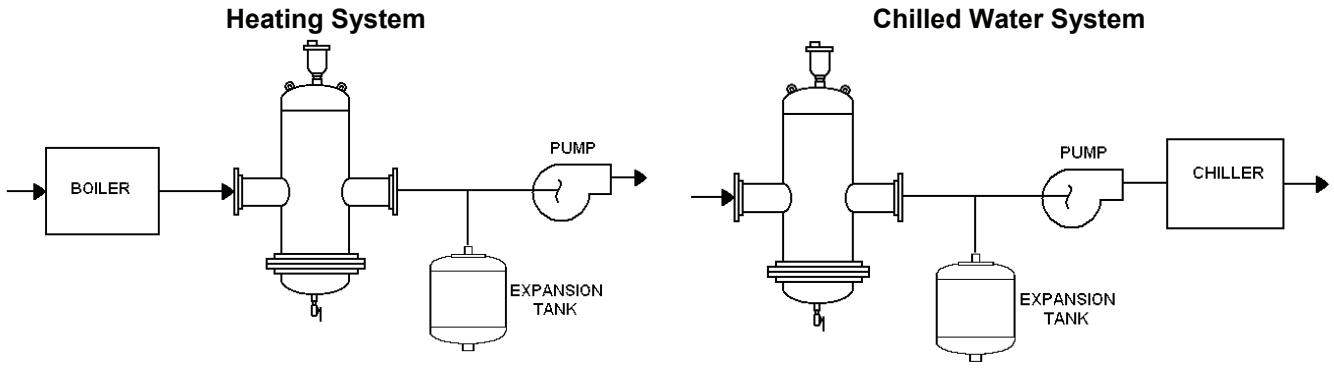

Fig. 2 Recommended Installations

Note: 100% of system flow should pass through the DAS to ensure all particles can be filtered.

OPERATION

All systems contain air in a dissolved state or as free air bubbles. Dirt particles, from multiple sources (piping fabrication, boiler or pump castings, welding beads, rust, etc.) also flow with the system water. As system fluid enters the DAS, air bubbles will rise to the top of the vessel to the vent location. Small, or sometimes referred to as micro-bubbles, will become trapped by the coalescing stainless steel media. With time, these bubbles will combine to form larger bubbles that will, over time as buoyancy overcomes surface tension, float to the top of the vessel to the vent location. Dirt particles are strained out by the enhanced surface stainless screen and collect at the vessel bottom. The debris is then periodically flushed out of the vessel through a blow-down valve. In removable base designs, the coalescing media can be removed and cleaned periodically.

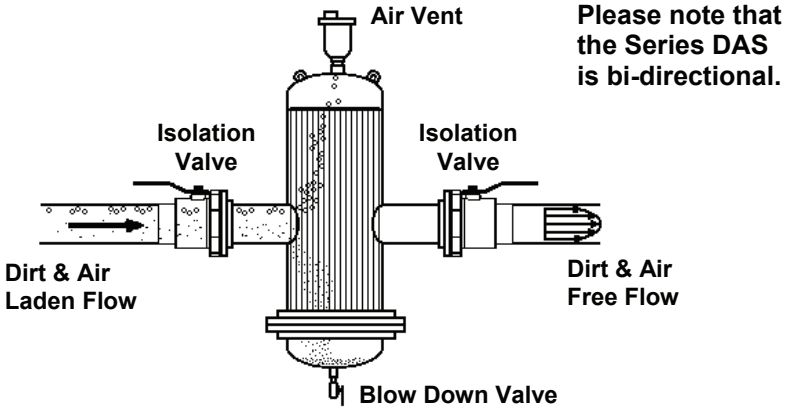

Fig. 3 DAS Working Configuration

MAINTENANCE

Air is eliminated automatically through the float-style vent. The vent should be periodically inspected to ensure optimum performance. If the vent used shows signs of continuous or intermittent leakage, or corrosion, it should be serviced or replaced.

During start up procedures, sediment should be removed frequently. The amount of sediment and the time of each blow-down should be recorded. As the amount of debris from blow-down diminishes, set a routine schedule to periodically blow-down the debris. If sediment builds on the coalescing screen, as evidenced though increased pressure drop, the screen can be removed. Inspect the screen cartridge periodically. Clean or replace if necessary.

WARNING: Standard units are not for use with potable water. Please consult factory for stainless steel option. For support recommendations, please reference local building code requirements

WARNING: The internal coalescing tubes are supported by the removable head. These tubes are not supported when the head bolts are removed.

INSTALLATION AND OPERATING INSTRUCTIONS

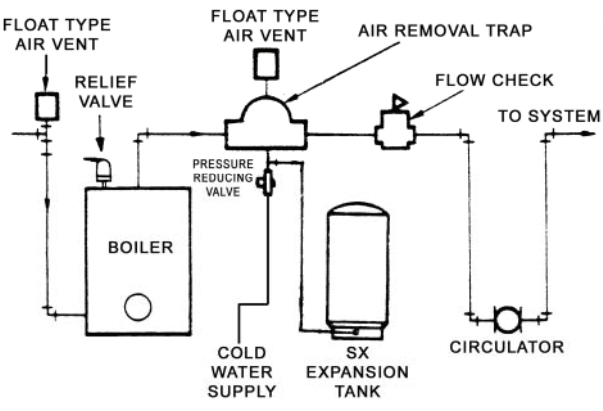
SX Series
Diagphragm Expansion Tanks

SX SERIES Expansion Tanks
This line of expansion tanks is specifically designed for use in hydronic heating systems.

The unique proven design of these tanks incorporates a flexible diaphragm that separates system water from the tank air charge (12 psig) resulting in more positive system protection.

HOW THEY WORK:
Heated water expands, and in a closed hot water heating system, provision must be made for this expansion. The captive air volume separated by the flexible diaphragm in the expansion tank provides for water expansion without permitting absorption of the air cushion by the water.

ATTACHING ACCEPTANCE FITTINGS:
SX tanks are equipped with a convenient bottom outlet elbow for connection to the system. Models SX-30V, SX-40V and SX-60V use a 1" NPTF fitting and models SX-90V, SX-110V and SX-160V use 1¼ " NPTF fitting. The air valve is located on top to provide accessibility no matter how the unit is positioned.



PROPER LOCATION AND INSTALLATION:
The SX Series tank may be located at any convenient point on a hot water heating system on the suction side of the pump. It may be installed into a tee or any other suitable tapping. The preferred installation is to pipe the SX tank into the system piping between the pressure reducing valve (in the water supply line) and the air removal trap / air vent, as shown in Figure 1. Conversely, the SX tank may be piped directly into the Armstrong Air Removal Trap. Regardless of installation, both offer continuous automatic air removal and complete pressure control protection.

ADJUSTING SX EXPANSION TANK PRECHARGE TO SYSTEM REQUIREMENTS:
All SX Series tanks are shipped with a standard precharge of 12 psi. This precharge can be adjusted if necessary. The following steps should be taken:

1. Remove red air charge valve cap and, using a suitable pressure gauge, check precharge pressure.
2. Release or add air as necessary to make precharge pressure equal to the desired fill pressure.
3. Replace protective air valve cap and seal with the air valve label provided. This will enable you to determine if valve has been tampered with on possible future service calls.

SYSTEM CONNECTION:
1. Locate SX Series expansion tank in final desired location.
2. Level as necessary.
3. Connect to heating system.
4. All piping should be in accordance with prevailing local codes and standards.

RECOMMENDED INSTALLATION:

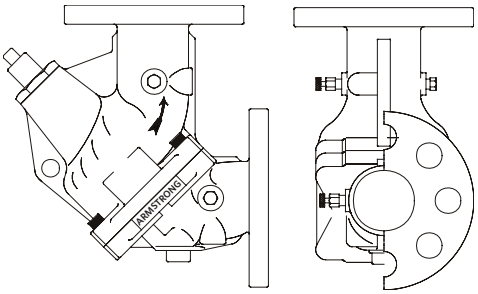
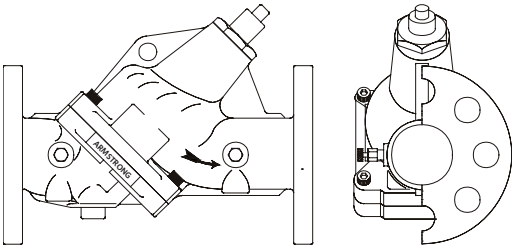
9.0	Repacking of FTV valve under full system pressure	7
10.0	Maximum number of turns (full open valve)	7
11.0	Seat replacement	7

1.0 INTRODUCTION



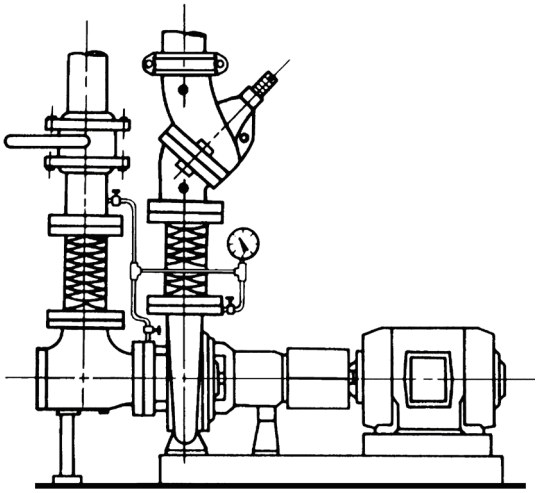
The Armstrong model FTV Flo-Trex combination valves are designed for installation on the discharge side of centrifugal pumps. The Armstrong combination valve incorporates three functions in one valve:

- Drip-tight, shut-off valve
- Spring closure design, non-slam check valve
- Flow throttling valve

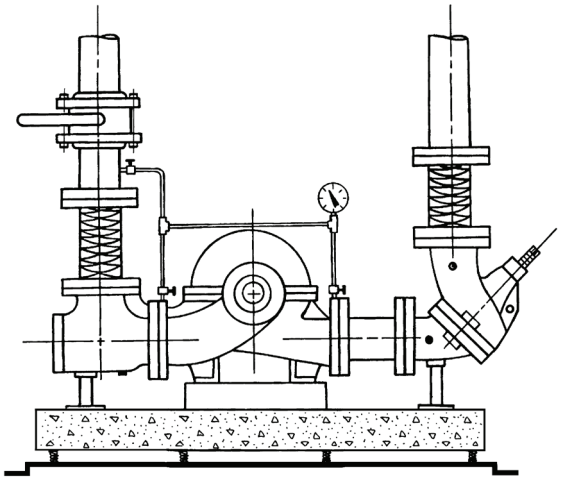


Armstrong model FTV-AF Flo-Trex combination valve

Angle pattern model FTV-AF

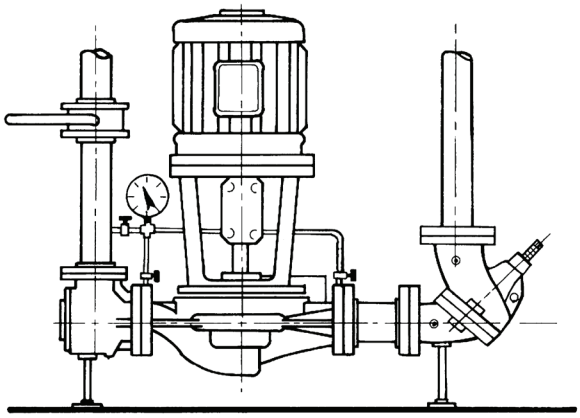


Angle pattern model FTV-SF



2.0 INSTALLATION

1. The valve should be mounted to a spool piece on the discharge side of the pump. Spool piece required is based on a minimum recommended space of 12" for pump sizes 2 × 2 to 6 × 6 and 24" for pump sizes 8 × 8 to 12 × 12.
2. It is not recommended to mount a valve directly to the pump as this could cause undesirable noise in the system.
3. Sufficient clearance around the valve should be left for valve removal or repair.
4. Install valve in the direction of the flow arrows on the valve body.
5. The valve body has been designed to handle the weight of the pump on vertical in-line installations. The body is not designed to support the piping weight. It is recommended that the piping be supported by hangers. Pipe supports are not required under the valve and strainer bodies but may be used if desired.
6. Ensure that the FTV is installed with the valve stem in the upright position. Valve slam may occur if installed in any other configuration



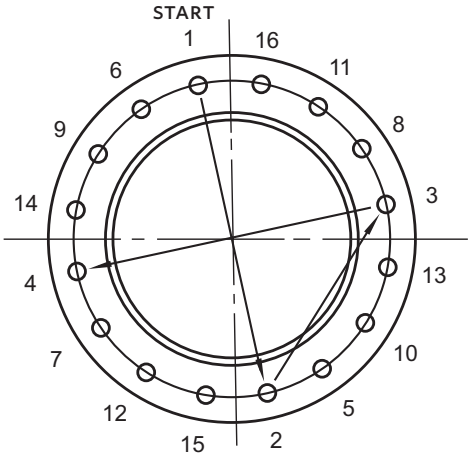
3.0 TYPICAL INSTALLATIONS

Base-mounted single suction

Base-mounted double suction

Vertical in-line

4.0 FLANGE BOLT TIGHTENING



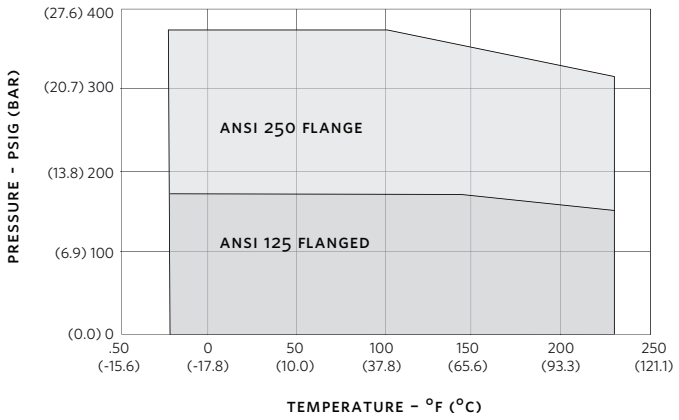


FIG 1: Recommended bolt tightening procedure

VALVE SIZE	125 PSI/150 PSI CAST IRON BOLT	
	BOLT NO.	SIZE
2½	4	⅝
3	4	⅝
4	8	⅝
5	8	¾
6	8	¾

TABLE 1

Tighten nuts evenly, following bolting instructions (**FIG 1**) so that the flange faces remain parallel. Flange bolts should be tightened to 70 ft/lbs. Torque minimum to assure firm metal-to-metal contact. When raised face flanges are used, there will be a gap between the faces of the outer diameter.

5.0 PRESSURE-TEMPERATURE LIMITS

6.0 FIELD CONVERSION (straight to angle pattern valve)

Open valve at least one complete turn.

Remove the body bolts from valve body using allen key.

Rotate one half of the valve body 180° making sure the lower valve seat and o-ring stay in position. Inspect the o-ring for any cuts or nicks and replace if necessary.

Replace body bolts and torque evenly to 70 ft/lbs.

7.0 FLOW MEASUREMENT

Where approximate indication of flow is acceptable the Armstrong Flo-Trex valve can be used.

Measure the flow with valve in fully open position.

1 Measure and record the differential pressure across the valve using an Armstrong CompuFlo with high pressure range transducer, or CBDM- 135/60 meter, or pressure gauges with PMP adapters.

Caution: Safety glasses should be used and the probe should not be left inserted into fittings for prolonged periods of time (overnight, etc), as leakage from the PMP may occur when probe is removed.

2 Refer to Flo-Trex performance curves with valve in full open position (**FIG 2**).

Locate Pressure Differential on left hand side of chart and extend line horizontally across to valve size being used. Drop line vertically down and read flow rate from bottom of chart.

Determining flow rate with valve in throttled position

FLO-TREX PERFORMANCE CURVE WITH VALVE IN FULL OPEN POSITION

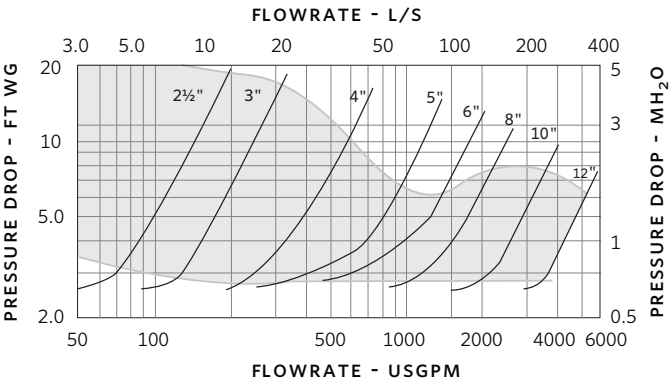

FIG: 5

INHERENT FLOW CHARACTERISTIC CURVE WITH VALVE IN THROTTLED POSITION

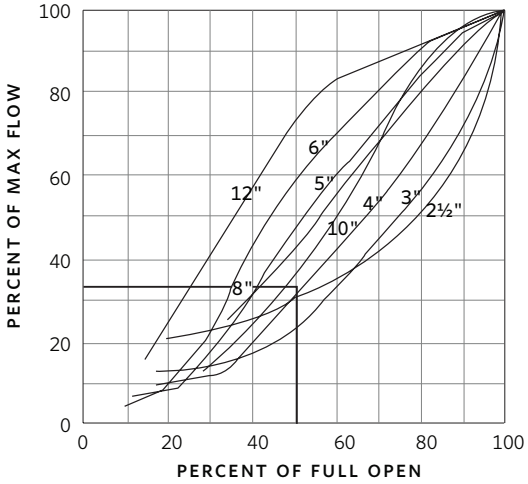

FIG: 6

1 Record the size of valve and stem position using the flow indicator scale (page 7). Calculate percentage of valve opening referring to table below:

VALVE SIZE	NUMBER OF RINGS (VALVE FULL OPEN)
2½	5
3	5
4	6
5	9
6	10
8	12
10	18
12	28

2 Measure and record the differential pressure across the valve in the throttled position.

3 Locate percentage of valve opening on the bottom scale of Flow characteristic curve (**FIG 3**). Project line vertically up to intersect with the valve characteristic curve and from this point project line horizontally across to the left of the chart and record the percentage of maximum flow rate.

4 On the Flo-Trex performance curve (**FIG. 2**) locate the differential pressure obtained in **STEP 2** and project line horizontally across to intercept with valve performance curve. Drop a line vertically down to read the flow rate at the bottom of the chart.

5 To calculate flow rate of valve in the throttled position, multiply the flow rate from **STEP 4** by the percentage flow rate from **STEP 2** divided by 100.

Example: Valve size 4 inch.

Differential Pressure is 5.4 ft. (1.65 m).

Number of rings open = 3. Therefore: 3 rings ÷ 6 rings x 100 = 50% throttled.

From the Flo-Trex Performance Curve (**FIG 2**), a 4 inch, valve with 5.4 ft. pressure drop (1.65 m) represents a flow of 400 USgpm (25.2 L/s).

From Flow Characteristic Curve (**FIG 3**), a 4 inch valve 50% open, represents 34% of maximum flow.

Approximate flow of a 4 inch valve, with a 5.4 ft (1.65 m) pressure drop when 50% throttled is:

$$\frac{400x34}{100} = 136USgpm \left(\frac{25.2x34}{100} = 8.57L/s \right)$$

Note: To prevent premature valve failure it is not recommended that the valve operate in the throttled position with more than 25 ft pressure differential. Instead the pump impeller should be trimmed or valves located elsewhere in the system be used to partially throttle the flow.

FLOW INDICATOR SCALE

The valve stem with its grooved rings and positioning sleeve indicates the throttled position of the valve. The quarter turn graduations on the sleeve, with the scribed line on the stem, provide for approximate flow measurement.

Note: The valve is shipped in the closed position. The indicator on the plastic sleeve is aligned with the vertical scribed line on the stem.

8.0 OPERATION

To assure tight shut off, the valve must be closed using a wrench with 25 to 30 ft/lbs of torque.

To assure trouble-free check valve operation and shut off operation, the valve should be periodically opened and closed to keep valve seat and valve disc guide stem free of build up of system contaminants.

9.0 REPACKING OF FTV VALVE UNDER FULL SYSTEM PRESSURE

1. Should it be necessary, stem o-ring can be changed under full system pressure.
   Caution: Safety glasses should be worn.
2. Record the valve setting.
3. Turn the valve stem counter-clockwise until the valve is fully open and will not turn any further. Torque to a maximum force of 45 ft/lbs. This will ensure good metal-to-metal contact and minimum leakage.
4. The valve bonnet may now be removed. There may be slight leakage, as the metal-to-metal back seating does not provide a drip-tight seal.
5. Clean exposed portion of valve stem (do not scratch).
6. Remove and replace the o-ring and gasket.
7. Install the valve bonnet.
8. Tightening valve bonnet is necessary to stop any leaks.
9. Open valve to balance set point as recorded in **STEP 2**.

10.0 MAXIMUM NUMBER OF TURNS (FULL OPEN VALVE)

Note: On valve sizes 2½" and 3", full open position of valve is 5 turns. However valve will open to 5½ turns which is just back of seating of valve.

11.0 SEAT REPLACEMENT

1. Drain system and remove valve from piping.
2. Remove the body bolts from the body using an allen key.
3. Remove seat and o-ring. O-ring is not used on valves 8" and larger.
4. Inspect and clean o-ring cavity and install new o-ring and seat. Valve disc stem also should be inspected and replaced if worn. Valve stem o-ring should be replaced at this time. Refer to section **8.0**.

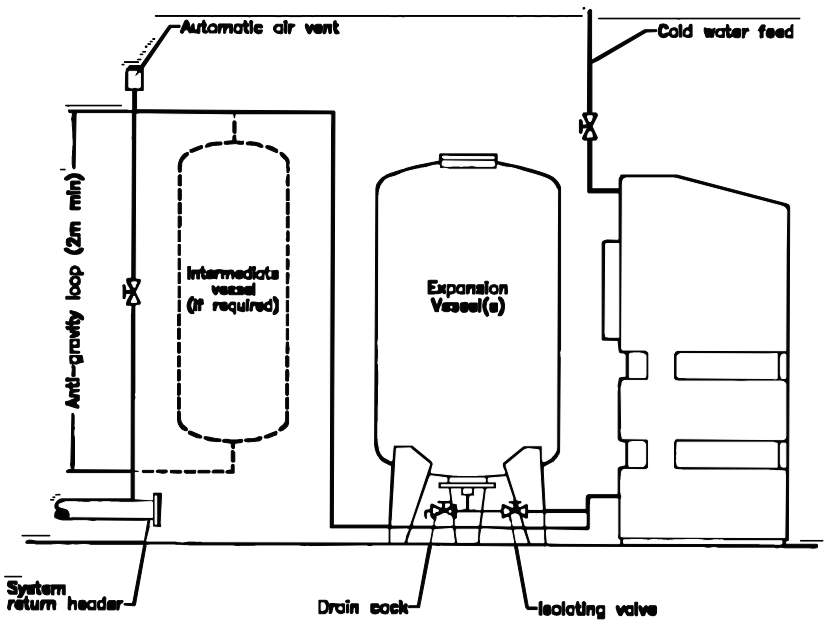
Installation & Operating Instructions
GLA - Glycol Make-up Units



ESSENTIAL SAFETY REQUIREMENTS

1) **Glycol** is toxic and the glycol supplier's safety instructions must be adhered to. In critical areas a retaining wall should be used to contain any spillage or leakage. Overflows should be arranged not to contaminate drainage systems.
2) It is recommended that initial commissioning be carried out with water.
3) The flow rates from the unit are designed for make-up rates. It is therefore suggested that the system is back-filled with due precautions taken to avoid contamination.
4) Glycol is sometimes subject to bacterial attack and can become slimy as a result. We recommend the addition of a suitable biocide. The dosage should be calculated on the amount of water glycol mixture added and not the total tank contents. If bacterial attack occurs on untreated mixtures the unit should be drained, flushed and refilled with fresh mixture and dosed with biocide.
5) Locate units in a well-ventilated environment and ensure that ventilation fans and apertures are not obstructed.
6) Check that the supply voltage and overload protection is correct.
7) A competent electrician should perform the electrical installation.
8) Guards and covers must not be removed during operation.

Expansion Vessel Installation and Commissioning

Refer to separate Armstrong publication for Armstrong vessels.

Install the **GLA** unit as indicated in the diagram below.

NOTES:

1) The pipework from the system to the expansion vessels should not be insulated.
2) For systems operating above 200 degrees F (93 C), an anti-gravity loop with a minimum height of 6 feet, (or an intermediate vessel) should be installed to provide thermal protection to the expansion tanks.
3) For hot water systems, the connections to the intermediate vessel should be reversed, i.e. top to system, and bottom to expansion vessel.
4) The GLA unit is suitable for floor mounting.
5) The ball float valve is fitted with a low-pressure seat; a high-pressure seat is attached to the float valve and should be fitted if required.
6) The pipework to the expansion vessels should be sized according to the size and number of vessels and should be at least the same size as the vessel connection.
7) Where multiple expansion vessels are required it is recommended that each vessel be installed with its own isolating valve and drain cock.

Pressure Switch Adjustment

1) Low system pressure – PS1
2) High system pressure – PS2
3) Duty pump control switch – PS3
4) Standby pump control switch (where fitted) – PS4

For each switch, set the delivery to the required pressure. Then very slowly turn the adjusting screw on the switch until the contacts change.
The high system pressure switch should first be set higher than the required pressure by turning the screw clockwise, and the setting then made by turning the screw anti-clockwise until the switch contacts change-over. The other switches should first be set lower than the required pressure by turning the screw anti-clockwise, and the setting then made by turning the screw clockwise until the switch contacts changeover.
A pipe plug is provided on the outlet to allow connection of a test pump to simulate differing system pressures to check switch settings.
The Ultra versions of the GLA have the capability of controlling duty and standby pumps from a single pressure switch.

GLA Ultra Settings

The extra functionality of Ultra units is integral. The only selectable option is Manual or Automatic reset of alarm conditions. DIP switch 1, on the display board should be set to OFF for auto reset (Factory setting), and ON for manual reset. On alarm conditions, the MUTE switch will mute the buzzer. In manual reset mode this MUTE switch will reset the alarms after the fault condition has been cleared. Other switches change the mode of the printed circuit board for use with other Armstrong products. For GLA application, all switches except 1 and 7 must be set to OFF.

Priming the make-up pumps

1. Close suction isolating valve.
2. Fill the glycol-mixing tank.
3. Remove the upper vent plug from the make-up pump.
4. Open suction isolation valve until water flows out of this tapping.
5. Close valve and replace plug.
6. Repeat for standby pump (where fitted).
7. Close the system-isolating valve.
8. Open suction isolating valve.
9. Switch on unit, initially both pumps will run. As the pressure reaches the pump control switch threshold, the pumps will switch off.
10. Check all piping for leaks following shipping.
11. Crack open system valve. The pressure will fall and the pump will start and maintain pressure.

Powered agitation (Ultra model only)

A solenoid valve is fitted to provide powered agitation of the mixture. Automatically this valve is periodically opened and the duty pump starts creating circulation through the pump and mixing tank. Automatic mixing is inhibited when there is a system demand for make-up.

A switch is provided for manual agitation when adding glycol to the mixing tank.

Topping up with glycol

The mixing tank is calibrated in liters and US gallons. The normal top up level is 53 US gallons (200 liters).

1. Calculate the amount of water needed and add or drain to the correct level.
2. Add the required amount of glycol.
3. Operate the manual-agitating switch.
4. Check the mixture percentage.

The unit is now ready for service.

PRESSURE REDUCING VALVES | RD-11, RD-40, RD-50 & HRD-70 | INSTALLATION AND OPERATING INSTRUCTIONS

File No: 11.85
Date: DECEMBER 24, 2015
Supersedes: 11.85
Date: MAY 13, 2008

1.0 INSTALLATION

The pressure reducing valve should be installed with the flow arrow on the body pointing in the direction of the flow. Install the union fittings, supplied with the valve (model RD-11 and C-11), on the inlet side of the valve body, for quick installation and removal if necessary. A shut-off valve should be installed on the city water side of the pressure reducing valve. If the pressure reducing valve is not equipped with a fast fill feature, a by-pass may be used. A three valve by-pass around the pressure reducing valve will also serve as a fast fill option and is recommended for service.

CAUTION

The use of Teflon tape when installing a valve provides lubricity. Care should be taken to avoid over tightening, which may crack the valve body.

2.0 OPERATION

Models RD-11, RD-40 and RD-50 are preset at 12 psi, and the HRD-70 is preset at 45 psi. Open the cold water fill valve and the system will be filled until the boiler gauge indicates the preset valve pressure has been obtained.

Model RD-11 is preset at 12 psi and is equipped with a fast fill feature. When filling the system as noted above, the fast fill thumbscrew should be manually turned in completely. This overrides the pressure regulating function of the valve. The system should be filled until the boiler gauge indicates the preset pressure of the valve and then the fast fill thumbscrew should be backed off completely until it spins freely.

WARNING

The fast fill thumbscrew must never be left in the down position after the system has been filled. The thumbscrew must be placed in the free position to avoid over pressurization and unnecessary relief valve discharge.

3.0 ADJUSTMENT

Allow system water to cool to ambient temperature. If necessary, adjust valve pressure setting as follows: pressure setting can be raised or lowered by loosening the jam nut and turning the slotted adjusting screw clockwise to increase the set pressure or counter-clockwise to lower the set pressure. This should be done slowly until the boiler pressure gauge indicates the required system pressure. A screw driver should be used to hold the adjusting stem stationary while the jam nut is secured.

4.0 SERVICE

If the pressure reducing valve fails to maintain the set cold fill pressure, the sediment strainer may be clogged. To service the strainer, shut off city water supply and the isolation valve on the discharge of the pressure reducing valve. Remove and clean or replace the strainer and replace the strainer gasket and nut. Open both the city water shut-off valve and the isolation valve to resume normal system operation.

Suction Guides

Installation and operating instructions

File No: 35.82
Date: OCTOBER 03, 2013
Supersedes: 35.82
Date: AUGUST 16, 2013

CONTENTS

1.0	Introduction	4
2.0	Operating limits	4
3.0	Inspection	4
4.0	Installation	4
5.0	Operation	5

1.0 INTRODUCTION

Armstrong Suction Guides are designed for bolting directly onto the suction flange of horizontal or vertical shaft centrifugal pumps.

2.0 OPERATING LIMITS

Armstrong Suction Guides are designed in five series:

SERIES DESIGNATION	INLET CONNECTION	PUMP CONNECTION
SG	ANSI 125 / PN16 flange	ANSI 125 / PN16 flange
SG–TF	NPTF / BSPT	ANSI 125 / PN16 flange
SGG	GROOVED*	ANSI 125 / PN16 flange
SGHH	ANSI 250 / PN25 flange	ANSI 250 / PN25 flange
SGH–TF	NPTF / BSPT	ANSI 250 / PN25 flange

*Suitable for straight cut grooved anvil or victaulic fittings.

Each series is designed to be a four-function fitting. Each Suction Guide is a 90º elbow, a pipe strainer and a flow stabilizer. It may also be used as a reducing elbow, should the suction piping be larger than the pump inlet.

3.0 INSPECTION

Armstrong Suction Guides are thoroughly tested and inspected before shipment to assure they meet with your order requirements. All units must be carefully examined upon arrival for possible damage during transit. Any evidence of mishandling should be reported immediately to the carrier and noted on the freight bill.

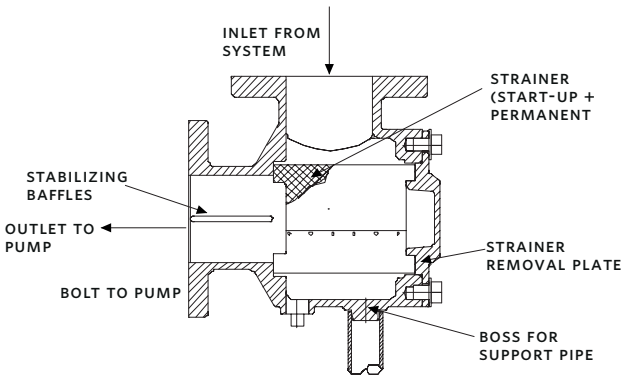

FIG. 1 Armstrong Suction Guide

4.0 INSTALLATION

Install the Suction Guide with the directional arrow, indicated on the body, being aligned with the system flow direction.

Armstrong Suction Guides may be installed in any position, providing the guide vanes are facing the pump inlet flange.

Centrifugal pumps need a minimum of 5 pipe diameters of straight pipe before the pump suction. This length of straight pipe, after the last elbow, tee or fitting, helps to ensure that the flow is stable when entering the pump suction.

Crosspiece guide vanes are fitted into the Armstrong Suction Guide outlet, where it bolts to the pump flange, to stabilize the flow and eliminate the need of long straight suction pipe.

Space must be allowed to remove the end cover and remove the strainer.

A blow–down valve may be installed on the Suction Guide drain connection. Should the Suction Guide be installed with the inlet port facing vertically down: The inlet piping configuration should include a blow–down valve at the lowest point on the down-pipe to exhaust any debris that may fall from the Suction Guide strainer.

The Suction Guide must not be used to support the suction piping. Piping must be supported independently.

On base mounted pumps, a flexible piping connections may allow the Suction Guide to be supported by the pump suction flange. A boss is cast on every SG allowing a supporting pipe-stool to be located under the fitting, thereby removing the weight of the Suction Guide from the pump suction flange.

Suction Guides are supplied with an inlet tapped gauge connection. Monitoring the differential pressure across the fitting, from the suction guide inlet gauge to the pump inlet gauge, will alert the operator should the strainer need to be removed and cleaned.

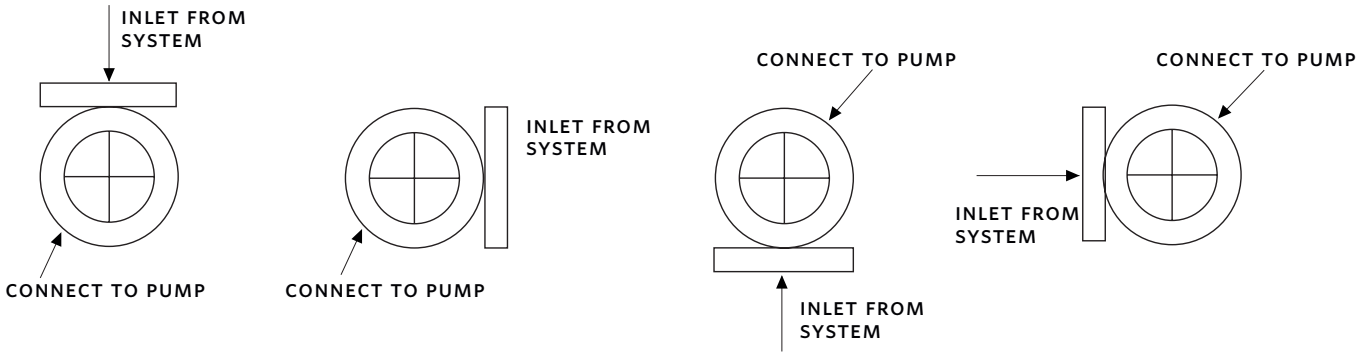

FIG. 2 Armstrong Suction Guide may be installed in any arrangement feasible by pump flange boltholes arrangement.

5.0 OPERATION

No special attention need be paid to the Suction Guide at start-up. The fitting is stationary and will strain the pumped fluid and stabilize the flow into the pump automatically.

Temporary strainer must be removed following system clean up.

After all debris has been removed from the system, or a maximum of 24 running hours, stop the pump and close the pump isolation valves. Drain the Suction Guide by removing the drain plug or opening the blowdown valve, if installed. Remove the Suction Guide cover and remove the strainer assembly from the valve body.

A temporary fine-mesh start-up strainer is tack-welded to the permanent stainless steel strainer. This temporary strainer should now be removed from the permanent strainer. The fine-mesh strainer is designed to remove small particulate from new piping systems and could easily clog with debris if left in place. This will be detrimental to the operation of the pump.

Replace the permanent strainer into the fitting body, once the temporary strainer is removed.

Inspect the cover O-ring and replace if necessary. Replace the cover into the body. Ensuring that the strainer is properly seated, tighten the cover bolts diagonally, evenly and firmly.

INSTALLATION WARNING

PRIOR TO Media Loading

Inspection Requirement Prior to Loading Media

1. Inspect condition of upper distributor piping. Verify fittings are tight and positioned as shown.
2. Inspect condition of strainers, laterals and hub through top or side access ports. Verify fittings are secured to hub and strainers, if present are secured to laterals.
3. **DO NOT** load media if damaged components are observed. Contact factory.
4. Installer is responsible for media loss into treated water resulting from failure to report and repair damaged components inside media tank prior to media loading.
5. **INSTALLER WARNING:** Refer to installation instructions for media loading procedure. Improper loading of media will damage components inside media tank.

Ordering:
Orders may be phoned, faxed, or emailed to Marlo Incorporated Purchase orders must include Marlo Incorporated part numbers and pricing. Purchase orders must also state if partial shipments are allowed. If you do not have the correct part numbers, pricing, or case quantities, please contact our customer service department.

Order Confirmations:
All purchase orders will be confirmed by phone, fax, or email. Any discrepancies in part numbers, pricing, descriptions, or case quantities will be listed in the order confirmation. It is the customer's responsibility to review the order confirmations and advise if any changes are to be made. If we do not hear from the customer regarding the confirmation within 24 hours, we will assume everything is correct and will invoice and ship accordingly.

Quotes & Prices:
Quotations are valid for a period of up to 45 days or for the term stated on the quote, whichever term is shortest. We make every effort to notify customers with price change information. However, prices are subject to change or correction without notice. Shipping weights, dimensions and anticipated ship dates are all approximate and subject to change.

Minimum Orders:
Minimum order accepted is $25.00, not including freight or taxes.

Taxes:
Taxes are not included. Quoted prices are exclusive of all taxes. Purchaser shall be responsible for payment of all applicable state/local taxes. Orders shipped within Wisconsin are subject to applicable state tax rates unless a completed resellers card or exempt certificate is on file.

Freight:
All shipments are F.O.B. Marlo Incorporated Racine, Wisconsin, unless otherwise specified.

Shipment:
The shipment method should be specified by the customer on the purchase order; otherwise, Marlo Incorporated will choose the best method of shipment.

Packaging:
Pricing includes packaging that is satisfactory for air, truck, or containerized shipment at no additional cost, unless otherwise stated. Ocean export crating will require an additional charge.

Terms - Domestic Customers:
Terms of payment on open accounts are net 30 days from the date of invoice, unless otherwise stated and mutually agreed upon by both parties. This agreement is subject to credit approval. Terms will only be issued to companies which reside in the United States of America. Orders will not be shipped if any account is past due and/or until payment by check has cleared.

Orders in excess of $60,000 will require partial payments prior to shipment. A specific progress payment schedule will be stated in the quotation. Partial payments may also be required for orders involving special engineering or custom ordered items regardless of order amount.

Interest will be charged on past due accounts. Interest charges will be calculated on the unpaid balance at 1.5% per month. All questions regarding invoices and terms must be addressed with our accounting department before invoices become due.

Unless specifically included as a separate item, prices quoted do not include any city, county, state or federal taxes, or transportation of merchandise.

Terms - International Customers:
All payments due are in U.S. dollars and must be made in advance by check (must clear before shipment), money orders, wire transfer, or credit card. Credit cards that are accepted are Visa, MasterCard, and American Express. Irrevocable Letters of Credit are accepted with a minimum order of $25,000.00 U.S. dollars, per order. Unless specifically included as a separate item, prices quoted do not include any city, county, state or federal taxes, or transportation of merchandise. A deposit may be required for special or custom ordered items.

Freight Claims:
Any damage, discrepancies and/or freight claims must be made immediately and directly, in writing within ten (10) days to Marlo Incorporated. Marlo Incorporated will help as much as possible in settling claims. However, Marlo Incorporated will not be held responsible for breakage or shortage after products are accepted by common carrier. All shipments must be inspected for damages and counted for shortages at the time of delivery.

Order Changes:
Additions to an order may be made at no charge prior to the processing of an order. Processing of an order typically begins within one hour of receipt of a purchase order and is typically accomplished within one working day.

Orders cancelled after the order has been processed and sent to shipping or engineering, will be subject to a minimum 10% cancellation fee, assuming manufacturing has not commenced, and no detailed engineering or special parts have been ordered. Additional fees may be charged depending on the level of completion of detailed engineering, manufacturing, and/or if any special parts have been ordered.

Returns & Restocking:
A Return Goods Authorization (RGA) number must be obtained from Marlo Incorporated before any product returns can be accepted and/or replacements shipped. All returns for warranty consideration are to be shipped prepaid and must be returned within ten (10) business days from the RGA issuance. Returns determined to be in warranty will be replaced or repaired and will be returned to Buyer prepaid. Products returned, other than valid warranty claims, may be subject to a restocking charge of up to 25%. Orders shipped incorrectly by Marlo Incorporated are not subject to restocking charges and correct items will be shipped to Buyer prepaid.

Excusable Delays:
Marlo Incorporated shall not be in default for failure to deliver or delay in delivery arising out of causes beyond its control and without its negligence, including but not limited to Acts of God or the public enemy; acts of the Government in either its sovereign or contractual capacity; fires; floods; epidemics; quarantine restrictions; strikes; shortages of materials or supplies; labor disputes; freight embargoes; delays in transit; consignments lost or damaged by freight agent(s); and unusually severe weather.

Warranty:
Marlo Incorporated warrants its products to be free from defects in design, material, or workmanship for a period of 18 months from shipment date or 12 months from installation, whichever occurs first, when said products are installed and operated in accordance with the written instructions provided. The fiberglass reinforced polyester (FRP) resin/media tanks used in certain products alone have an extended warranty period of five (5) years from the shipment date. If within that period any products shall be proven to Marlo, Inc.'s satisfaction to be defective, those products will be replaced, or the price refunded at Marlo Inc.'s option. Marlo Inc.'s obligations or nonperformance, defective, or any damage caused by its products or their use, and buyer's exclusive remedy therefore, shall be limited to product replacement or refund and shall be conditioned upon Marlo Inc.'s receiving written notice together with a demand for such replacement or refund:

The foregoing warranty is exclusive and in lieu of all other expressed implied warranty (except of title) including but not limited to implied warranty of merchantability and fitness for particular purpose.

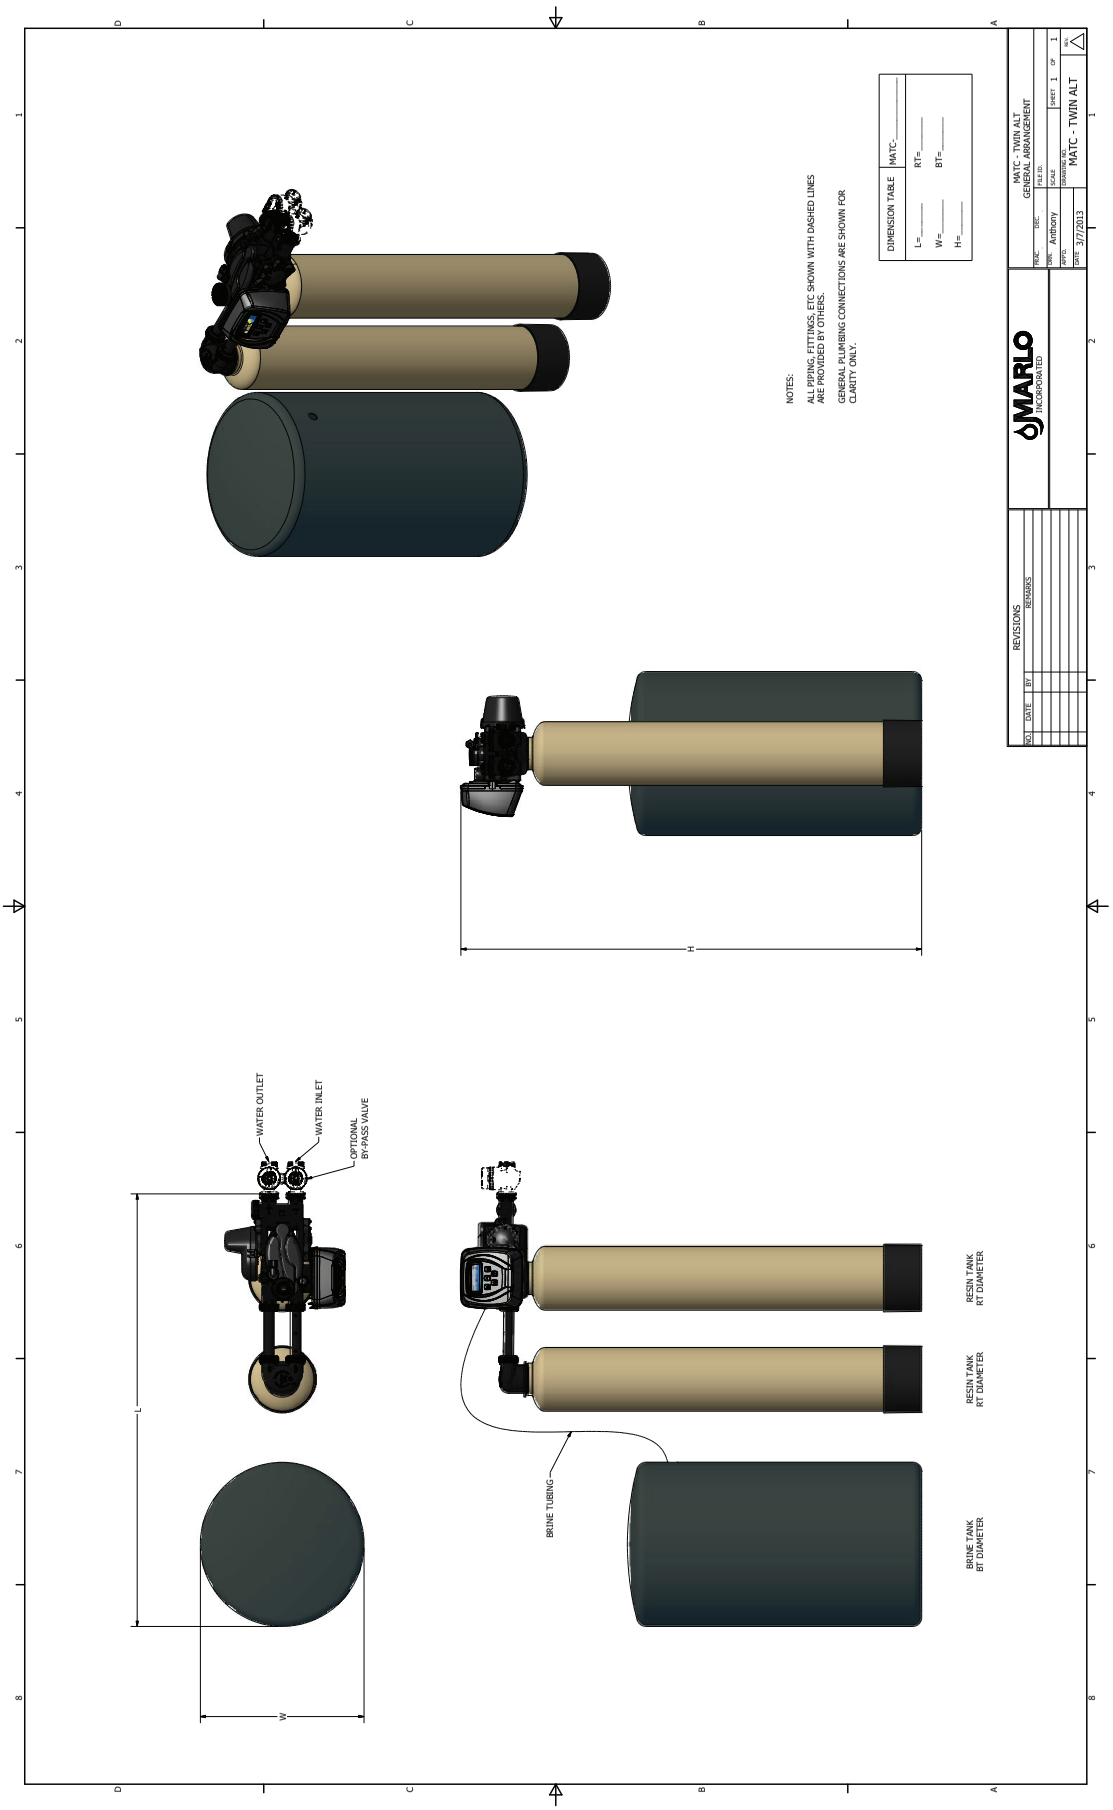
Marlo Inc. will not be subject to and disclaims the following:

1. Any other obligations or liabilities arising out of breach of contract or out of warranty.

2. Any obligations whatsoever arising from tort claims (including negligence and strict liability) or arising under other theories of law with respect to products sold or services rendered by Marlo Inc. or any undertakings, acts, or omissions relating thereto.

3. All consequential, incidental, and contingent damages including labor charges, back charges or handling charges are excluded from Marlo Inc.'s warranty provisions.

Policy:
These terms and conditions may be superseded by specific provisions provided by Marlo Incorporated. However, should any of these terms and conditions be contrary to or inconsistent with any terms and conditions contained in any purchase order form or other document between Marlo Incorporated and the buyer, which is prepared by the buyer and whenever executed, the provisions hereof shall be controlling and shall supersede the conflicting terms and conditions which are contained in such other document. No changes shall be made to our terms and conditions unless prior written authorization by Marlo Incorporated



SPECIFICATION CHART

		MODEL MATC -	15	30	45	60	90	120	150
SYSTEM SIZE		Valve Size (In)	1	1	1	1	1	1	1

NOTES:

1. FLOW RATES
   Continuous: pressure loss does not exceed 15 psig.
   Peak: pressure loss does not exceed 25 psig
   Backwash & Flush: maximum flow to drain
   Brine & Rinse: Injector flow to drain @50 psi inlet pressure
   Brine Tank Refill: flow to refill Brine Tank
2. SOFTENER TANK
   Freeboard: distance in inches from surface of resin to top sealing flange of tank
3. SALT DOSAGE
   Maximum 15 lbs./cu.ft. - regeneration efficiency: 2,000 grains/pound of salt (factory setting)
   Maximum 6 lbs./cu.ft. - regeneration efficiency: 3,000 grains/pound of salt
4. REGENERATION WASTE VOLUME - Total gallons water discharged per regeneration
5. DIMENSIONS:
   Leave a minimum 24 inch clearance to the height of the unit for loading media.
   Dimensions are for general arrangement use only.

MATC 1" GENERAL ARRANGEMENT DRAWING

INSTALLATION FITTING ASSEMBLIES

Installation fittings connect to the control valve or the bypass valve (bypass valve is optional) **using nuts that only require hand tightening**. Hand tighten nut connections between control valve and installation fittings, control valve and bypass valve, and bypass valve and installation fittings allow for ease serviceability. Do not use a pipe wrench to tighten nuts on installation fittings. **Hand tighten only.**

Split ring retainer design holds the nut on and allows load to be spread over the entire nut surface area reducing the chance for leakage. The split ring design, incorporated into the installation fittings allows approximately 2 degrees off axis alignment to the plumbing system. The installation fittings are designed to accommodate minor plumbing misalignments but are not designed to support the weight of a system or the plumbing.

When assembling the installation fitting package, connect the fitting to the plumbing system first and then attach the nut, split ring and o-ring. Heat from soldering or solvent cements may damage the nut, split ring or o-ring. Solder joints should be cool and solvent cements should be set before installing the nut, split ring and o-ring. Avoid getting primer and solvent cements on any part of the o-rings or split rings, bypass valve or control valve. Solvent cements and primers should be used in accordance with the manufacturer's instructions.

Slip the nut onto the fitting first, then the split ring second and the o-ring last. hand tighten the nut. If the fitting is leaking, tightening the nut will not stop the leak. Remove the nut, remove the fitting, and check for damage or misalignment of the o-ring.

Do not use the pipe dope or other sealant on threads. Teflon tape must be used on the threads of the 1" NPT elbow and the 1/4" NPT connection and on the threads for the drain line connection. Teflon tape is not necessary on the nut connection or caps because of o-ring seals.

Do not use Vaseline, oils or other unacceptable lubricants on o-rings. A silicon lubricant may be used on black o-rings.

Bypass Valve

The optional bypass valve easily connects to the control valve body using nuts that only require hand tightening. Hand tighten nut connections between control valve and fittings, control valve and bypass valve, and bypass valve and installation fittings allow for easy serviceability. The split ring retainer design holds the nut on and allows load to be spread over the entire nut surface area reducing the chance for leakage. The split ring design, incorporated into the bypass, allows approximately 2 degrees off axis alignment to the plumbing system. The bypass is designed to accommodate minor plumbing misalignments but is not designed to support the weight of a system or the plumbing.

Avoid getting primer and solvent cements on any part of the o-rings or split rings, bypass valve or control valve. Do not use pipe dope or other sealant on threads. Teflon tape is not necessary on the caps because of o-ring seals.

Do not use Vaseline, oil or other unacceptable lubricants on o-rings. A silicon lubricant may be used on black o-rings.

A. GENERAL

1. Shut off all water at main supply valve.
2. Shut off the fuel supply to water heater.
3. Open faucets (hot and cold) nearest pump or water meter to relieve pressure and drain system.
4. Move softener into the installation position. Loosely attach all fittings to measure for bypass valve assembly (if used), or manual bypass valve.
5. Level the unit. Place shims under cabinet or brine tank as needed. (Do Not use metal shims.)
6. Cut the cold water supply line as required.
7. Install the bypass valve assembly if used.

B. PLANNING INSTALLATION

1. All installation procedures must conform to local plumbing, electrical and sanitation codes and ordinances.
2. It is recommended that outside faucets for lawn service be on the hard water line, ahead of the softener, to conserve softened water, save salt and prevent lawn damage.
3. If this isn't practical, use the convenient integral bypass valve assembly during irrigation flows.
   CAUTION: The inlet water temperature MUST NOT exceed 110 F.
4. Do not locate softener where ambient temperature drops below 40 F.
5. Allow space around the softener for ease of servicing.
6. The softener drain lines must never be solidly connected to the sewer line. (Always provide an air gap at the END of the drain line). Valve drain line must not be elevated over 5' from the top of the softener on well systems, and not over 8' on municipal water systems.
7. Move the softener into position. MATC-15, 30, 45 & 60 systems have been pre-loaded at the factory. For systems larger than the MATC-60, complete section C before continuing on to section D.
8. **IMPORTANT:** Be sure that the water inlet line is connected to the "inlet" side of the bypass valve or to the inlet fitting. (Bypass valve both inlet/outlet fittings are marked.) If water lines are reverse, (inlet/outlet) resin may be forced from the water softener into the plumbing system. If this occurs, household plumbing system must be clean.
   NOTE: The twin tanks need to be a specific distance from each other. Refer to the table in paragraph F for the correct center-to-center distance for the tanks.

C. LOADING SOFTENER TANK

1. On Model MATC-15, 30, 45 and 60 the softening media has been pre-loaded at the factory. Skip this section and go to "Connect All Fittings".
2. Fill tank(s) approximately 1/3 full of water using a hose, bucket, etc. Plug the PVC distributor manifold pipe using a plastic cap, cork, rag, etc. NO gravel or resin should go into this distributor manifold pipe.=
3. Verify the distributor manifold is center in the tank with the distributor resting on the bottom of the tank. Verify the riser pipe is still plugged.
   NOTE: Reference the specification table in the front of this manual for the correct quantities of gravel and resin. Note that these quantities are for each tank. Make sure you have the required amounts on site before you begin. Gravel is not required on systems with 12" tanks or smaller.
4. With care not to damage any lateral, pour in the gravel provided for each tank through the top opening in the tank and level out evenly. This will cover the distributor assembly.
   NOTE: Wetting the gravel in the bags before loading will eliminate the normal amount of dust.
5. When gravel is loaded and leveling is completed, proceed as follows:
6. With the distributor riser pipe still plugged, add the proper amount of resin supplied for each tank through the top opening in the tank.
   Caution: The softener resin is very slippery. Take care when stepping on any spilled resin. Remove spilled resin from standing surface immediately.
7. When loading is complete, remove plastic cap, cork, or rag that was used to plug the distributor riser pipe. Be careful not to let any foreign debris fall into the pipe. The result could be damage to system.
8. Repeat instruction steps 1-7 for each softener tank (if applicable).

D. MOUNTING CONTROL VALVE ASSEMBLY

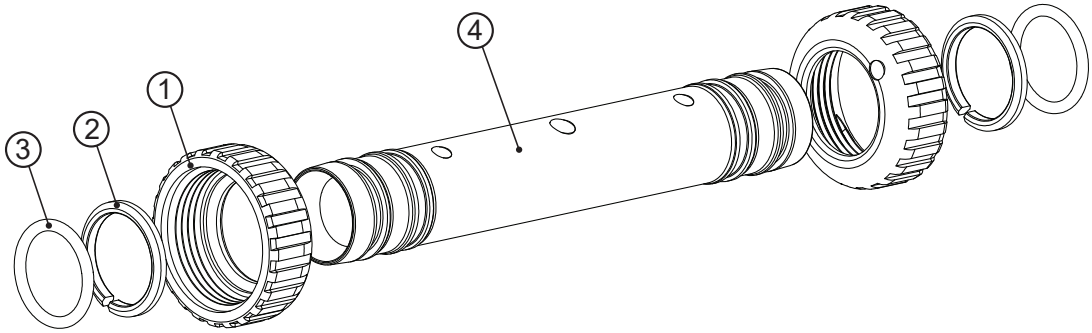
1. Verify that the distributor riser pipe is not plugged.
2. Lubricate the distributor o-ring on the bottom of the control valve with silicone.
3. Screw the control valve into top opening of tank making sure the distributor riser pipe slides easily through the distributor o-ring. Care must be taken not to “nick” this o-ring as hard water leakage could result.
4. Tighten down the control valve to ensure positive o-ring seal at top of tank.
5. Repeat steps 1-4 for the second tank adapter.

E. CONNECT ALL FITTINGS

CAUTION: Care must be used when working with copper tubing. Do not allow the flame from torch to contact any portion of the Valve assembly.

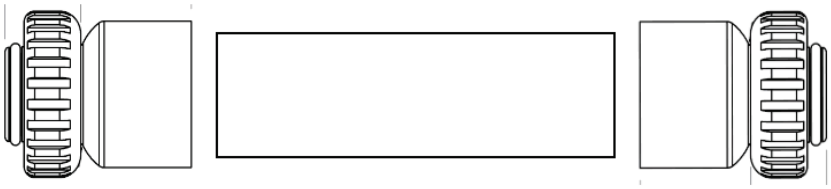
1. Attach 1/2” drain line to drain elbow with insert and nut. Use optional 3/4” drain fittings if drain run exceeds 25 ft.
2. Do not elevate the drain line over 5’ above the top of the valve (8’ on municipal systems) or to exceed 25’ in length at either height.

CAUTION: An air gap must be provided upon sewer entry. (Conform to local plumbing and sanitation codes and ordinances).



3. The salt storage cabinet or brine tank provides an overflow. Attach 1/2” ID flexible plastic tubing to the overflow fitting and direct it to the drain. DO NOT connect to the main drain line. Use a separate gravity flow line.
4. For pre-loaded systems, connect to bypass assembly (if used). The integral manual bypass option is a connection which eliminates the need for a 3-valve manifold. This makes installation easier and provides a more convenient method of bypassing.

F. TWIN ALTERNATING PLUMBING



The tanks should have been placed at the distance shown in the chart below. Locate the interconnect pipes (there are two).

Tank Placement based on Diameter	
Tank Diameter (in.)	Center-to-Center Distance (in.)
7”, 8”, 9”, 10”	11.5”
12”	13.5”
14”	15.5”
16”	17.5”
18”	19.5”

For systems with tank diameters from 7” to 10”, place the quick-connect nut (1), o-ring (2) and then split ring (3) on each end of each pipe (4). Insert the pipes between the main valve and the second tank adapter. Secure the pipes on each end using the quick-connect nut. Hand tighten only.

For systems with tanks 12” diameter and larger – additional connectors are needed to adapt the interconnecting pipes to the valve and second tank adapter. Locate the two interconnecting pipes (1-1/4” PVC) and the four (4) connectors and glue one connector to each end of the two interconnecting pipes using PVC glue. Once the glue is set up, insert the interconnecting piping assemblies between the main valve and the second tank adapter. Secure the pipes on each end using the split ring and quick-connect nut. Hand tighten all quick-connect nuts.

The inlet and outlet of the valve can be connected to an optional bypass assembly, or a 3-valve bypass as shown on the layout drawing. The integral manual bypass option is a connection which eliminates the need for a 3-valve manifold. This makes installation easier and provides a more convenient method of bypassing.

The softener system includes a 1” NPT male connector kit. Insert the two connectors into the inlet and outlet (of the valve or optional bypass) and hand tighten the quick-connect nuts. The raw water inlet line and soft water outlet lines are to be attached to the 1” male connectors.

G. PRESSURE TEST THE INSTALLATION

At this point, the water supply is still off and the softener bypass valve is open (inlet and outlet valves are closed). The unit can be plugged in at this time. The plumbing system can now be checked for any possible leaks.

1. Put the unit into fast rinse. To do this, push and hold the REGEN button for 3-5 seconds. When the Valve stops cycling, push the REGEN button again to advance to the next cycle. Continue until FAST RINSE is shown in the display, then unplug the unit. With water supply off, take the softener out of bypass and into the service position.
2. Open water supply line valve very slowly. Water should escape slowly from the drain line. If water enters too quickly, resin may be lost to the drain.
3. When all of the air has been purged from the mineral tank (water flows steadily from the drain) open the main supply valve fully.
4. Allow water to run to drain until clear. CHECK FOR LEAKS!
5. Plug the unit back in.
6. Manually step the unit through the remaining steps, stopping at the fill cycle (to do this, push the REGEN button). Once the piston has stopped moving, push the REGEN button again to the next cycle. Continue until Fill appears on the screen. The unit will now fill the brine tank to the appropriate level. (This sequence is for softeners with post fill brine)
7. Allow control to return to the home position.
8. Check for leaks!
9. Make sure the power cord is plugged into a properly grounded wall receptacle.

H. MANUAL REGENERATION

The user can initiate manual regeneration. The user has the option to request a manual regeneration at the delayed regeneration time or to have the regeneration occur immediately:

1. Pressing and releasing the REGEN button. "Regen Today" will flash on the display and the regeneration will occur at the delayed regeneration time. The user can cancel the request by pressing and releasing the REGEN button. This method of manually initiating regeneration is not allowed when the system is set to immediately regenerate when the gallon capacity reaches zero.
2. Pressing and holding the REGEN button for approximately 3 seconds will immediately start the regeneration The user cannot cancel this request.

NOTE: Program Timer "Lockout" Feature

The Program Timer is initially set to allow access to all Programming, Diagnostic and History screens

The Installer can limit access to (lockout) most screens by activating the Lockout Feature.

Activating "Lockout" allows the user to view and change only Water Hardness, Days Override, Time of Regeneration and Time of day.

Activate "Lockout" Feature: Press DOWN then NEXT then UP then SET CLOCK in sequence. LOCK will briefly appear in the display.

De-activate "Lockout" Feature: Press DOWN then NEXT then UP then SET CLOCK. UNLOCK will briefly appear in the display.

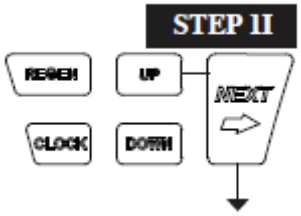
When in operation normal user displays such as time of day, gallons remaining or days remaining before regeneration are shown. When stepping through a procedure if no buttons are pressed within five minutes the display returns to a normal user display. Any changes made prior to the five minute time out are incorporated. The one exception is current flow rate display under the diagnostic procedure. The current flow rate display has a 30 minute time out feature.

CONTROL VALVE FUNCTION AND CYCLES OF OPERATION

This glass filled Noryl™ fully automatic control valve is designed as the primary control center to direct and regulate all cycles of a water softener or filter. When the control valve is set up as a softener, the control valve can be set to perform down flow or up flow regeneration with the proper piston. When the control valve is set up as a filter, the control valve can be set to perform down flow regeneration or simply backwash. The control valve can be set to regenerate on demand (consumption of a predetermined amount of water) and/or as a time clock (passage of a particular number of days). The control valve can be set so that the softener can meet the Water Quality Association (WQA) or NSF International efficiency rating.

The control valve is compatible with a variety of regenerants and resin cleaners. The control valve is capable of routing the flow of water in the necessary paths to regenerate or backwash water treatment systems. The injector regulates the flow of brine or other regenerants. The control valve regulates the flow rates for backwashing, rinsing and the replenishing of treated water into a regenerant tank, when applicable.

The 1” control valve is designed to deliver high service (30 gpm @ 15 psig) and backwash (16 gpm @ 25 psig) flow rates when the bypass has straight fittings and a 1.050” distributor. The control valve uses no traditional fasteners (e.g. screws), instead clips, threaded caps, nuts and snap type latches are used. Caps and nuts only need to be firmly hand tightened because radial seals are used. Tools required to service the valve include one small blade screwdriver, pliers and a pair of hands. Disassembly for servicing takes much less time than comparable products currently on the market. Control valve installation is made easy because the distributor tube can be cut 1/2” above to 1/2” below the top of the tank thread. The distributor tube is held in place by an o-ring seal and the control valve also has a bayonet lock feature for upper distributor baskets.



The transformer power pack comes with a 15-foot power cord and is designed for use with the control valve. The transformer power pack is for dry location use only. The control valve remembers all settings for up to 8 hours if the power goes out and the battery is not depleted. After 8 hours, the only item that needs to be reset is the time of day; other values are permanently stored in the nonvolitile memory. If a power loss lasts less than 8 hours and the time flashes on and off, the time of day should be reset and the non rechargeable battery should be replaced. The replacement battery is a commercially available 3 volt Lithium coin cell type 2032.

Table 3 shows the order of the cycles when the valve is set up as a softener.

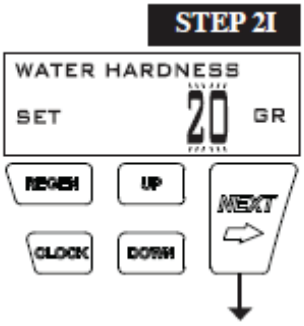


Table 3
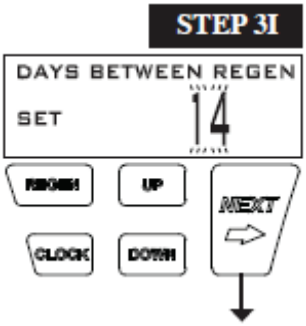
Regeneration Cycles Time

		Down Flow Softener
Grains Capacity / LB NaCl		3500 to 2501
Lbs. NaCl/cu ft resin		7.5 to 1.2
Cycle Time In Minutes	**1st Cycle: Backwash Normal**	8-10 minutes
	2nd Cycle: Brine Slowrinse	60 minutes
	3rd Cycle: Rinse	8-10 minutes
	4th Cycle: Fill	minutes will vary depending on softener capacity
	5th Cycle: End	0.011–200

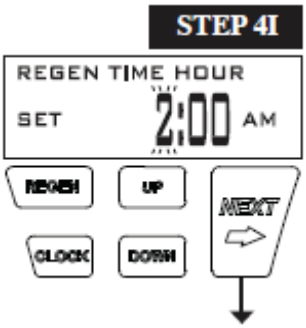
VALVE PROGRAMMING



STEP 1I - Press NEXT and UP simultaneously for 3 seconds.

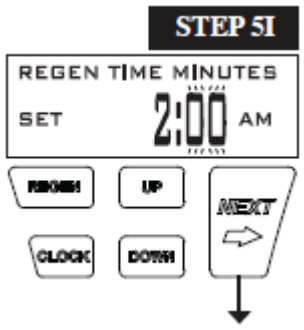
STEP 2I – **Hardness:** The default is 20 with value ranges from 1 to 150 in 1 grain increments. Note: The grains per gallon can be increased if soluble iron needs to be reduced.

Set the amount of hardness in grains of hardness as calcium carbonate per gallon using DOWN or UP.



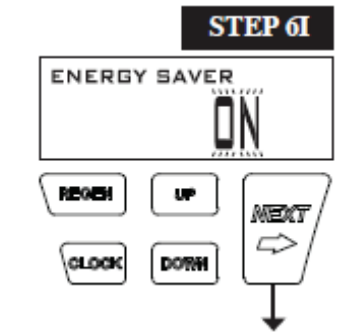
This display will not show if 'AUTO' is not selected in Set Volume Capacity in OEM Softener System Setup. Press NEXT to go to step 3I. Press REGEN to exit Installer Display Settings.

STEP 3I – **Day Override:** Number of days between regeneration (1 to 28); or "OFF".



If value set to "OFF", regeneration initiation is based solely on volume used. If value is set as a number (allowable range from 1 to 28) a regeneration initiation will be called for on that day even if sufficient volume of water were not used to call for a regeneration. Set Day Override using DOWN or UP.

When volume capacity is set to "OFF" (time clock), sets the number of days between regenerations. When volume capacity is set to AUTO or to a number (metered), sets the maximum number of days between regenerations. See Setting Options Table 8 for more detail on setup. Press NEXT to go to step 4I. Press REGEN to return to previous step.

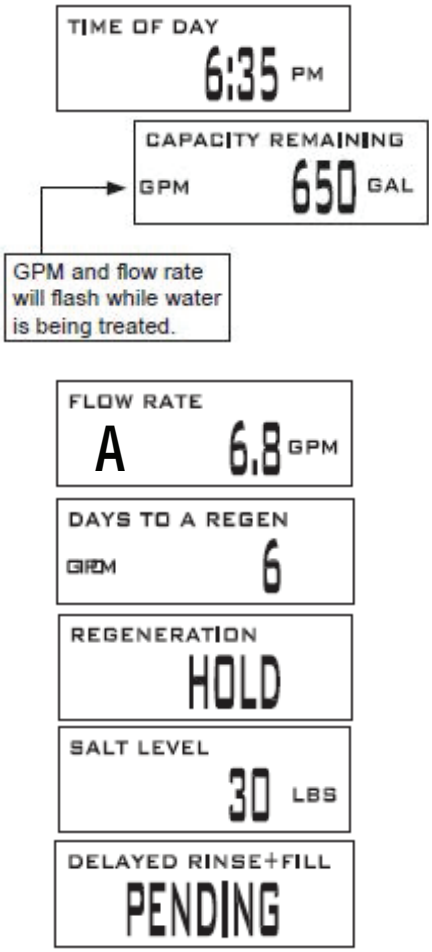


STEP 4I – **Next Regeneration Time (hour):** The default time is 2:00 AM. AM/PM toggles after 12.

Used for DELAY regeneration. Set the "hour" of day for regeneration using DOWN or UP. If "IMMEDIATE" is selected in Set Regeneration Time Option in OEM Softener System Setup, this display will show "REGEN IMMEDIATE ON ZERO GAL". Press NEXT to go to step 5I. Press REGEN to return to previous step.

STEP 5I – **Next Regeneration Time (minutes):**

Used for DELAY regeneration. Set the "minutes" of day for regeneration using DOWN or UP. This display will not be shown if "IMMEDIATE" is selected in Set Regeneration Time Option in OEM Softener System Setup. Press NEXT to go to Step 6I. Press REGEN to return to previous step.



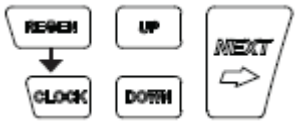
STEP 6I – Energy Saver operation: Set to "OFF" or "ON".

When set to OFF, the display backlight is always on. When set to ON, the display backlight will go off after 5 minutes of no keypad activity.

A valve error or salt level alert will activate the display backlight, and prevent deactivation until the error or alert is reset by the user. Press NEXT to exit Installer Display Settings. Press REGEN to return to the previous step.

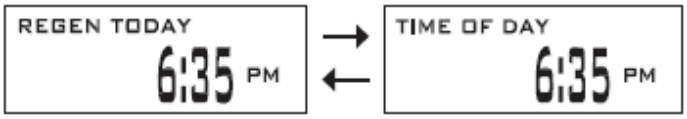
User Display Settings

When the system is operating, several displays may be shown. Pressing NEXT will alternate between the displays.



- Current TIME OF DAY.
- CAPACITY REMAINING is the gallons that will be treated before the system goes through a regeneration cycle (Metered units only). Pressing DOWN while in the Capacity Remaining display will decrease the capacity remaining in 10 gallon increments and will also increase the volume used impacting the recorded values in Diagnostics Steps 3D, 4D and 5D and Valve History, Step 4VH.
- If a water meter is installed, GPM flashes (and alternates with the flow rate) on the display when water is being treated (i.e. water is flowing through the system). A tank in service indicator (A or B) will show which tank is in service.
- DAYS TO A REGEN is the number of days left before the system goes through a regeneration cycle. Pressing UP or DOWN while in this screen will temporarily increase or decrease the displayed value by 1 day.
- Contact information will be displayed if it was edited. For concerns with phone number or banner text displays, contact OEM for instructions.
- DP or HOLD if the dP switch is closed.
- REGEN TODAY will alternate with the header on the display if the system has called for a regeneration that will occur at the pre-set time of regeneration.
- If Salt Level Monitor has been set to ON in Step 16S, the SALT LEVEL screen will appear. To adjust the salt level, press CLOCK, and use UP or DOWN to set the current value. The salt level is adjustable from 0 to 500 lbs. in 10 lb. increments
- DELAYED RINSE+FILL PENDING will be displayed whenever a zero-capacity tank has transferred to an off-line state and is currently waiting to initiate the second portion of a regeneration cycle. Viewed only when Delayed Rinse and Fill is set to ON.

Regeneration Mode

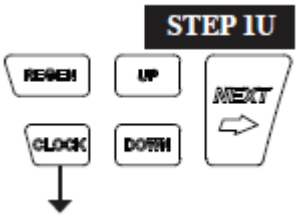


Typically a system is set to regenerate at a time of low water usage. An example of a time with low water usage is when a household is asleep. If there is a demand for water when the system is regenerating, untreated water will be used.

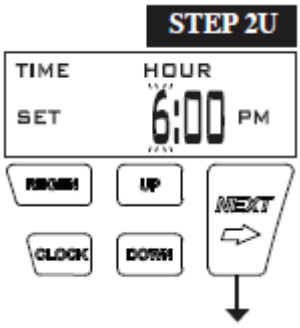
When the system begins to regenerate, the display will change to include information about the step of the regeneration process and the time remaining for that step to be completed. The system runs through the steps automatically and will reset itself to provide treated water when the regeneration has been completed.

Manual Regeneration

Sometimes there is a need to regenerate the system sooner than when the system calls for it, usually referred to as manual regeneration. There may be a period of heavy water usage because of guests or a heavy laundry day. To initiate a manual regeneration at the preset delayed regeneration time, when the regeneration time option is set to “DELAYED REGEN” or “DELAY + IMMEDIATE”, press and release “REGEN”.

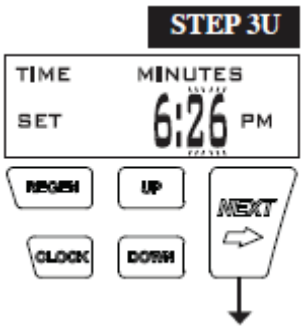


The words “REGEN TODAY” will periodically be shown on the display to indicate that the system will regenerate at the preset delayed regeneration time. If you pressed the “REGEN” button in error, pressing the button again will cancel the request.



Note: If the regeneration time option is set to “IMMEDIATE” there is no set delayed regeneration time so “REGEN TODAY” will not activate if “REGEN” button is pressed. To initiate a manual regeneration immediately, press and hold the “REGEN” button for three seconds. The system will begin to regenerate immediately. The request cannot be cancelled. Note: For softeners, if brine tank does not contain salt, fill with salt and wait at least two hours before regenerating.

Set Time of Day



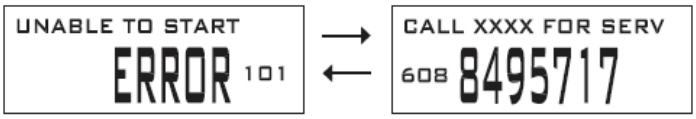
The user can also set the time of day. Time of day should only need to be set if the battery has been depleted because of extended power outages or when daylight saving time begins or ends. If an extended power outage occurs, the time of day will flash on and off which indicates the time of day should be reset. The non rechargeable battery should also be replaced.

STEP 1U – Press CLOCK

STEP 2U - Current Time (hour): Set the hour of the day using DOWN or UP. AM/PM toggles after 12. Press NEXT to go to Step 3U.

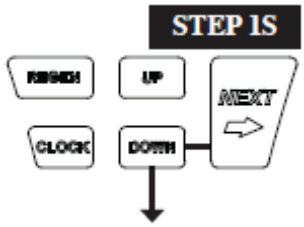
RETURN TO NORMAL MODE

STEP 3U - Current Time (minutes): Set the minutes of the day using DOWN or UP. Press NEXT to exit Set Time of Day. Press REGEN to return to previous step.



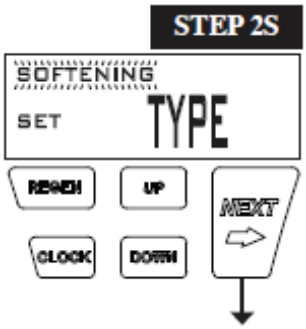
Power Loss

If the power goes out the system will keep time until the battery is depleted. If an extended power outage occurs, the time of day will flash on and off which indicates the time of day should be reset and the non rechargeable battery replaced. The system will remember the rest.

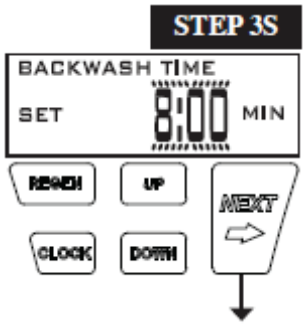


Error Message

If the word “ERROR” and a number are displayed contact the OEM for help. This indicates that the valve was not able to function properly. If the number and banner text in the Contact Screens has been edited, the two displays below will alternate.

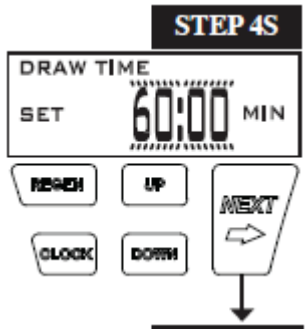


Manufacturers Softener System Setup

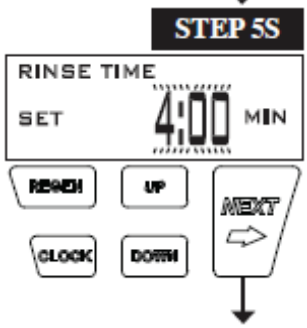


Step 1S – Press NEXT and DOWN simultaneously for 3 seconds and release. If screen in Step 2S does not appear in 5 seconds the lock on the valve is activated. To unlock press DOWN, NEXT, UP, and SET CLOCK in sequence, then press NEXT and DOWN simultaneously for 3 seconds and release.

It is not necessary for the installer or end user to program these screens. All screens have been programmed for your specific equipment.

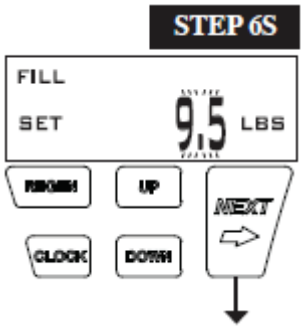


Step 2S – Choose SOFTENING using UP or DOWN. Press NEXT to go to Step 3S. Press REGEN to exit OEM Softener System Setup.



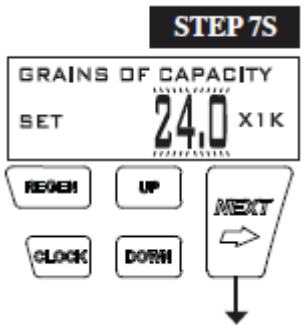
Step 3S – Select the time for the fi rst cycle (which in this example is BACKWASH) using UP or DOWN. Press NEXT to go to Step 4S. Press REGEN to return to previous step.

This is already programmed for your specific unit at Marlo Inc. You do not need to change.



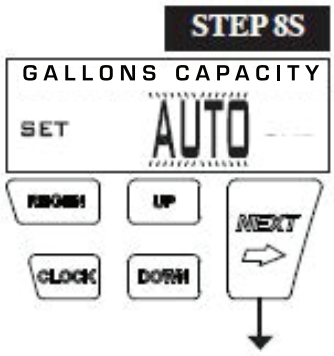
Step 4S – Select the time for the second cycle (which in this example is DRAW) using UP or DOWN. Press NEXT to go to Step 5S. Press REGEN to return to previous step.

This is already programmed for your specific unit at Marlo Inc. You do not need to change.



Step 5S – Select the time for the third cycle (which in this example is RINSE) using UP or DOWN. Press NEXT to go to Step 6S. Press REGEN to return to previous step.

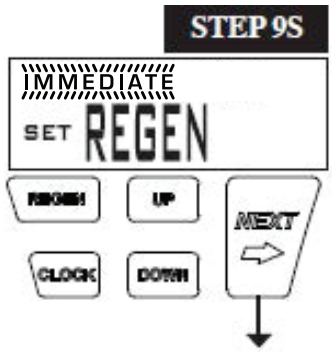
This is already programmed for your specific unit at Marlo Inc. You do not need to change.



Step 6S – Select the LBS for the fourth cycle (which in this example is FILL) using UP or DOWN. When both 2.0L and 2.0 are options in Step 2CS, and 2.0 is selected, FILL is in minutes. Press NEXT to go to Step 7S. Press REGEN to return to previous step.

This is already programmed for your specific unit at Marlo Inc. You do not need to change.

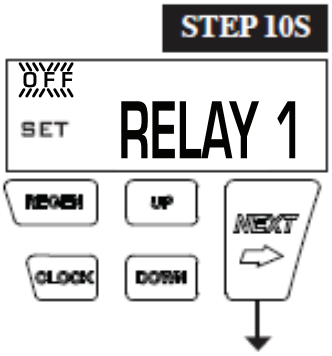
Step 7S – Set Grains Capacity using UP or DOWN. The ion exchange capacity is in grains of hardness as calcium carbonate for the system based on the pounds of salt that will be used. Calculate the pounds of salt using the fill time previously selected. Grains capacity is affected by the fill time. The grains capacity for the selected fill time should be confirmed by OEM testing. The capacity and hardness levels entered are used to automatically calculate reserve capacity when volume capacity is set to AUTO. Press NEXT to go to Step 8S. Press REGEN to return to previous step.



Capacity is already set by Marlo Inc.

Step 8S – Set Gallons Capacity using UP or DOWN. If value is set to:

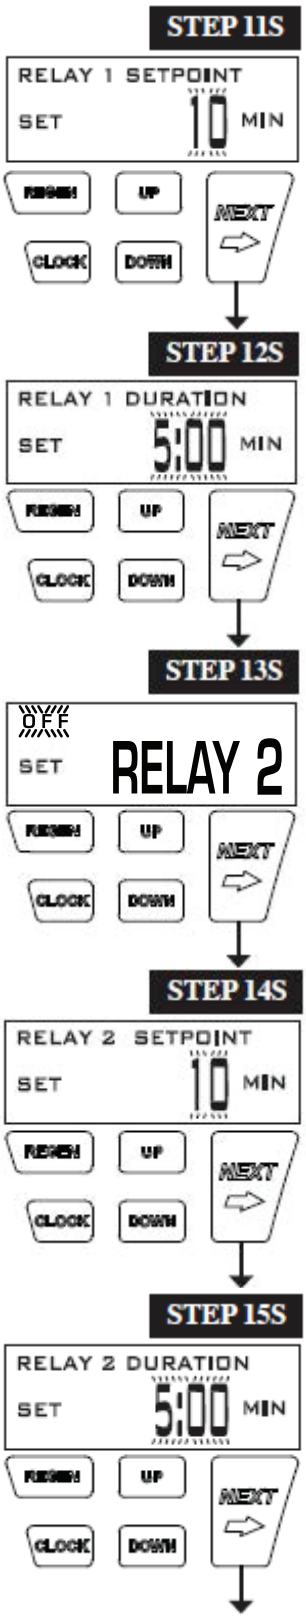
- "AUTO" capacity will be automatically calculated and reserve capacity will be automatically estimated; **AUTO is the default of all Marlo equipment.**
- "OFF" regeneration will be based solely on the day override set (see Installer Display Settings Step 3I); **"OFF" feature is for Time Clock units only**; or
- "GAL", regeneration initiation will be based off the value specified.



If "OFF" or a number is used, hardness display will not be allowed to be set in Installer Display Settings Step 2I.
If "OFF" is selected, Regeneration Time is automatically "Delayed", so Step 9S will not appear.
See Setting Options Table 8 for more detail. Press NEXT to go to Step 9S. Press REGEN to return to previous step

Step 9S – Set Regeneration Time Options using UP or DOWN. If value is set to:

- "DELAYED" means regeneration will occur at the preset time
- "IMMEDIATE" means regeneration will occur immediately when the volume capacity reaches 0 (zero). "IMMEDIATE" is the default on all Marlo equipment configured as twin alternating



See Setting Options Table 8 for more detail. Press NEXT to go to Step 10S. Press REGEN to return to previous step.

Step 10S: Set Relay 1 operation using UP or DOWN. The choices are:

- Set TIME: Relay activates after a set time at the beginning of a regeneration and then deactivates after a set period of time. The start of regeneration is defined as the first backwash cycle or Regenerant Draw UP (1" only) or DN, which ever comes first. See steps 11S & 12S.
- Set GALLONS: Relay activates after a set number of gallons have been used while in service and then deactivates after a set period of time or after the meter stops registering flow, whichever comes first.
- Set REGEN GAL: Relay activates after a set number of gallons have been used while in service or during regeneration and then deactivates after a set period of time or after the meter stops registering flow, whichever comes first.
- Set OFF: If set to Off, Steps 11S and 12S will not be shown.

Press NEXT to go to Step 11S. Press REGEN to return to previous step.

Step 11S: Set Relay 1 SETPOINT Time or Gallons using UP or DOWN. The choices are:

- Relay Actuation Time: After the start of a regeneration the amount of time that should pass prior to activating the relay. The start of regeneration is defined as the first backwash cycle or Regenerant Draw UP (1" only) or DN, which ever comes first. Ranges from 0 to 500 minutes.
- Relay Actuation Gallons: Relay activates after a set number of gallons have passed. Ranges from 1 to 20,000 gallons.

Press NEXT to go to Step 12S. Press REGEN to return to previous step.

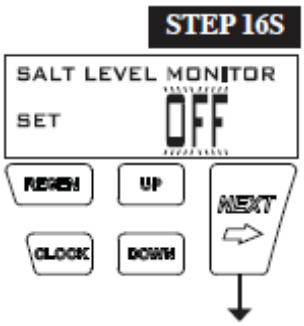
Step 12S: Set Relay DURATION TIME using UP or DOWN.

- If TIME is selected in Step 10S, the relay will deactivate after the time set has expired. Ranges from 0:01 to 500:00 minutes.
- If GALLONS or REGEN GAL is selected in Step 10S, the relay will deactivate after the time set has expired.

Press NEXT to go to Step 13S. Press REGEN to return to previous step.

Step 13S: Set Relay 2 operation using UP or DOWN. The choices are the same as Step 10S.

- If set to Off, Steps 14S and 15S will not be shown.



Press NEXT to go to Step 14S. Press REGEN to return to previous step.

Step 14S: Set Relay 2 SETPOINT Time or Gallons using UP or DOWN. The choices are the same as Step 11S. Press NEXT to go to Step 15S. Press REGEN to return to previous step.

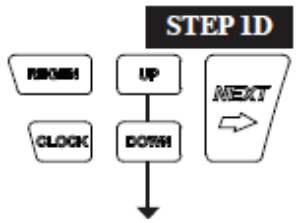
Step 15S: Set Relay DURATION TIME using UP or DOWN.

- If TIME is selected in Step 13S the relay will deactivate after the time set has expired.
- If GALLONS or REGEN GAL is selected in Step 13S the relay will deactivate after the time set has expired or after the meter stops registering fl ow, whichever comes first.

Press NEXT to go to Step 16S. Press REGEN to return to previous step

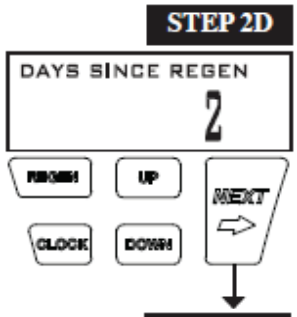
RETURN TO NORMAL MODE

Step 16S: Marlo does not turn this option on. Set Salt Level Monitor. This screen will not appear if Step 2CS is set to 2.0. Press NEXT to exit Softener System Setup. Press REGEN to return to the previous step.



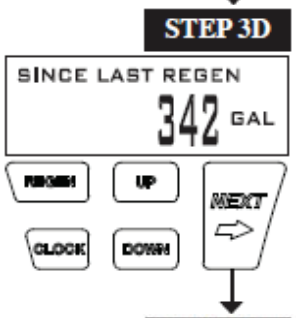
All Marlo equipment has “OFF” as the default.

SETTING OPTIONS TABLE 8



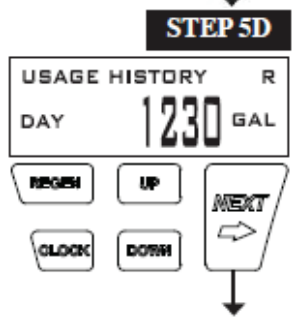
Volume Capacity	Regeneration Time Option	Day Override	Result4
AUTO	DELAYED REGEN	OFF	Reserve capacity automatically estimated. Regeneration occurs when volume capacity falls below the reserve capacity at the next Regen Set Time
AUTO	DELAYED REGEN	Any number	Reserve capacity automatically estimated. Regeneration occurs at the next Regen Set Time when volume capacity falls below the reserve capacity or the specified number of days between regenerations is reached.
Any number	DELAYED REGEN	OFF	Reserve capacity not automatically estimated. Regeneration occurs at the next Regen Set Time when volume capacity reaches 0.
OFF	DELAYED REGEN	Any number	Reserve capacity not automatically estimated. Regeneration occurs at the next Regen Set Time when the specified number of days between regenerations is reached.
Any number	DELAYED REGEN	Any number	Reserve capacity not automatically estimated. Regeneration occurs at the next Regen Set Time when volume capacity reaches 0 or the specified number of days between regenerations is reached.
AUTO	IMMEDIATE	OFF	Reserve capacity not automatically estimated. Regeneration occurs immediately when volume capacity reaches 0. Time of regeneration will not be allowed to be set because regeneration will always occur when volume capacity reaches 0.
Any number	IMMEDIATE	OFF	Reserve capacity not automatically estimated. Regeneration occurs immediately when volume capacity reaches 0. Time of regeneration will not be allowed to be set because regeneration will always occur when volume capacity reaches 0.

4 Reserve capacity estimate is based on history of water usage

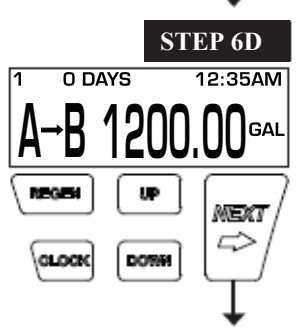


DIAGNOSTICS

STEP 1D – Press UP and DOWN simultaneously for three seconds. If screen in step 2D does not appear in 5 seconds the lock on the valve is activated. To unlock press DOWN, NEXT, UP, and CLOCK in sequence, then press UP and DOWN simultaneously for 3 seconds.

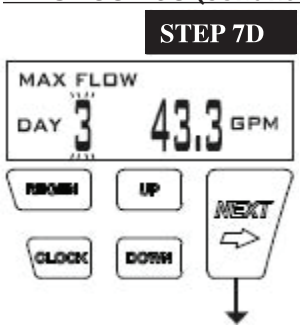


STEP 2D – Days, since last regeneration: This display shows the days since the last regeneration occurred. Press NEXT to go to Step 3D. Press REGEN to exit Diagnostics.



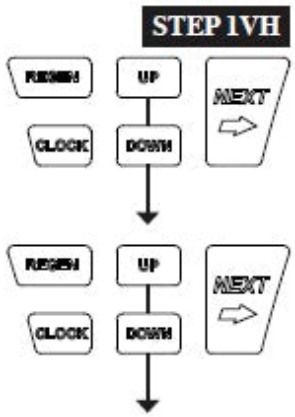
STEP 3D – Volume, since last regeneration: This display shows the volume of water that has been treated since the last regeneration. This display will equal zero if a water meter is not installed. Press NEXT to go to Step 4D. Press REGEN to return to previous step.

STEP 4D – Reserve History Volume used for last 7 days: If the valve is set up as a softener, a meter is installed and Set Volume Capacity is set to "Auto," this display shows 0 day (for today) and the reserve capacity. Pressing UP will show day 1 (which would be yesterday) and the reserve capacity used. Pressing UP again will show day 2 (the day before yesterday) and the reserve capacity. Keep pressing UP to show the capacity for days 3, 4, 5 and 6. DOWN can be pressed to move backwards in the day series. This screen is not displayed if fi lter, time clock, meter immediate, alternator or volume override regeneration is selected. Press NEXT at any time to go to Step 5D. Press REGEN to return to previous step.

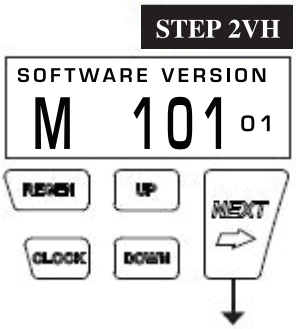


STEP 5D - Volume, 63-day usage history: This display shows day 0 (for today), day 1 (for yesterday), etc., and the volume of water treated that day. Press UP to show the volume of water treated for the last 63 days.
For the 1" twin valve, the usage for tank 1 & tank 2 is combined in this display. If a regeneration occured on the day the letter "R" will also be displayed. This display will show dashes if a water meter is not installed. Press NEXT at any time to go to Step 6D. Press REGEN to return to previous step.

STEP 6D- Tank Transfer History
This display shows data for the last 10 transfers. Flashing number indicates transfer number. A→B or B→A shows which direction transfer occurred. Days shows how many days ago the transfer happened. The number of gallons used at time of transfer is shown. Use UP or DOWN to scroll through each transfer. Press NEXT at any time to go to step 7D. Press REGEN to return to previous step.

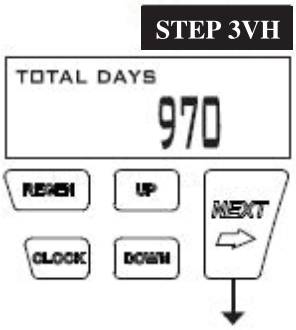


DIAGNOSTICS (continued)

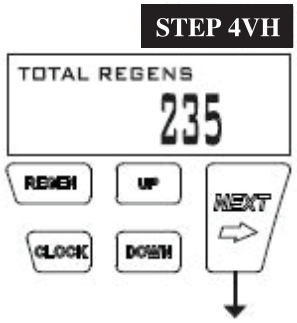


RETURN TO NORMAL MODE

STEP 7D – Flow rate, maximum last seven days: Use UP or DOWN to display the maximum flow rate in gallons per minute that occurred in each of the last seven days. This display will equal zero if a water meter is not installed. Press NEXT to exit Diagnostics. Press REGEN to return to previous step.

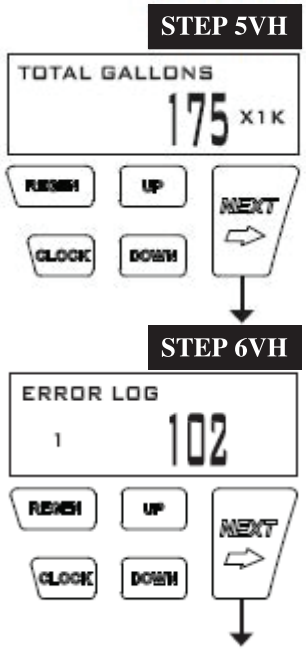


Valve History



STEP 1VH – Press UP and DOWN simultaneously for three seconds and release. Then press UP and DOWN simultaneously and release. If screen in step 2VH does not appear in 5 seconds the lock on the valve is activated. To unlock press DOWN, NEXT, UP, and CLOCK in sequence, then press UP and DOWN simultaneously for 3 seconds and release. Then press UP and DOWN simultaneously and release.

STEP 2VH – Software Version displays current software version programmed.



STEP 3VH$_5$ – Days, total since start-up: This display shows the total days since startup. Press NEXT to go to Step 3VH. Press REGEN to return to previous step

STEP 4VH – Regenerations, total number since start-up: This display shows the total number of regenerations that have occurred since startup. Press NEXT to go to Step 4VH. Press REGEN to return to previous step.

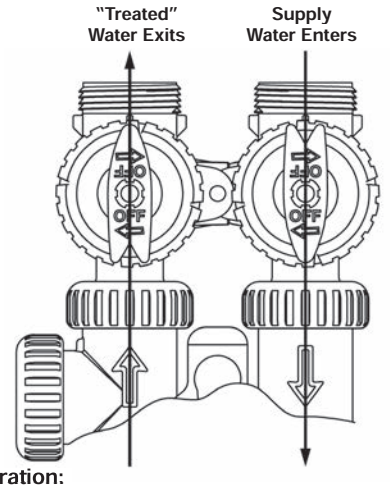
DIAGNOSTICS (continued)

STEP 5VH – Volume, total used since start-up: This display shows the total gallons treated since startup. This display will equal zero if a water meter is not installed. Press NEXT to go to Step 5VH. Press REGEN to return to previous step.

STEP 6VH – Error Log: This display shows a history of the last 10 errors generated by the control during operation. Press UP or DOWN to view each error recorded. Press NEXT to exit Valve History. Press REGEN to return to previous step.

RETURN TO NORMAL MODE

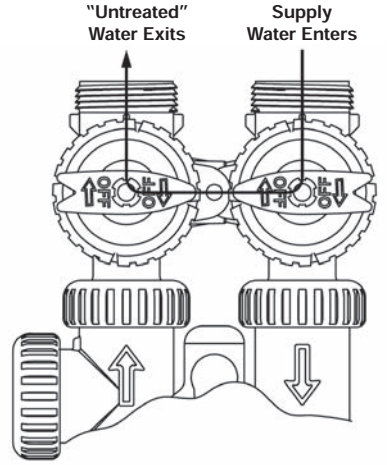
5 Values in steps 3VH through 6VH cannot be reset.



BYPASS VALVE (OPTIONAL)

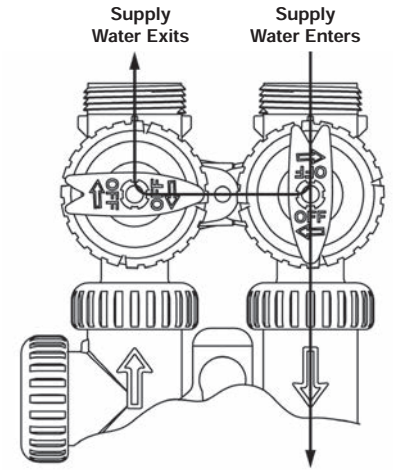
The bypass valve is typically used to isolate the control valve from the plumbing system's water pressure in order to perform control valve repairs or maintenance. The WS1 bypass valve is particularly unique in the water treatment industry due to its versatility and state of the art design features. The 1" full flow bypass valve incorporates four positions including a diagnostic position that allows service personal to work on a pressurized system while still providing untreated bypass water to the facility or residence. Its completely non-metallic, all plastic, design allows for easy access and serviceability without the need for tools.

The bypass body and rotors are glass filled Noryl and the nuts and caps are glass filled polypropylene. All seals are self-lubricating EPDM to help prevent valve seizing after long periods of non-use. Internal o-rings can easily be replaced if service is required.



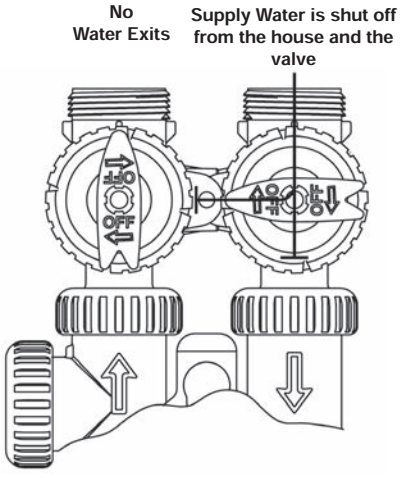
The bypass consists of two interchangeable plug valves that are operated independently by red arrow shaped handles. The handles identify the flow direction of the water. The plug valves enable the bypass valve to operate in four positions.

Figure 1
NORMAL OPERATION



Normal Operation:
The inlet and outlet handles point in the direction of flow indicated by the engraved arrows on the control valve. Water flows through the control valve during normal operation and this position also allows the control valve to isolate the media bed during the regeneration cycle.

Figure 2
BYPASS OPERATION

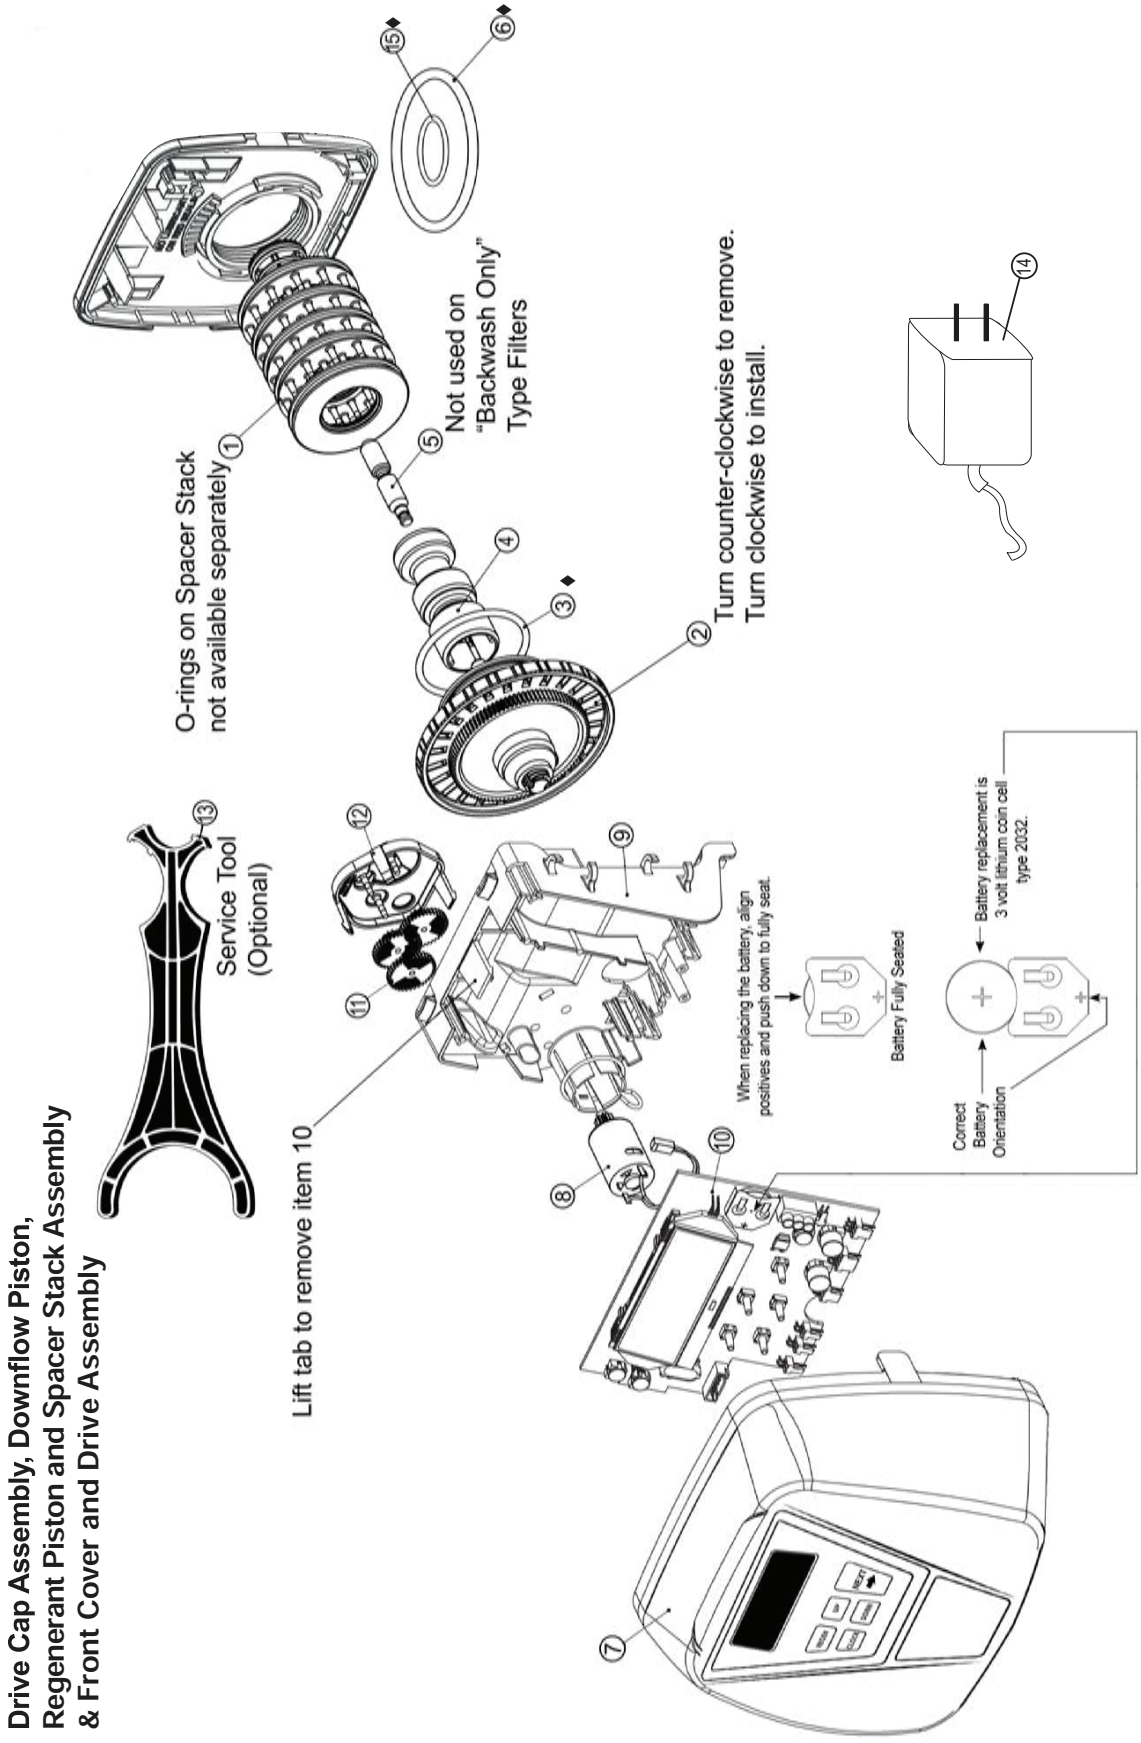


Bypass:
The inlet and outlet handles point to the center of the bypass, the control valve is isolated from the water pressure contained in the plumbing system. Untreated water is supplied to the plumbing system.

Figure 3
DIAGNOSTIC MODE

Diagnostic:
The inlet handle points in the direction of flow and the outlet handle points to the center of bypass valve, system water pressure is allowed to the control valve and the plumbing system while not allowing water to exit from the control valve to the plumbing.

Figure 4
SHUT OFF MODE



Shut Off:
The inlet handle points to the center of the bypass valve and the outlet handle points in the direction of flow, the water is shut off to the plumbing system. If water is available on the outlet side of the softener it is an indication of water bypass around the system (i.e. a plumbing connection somewhere in the building bypasses the system).

MATC PARTS LISTING

Part Number	No.	Description
B3950550	1	Complete control valve for MATC-15-1 Metered
B3950551	1	Complete control valve for MATC-30-1 Metered
B3950552	1	Complete control valve for MATC-45-1 Metered
B3950553	1	Complete control valve for MATC-60-1 Metered

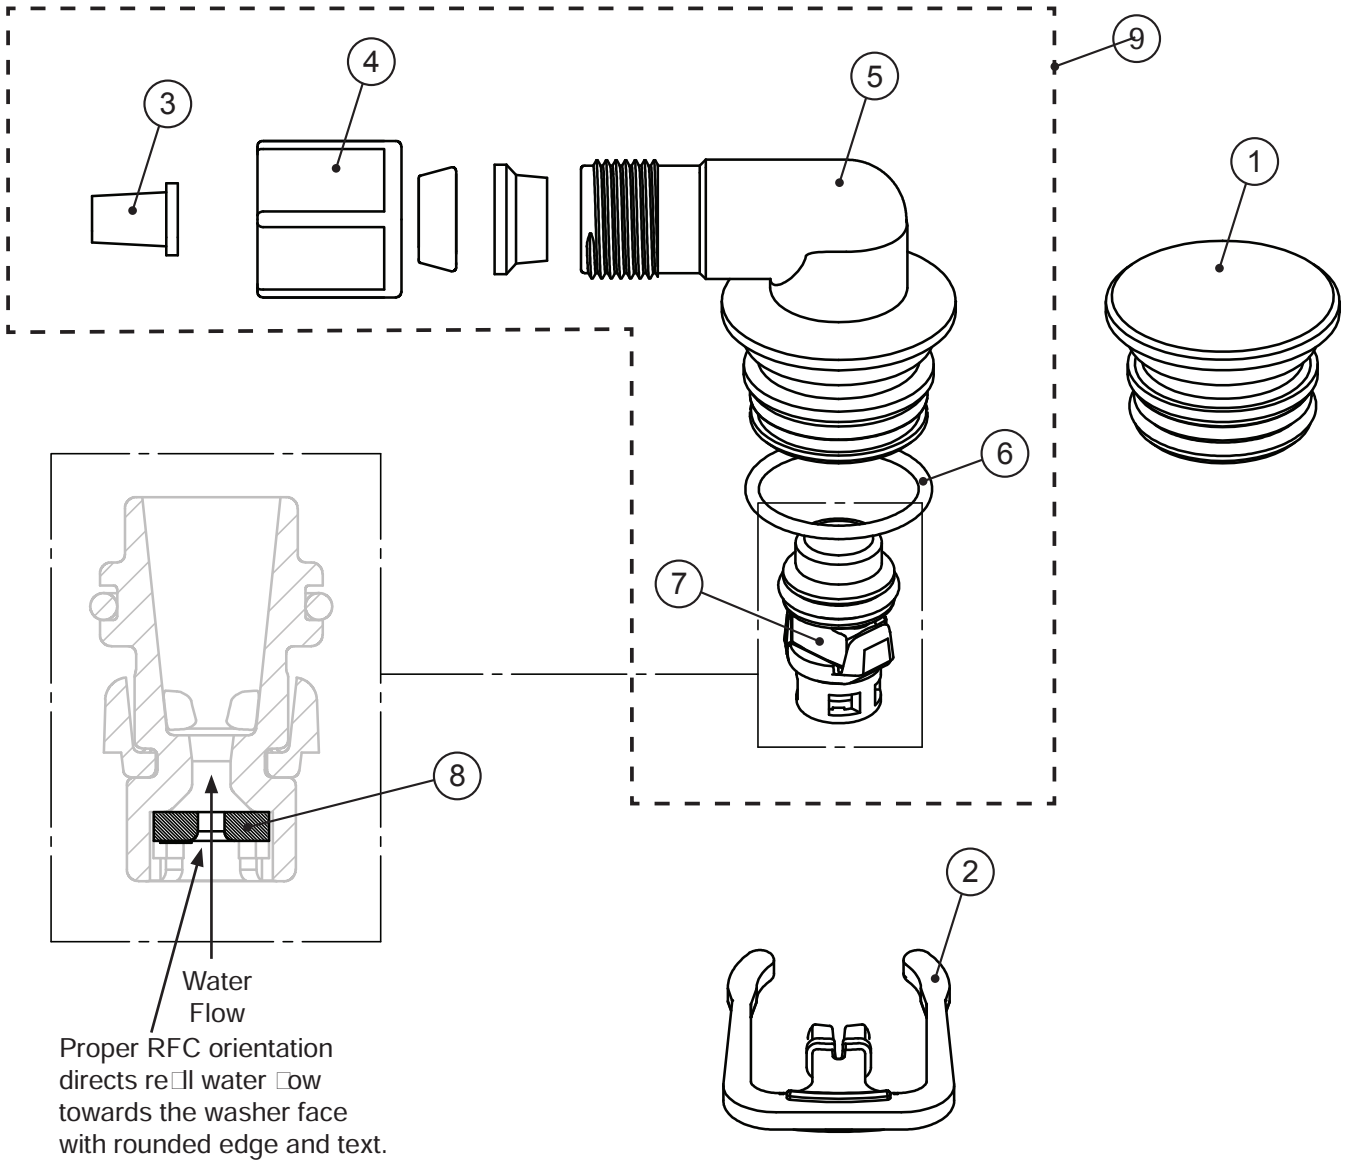
Not Shown	A2077225	V3170	O-RING 011	*
Not Shown	A2077226	V3171	O-RING 013	*

* The injector plug and the injector each contain one 011 (lower) and 013 (upper) o-ring.



Note: For up□ow position, injector is located in the up hole and injector plug is in the other hole. Up□ow option is not applicable to EA, EE or EI control valves.
For a □lter that only backwashes, injector plugs are located in both holes.

Refi ll Flow Control Assembly and Refi ll Port Plug

Drawing No.	Marlo Part #	Order No.	Description	Quantity

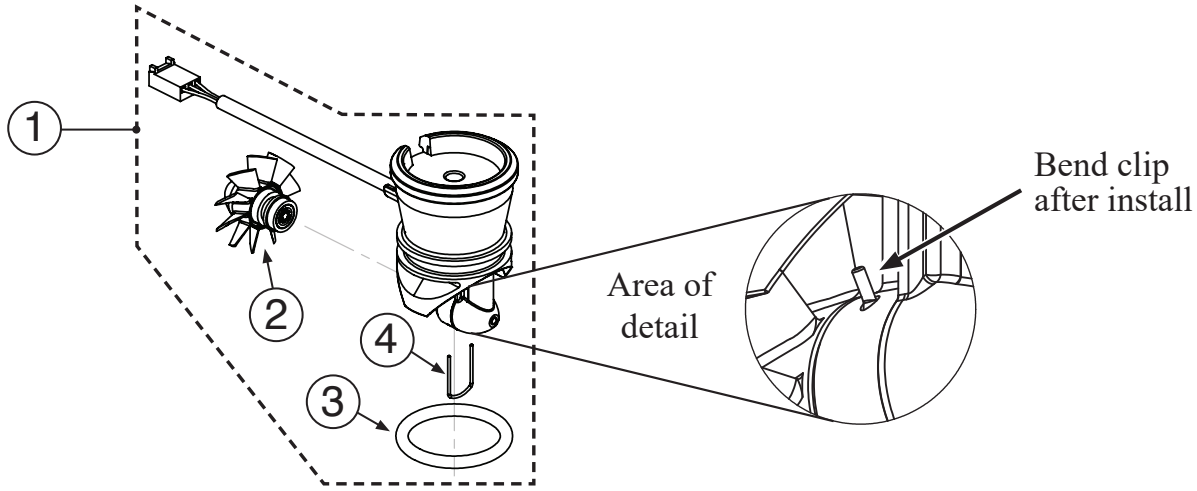
	A2253133	V3162-100	WS1 DLFC 10.0 gpm for ¾	

*4 and 6 can be ordered as a complete assembly - V3331 WS1 Drain Elbow and Retainer Asy



Valves are shipped without drain line flow control (DLFC) - install DLFC before using. Valves are shipped without ¾ nut for drain elbow (polytube installation only) and 5/8" polytube insert (polytube installation only).

Meter Assembly

Service or replace the turbine by:
1. Turn the bypass for the system on and relieve the pressure on the system before removing the meter.
2. Remove the nut and take the meter assembly out of the housing.
3. Remove the bend from the two exposed tips of the retaining clip V3501 and remove clip.
4. Service or replace the V3118-03 WS15/2 Turbine Assembly and place it back on the turbine shaft.
5. Insert the V3501 WS15/2 Turbine Clip and re-bend the exposed ends of the clip. The V3118-03 turbine has a groove to line up with the V3501 WS15/2 Turbine Clip.
6. Insert meter assembly back into the meter housing.
7. Re-install the nut.
8. Open the bypass for the system slowly to bring back into service and check to be sure you have no water leaks.

The V3118-03 has a groove to line up with the V3501 WS1.5/2 Turbine Clip.

Troubleshooting

Problem	Possible Cause	Solution
1. No Display on PC Board	a. No power at electric outlet	a. Repair outlet or use working outlet
	b. Control valve Power Adapter not plugged into outlet or power cord end not connected to PC board connection	b. Plug Power Adapter into outlet or connect power cord end to PC Board connection
	c. Improper power supply	c. Verify proper voltage is being delivered to PC Board
	d. Defective Power Adapter	d. Replace Power Adapter
	e. Defective PC Board	e. Replace PC Board
2. PC Board does not display correct time of day	a. Power Adapter plugged into electric outlet controlled by light switch	a. Use uninterrupted outlet
	b. Tripped breaker switch and/or tripped GFI	b. Reset breaker switch and/ or GFI switch
	c. Power outage	c. Reset time of day. If PC Board has battery back up present the battery may be depleted. See Front Cover and Drive Assembly drawing for instructions.
	d. Defective PC Board	d. Replace PC Board
	a. Meter is not connected to meter connection on PC Board	a. Connect meter to three pin connection labeled METER on PC Board
	b. Restricted/ stalled meter turbine	c. Remove meter and check for rotation or foreign material
	c. Meter wire not installed securely into three pin connector	c. Verify meter cable wires are installed securely into three pin connector labeled METER
	d. Defective meter	d. Replace meter
	e. Defective PC Board	e. Replace PC Board
4. Control valve regenerates at wrong time of day	a. Power outage	a. Reset time of day. If PC Board has battery back up present the battery may be depleted. See Front Cover and Drive Assembly drawing for instructions.
	b. Time of day not set correctly	b. Reset to correct time of day
	c. Time of regeneration set incorrectly	c. Reset regeneration time
	d. Control valve set at “on 0” (immediate regeneration)	d. Check programming setting and reset to NORMAL (for a delayed regen time)
	e. Control valve set at “NORMAL + on 0” (delayed and/ or immediate)	e. Check programming setting and reset to NORMAL (for a delayed regen time)
5. Time of day flashes on and off	a. Power outage	a. Reset time of day. If PC Board has battery back up present the battery may be depleted. See Front Cover and Drive Assembly drawing for instructions.
6. Control valve does not regenerate automatically when the REGEN button is depressed and held.	a. Broken drive gear or drive cap assembly	a. Replace drive gear or drive cap assembly
	b. Broken Piston Rod	b. Replace piston rod
	c. Defective PC Board	c. Defective PC Board
7. Control valve does not regenerate automatically but **does** when the REGEN button is depressed and held.	a. Meter is not connected to meter connection on PC Board	a. Connect meter to three pin connection labeled METER on PC Board
	b. Restricted/ stalled meter turbine	b. Remove meter and check for rotation or foreign material
	c. Incorrect programming	c. Check for programming error
	d. Meter wire not installed securely into three pin connector	d. Verify meter cable wires are installed securely into three pin connector labeled METER
	e. Defective meter	e. Replace meter
	f. Defective PC Board	f. Replace PC Board

Problem	Possible Cause	Solution
8. Hard or untreated water is being delivered	a. Media is exhausted due to high water usage	a. Check program settings or diagnostics for abnormal water usage
	b. Meter not registering	b. Remove meter and check for rotation or foreign material
	c. Water quality fluctuation	c. Test water and adjust program values accordingly
	d. No regenerant or low level of regenerant in regenerant tank	d. Add proper regenerant to tank
	e. Control fails to draw in regenerant	e. Refer to Trouble Shooting Guide number 12
	f. Insufficient regenerant level in regenerant tank	f. Check refill setting in programming. Check refill flow control for restrictions or debris and clean or replace
	g. Damaged seal/stack assembly	g. Replace seal/stack assembly
	h. Control valve body type and piston type mix matched	h. Verify proper control valve body type and piston type match
	i. Fouled media bed	i. Replace media bed
9. Control valve uses too much regenerant	a. Improper refill setting	a. Check refill setting
	b. Improper program settings	b. Check program setting to make sure they are specific to the water quality and application needs
	c. Control valve regenerates frequently	c. Check for leaking fixtures that may be exhausting capacity or system is undersized
10. Residual regenerant being delivered to service	a. Low water pressure	a. Check incoming water pressure – water pressure must remain at minimum of 25 psi
	b. Incorrect injector size	b. Replace injector with correct size for the application
	c. Restricted drain line	c. Check drain line for restrictions or debris and clean
11. Excessive water in regenerant tank	a. Improper program settings	a. Check refill setting
	b. Plugged injector	b. Remove injector and clean or replace
	c. Drive cap assembly not tightened in properly	c. Re-tighten the drive cap assembly
	d. Damaged seal/ stack assembly	d. Replace seal/ stack
	e. Restricted or kinked drain line	e. Check drain line for restrictions or debris and or straighten drain line
	f. Plugged backwash flow controller	f. Remove backwash flow controller and clean or replace
	g. Missing refill flow controller	g. Replace refill flow controller
12. Control valve fails to draw in regenerant	a. Injector is plugged	a. Remove injector and clean or replace
	b. Faulty regenerant piston	b. Replace regenerant piston
	c. Regenerant line connection leak	c. Inspect regenerant line for air leak
	d. Drain line restriction or debris cause excess back pressure	d. Inspect drain line and clean to correct restriction
	e. Drain line too long or too high	e. Shorten length and or height
	f. Low water pressure	f. Check incoming water pressure – water pressure must remain at minimum of 25 psi
13. Water running to drain	a. Power outage during regeneration	a. Upon power being restored control will finish the remaining regeneration time. Reset time of day.
	b. Damaged seal/ stack assembly	b. Replace seal/ stack assembly
	c. Piston assembly failure	c. Replace piston assembly
	d. Drive cap assembly not tightened in properly	d. Re-tighten the drive cap assembly

Problem	Possible Cause	Solution
14. E1, Err – 1001, Err – 101 = Control unable to sense motor movement	a. Motor not inserted full to engage pinion, motor wires broken or disconnected	a. Disconnect power, make sure motor is fully engaged, check for broken wires, make sure two pin connector on motor is connected to the two pin connection on the PC Board labeled MOTOR. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	b. PC Board not properly snapped into drive bracket	b. Properly snap PC Board into drive bracket and then Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	c. Missing reduction gears	c. Replace missing gears
15. E2, Err – 1002, Err – 102 = Control valve motor ran too short and was unable to find the next cycle position and stalled	a. Foreign material is lodged in control valve	a. Open up control valve and pull out piston assembly and seal/ stack assembly for inspection. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	b. Mechanical binding	b. Check piston and seal/ stack assembly, check reduction gears, check drive bracket and main drive gear interface. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	c. Main drive gear too tight	c. Loosen main drive gear. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	d. Improper voltage being delivered to PC Board	d. Verify that proper voltage is being supplied. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
16. E3, Err – 1003, Err – 103 = Control valve motor ran too long and was unable to find the next cycle position	a. Motor failure during a regeneration	a. Check motor connections then Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	b. Foreign matter built up on piston and stack assemblies creating friction and drag enough to time out motor	b. Replace piston and stack assemblies. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	c. Drive bracket not snapped in properly and out enough that reduction gears and drive gear do not interface	c. Snap drive bracket in properly then Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
17. Err – 1004, Err – 104 = Control valve motor ran too long and timed out trying to reach home position	a. Drive bracket not snapped in properly and out enough that reduction gears and drive gear do not interface	a. Snap drive bracket in properly then Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect

Problem	Possible Cause	Solution
18. Err -1006, Err – 106, Err - 116 = MAV/ SEPS/ NHBP/ AUX MAV valve motor ran too long and unable to find the proper park position Motorized Alternating Valve = MAV Separate Source = SEPS No Hard Water Bypass = NHBP Auxiliary MAV = AUX MAV	a. Control valve programmed for ALT A or b, nHbP, SEPS, or AUX MAV with out having a MAV or NHBP valve attached to operate that function	a. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect. Then re-program valve to proper setting
	b. MAV/ NHBP motor wire not connected to PC Board	b. Connect MAV/ NHBP motor to PC Board two pin connection labeled DRIVE. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	c. MAV/ NHBP motor not fully engaged with reduction gears	c. Properly insert motor into casing, do not force into casing Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	d. Foreign matter built up on piston and stack assemblies creating friction and drag enough to time out motor	d. Replace piston and stack assemblies. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
19. Err – 1007, Err – 107, Err - 117 = MAV/ SEPS/ NHBP/ AUX MAV valve motor ran too short (stalled) while looking for proper park position Motorized Alternating Valve = MAV Separate Source = SEPS No Hard Water Bypass = NHBP Auxiliary MAV = AUX MAV	a. Foreign material is lodged in MAV/ NHBP valve	a. Open up MAV/ NHBP valve and check piston and seal/ stack assembly for foreign material. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.
	b. Mechanical binding	b. Check piston and seal/ stack assembly, check reduction gears, drive gear interface, and check MAV/ NHBP black drive pinion on motor for being jammed into motor body. Press NEXT and REGEN buttons for 3 seconds to resynchronize software with piston position or disconnect power supply from PC Board for 5 seconds and then reconnect.

IMPORTANT PLEASE READ:

- **Warranty of this product extends to manufacturing defects.**
- **The information, specifications and illustrations in this manual are based on the latest information available at the time of printing. The manufacturer reserves the right to make changes at any time without notice.**
- **This product should be installed by a plumbing professional on potable water systems only.**
- **This product must be installed in compliance with all local and state and municipal plumbing and electrical codes. Permits may be required at the time of installation.**
- **If operating pressure exceeds 100 psi a pressure reducing valve must be installed. If operating pressure drops below 30 psi a booster pump must be installed.**
- **Do not install the unit where temperatures may drop below 32°F or rise above 100°F.**
- **A prefilter should be used on installations in which free solids are present.**
- **A constant voltage of 120V/60Hz (unless otherwise specified) must be supplied to the controller to maintain proper function.**
- **Union or flange fittings are recommended at the control valve’s inlet, outlet, and drain connections**
- **If distance of drain line is over a 10 ft. vertical or 25 ft. horizontal run, increase drain line one pipe size over that provided on the control valve.**
- **Do not make a direct connection to the drain. Provide an air gap of at least four times the diameter of the pipe to conform to sanitation codes and to permit observation of the flow.**

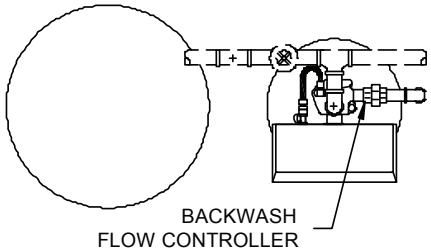
COMMERCIAL AND INDUSTRIAL PRODUCT WARRANTY

Marlo, Inc. warrants all commercial and industrial water treatment products manufactured and/or distributed by it to be free from defects in materials and workmanship for a period of one (1) year from the date of shipment. If within that period any products shall be proven to Marlo, Inc.’s satisfaction to be defective, those products will be replaced or the price refunded at Marlo Inc.’s option.

Marlo Inc.’s obligations or nonperformance, defective, or any damage caused by its products or their use, and buyer’s exclusive remedy therefore, shall be limited to product replacement or refund and shall be conditioned upon Marlo Inc.’s receiving written notice together with a demand for such replacement or refund:

The foregoing warranty is exclusive and in lieu of all other expressed implied warranty (except of title) including but not limited to implied warranty of merchantability and fitness for particular purpose.

Marlo Inc. will not be subject to and disclaims the following:



1. Any other obligations or liabilities arising out of breach of contract or out of warranty.
2. Any obligations whatsoever arising from tort claims (including negligence and strict liability) or arising under other theories of law with respect to products sold or services rendered by Marlo Inc. or any undertakings, acts, or omissions relating thereto.
3. All consequential, incidental, and contingent damages. Labor charges, change backs or handling charges are excluded from Marlo Inc.’s warranty provisions.

COMMERCIAL AND INDUSTRIAL WATER CONDITIONER GUARANTEE

Under normal operating conditions:

1. The loss of filter media through attrition during the first three (3) years shall not exceed 3% per year.
2. The filter media shall not be washed out of the system during backwash.
3. The color and turbidity of the softener effluent shall not be greater than the incoming water.

Any mechanical equipment proving defective in workmanship or material within one year after installation or eighteen (18) months after shipment, whichever comes first, shall be replaced FOB factory.

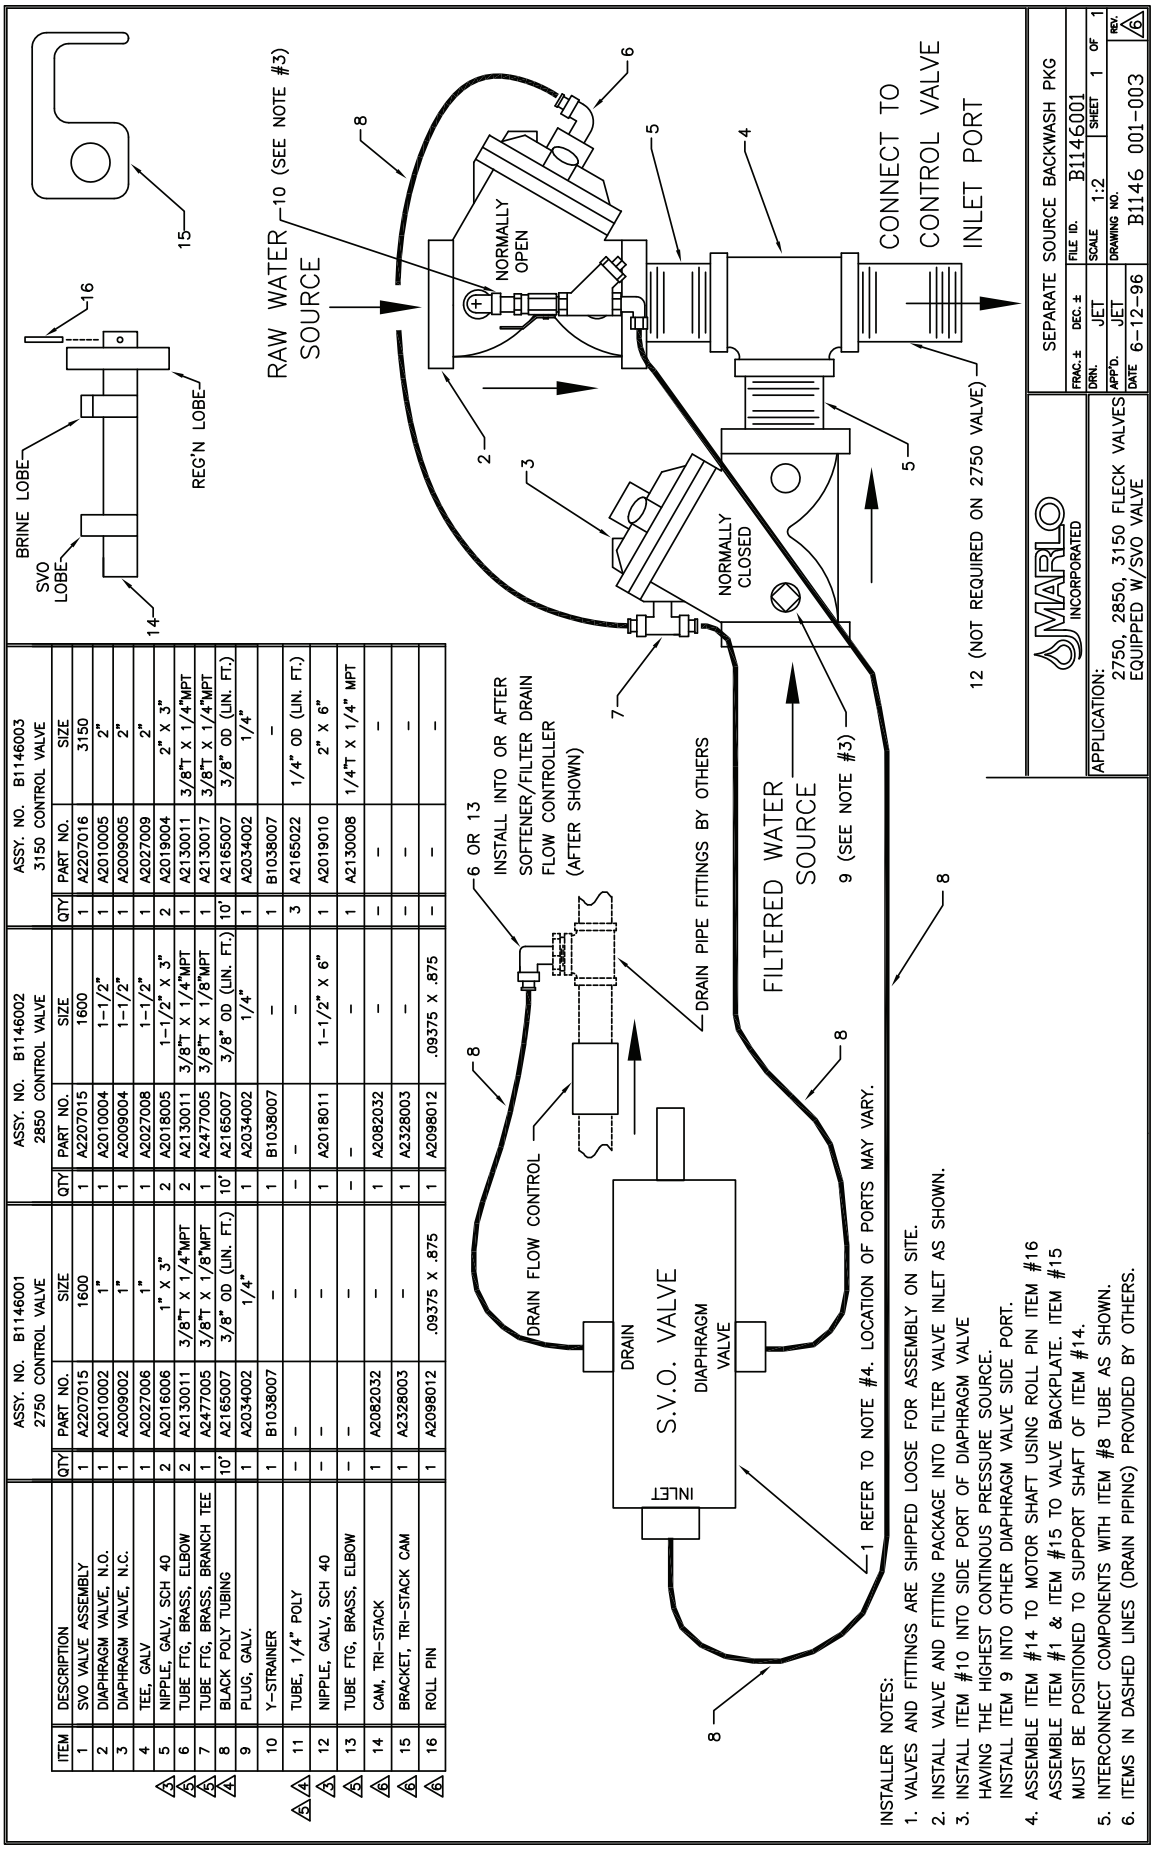
SEPARATE SOURCE BACKWASH (OPTIONAL)

This option allows the filter to use a separate water source for backwashing the system. The separate source uses diaphragm valves to control the flow of the backwash water. The diaphragm valves are controlled by a SVO (Service Valve Operator) that is mounted to the filter valve backplate.



The piston in the SVO Valve is actuated by a cam on the filter valve motor shaft. Extending the piston will allow Raw Water flow. Depressing the piston will allow Separate Source water flow.

ACTUAL SVO PORT LOCATIONS MAY VARY.

DRAWING IS SHOWN FOR CLARITY ONLY.

INSTALL THE STRAINER ASSEMBLY INTO THE INLET BOSS OF THE VALVE WITH THE HIGHEST PRESSURE. PLUG THE OTHER VALVE'S INLET BOSS.

INSTALLER NOTES:
1. VALVES AND FITTINGS ARE SHIPPED LOOSE FOR ASSEMBLY ON SITE.
2. INSTALL VALVE AND FITTING PACKAGE INTO FILTER VALVE INLET AS SHOWN.
3. INSTALL ITEM #10 INTO SIDE PORT OF DIAPHRAGM VALVE HAVING THE HIGHEST CONTINOUS PRESSURE SOURCE. INSTALL ITEM 9 INTO OTHER DIAPHRAGM VALVE SIDE PORT.
4. ASSEMBLE ITEM #14 TO MOTOR SHAFT USING ROLL PIN ITEM #16 ASSEMBLE ITEM #1 & ITEM #15 TO VALVE BACKPLATE. ITEM #15 MUST BE POSITIONED TO SUPPORT SHAFT OF ITEM #14.
5. INTERCONNECT COMPONENTS WITH ITEM #8 TUBE AS SHOWN.
6. ITEMS IN DASHED LINES (DRAIN PIPING) PROVIDED BY OTHERS.

AUX SWITCH (OPTIONAL)

The Aux Switch Option provides an extra switch on the brine valve cam assembly that ties to the terminal strip located on the back-plate of the valve. The switch provides a dry contact circuit that changes status dependent on filter valve’s step. It is most commonly used to lockout an RO activate a pump, or activate separate source inlet valves.

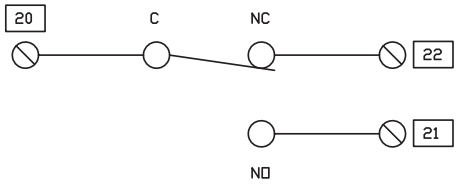
The switch is normally closed during service and normally open during regeneration.

STEP	DRY CONTACT STATUS	
	OPEN	CLOSED
SERVICE	20-21	20-22
BACKWASH/ / REGENERATION	20-22	20-21

Contact Rating: 220 VAC Max. / 2.0 AMP Max.

CONSTRUCTION NOTES:

1. INSTALL MICROSWITCH ASSEMBLY NEXT TO BRINE VALVE CAM ASSEMBLY ON VALVE.
2. INSTALL THE 3 TERMINALS AND LABEL THE TERMINALS NUMBERS 20, 21, 22.
3. WIRE THE MICROSWITCH USING 16 AWG RED WIRE.
4. WIRE AS FOLLOWS:
   COMMON TO 20
   NORMALLY OPEN TO 21
   NORMALLY CLOSED TO 22



LOCKOUT SWITCH NOTES:

2900 AND 3900 VALVE ALREADY USES THIS SWITCH FOR ITS OPEERATION.
3150 VALVE SYSTEM 4 THIS SWITCH IS ALREADY INSTALLED ON THE VALVE
AND IS AVAILABLE FOR RD LOCKOUT USE.

INSTALLATION INSTRUCTIONS

GENERAL INFORMATION

1. Minimum operating pressure is 25 psi. If pressures less then 25 psi are encountered, a pump must be installed.
2. Maximum operating pressure is 120 psi. If pressures greater then 120 psi are encountered, a pressure regulator must be installed.
3. Power requirements are shown on inside cover of the control valve.
4. Standard units are designed to condition unheated water not to exceed 100° F. Special valve assemblies are available to handle heated water supplies exceeding 100°F. Consult factory if applicable.
5. Each mineral tank is shipped with distributor manifold and control valve preassembled. Take care when uncrating and erecting so that no items are damaged.
6. The distributor assembly has been shipped inside the fiberglass mineral tank. Check to make sure that there is no damage to the riser pipe, basket, laterals, or hub.

LOCATE MINERAL TANKS

1. Select a location that is accessible and near a floor drain that has adequate carrying capacity to handle the water conditioner backwash flow. See specification table for the backwash flow rate.
2. Erect the mineral tanks on a concrete or other firm foundation and level.
3. A grounded electric receptacle is required for the control valves.

LOAD FILTER TANKS

1. On sizes 10 and 12 the media has been pre-loaded at the factory. Skip this section and go to “Mount Control Valve Assembly”.
2. Fill tank(s) approximately 1/3 full of water using a hose, bucket, etc. Plug the PVC distributor manifold pipe using a plastic cap, cork, rag, etc. No gravel or resin should go into this distributor manifold pipe.
3. Verify the distributor manifold is center in the tank with the distributor resting on the bottom of the tank. Verify the riser pipe is still plugged.

   Note: Reference the specification table in the front of this manual for the correct quantities of gravel and media. Note that these quantities are for each tank. Make sure you have the required amounts on site before you begin.
4. With care not to damage any lateral, pour in the gravel provided for each tank through the top opening in the tank and level out evenly. This will cover the distributor assembly.

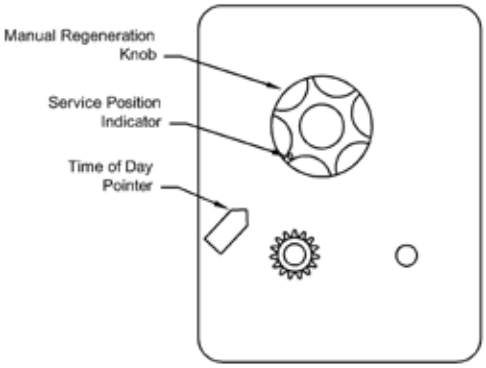
   Note: Wetting the gravel in the bags before loading will eliminate the normal amount of dust.
5. When gravel is loaded and leveling is completed, proceed as follows:
6. Refer to the specification table for the correct amounts and the order of media. Load the bottom layer first and work your way up to the top layer. With the distributor riser pipe still plugged, add the proper amount of media supplied for each tank through the top opening in the tank and then level the media layer.
7. Repeat step 6 for each type of media.
8. When loading is complete, remove plastic cap, cork, or rag that was used to plug the distributor riser pipe. Be careful not to let any foreign debris fall into the pipe. The result could be damage to system.
9. Repeat instruction steps 1-8 for each media tank.

MOUNT CONTROL VALVE ASSEMBLY

1. Verify that the distributor riser pipe is not plugged.
2. Lubricate the distributor O-ring on the bottom of the control valve with silicone.
3. Insert disperser in threaded base of control valve. The threaded base has a groove machined into the inside of the threaded part of the base to allow for the installation of this disperser.
4. Screw control valve into top opening of tank making sure the distributor riser pipe slides easily through the distributor O-ring. Care must be taken not to “nick” this O-ring as hard water leakage could result.
5. Tighten down the control valve to ensure positive O-ring seal at top of tank.
6. Repeat instruction steps 1-5 for each filter tank.

INSTALLATION OF CONNECTION PIPING

Note:



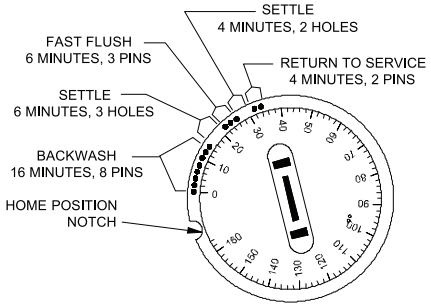
- Use thread sealing tape on all threaded piping connections.
- Install the piping conforming to federal, provincial, and local codes.
- Union or flanges are recommended at the control valve’s inlet, outlet, and drain connections
- To enhance the monitoring of the system’s performance sample valves and pressure gauges can be installed at the inlet and outlet piping to each control valve.
- If distance of drain line is over a 10 ft. vertical or 25 ft. horizontal run, increase drain line one pipe size over that provided on the control valve.
- Do not make a direct connection to the drain. Provide an air gap of at least four times the diameter of the pipe to conform to sanitation codes and to permit observation of the flow.

Caution: All piping must be properly supported. The tank and valve assemblies are not meant to support the connecting piping.

1. Install piping as shown on installation diagram. It is recommended that unions be installed on inlet and outlet connections to facilitate service of unit. Be sure piping is free of thread chips and other foreign matter. The connecting piping should be the same size or larger then the service inlet and outlet of the control valve. On multiple units that are both in service at the same time the common service inlet and outlet headers should be up-sized to accommodate the total flow.
2. Verify that the flow arrow stamped on the brass flow controller is pointing away from the control valve. See installation diagram or valve manual for the location. Install a drain line from backwash control assembly to an appropriate drain using a minimum of elbows. Install a union near the backwash control to facilitate cleaning. Do not install a valve on the drain line.

START-UP

Note: The Activated Carbon needs be allowed to soak for 1 to 2 hours before it can be backwashed. Dry Activated Carbon tends to float in water and will washout to drain.



1. Make sure all plumbing is complete and tight including drain line(s). Make all electrical connections per wiring diagrams provided.
2. Make sure inlet and outlet isolation valves are closed, and then turn on power to the system.
3. Remove the black plastic cover from the control valve. The regeneration cycle timer is secured to the backplate of the control valve. The timer is hinged on the right side. Grab the upper left corner of the timer and pull towards you. The timer will swing out to the right. The backside of the timer has a program wheel with holes and pins in it. Each hole or pin represents two (2) minutes.

The holes and pins control the regeneration cycle times as follows:

Step 1 - (Backwash)	First group of pins
Step 2 - (Settle)	First group of holes
Step 3 - (Fast Rinse)	Second group of pins
Step 4 - (Settle)	Second group of holes
Step 5 - (Return to Service)	Third group of pins

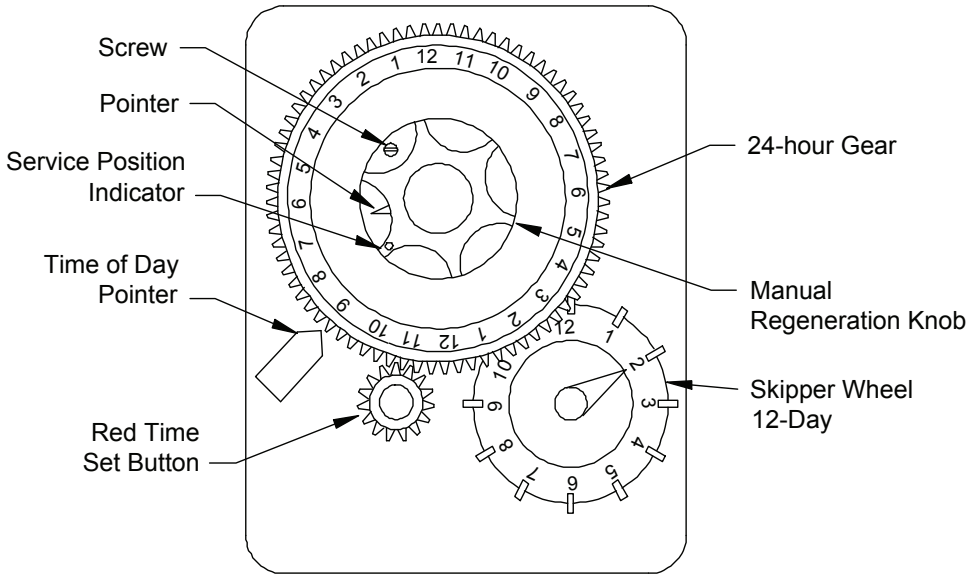
PROGRAM WHEEL

4. Locate the manual regeneration knob on the front side of the timer. Slightly turn the knob clockwise. The control valve will advance to backwash position. Be patient this will take several minutes.
5. Remove electrical power from unit, and then slowly open inlet water valve approximately half open. Water will begin to fill through bottom distributor into tank. When tank is full, water will begin to flow out of drain line. Slowly pen the inlet valve until full open. Allow water to flow from drain line for approximately 15 minutes.

   Note: Carbon filters will normally have considerable black fines on the initial backwash and may take 10–15 minutes to run clear. Monitor this drain water flow carefully. There is a problem if you see media in the drain water. Turn off inlet water immediately and then consult factory.
6. Restore electrical power to unit. Advance the control valve to settle position, using the same method as step 5. There should also be to flow at the drain line.
7. Advance the control valve to the fast rinse position. Remove electrical power to the unit. Let water run to drain position for approximately 5 minutes or until water runs clear.
8. Advance control valve to service position.
9. Proceed to start up the next tank (if applicable), by repeating steps 1-8.

SETTING THE TIME / DAY CLOCK

How to set the time of day:



1. Press and hold the red button in to disengage the drive gear.
2. Turn the large gear until the actual time is at the time of day pointer.
3. Release the red button to again engage the drive gear.

How to set days on which the filter is to regenerate:

1. Rotate the skipper wheel until the number “1” is at the red pointer.
2. Set the day that regeneration is to occur by sliding tabs on the skipper wheel outward to expose trip fingers. Each tab is one day. Finger at red pointer is tonight.
3. Moving clockwise from the red pointer, extend or retract fingers to obtain the desired regeneration schedule.

How to manually regenerate your Water Conditioner at any time:

Turn the manual regeneration knob clockwise. This slight movement of the manual regeneration knob engages the program wheel and starts the regeneration program. The manual regeneration knob will make one revolution in approximately three hours and stop in the position shown in the drawing. Even though it takes three hours for this center knob to complete one revolution, the regeneration cycle of your unit might be set only half of this time. In any event, conditioned water may be drawn after rinse water stops flowing from the water conditioner drain line.

How to adjust the time of day regeneration occurs:

1. Disconnect the power source.
2. Locate the three screws behind the manual regeneration knob by pushing the red button in and rotating the 24-hour dial until each screw appears in the cut out portion of the manual regeneration knob.
3. Loosen each screw slightly to release the pressure on the time plate from the 24-hour gear.
4. Locate the regeneration time pointer on the inside of the 24-hour dial in the cutout. The pointer is hard to see.
5. Turn the time plate so the pointer on the desired regeneration time aligns next to the raised arrow.
6. Push the red button in and rotate the 24-hour dial. Tighten each to the three screws.
7. Push the red button and locate the pointer one more time to ensure the desired regeneration time is correct.
8. Reset the time of day and restore power to the unit.

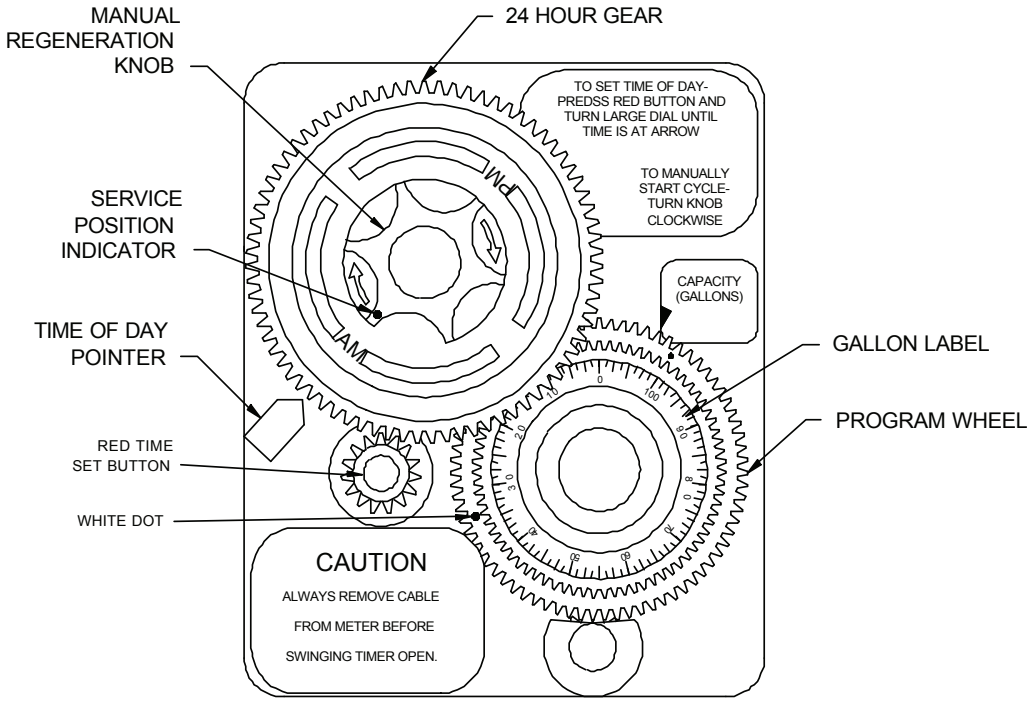
Note: On twin or triple unit filters with time clock controls, each unit should be set to regenerate on different days or different times to avoid simultaneous regenerations.

Note: The screw and pointer are shown for reference only. There is only one cutout in the knob

SETTING THE TIME CLOCK AND GALLONAGE (For filters with the water meter option)

Set the gallons required by lifting the gallon dial and rotating it so that the number of gallons required is aligned with the white dot on the program wheel gear. Release the gallon dial and check for firm engagement with the gear.

Note: To set meter capacity at the initial start-up, either:



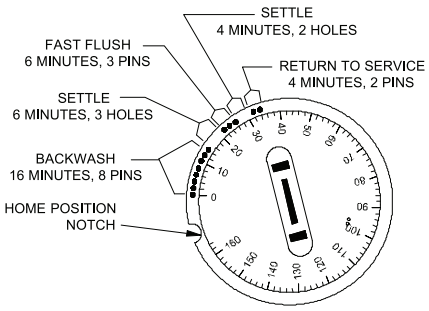
- Rotate the manual regeneration knob one full revolution.
- Rotate the program wheel manually clockwise and align the white dot with the capacity arrow.

How to set the time of day:

1. Press and hold the red button in to disengage the drive gear.
2. Turn the large gear until the actual time is at the time of day pointer.
3. Release the red button to again engage the drive gear.

How to manually regenerate your filter at any time:

Turn the manual regeneration knob clockwise. This slight movement of the manual regeneration knob engages the program wheel and starts the regeneration program. The manual regeneration knob will make one revolution in approximately three hours and stop in the position shown in the drawing. Even though it takes three hours for this center knob to complete one revolution, the regeneration cycle of your unit might be set only half of this time. In any event, conditioned water may be drawn after rinse water stops flowing from the water conditioner drain line.



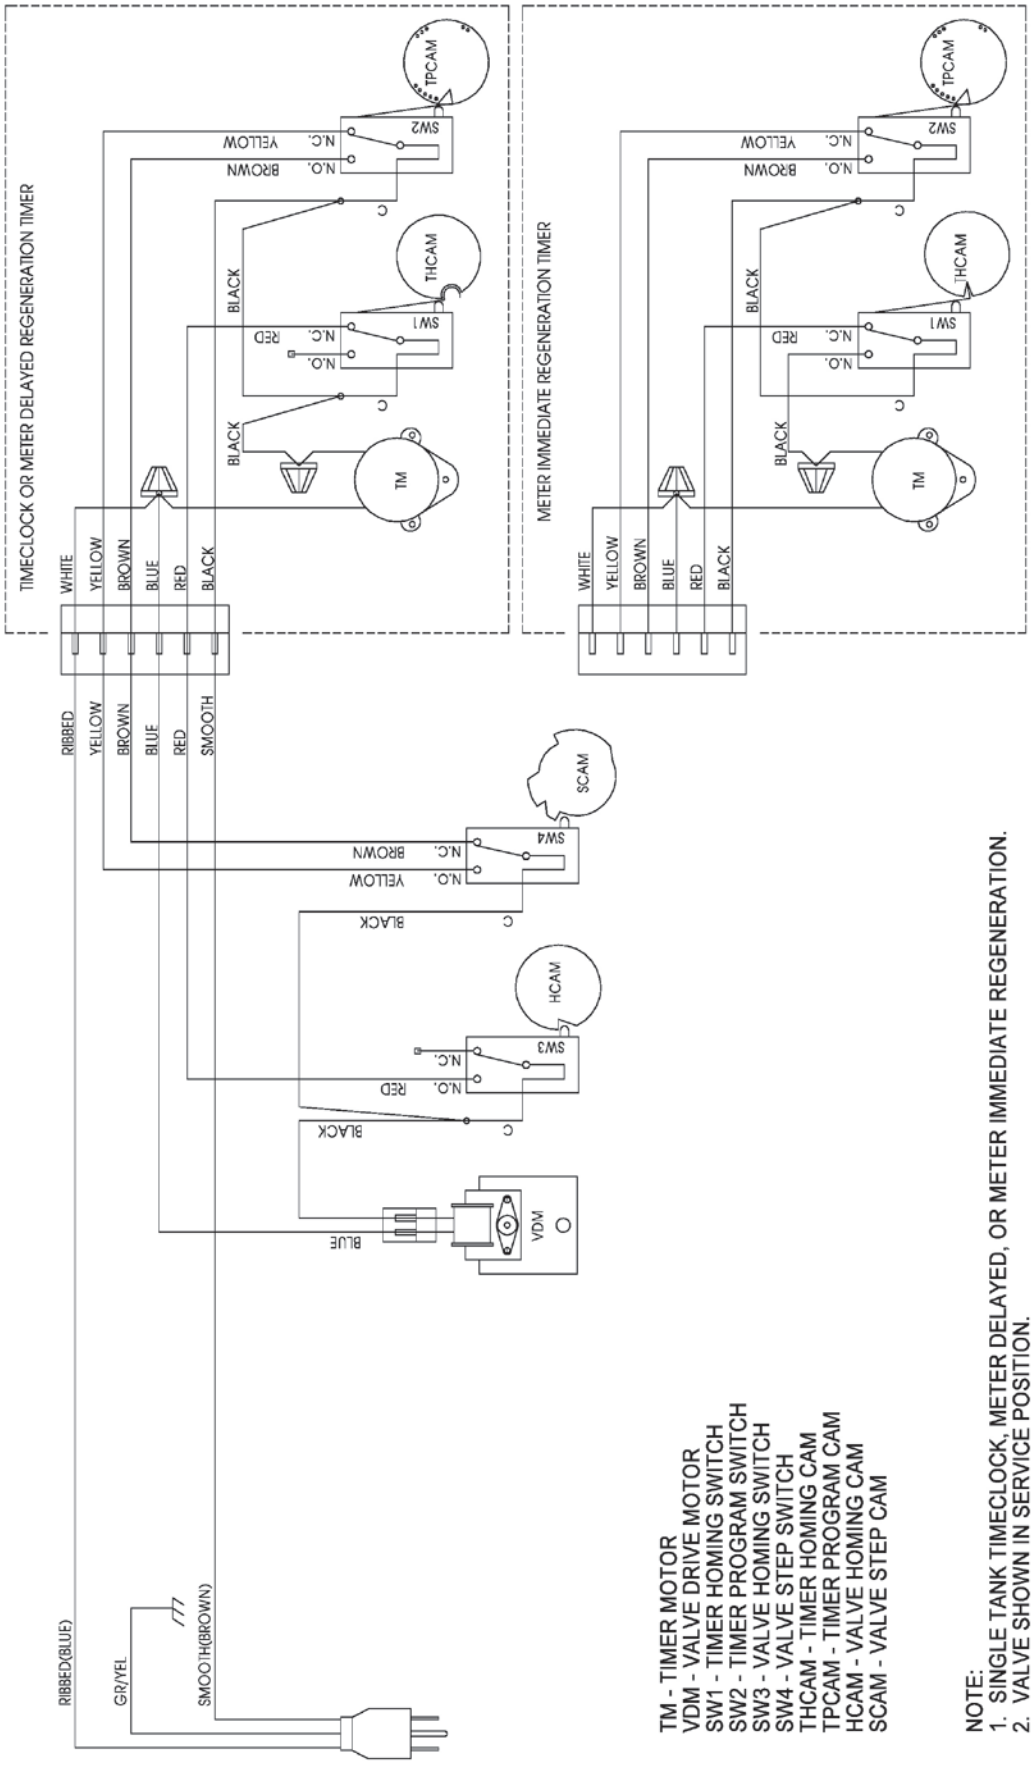
SETTING THE REGENERATION CYCLE PROGRAM TIMER

The regeneration cycle program on your water softener has been factory set. However, portions of the cycle program may be lengthened or shortened in time to suit local conditions. The regeneration cycle timer is secured to the back-plate of the control valve. The timer is hinged on the right side. Grab the upper left corner of the timer and pull towards you. The timer will swing out to the right. The backside of the timer has a program wheel with holes and pins in it.

The holes and pins control the regeneration cycle times as follows:

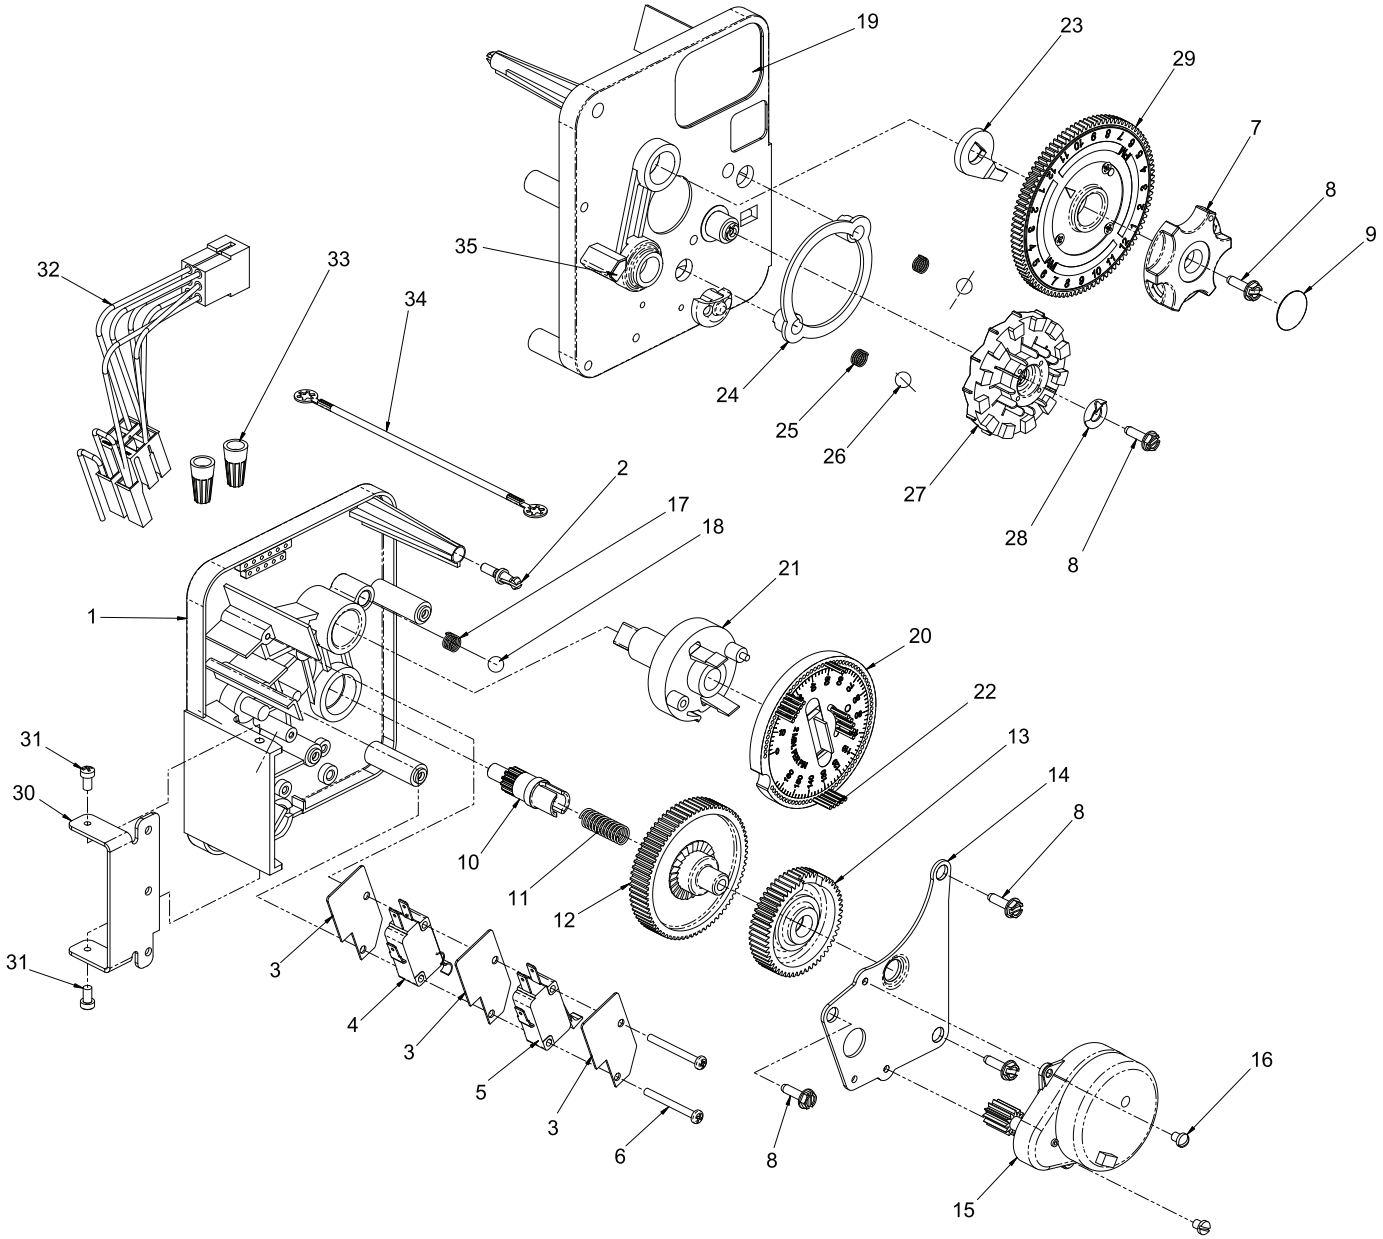
Step 1 - (Backwash)	First group of pins
Step 2 - (Settle)	First group of holes
Step 3 - (Fast Rinse)	Second group of pins
Step 4 - (Settle)	Second group of holes
Step 5 - (Return to Service)	Third group of pins

PROGRAM WHEEL



- **Backwash**: The cycle duration is factory set at 16 minutes for clean feed water applications. Increase time if turbidity is present in the feed water.
- **Settle**: The cycle duration is factory set at 6 minutes for clean feed water applications.
- **Fast Flush**: The cycle duration is factory set at 6 minutes.
- **Settle**: The cycle duration is factory set at 4 minutes.
- **Cycle End**: The cycle duration is factory set at 4 minutes. Its purpose is to identify the end of regeneration and advance the filter back to the service cycle.

To adjust the regeneration cycle program it is easier to remove the program wheel by pushing the two black tabs located in the center of the program wheel while pushing up on the program wheel.



As you look at the number side of the program wheel, starting at zero the number of the group of pins determines the length of time that your unit will be in Backwash. If there are six pins in this section, the time of backwash will be 16 minutes (2 minutes per pin). You must add or remove pins to change the length of this time. All the following groups of holes or pins must be adjusted to maintain their original time.

Important: Changing the time duration in any cycle will require a readjustment of all pins and holes for all the following steps.

60150-01 SVO (New Style)

TROUBLESHOOTING 2750 VALVE

Problem	Cause	Correction
1. Water conditioner fails to regenerate.	**A.** Electrical service to unit has been interrupted	**A.** Assure permanent electrical service (check fuse, plug, pull chain, or switch)
	B. Timer is defective.	**B.** Replace timer.
	C. Power failure.	**C.** Reset time of day.
2. Untreated water.	**A.** By-pass valve is open.	**A.** Close by-pass valve
	B. Leak at distributor tube.	**B.** Make sure distributor tube is not cracked. Check O-ring and tube pilot.
	C. Internal valve leak.	**C.** Replace seals and spacers and/or piston.
3. Loss of water pressure.	**A.** Iron buildup in line to water conditioner.	**A.** Clean line to water conditioner.
	B. Iron buildup in water conditioner.	**B.** Clean control and add mineral cleaner to mineral bed. Increase frequency of regeneration.
	C. Inlet of control plugged due to foreign material broken loose from pipes by recent work done on plumbing system.	**C.** Remove piston and clean control.
4. Loss of mineral through drain line.	**A.** Air in water system.	**A.** Assure that well system has proper air eliminator control. Check for dry well condition.
	B. Improperly sized drain line flow control.	**B.** Check for proper drain rate.
5. Iron in conditioned water.	**A.** Fouled mineral bed.	**A.** Check backwash, brine draw, and brine tank fill. Increase frequency of re-generation. Increase backwash time.
6. Control cycles continuously.	**A.** Misadjusted, broken, or shorted switch.	**A.** Determine if switch or timer is faulty and replace it, or replace complete power head.
7. Drain flows continuously.	**A.** Valve is not programming correctly.	**A.** Check timer program and positioning of control. Replace power head assembly if not positioning properly
	B. Foreign material in control.	**B.** Remove power head assembly and inspect bore. Remove foreign material and check control in various regeneration positions.
	C. Internal control leak.	**C.** Replace seals and piston assembly.

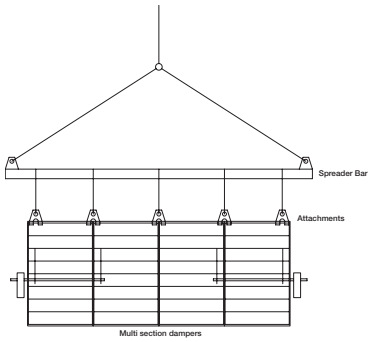
Installation, Operation, and Maintenance Instructions

This manual is the property of the owner, and is required for future maintenance. Please leave it with the owner when the job is complete.

RECEIVING AND HANDLING

Upon receiving dampers, check for both obvious and hidden damage. If damage is found, record all necessary information on the bill of lading and file a claim with the final carrier. Check to be sure that all parts of the shipment, including accessories, are accounted for.

Dampers must be kept dry and clean. Indoor storage and protection from dirt, dust and the weather is highly recommended. Do not store at temperatures in excess of 100°F (37ºC).



SAFETY WARNING:

Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury or death. Read the installation, operating, and maintenance instructions thoroughly before installing or servicing this equipment.

PRE-INSTALLATION GUIDELINES

The basic intent of a proper installation is to secure the volume control damper into the opening in such a manner as to prevent distortion and disruption of damper operation. The following items will aid in completing the damper installation in a timely and effective manner.

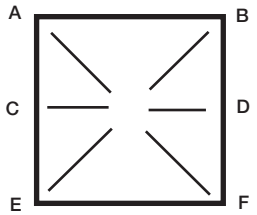
1) Check the schedules for proper damper locations within the building. Visually inspect the damper for damage.
2) Lift or handle damper using sleeve or frame. Do not lift damper using blades, linkage, actuators, or jackshafting. When handling multiple sections assemblies, use sufficient support to evenly lift at each section mullion (see drawing). Do not drag, step on, apply excessive bending, twisting, or racking.
3) Do not install screws in damper frame that will interfere with unexposed blade linkage and prevent damper blades from opening and/or closing.
4) Damper must be installed into duct or opening square and free of twist or other misalignment. Damper must not be squeezed or stretched into duct or opening. Out of square, racked, twisted or misaligned installations can cause excessive leakage and/or torque requirements to exceed damper/actuator design.

5) Damper and actuator must be kept clean, dry and protected from dirt, dust and other foreign materials prior to and after installation. Examples of such foreign materials include but are not limited to:
    a) Mortar dust
    b) Drywall dust
    c) Firesafing materials
    d) Wall texture
    e) Paint overspray
6) Damper should be sufficiently covered as to prevent overspray if wall texturing or spray painting will be performed within 5 feet (1.50m) of the damper. Excessive dirt or foreign material deposits on damper can cause excessive leakage and/or torque requirements to exceed damper/actuator design.
7) ACCESS: Suitable access (actuators maintenance, etc.) must be provided for damper inspection and servicing. Where it is not possible to achieve sufficient size access, it will be necessary to install a removable section of duct.

ELECTRICAL GUIDELINES

Electrical and/or pneumatic connections to damper actuators should be made in accordance with wiring and piping diagrams developed in compliance with applicable codes, ordinances and regulations.

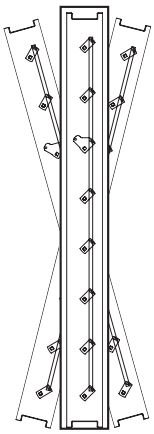
SAFETY CAUTION!



Verify power requirements before wiring actuator. Greenheck is not responsible for any damper to, or failure of the unit caused by incorrect field wiring.

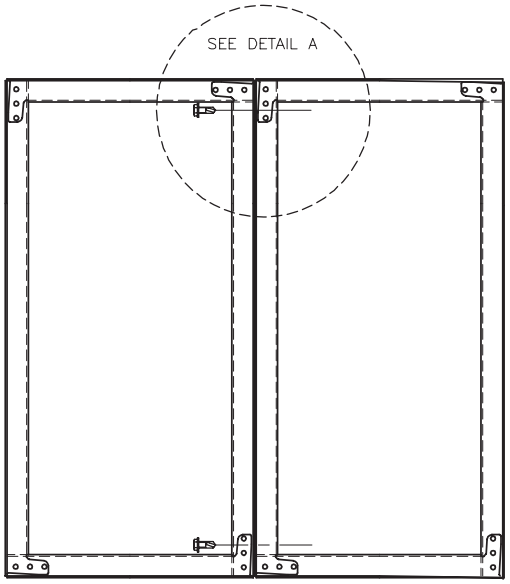
SAFETY DANGER!

Electrical input may be needed for this equipment. This work should be performed by a qualified electrician.

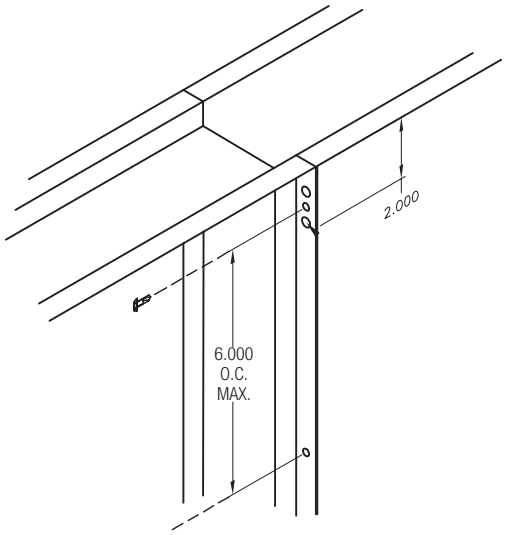


INSTALLATION - FAILURE TO FOLLOW INSTRUCTIONS WILL VOID ALL WARRANTIES

1. Duct opening or opening square should be measured 1/4 inch (6mm) larger than damper dimension and should be straight and level.



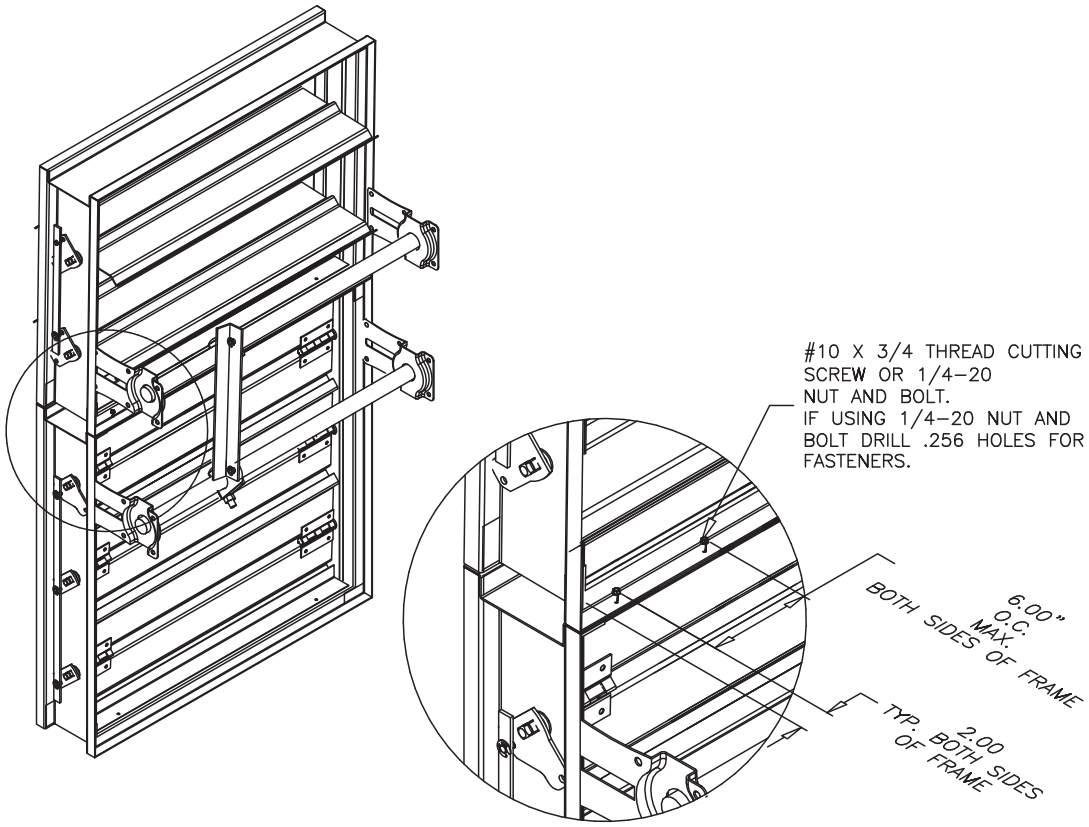
AF=BE
AB=CD



Do not twist or bow. Mount damper plumb in the opening.

INSTALLATION CONTINUED....

2. If more than two sections wide, unit ships as a multiple section assembly and a single section together. The single section is joined to the side of the multiple section where the jackshaft extends past the frame four inches (102mm).



3. A damper assembly is not restricted to a maximum number of sections but, the assembly must not exceed the section sizes and overall sizes (see table below).

Damper Model	Maximum Single Section Size W x H in. (mm)	Maximum Overall Size for Multi-Section Dampers
VCD-20, VCD-23	48 x 74 (1219 x 1880)	Unlimited
VCD-33, VCD-34, VCD-40, VCD-42, VCD-43	60 x 74 (1524 x 1880)	Unlimited
VCD-20V, VCD-23V	74 x 48 (1879 x 1219)	NA
VCD-33V, VCD-42V, VCD-43V	74 x 60 (1879 x 1524)	NA
FBH-33 FBH-43	Face: 60 x 74 (1524 x 1880) Bypass: 60 x 74 (1524 x 1880)	Face: 96 x 74 (2438 x 1880)
FBV-33 FBV-43	Face: 60 x 74 (1524 x 1880) Bypass: 60 x 74 (1524 x 1880)	Face: 96 x 74 (2438 x 1880) Bypass: 96 x 74 (2438 x 1880)
FBH-23	Face: 48 x 74 (1219 x 1880) Bypasss: 48 x 74 (1219 x 1880)	Face: 96 x 74 (2438 x 1880)
FBV-23	Face: 48 x 74 (1219 x 1880) Bypasss: 48 x 74 (1219 x 1880)	Face: 96 x 74 (2438 x 1880) Bypass: 96 x 74 (2438 x 1880)

INSTALLATION (CONTINUED)....

4. The damper sections must be attached together with #10 x 3/4 in. (19mm) max. sheet metal screws, 1/4 in. (6mm) diameter nuts and bolts, tack or spot welds, or 3/16 in. (4mm) diameter steel pop rivets. Attachments must be spaced a maximum of 6 in. (152mm) on centers and a maximum of 2 in. (51mm) from corners. Attachments must be made on front face and back face (air entering and air exiting side) of damper sections.
5. Two section high dampers require reinforcement using a 14 gauge (2mm), 5 in. (127mm) wide mullion or two individually sleeved units stacked vertically. When using two individually sleeved units, the sleeve acts as the mullion, therefore no mullion is required (mullions are not provided by Greenheck).
6. When the height of a face & bypass vertical style (FBV) is greater than 84 in. (2134mm), the damper sections are shipped separate and field assembly is required. Before fastening damper sections together, the non-actuated damper section will need to be flipped upside down so that the linkage is on the same side as the actuated damper. After damper sections are fastened together, attach interconnecting angle as shown.

FRAME FASTENING DETAIL

7. If no holes are present in the frame, drill 1/4 inch (6mm) diameter holes at six inch (52mm) centers and fasten frames together with 1/4 inch (6mm) #20 (.03mm) bolts and nuts (see installation #2).
8. Use shims between damper frame and duct opening or opening space to prevent distortion of frame by fasteners holding it in place. Brace at every horizontal mullion and vertically brace at every eight feet (2.4m) of damper width for strength. Dampers in high velocity (2000 fpm [610mm] per second) may require more bracing.
   Note: Greenheck dampers are specifically designed and engineered for structural integrity based on model and conditions. Attachment, framing, mating flanges, and anchoring of damper assemblies into openings, ductwork, or walls is the responsibility of the installer. Design calculation for these retaining and supporting members should be determined by field engineers for that particular installation.
9. If the damper actuator is to be mounted out of the airstream, the extension pin should extend approximately six inches (152mm) beyond the frame. On jackshafted units, the jackshaft should extend through the jackshaft bearing assembly approximately six inches (152mm) beyond the frame.
10. Individual damper sections, as well as entire multiple section assemblies must be completely square and free from racking, twisting, or bending. Measure diagonally from upper corners to opposite lower corners of each section.
11. Damper blades, axles, and linkage must operate without binding. Before system operation, cycle dampers after installation to assure proper operation. On multiple section assemblies, all sections should open and close simultaneously.

Note: When you have a vertical damper installation, blades must be horizontal. When blades need to be vertical, you need a vertical blade damper (example: VCD-23V). These dampers are built so they don't crush the jamb seal.

DAMPER MAINTENANCE

Greenheck's dampers are designed to be trouble free and hassle free under normal operation. Dampers are to installed square and straight so as to prevent binding during operation. the following annual damper maintenance suggestions will help to insure proper damper operation and increase the life expectancy of the damper.

Foreign Matter Over the course of time, dirt and grime may collect on damper surfaces. The damper surfaces should be cleaned to prevent hindrance to airflow.

Moving Parts Make sure that parts such as linkage, bearings, blades, etc. that are intended to move freely, can do so. Lubricating these components can prevent possible rusting and unnecessary friction increase. Use only a moli-spray oil or similar graphite based oil as regular lubricating oil will attract dirt.

Bearings. Synthetic, oil impregnated, and ball bearings (without grease fittings) do not require lubrication. Ball bearings with grease fittings require only minimal grease.

Closure Remove foreign materials that may be interfering with blade closure or effective sealing of the blades with each other or with the frame.

Operation While operating the damper through its full cycle, check to see that the blades open and close properly. If there is a problem, check for loose linkage, especially at the actuator. Tighten the linkage where required.

DAMPER TROUBLESHOOTING

The following is a cause and correction list for common concerns with the dampers.

Symptom	Possible Cause	Corrective Action
Damper does not fully open and/or fully close	Frame is 'racked' causing blades to bind on jamb seals	Adjust frame such that it is square and plumb
	Actuator linkage loose	Close damper, disconnect power, adjust and tighten linkage
	Defective motor	Replace
	Screws in damper linkage	Locate screws and remove
	Actuator linkage hitting wall or floor	Damper installed too far into wall. Move out to line designated on damper label
	Contaminants on damper	Clean with a non oil-based solvent (see Damper Maintenance)
Actuator runs hot or makes a humming noise	Actuator prohibited from reaching end of stroke	Disconnect linkage from jackshaft, open damper, power actuator to end of spring, tighten linkage. Verify amp draw

Our Commitment

As a result of our commitment to continuous improvement, Greenheck reserves the right to change specifications without notice.

Specific Greenheck product warranties are located on greenheck.com within the product area tabs and in the Library under Warranties.

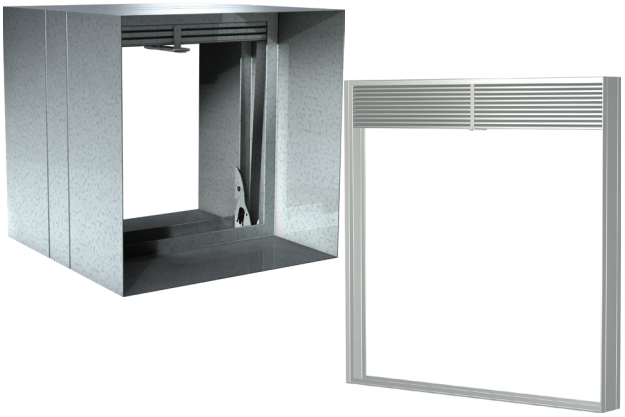
1½ and 3 Hour Curtain Fire Dampers



Vertical and Horizontal Mount

Installation, Operation and Maintenance Manual

Please read and save these instructions for future reference. Read carefully before attempting to assemble, install, operate or maintain the product described. Protect yourself and others by observing all safety information. Failure to comply with instructions could result in personal injury and/or property damage!

These instructions apply to 1½ and 3 hour rated fire dampers mounted (blades must be horizontal) in: 1) masonry, block, or stud walls and 2) concrete floors. Specific requirements in these instructions are mandatory. Dampers must be installed in accordance with these instructions to meet the requirements of UL 555.

Note: Fire dampers are manufactured and labeled for either vertical or horizontal installation. The dampers must be installed in accordance with labeling.

Receiving and Handling

Upon receiving dampers, check for both obvious and hidden damage. If damage is found, record all necessary information on the bill of lading and file a claim with the final carrier. Check to be sure that all parts of the shipment, including accessories, are accounted for.

Dampers must be kept dry and clean. Indoor storage and protection from dirt, dust and the weather is highly recommended. Do not store at temperatures in excess of 100°F (38°C).

Safety Warning

Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury or death. Read the installation, operating, and maintenance instructions thoroughly before installing or servicing this equipment.

Installation Supplements

Refer to the appropriate Greenheck installation supplements for special requirements:

- Closed Indicator Switch
- Concrete Floor with Steel Deck
- Drive Slip Breakaway Connection
- Field Installed Sleeve
- Fire Resistant Ventilated Duct Assembly
- Firestop Material
- Fusible Link Replacement
- Grille Installation
- Metal Stud in Shaftwall Partition
- Non-Concrete Horizontal Mount
- Quick Connect Breakaway Connection
- Sealant Supplement
- Single Side Retaining Angle
- Single 3-Sided Retaining Angle Supplement
- Sleeve Extension
- Support Mullions

Installation supplements available at www.greenheck.com.

Pre-Installation Guidelines

The following items will aid in completing the damper installation in a timely and effective manner.

1) Check the schedules for proper damper locations within the building. Visually inspect the damper for damage and verify that the fusible link is in place and has not activated. Never install a fire damper without the proper UL approved fusible link in place. Visually inspect the link to verify its not damaged. Replace link as necessary.

2) Lift or handle damper using sleeve or frame. Do not lift damper using blades.

3) Dampers have a label indicating the required mounting orientation. Care must be taken to ensure that the indicated orientation is adhered to.

4) Damper must be installed into duct or opening square and free of twist or other misalignment.

5) Damper must be kept clean and protected from dirt, dust and other foreign materials prior to and after installation. Examples of such foreign materials include but are not limited to:

    a) Mortar dust
    b) Drywall dust
    c) Firesafing materials
    d) Wall texture
    e) Paint overspray

6) Damper should be sufficiently covered as to prevent overspray if wall texturing or spray painting will be performed within 5 feet of the damper.

7) Caulking is not necessary, nor is it allowed, between the damper sleeve and the wall or floor opening (annular space). However, caulking may be applied to the retaining angles.

8) ACCESS: Suitable access (such that the fusible link may be removed and the damper's blade stack may be reset, etc.) must be provided for damper inspection and servicing. Where it is not possible to achieve sufficient size access, it will be necessary to install a removable section of duct. (Refer to NFPA 90A).

9) The Code Authority Having Jurisdiction (AHJ) must evaluate and provide approval of final installation where variations to these instructions are necessary.

Preparation of Openings

- Frame wall openings as shown below (**see Figure 1 & 2**).
- Gypsum wall board must be fastened 12 in. (305mm) on center to all stud and runner flanges surrounding opening.
- Prepare opening between studs and sleeve assembly as shown below (**see Figure 3 & 4**).
- All construction and fasteners must meet the requirements of the appropriate wall design (See UL Fire Resistance Directory) and/or local codes.

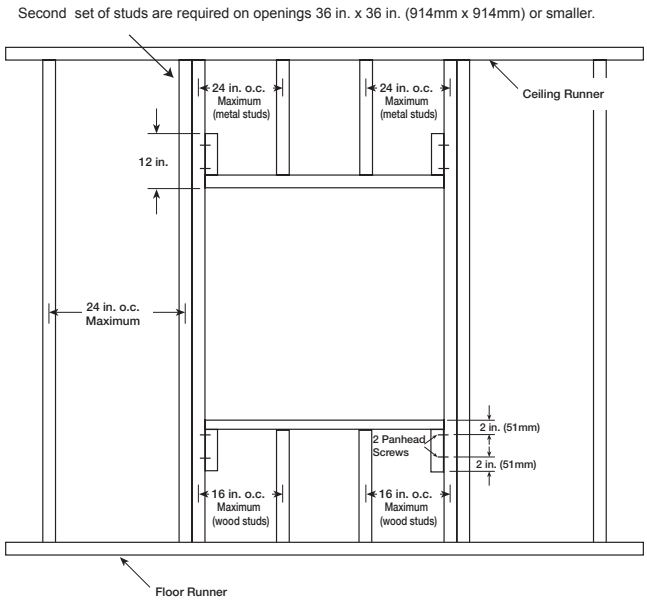

Figure 1

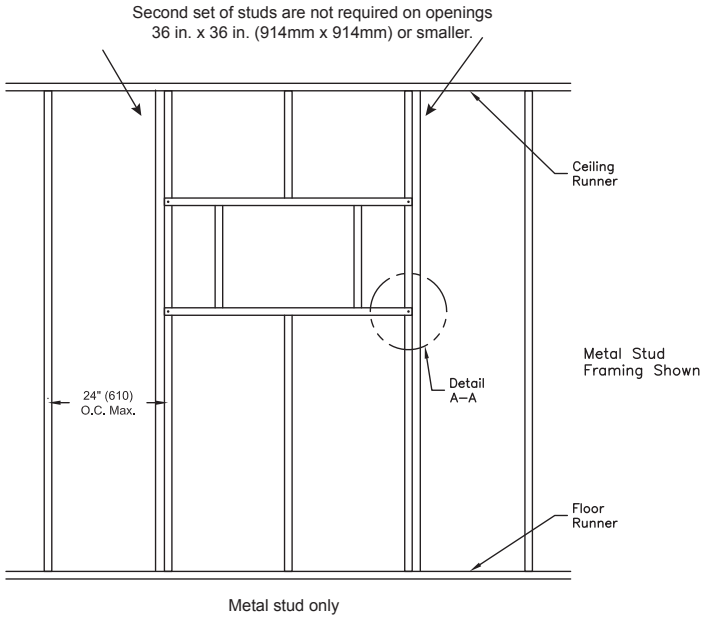

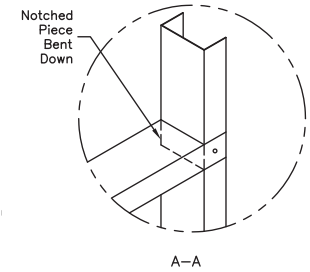

Figure 2

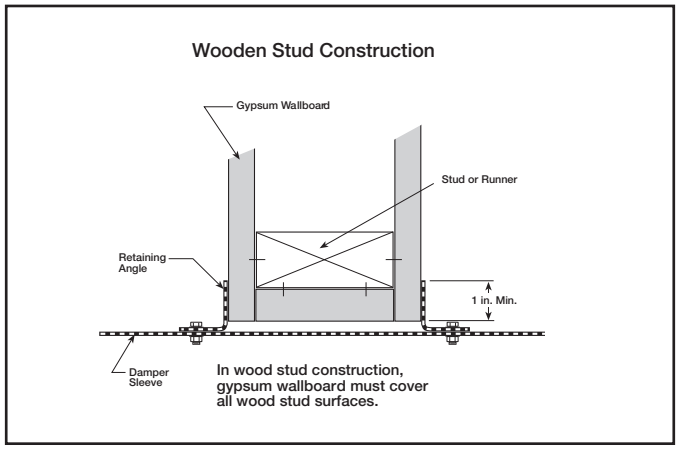

Figure 3 (2 sided angle installation shown)

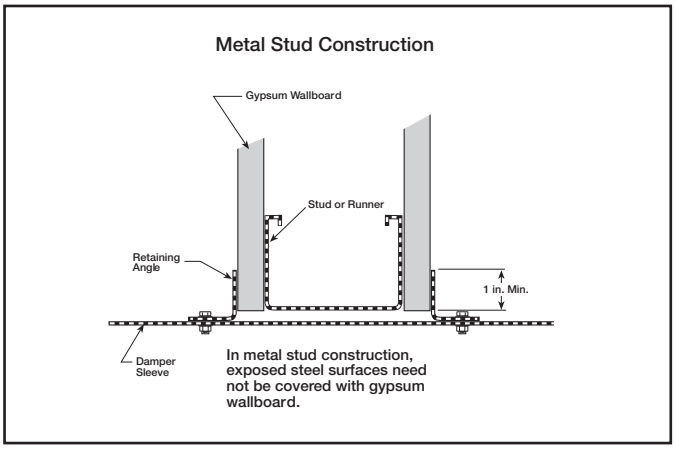

Figure 4 (2 sided angle installation shown)

Clearances Required Between Damper Sleeves & Wall/Floor Openings

Two-sided Angle Installation

Two sided angle installations require clearances for thermal expansion between the damper sleeve and the wall/floor opening. The minimum required clearances are:

- For galvanized steel fire dampers and sleeves: ⅛ in. per foot (3mm per .3 m) of damper width and ⅛ in. per foot (3mm per .3 m) height with a minimum clearance of ¼ in. (6mm), maximum of 1½ in. (38mm).
- For stainless steel fire/smoke dampers and stainless steel or galvanized sleeves: 3⁄16 in. per foot (5mm per .3 m) of damper width and height with a minimum clearance of ¼ in. (6mm), maximum of 2 in. (51mm).

These are total clearances (ignoring fastener heads) and do not need to be equally spaced around the damper.

Example:

A 12 in. x 12 in. (305mm x 305mm) will require a minimum clearance of ¼ in. (6mm) width and ¼ in. (6mm) on height

A 48 in. x 12 in. (1219mm x 305mm) damper will required a minimum clearance of ½ in. (13mm) on width and ¼ in. (13mm) on height.

Although the minimum requirements are listed above, for ease of installation the following are the recommended clearances for galvanized dampers:

- Width/Height of 48 in. (1219 mm) or less - ½ in. (13mm) clearance
- Width/Height between 48.01 in. (1220 mm) and 96 in. (2438 mm): 1 in. (25mm) clearance
- Width/Height greater than 96 in. (2438 mm): 1½ in. (38 mm) clearance

Single Side Angle Installation

On vertical mount single side angle installations there are no minimum clearance requirements between the wall opening and the damper sleeve. However, to facilitate installation, clearances between the wall opening and the damper sleeve are recommended.

On horizontal mount single side angle installations a minimum clearance is required between the outside of the damper sleeve and the floor opening of ⅛ in. per foot (3mm per .3m) of damper width and ⅛ in. per foot (3mm per .3m) height with a minimum clearance of ¼ in. (6mm).

Installing Multiple Section Assemblies

A damper assembly is not restricted to a maximum number of sections, but must not exceed the section sizes and overall sizes shown (see chart below).

The damper sections must be attached together with #10 (¾ in. max. [19mm]) sheet metal screws, ¼ in. (6mm) diameter nuts and bolts, tack or spot welds, or 3⁄16 in. (48mm) diameter steel pop rivets. Attachments must be spaced a maximum of 6 in. (152mm) on centers and a maximum of 2 in. (51mm) from corners. Attachments must be made on front face and back face (air entering and air exiting side) of damper sections.

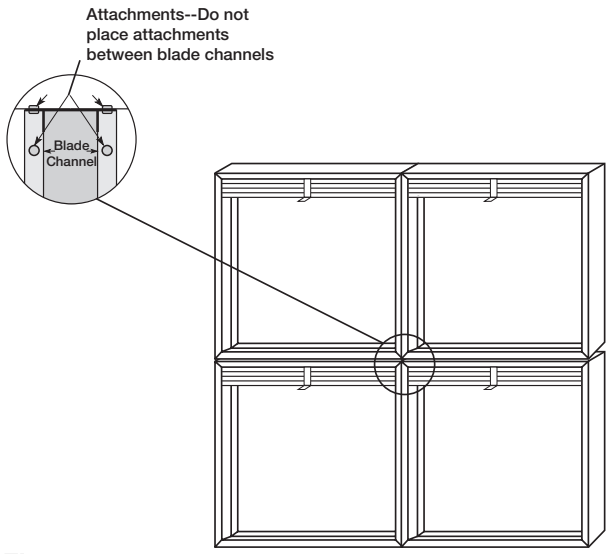

Figure 5

Maximum Assembly Tables

When multiple sections are shipped unassembled, installer shall fasten dampers together. The table shows maximum sizes for multiple section dampers. Dampers that are two or more sections tall must be factory assembled. **Note:** All dimensions are shown in inches (W x H). * Sizes listed is the damper size, not transition size.

Damper Model	Mounting	Maximum Single Section Damper Sizes*	Maximum Multi-Section Damper Sizes*
FD-100 , FD-300, FD-310, SSFD-350	Vertical	48 X 48 (1219mm x 1219mm)	-
FD-150	Vertical or Horizontal	48 X 48 (1219mm x 1219mm)	96 x 48 (2438mm x 1219mm) or 120 x 40 (3048mm x 1016mm)
FD-110	Vertical or Horizontal	48 x 48 (1219mm x 1219mm)	96 x 48 (2438mm x 1219mm)
SSFD-150	Vertical	48 X 48 (1219mm x 1219mm)	96 X 48 (2438mm x 1219mm) or 120 X 40 (3048mm x 1016mm)
	Horizontal	36 x 36 (914mm x 914mm)	-
FD-350	Vertical	48 x 48 (1219mm x 1219mm)	-
	Horizontal	40 x 40 (1016mm x 1016mm)	80 x 40 (2032mm x 1016mm)
KFD-150	Vertical or Horizontal	36 x 16 (914mm x 406mm)	96 x 48 (2438mm x 1219mm) or 120 x 40 (3048mm x 1016mm)
KFD-110	Vertical or Horizontal	36 x 16 (914mm x 406mm)	96 x 48 (2438mm x 1219mm)
SSKFD-150	Vertical	36 x 16 (914mm x 406mm)	96 X 48 (2438mm x 1219mm) or 120 X 40 (3048mm x 1016mm)
KFD-350	Vertical	36 x 16 (914mm x 406mm)	-
	Horizontal	36 x 16 (914mm x 406mm)	80 x 40 (2032mm x 1016mm)
SSKFD-350	Vertical	36 x 16 (914mm x 406mm)	-
DFD-150, DFD-110	Vertical	36 x 36 (914mm x 914mm)	72 x 48 (1828mm x 1219mm) or 60 x 60 (1524mm x 1524mm) or 120 x 30 (3048mm x 762mm)
	Horizontal	24 x 18 (610mm x 457mm)	48 x 36 (1217mm x 914mm)
		30 x 30 (762mm x 762mm)	-

	Horizontal	24 x 18 (610mm x 457mm)	48 x 36 (1217mm x 914mm)
		30 x 30 (762mm x 762mm)	
DFD-310	Vertical	36 x 36 (914mm x 914mm)	-
	Horizontal	30 x 30 (762mm x 762mm)	-
SSDFD-110, SSDFD-150. SSDFD-350	Vertical	30 x 30 (762mm x 762mm)	-
FD-150X	Vertical or Horizontal	48 x 48 (1219mm x 1219mm)	-
DFD-150X	Vertical	36 x 36 (914mm x 914mm)	-
	Horizontal	30 x 30 (762mm x 762mm)	-

Sleeve Requirements

All fire dampers must be installed in a steel sleeve of the required gauge and length. Note that DFD-150X and FD-150X series dampers are provided with an integral sleeve. See **Table on page 10** for required minimum sleeve gauges. Maximum sleeve thickness is 10 gauge (3.5mm). Sleeve inside dimensions must equal damper outside dimensions.

Sleeves shall extend a maximum of 6 in. (152mm) beyond the wall or floor opening on each side. When a factory mounted access door is incorporated as a part of the sleeve the sleeve may extend a maximum of 16 in. (406mm) beyond the wall or floor opening on the access door side.

Fire dampers must be attached to sleeves as shown in **Figure 6**. All four sides of the damper frame must be attached to the sleeve with one row of attachments on each side of the blade channel. Attachments must be spaced a maximum of 6 in. (152mm) on centers and a maximum of 2 in. (51mm) from corners. A minimum of 4 attachments (2 on each side of the blade channel) per side (16 per damper) are required. One of the methods of attachment shown below must be used:

- tack or spot welds
- #10 sheet metal screws
- ¼ in. (6mm) bolts and nuts
- 3⁄16 in. (4.7mm) steel pop rivets

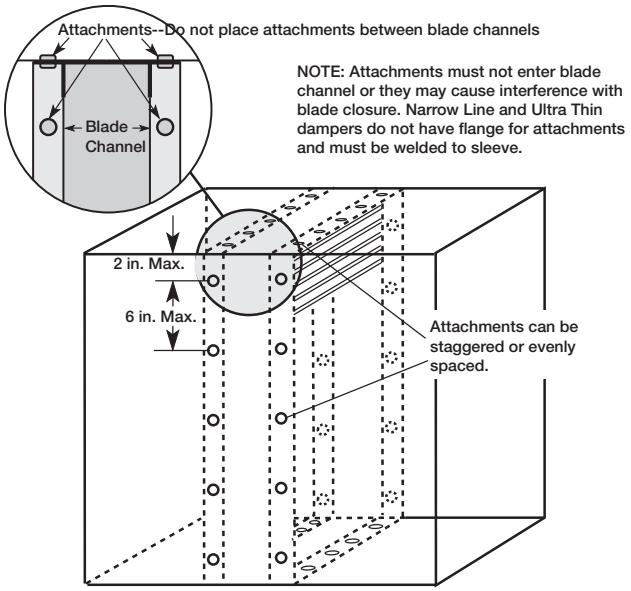

Figure 6: Field attachment of fire dampers to sleeves.

Securing the Damper/Sleeve Assembly to Wall/Floor Openings

All fire dampers may utilize the two sided angle installation method described below. 1½ hour rated fire dampers may use the single sided angle installation method up to the following maximum sizes:

- Vertical mount: 80 in. W x 50. in. H (2032mm W x 1270mm H), 50 in. W x 80 in. H (1270mm W x 2032mm H), or 40 in. W x 100 in. H (1016mm W x 2540mm).
- Horizontal mount: 144 in. W x 96 in. H (3658mm W x 2438mm H)

- **Retaining Angle Gauge**: Retaining angles for 1½ hour rated dampers with a width and height 48 in. (1219mm) or less must be a minimum of 20 ga. (1mm). Retaining angles for all 3 hour rated dampers and all dampers with a width or height greater than 48 in. (1219mm) must be a minimum of 16 gauge (1.5mm).
- **Retaining Angle Size:** The leg of the retaining angle on the damper sleeve shall be a minimum of 1¼ in. (32mm). The leg of the retaining angle on the wall/floor shall be long enough to cover the annular space and overlap the wall/floor by a minimum of 1 in. (25mm).
- **Retaining Angle Attachment to Sleeve:** Retaining angles must be attached to the damper using one or more of the following methods of attachment (refer to label on outside of sleeve for 'No Screw' area):

  - Tack or spot welds
  - #10 (¾ in. [19mm] max.) sheet metal screws
  - ¼ in. (6mm) bolts and nuts
  - 3⁄16 in. (5mm) steel pop rivets

A minimum of two connections per side, top, and bottom, 12 in. (305mm) O.C. maximum for openings of 48 in. W x 36 in. H (1219mm x 914mm) and less. Dampers greater than 48 in. wide (1219mm) or 36 in. high (914mm) require the connections to be no more than 6 in. (152mm) O.C.

The angles must be attached to all 4 sides of the sleeve. Ensure that fasteners do not interfere with the operation of the damper. The angles need not be attached to each other at the corners.

- **Retaining Angle Attachment to Wall/Floor:**

Two sided Angle Method: For two sided angle installations the retaining angles shall not be attached to the wall/floor (**see Figure 7**).

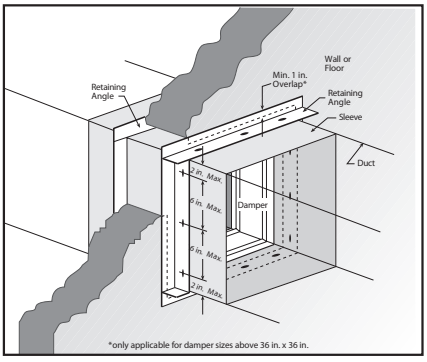

Figure 7: Two Sided Angle Installation

Single Sided Angle Method: For single side installations the retaining angles must be attached to the wall/floor (see **Figures 8-11**). For metal stud partitions only, the single-side mounting angle may be directly attached to the metal stud prior to the installation of the drywall.

- Retaining angles must be attached to the partition using one of the methods shown below:

  - Drywall screws of a length such that the screw engages the steel stud/track by ½ in. (13mm) (steel framing).
  - Drywall screws of a length such that the screw engages the wood stud by 1¾ in. (44mm) (wood framing).
  - Steel anchors or self tapping concrete screws penetrating masonry or block 1¼ in. (31mm).

- A minimum of two connections per side are required. Additional connections made at a maximum of 12 in. (305mm) O.C. maximum for openings of 48 in. W x 36 in. H (1219mm x 914mm) and less. Dampers greater than 48 in. wide (1219mm) or 36 in. high (914mm) require the connections to be no more than 6 in. (152mm) O.C.

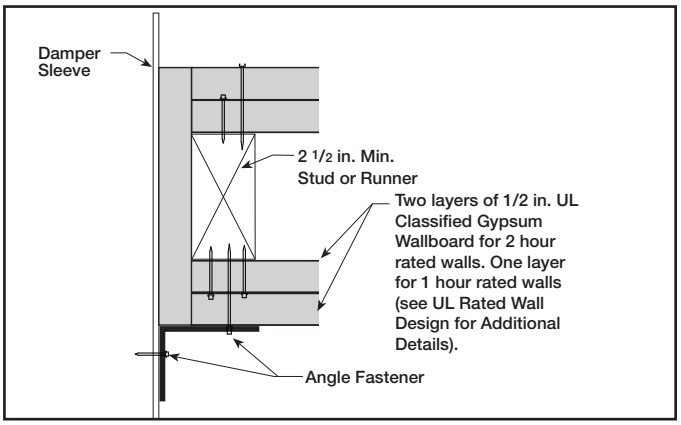

Figure 9: Single Side Angle With Wood Stud Wall

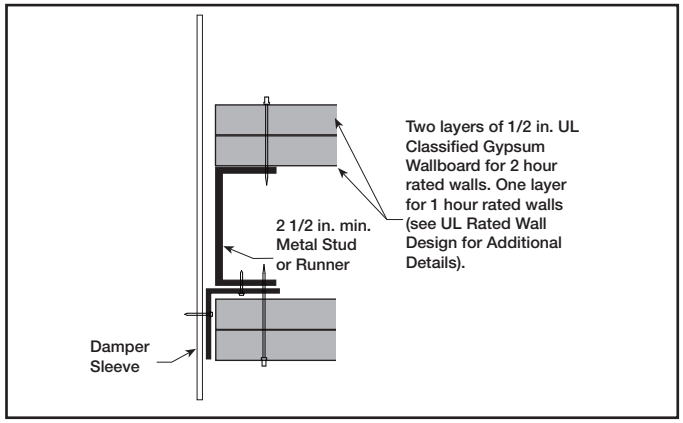

Figure 10: Single Side Angle With Steel Stud Wall - Angle Under Wallboard

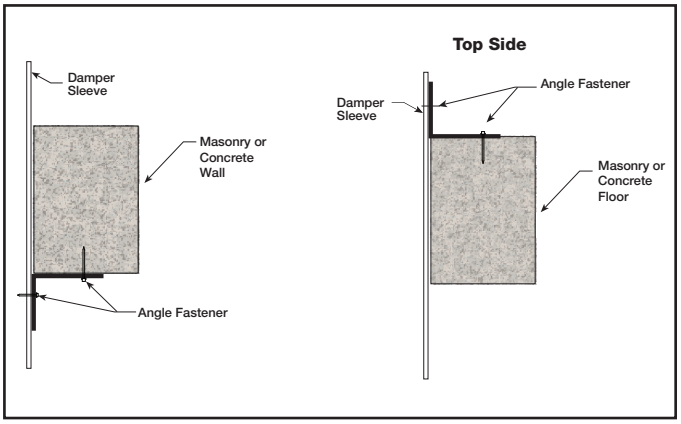

Figure 11: Single Side Angle With Masonry or Concrete Wall and Floor

Grille Installations (Dampers up to 36 in. x 36 in. [914mm x 914mm])

Retaining angles used in conjunction with grille installations must be a minimum of ⅝ in. x 1 in. (15mm x 25mm) 16 gauge (1.5mm) steel. Space screws a maximum of 6 in. (152mm) on center and a maximum of 2 in. (51mm) from the corners (minimum of 2 screws per side). See **Figure 12** and **Figure 13.**

Note: Screws used to attach grille are allowed to penetrate reversed angle leg.

Figure 14: Damper/Sleeves with Transition

Duct to Sleeve Connection

Sleeve Gauge and Connection Type Requirements

The size of the damper/duct determines the required sleeve gauge and the required duct to sleeve connection (see table to the right). The sleeve thickness must also not be less than the gauge of the connecting duct. Any duct connection other than the breakaway connections described below are considered rigid.

Sleeve Gauge	Duct Dimension	Type of Duct to Sleeve Connection Permitted
14 ga. (0.075 in.) - 10 ga. (0.138 in.) [2mm - 3.5mm]	All duct sizes	Rigid or Breakaway
16 ga. (0.060 in.) [1.5mm]	36 in. (914mm) max. width 24 in. (610mm) max. height 24 in. (610mm) diameter	Rigid or Breakaway
16 ga. (0.060 in.) [1.5mm]	All duct sizes	Breakaway only
18 ga. (0.048 in.) [1.2mm]	85 in. (2159mm) wide and over	
20 ga. (0.036 in.) [0.9mm]	55 in. - 84 in. wide (1397mm - 2134mm)	
22 ga. (.030 in.) [0.76mm]	31 in. - 54 in. wide (787mm - 1372mm)	
24 ga. (0.024) [0.6mm]	13 in. - 30 in. wide (330mm - 762mm)	
26 ga. (0.018 in.) [0.46mm]	12 in. wide and under (305mm)	
See Breakaway Connection section for additional information. UL Standard 555 requires all ducts to terminate at fire damper sleeves.		

Approved Breakaway Connections

All breakaway connections described below may utilize the following duct sealants: PA2084T duct sealant adhesive manufactured by Precision, DP1010 water base duct sealant manufactured by Design Polymetrics, Grey Pookie, Ductmate PROseal®, or CL Ward S Seal in accordance with SMACNA recommendations.

Transverse Joints

The transverse joints shown below are approved as breakaway connections.

- A maximum of two #10 (19mm) sheet metal screws on each side and on the bottom may be used. The screws should be located in the center of the slip pocket and penetrate both sides of the slip pocket.
- Dampers up to 20 inches (508mm) high may use transverse joints on the top and bottom and Drive Slip joints (**see Figure 16**) on the sides.

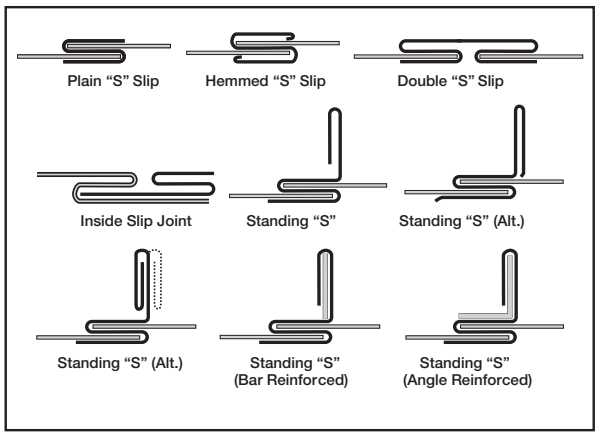

Figure 15 - Transverse Joints

Figure 16

Round and Oval Duct Breakaway Connections

Round or flat oval ducts connected to Type R or O damper collars shall be attached with #10 (19mm) sheet metal screws as follows:

- Ducts up to 22 in. (558mm) wide (or dia.) and less shall have three screws.
- Ducts larger than 22 in. (558mm) wide (or dia.) up to and including 36 in. (914mm) wide (or dia.) shall have five screws.

Factory furnished duct collars, type R and O, are also considered breakaway **(see Figure 17)**.

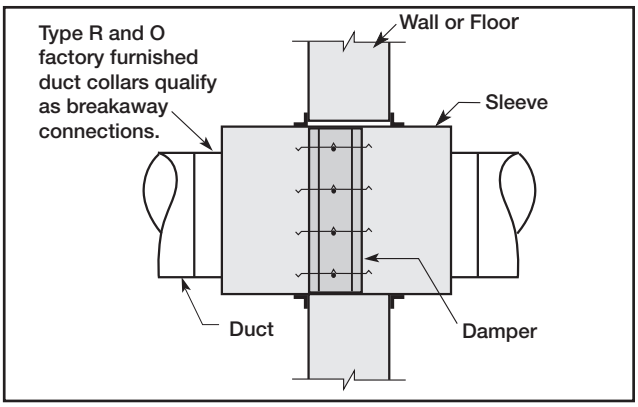

Figure 17: Type R and O Transition

Manufactured Flanged System Breakaway Connections

Flanged connection systems manufactured by Ductmate, Durodyne, Ward, Nexus, Radiant T-35m, and MEZ are approved as breakaway connections when installed as illustrated (**see Figure 18**).

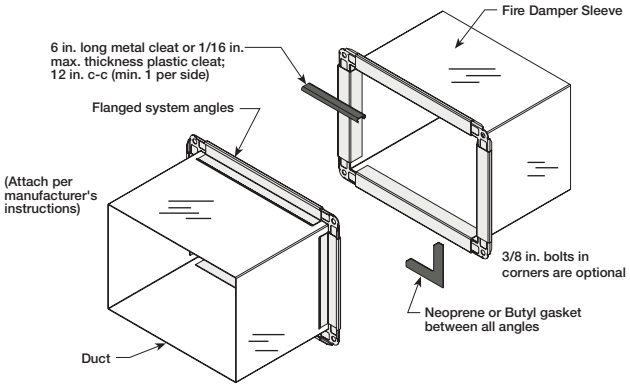

Figure 18

Proprietary Flange System Breakaway Connections

(TDC by Lockformer, TDF by Engle)

TDC and TDF systems are approved as breakaway connections when installed as described in the TDC or TDF addendum to the SMACNA Duct Construction. Standard 6 in. (152mm) metal clip may be used with spacing as shown in diagram (**see Figure 19 & 20**). 3⅜ in. (9.5mm) metal bolts and nuts may be used to fasten together corner pieces (**see Figure 21**).

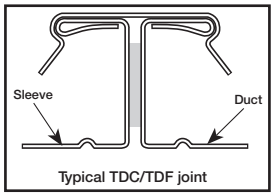

Figure 19

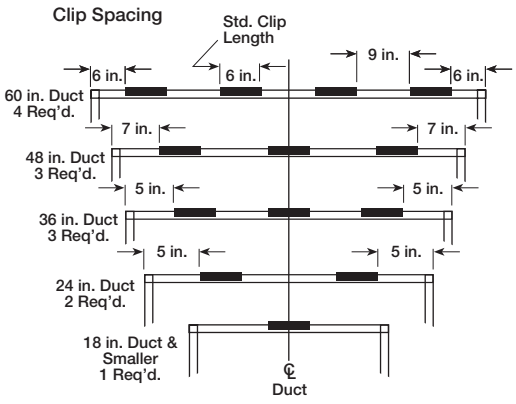

Figure 20

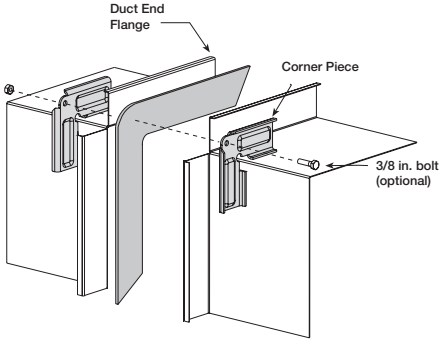

Figure 21

No Connecting Duct or Transfer Opening

Openings where duct does not attach on either side will not require a breakaway connection. Transfer openings are typical of a non-ducted installation (see **Figure 22**).

- Sleeve may end flush with the rated wall/floor on both sides
- Refer to Securing the Damper/Sleeve Assembly to Wall/Floor Openings for securing retaining angles to the sleeve.

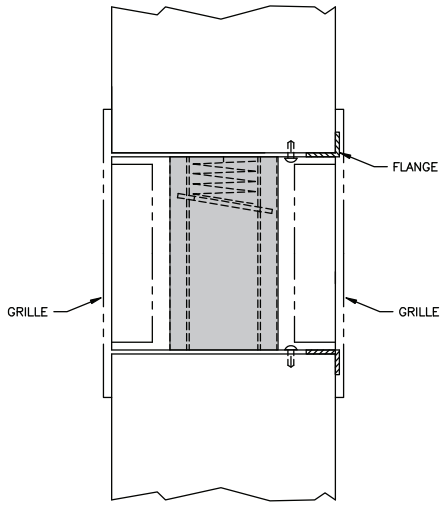

Figure 22: Transfer opening or no connecting duct

Damper Maintenance

Dampers do not typically require maintenance as long as they are kept dry and clean. If cleaning is necessary, use mild detergents or solvents. If lubrication is desired for components such as axle bearings, jackshaft bearings and jamb seals, do not use oil-based lubricants or any other lubricants that attract contaminants such as dust.

Damper Troubleshooting

The following is a possible cause and correction list for common concerns with the dampers.

Symptom	Possible Cause	Corrective Action
Damper does not fully open and/or close	Frame is 'racked' causing blades to bind on jamb seals	Adjust frame such that it is square and plumb
	Screws in damper linkage	Damper installed too far into wall. Move out to line as designated on damper label
	Contaminants on damper	Clean with a non-oil based solvent (see Damper Maintenance)
Link separated	Heat	Replace link

Our Commitment

As a result of our commitment to continuous improvement, Greenheck reserves the right to change specifications without notice.
Specific Greenheck product warrantees can be located on greenheck.com within the product area tabs and listed in the Library under Warrantees.

MULTI-BLADE FIRE AND COMBINATION FIRE SMOKE DAMPERS

DFD-XXX, DFDAF-XXX, DFDTF-XXX, FSD-XXX, FSD-XXXV, IMO-XXX,SEDFD-XXX, SEFSD-XXX, AND SSFSD-XXX
1½ and 3 Hour Fire & Combination Fire Smoke Dampers
(with factory installed sleeve and actuator)
Vertical and Horizontal Mount

Installation, Operation and Maintenance Manual

Please read and save these instructions for future reference. Read carefully before attempting to assemble, install, operate or maintain the product described. Protect yourself and others by observing all safety information. Failure to comply with instructions could result in personal injury and/or property damage!

These instructions apply to 1½ and 3 hour rated fire and combination fire smoke dampers mounted in: 1) masonry, block, or stud walls and 2) concrete floors. Specific requirements in these instructions are mandatory. Dampers must be installed in accordance with these instructions to meet the requirements of UL 555 and/or UL 555S.

Note: Combination fire smoke and fire dampers are manufactured and labeled for either vertical or horizontal installation. The dampers must be installed in accordance with labeling.

Receiving and Handling

Upon receiving dampers, check for both obvious and hidden damage. If damage is found, record all necessary information on the bill of lading and file a claim with the final carrier. Check to be sure that all parts of the shipment, including accessories, are accounted for.

Dampers must be kept dry and clean. Indoor storage and protection from dirt, dust and the weather is highly recommended. Do not store at temperatures in excess of 100°F (38°C).

Safety Warning

Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury or death. Read the installation, operating, and maintenance instructions thoroughly before installing or servicing this equipment.

This manual is the property of the owner and is required for future maintenance. Please leave it with the owner when the jobs is complete.

Installation Supplements

Refer to the appropriate Greenheck installation supplements for special requirements:

- Concrete Floor with Steel Deck
- Drive Slip Breakaway Connection
- Field Installed Sleeve
- Fire Resistant Ventilated Duct Assembly
- Firestop Material
- Fusible Link Replacement
- Greenheck Test Switch
- Grille Installation
- Metal Stud in Shaftwall Partition
- Non-Concrete Horizontal Mount
- Open or Close Indicator (OCI)
- Quick Connect Breakaway Connection
- Resettable Link (RRL)
- Resettable Link with Blade Indicator (RRL/OCI)
- Sealant Supplement
- Single 3-Sided Retaining Angle Supplement
- Sleeve Extension
- Smoke Detector - Various Types
- Temperature Limited Override (TOR)
- Tunnel Corridor

Installation supplements available at www.greenheck.com.

Electrical Guidelines

Electrical Guidelines

All wiring shall be done in accordance with the National Electrical Code ANSI/NFPA-70 latest edition, any local codes that may apply, and wiring diagrams developed in compliance with the job or project design and specifications.

Important!

Electrical input may be needed for this equipment. This work should be performed by a qualified electrician. Verify power before wiring actuator. Greenheck is not responsible for any damage to, or failure of the unit caused by incorrect field wiring. To avoid causing death or serious bodily harm to building occupants, follow all instructions carefully. Dampers must close completely to preserve the integrity of the fire smoke separation.

Pre-Installation Guidelines

The following items will aid in completing the damper installation in a timely and effective manner.

1) Check the drawings for proper damper locations within the building. Visually inspect the damper for damage and verify that the Reusable Resettable Link (RRL) is in place and has not activated if provided. These electric links have a button for resetting. Visually inspect the link to verify its not missing or broken. Replace link as necessary.
2) Lift or handle damper using sleeve or frame. Do not lift damper using blades or actuators.
3) Damper has label on outside of sleeve indicating a 'No Screw' area. Do not install screws into this area as screws may interfere with unexposed blade linkage and prevent damper blades from opening and/or closing.
4) Damper has label indicating position of damper and sleeve assembly in the wall. Install accordingly to comply with manufacturer's appropriate UL Classification file number.
5) Damper must be installed into duct or opening square and free of twist or other misalignment. Out of square, racked, twisted or misaligned installations can cause excessive leakage and/or torque requirements to exceed damper/actuator design.
6) Damper and actuator must be kept clean and protected from dirt, dust and other foreign materials prior to and after installation. Examples of such foreign materials include but are not limited to:
    a) Mortar dust
    b) Drywall dust
    c) Firesafing materials
    d) Wall texture
    e) Paint overspray
7) Damper should be sufficiently covered as to prevent overspray if wall texturing or spray painting will be performed within 5 feet of the damper. Excessive dirt or foreign material deposits on the damper can cause excessive leakage and/or torque requirements to exceed damper/actuator design.
8) Caulking is not necessary, nor is it allowed, between the damper sleeve and the wall or floor opening (annular space). However, caulking may be applied to the retaining angles.
9) ACCESS: Suitable access (such that RRL's and actuators can be maintained, etc.) must be provided for damper inspection and servicing. Where it is not possible to achieve sufficient size access, it will be necessary to install a removable section of duct. (Refer to NFPA 90A).
10) The Code Authority Having Jurisdiction (AHJ) must evaluate and provide approval of final installation where variations to these instructions are necessary.

Preparation of Openings

- Frame wall openings as shown below (**see Figure 1 & 2**).
- Gypsum wall board must be fastened 12 in. (305mm) on center to all stud and runner flanges surrounding opening.
- Prepare opening between studs and sleeve assembly as shown below (**see Figure 3 & 4**).
- All construction and fasteners must meet the requirements of the appropriate wall design (See UL Fire Resistance Directory) and/or local codes.

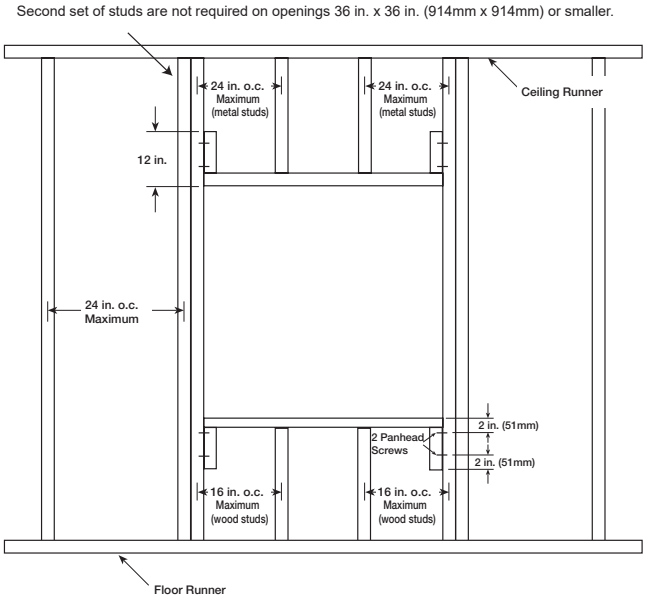

Figure 1

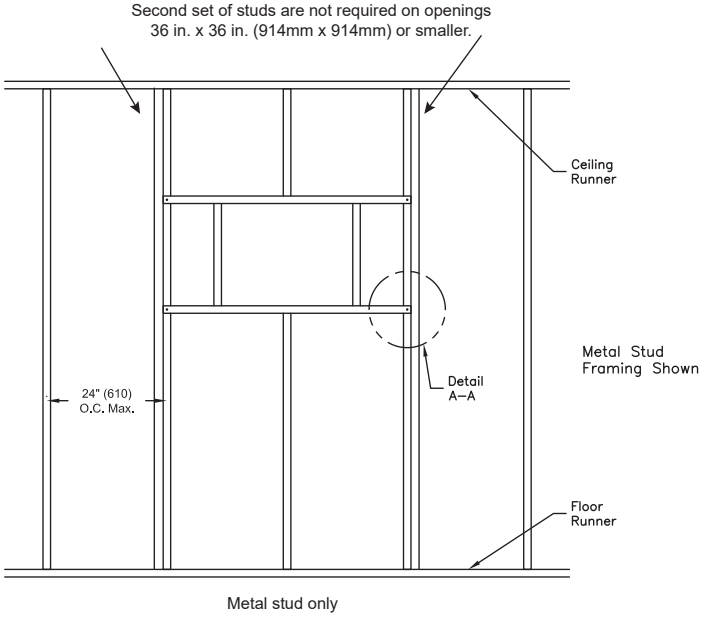

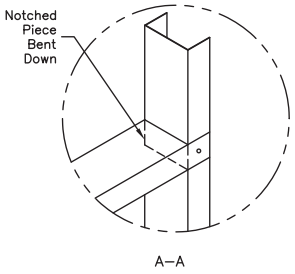

Figure 2

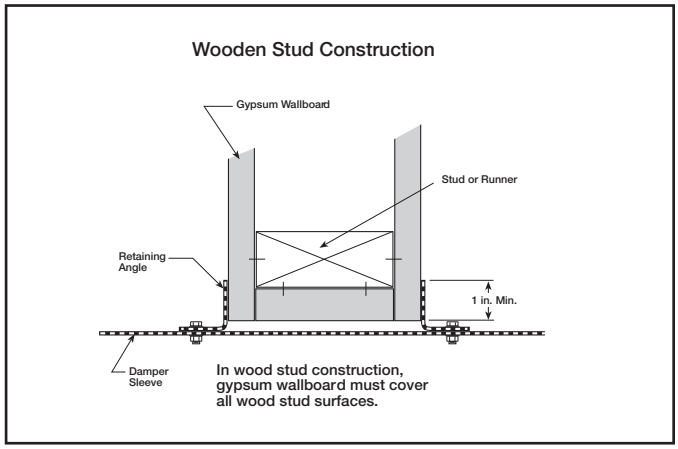

Figure 3 (2 sided angle installation shown)

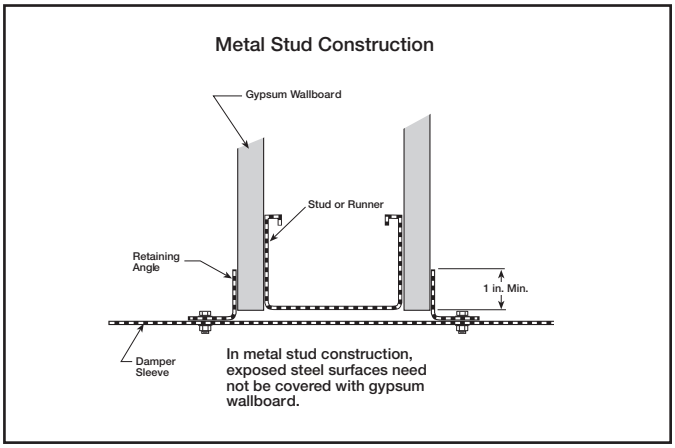

Figure 4 (2 sided angle installation shown)

Clearances Required Between Damper Sleeves & Wall/Floor Openings

Two-sided Angle Installation

Two sided angle installations require clearances for thermal expansion between the damper sleeve and the wall/floor opening. The minimum required clearances are:

- For galvanized steel fire dampers and sleeves: ⅛ in. per foot (3mm per .3 m) of damper width and ⅛ in. per foot (3mm per .3 m) height with a minimum clearance of ¼ in. (6mm), maximum of 1½ in. (38mm).
- For stainless steel fire/smoke dampers and stainless steel or galvanized sleeves: 3⁄16 in. per foot (5mm per .3 m) of damper width and height with a minimum clearance of ¼ in. (6mm), maximum of 2 in. (51mm).

These are total clearances (ignoring fastener heads) and do not need to be equally spaced around the damper.

Example:

A 12 in. x 12 in. (305mm x 305mm) will require a minimum clearance of ¼ in. (6mm) width and ¼ in. (6mm) on height

A 48 in. x 12 in. (1219mm x 305mm) damper will required a minimum clearance of ½ in. (13mm) on width and ¼ in. (13mm) on height.

Although the minimum requirements are listed above, for ease of installation the following are the recommended clearances for galvanized dampers:

- Width/Height of 48 in. (1219 mm) or less - ½ in. (13mm) clearance
- Width/Height between 48.01 in. (1220 mm) and 96 in. (2438 mm): 1 in. (25mm) clearance
- Width/Height greater than 96 in. (2438 mm): 1½ in. (38 mm) clearance

Single Side Angle Installation

On vertical mount single side angle installations there are no minimum clearance requirements between the wall opening and the damper sleeve. However, to facilitate installation, clearances between the wall opening and the damper sleeve are recommended.

On horizontal mount single side angle installations a minimum clearance is required between the outside of the damper sleeve and the floor opening of ⅛ in. per foot (3mm per .3m) of damper width and ⅛ in. per foot (3mm per .3m) height with a minimum clearance of ¼ in. (6mm).

Installing Multiple Section Damper Assemblies

A damper assembly is not restricted to a maximum number of sections, but must not exceed the section sizes and overall sizes shown (see chart below).

Some multiple section high damper assemblies require additional structural support between the damper frames. The following multiple section high damper assemblies require the use of either a support mullion between the damper frames as shown in **Figure 5** or individual sleeves around each row of dampers as shown in **Figure 6**:

- All horizontal mount dampers
- All vertical mount dampers over 72 in. (1829mm) high and greater than 2 sections wide
- All vertical mount dampers rated for more than 4 in. wg (1 kPa)
- All vertical mount dampers that use fusible links as a closure device

The damper sections must be attached together with #10 (¾ in. max. [19mm]) sheet metal screws, ¼ in. (6mm) diameter nuts and bolts, tack or spot welds, or 3⁄16 in. (48mm) diameter steel pop rivets. Attachments must be spaced a maximum of 6 in. (152mm) on centers and a maximum of 2 in. (51mm) from corners. Attachments must be made on front face and back face (air entering and air exiting side) of damper sections.

Note: Dampers ordered for individual installation may not be installed together. The full assembly size must be specified at the time the dampers are ordered.

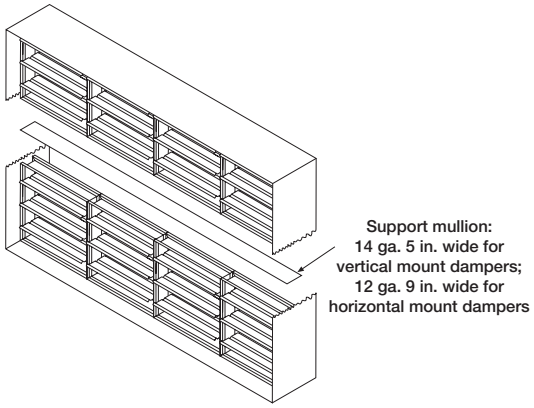

Figure 5: Single sleeve around outside with support mullion

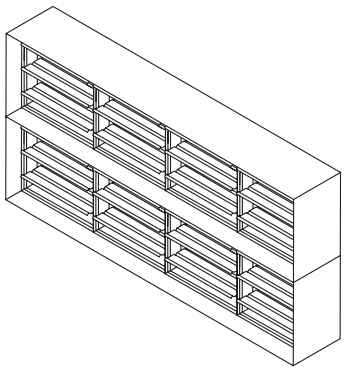

Figure 6: Two individually sleeved units with no mullions

Maximum Assembly Tables

SEFSD-211 SSFSD-211	24 x 30 or 22 x 36	88 x 72

Note: FSD model dampers fitted with a fusible link closure device are limited to single section sizes.

Inserting Damper into Wall/Floor Openings

Insert the sleeved damper assembly into the prepared opening. Refer to label on outside of sleeve for the recommended location of the damper in the wall or floor (see Dimension A and Detail 1, **Figure 7**).

Special attention must be paid to ensure the following:

1) The ℄ (centerline) of the damper frame remains within the plane of the wall or floor
2) Attachments made through the retaining angle do not penetrate the 'No Screw' area designated on the damper sleeve.
3) The sleeve does not extend more than 16 in. (406mm) beyond the wall or floor on the actuator side of the damper and 6 in. (152mm) on the side opposite the actuator. The sleeve may also extend up to 16 in. (406mm) beyond the wall or floor if the damper has a factory supplied access door.

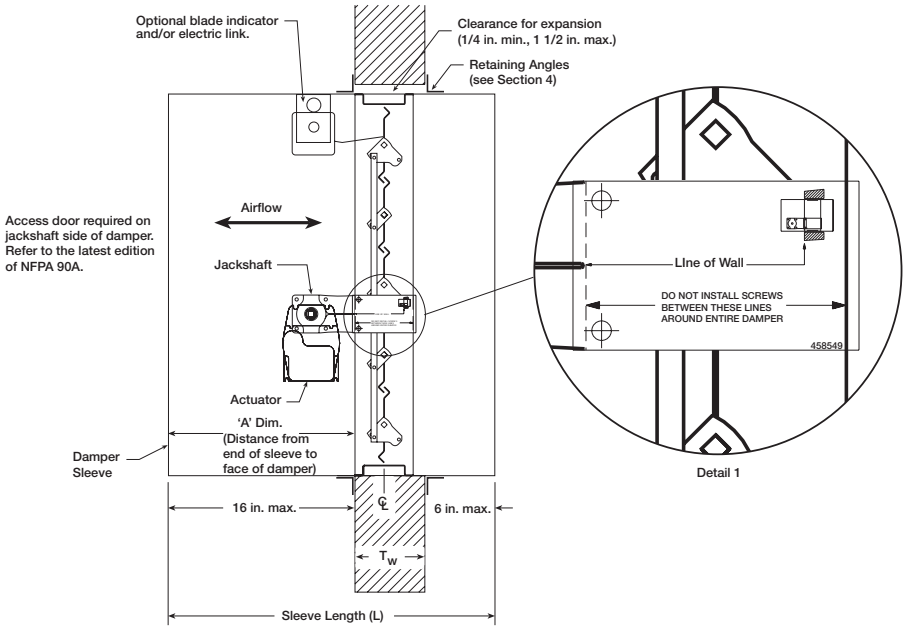

Figure 7: Properly Installed Combination fire smoke damper

Most fire and combination fire smoke dampers come with factory supplied sleeves. For field supplied sleeves, see the Field Supplied Sleeves supplement at www.greenheck.com. The following are recommended sleeve lengths for various wall thicknesses:

Wall Thickness Dimension (T_W)	Recommended Sleeve Length Dimension (L)
4 - 6 in. (102mm - 152mm)	16 in. (406mm)
7 - 10 in. (178mm - 254mm)	21 in. (533mm)
11 - 13 in. (279mm - 330mm)	24 in. (610mm)

Securing the Damper/Sleeve Assembly to Wall/Floor Openings

All fire and combination fire smoke dampers may utilize the two sided angle installation method described below. 1½ hour rated fire and combination fire smoke dampers may use the single sided angle installation method up to the following maximum sizes:

- Vertical mount: 80 in. W x 50. in. H (2032mm W x 1270mm H), 50 in. W x 80 in. H (1270mm W x 2032mm H), or 40 in. W x 100 in. H (1016mm W x 2540mm).
- Horizontal mount: 144 in. W x 96 in. H (3658mm W x 2438mm H)

- **Retaining Angle Gauge**: Retaining angles for 1½ hour rated dampers with a width and height 48 in. (1219mm) or less must be a minimum of 20 ga. (1mm). Retaining angles for all 3 hour rated dampers and all dampers with a width or height greater than 48 in. (1219mm) must be a minimum of 16 gauge (1.5mm).
- **Retaining Angle Size:** The leg of the retaining angle on the damper sleeve shall be a minimum of 1¼ in. (32mm). The leg of the retaining angle on the wall/floor shall be long enough to cover the annular space and overlap the wall/floor by a minimum of 1 in. (25mm).
- **Retaining Angle Attachment to Sleeve:** Retaining angles must be attached to the damper using one or more of the following methods of attachment (refer to label on outside of sleeve for 'No Screw' area):
  - Tack or spot welds
  - #10 (¾ in. [19mm] max.) sheet metal screws
  - ¼ in. (6mm) bolts and nuts
  - 3⁄16 in. (5mm) steel pop rivets

A minimum of two connections per side, top, and bottom, 12 in. (305mm) O.C. maximum for openings of 48 in. W x 36 in. H (1219mm x 914mm) and less. Dampers greater than 48 in. wide (1219mm) or 36 in. high (914mm) require the connections to be no more than 6 in. (152mm) O.C.

The angles must be attached to all 4 sides of the sleeve. Ensure that fasteners do not interfere with the operation of the damper. The angles need not be attached to each other at the corners.

- **Retaining Angle Attachment to Wall/Floor:**

  Two sided Angle Method: For two sided angle installations the retaining angles shall not be attached to the wall/floor (**see Figure 8**).

  Single Sided Angle Method: For single side installations the retaining angles must be attached to the wall/floor (see **Figures 9-12**). For metal stud partitions only, the single-side mounting angle may be directly attached to the metal stud prior to the installation of the drywall.

  - Retaining angles must be attached to the partition using one of the methods shown below:
    - Drywall screws of a length such that the screw engages the steel stud/track by ½ in. (13mm) (steel framing).
    - Drywall screws of a length such that the screw engages the wood stud by 1¾ in. (44mm) (wood framing).
    - Steel anchors or self tapping concrete screws penetrating masonry or block 1¼ in. (31mm).
  - A minimum of two connections per side are required. Additional connections made at a maximum of 12 in. (305mm) O.C. maximum for openings of 48 in. W x 36 in. H (1219mm x 914mm) and less. Dampers greater than 48 in. wide (1219mm) or 36 in. high (914mm) require the connections to be no more than 6 in. (152mm) O.C.

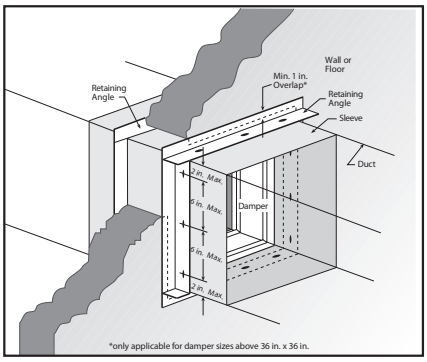

Figure 8: 2 sided angle installation method

Securing the Damper/Sleeve Assembly to Wall/Floor Openings cont.....

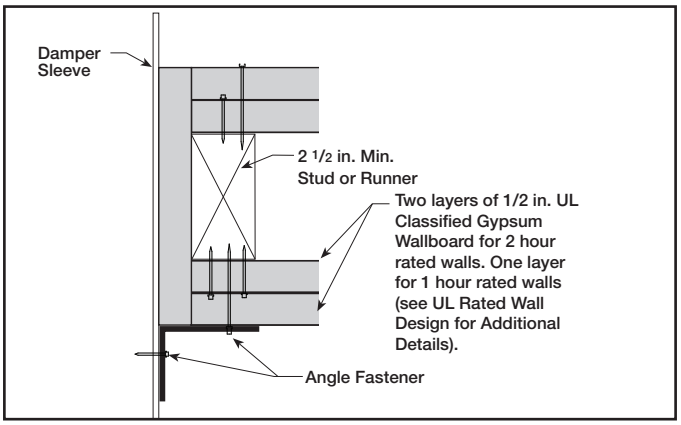

Figure 10: Single Side Angle With Wood Stud Wall

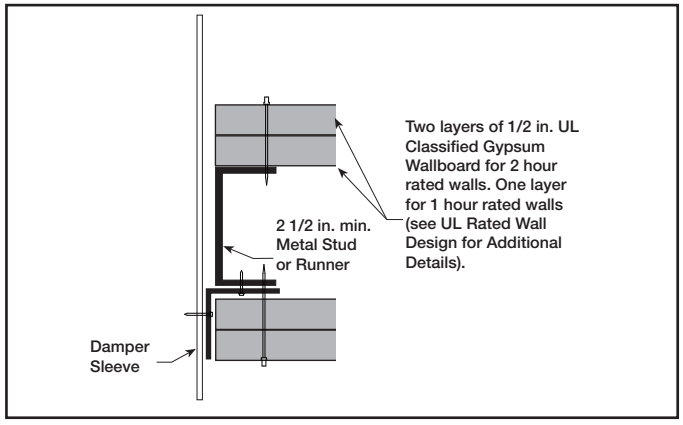

Figure 11: Single Side Angle With Steel Stud Wall - Angle Under Wallboard

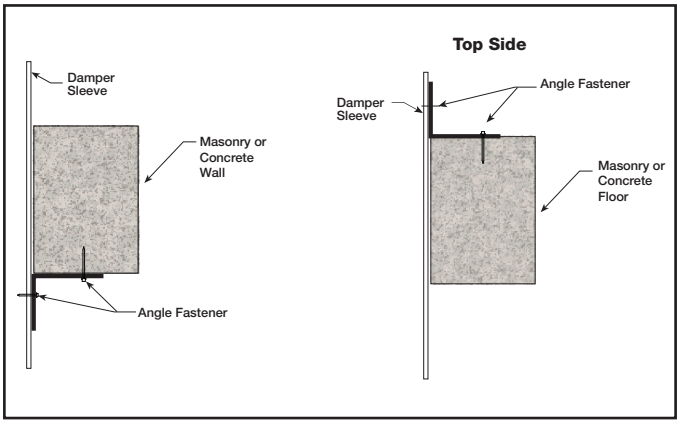

Figure 12: Single Side Angle With Masonry or Concrete Wall and Floor

Grille Installations (Dampers up to 36 in. x 36 in. [914mm x 914mm])

Retaining angles used in conjunction with grille installations must be a minimum of ⅝ in. x 1 in. (15mm x 25mm) 16 gauge (1.5mm) steel. Space screws a maximum of 6 in. (152mm) on center and a maximum of 2 in. (51mm) from the corners (minimum of 2 screws per side). See **Figure 13** and **Figure 14.**

Note: Screws used to attach grille are allowed to penetrate reversed angle leg.

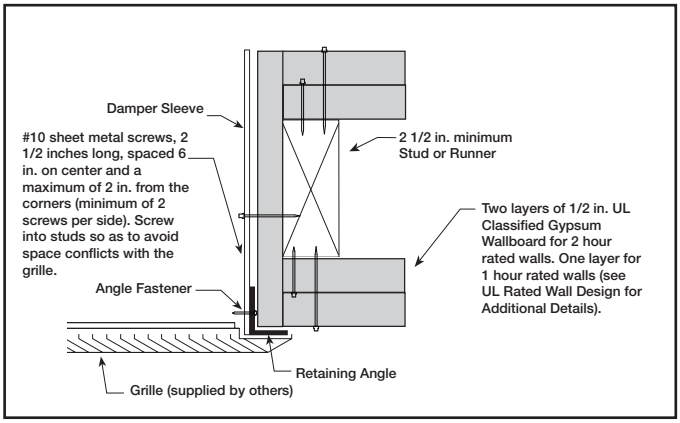

Figure 13: Wood Stud - Grille

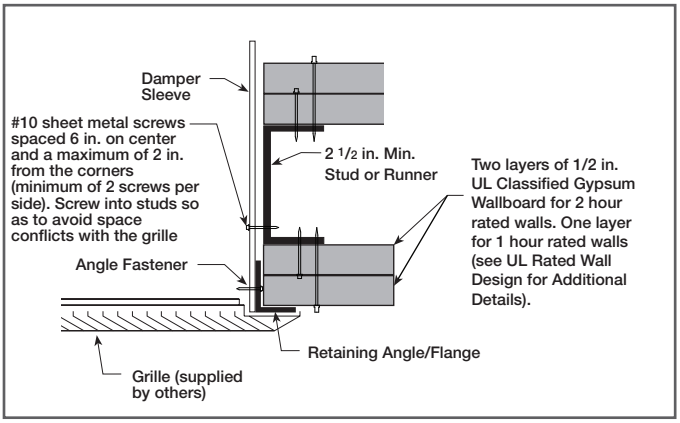

Figure 14: Metal Stud - Grille

Duct to Sleeve Connection

Sleeve Gauge and Connection Type Requirements

The size of the damper/duct determines the required sleeve gauge and the required duct to sleeve connection (see table to the right). The sleeve thickness must also not be less than the gauge of the connecting duct. Any duct connection other than the breakaway connections described below are considered rigid.

Sleeve Gauge	Duct Dimension	Type of Duct to Sleeve Connection Permitted
14 ga. (0.075 in.) - 10 ga. (0.138 in.) [2mm - 3.5mm]	All duct sizes	Rigid or Breakaway
16 ga. (0.060 in.) [1.5mm]	36 in. (914mm) max. width 24 in. (610mm) max. height 24 in. (610mm) diameter	Rigid or Breakaway
16 ga. (0.060 in.) [1.5mm]	All duct sizes	Breakaway only
18 ga. (0.048 in.) [1.2mm]	85 in. (2159mm) wide and over	
20 ga. (0.036 in.) [0.9mm]	55 in. - 84 in. wide (1397mm - 2134mm)	
22 ga. (.030 in.) [0.76mm]	31 in. - 54 in. wide (787mm - 1372mm)	
24 ga. (0.024) [0.6mm]	13 in. - 30 in. wide (330mm - 762mm)	
26 ga. (0.018 in.) [0.46mm]	12 in. wide and under (305mm)	
See Breakaway Connection section for additional information. UL Standard 555 requires all ducts to terminate at fire damper sleeves.		

Approved Breakaway Connections

All breakaway connections described below may utilize the following duct sealants: PA2084T duct sealant adhesive manufactured by Precision, DP1010 water base duct sealant manufactured by Design Polymetrics, Grey Pookie, Ductmate PROseal®, or CL Ward S Seal in accordance with SMACNA recommendations.

Transverse Joints

The transverse joints shown below are approved as breakaway connections.

- A maximum of two #10 (19mm) sheet metal screws on each side and on the bottom may be used. The screws should be located in the center of the slip pocket and penetrate both sides of the slip pocket.
- Dampers up to 20 inches (508mm) high may use transverse joints on the top and bottom and Drive Slip joints (**see Figure 16**) on the sides.

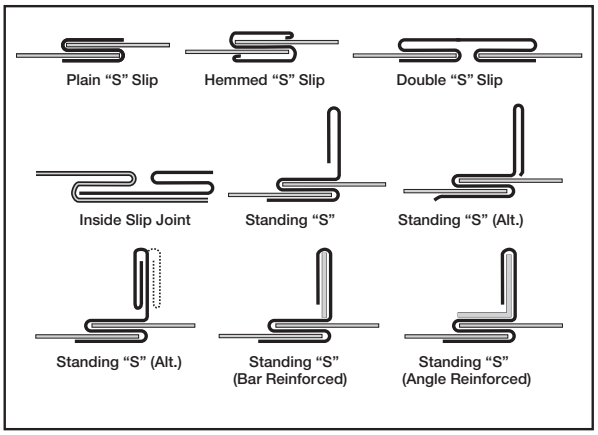

Figure 15 - Transverse Joints

Figure 16

Approved Breakaway Connections....

Round and Oval Duct Breakaway Connections

Factory furnished duct collars, type R and O, are also considered breakaway **(see Figure 17)**.

Round or flat oval ducts connected to Type R or O damper collars shall be attached with #10 (19mm) sheet metal screws as follows:

- Ducts up to 22 in. (558mm) wide (or dia.) and less shall have three screws.
- Ducts larger than 22 in. (558mm) wide (or dia.) up to and including 36 in. (914mm) wide (or dia.) shall have five screws.

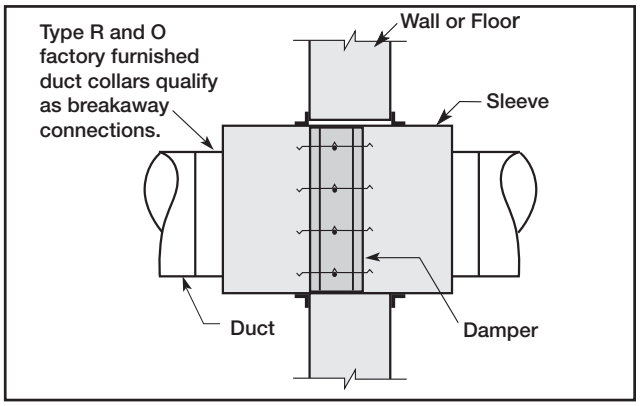

Figure 17: Type R and O Transition

Manufactured Flanged System Breakaway Connections

Flanged connection systems manufactured by Ductmate, Durodyne, Ward, Nexus, Radiant T-35m, and MEZ are approved as breakaway connections when installed as illustrated (**see Figure 18**).

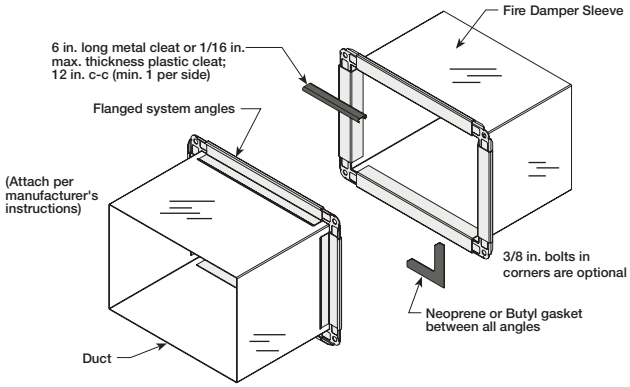

Figure 18

Proprietary Flange System Breakaway Connections

(TDC by Lockformer, TDF by Engle)

TDC and TDF systems are approved as breakaway connections when installed as described in the TDC or TDF addendum to the SMACNA Duct Construction. Standard 6 in. (152mm) metal clip may be used with spacing as shown in diagram (**see Figure 19 & 20**). 3⅜ in. (9.5mm) metal bolts and nuts may be used to fasten together corner pieces (**see Figure 21**).

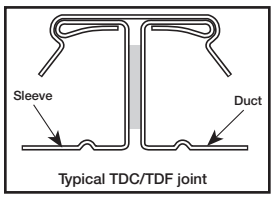

Figure 19

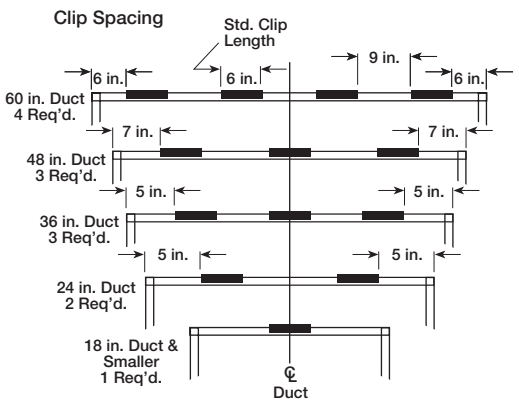

Figure 20

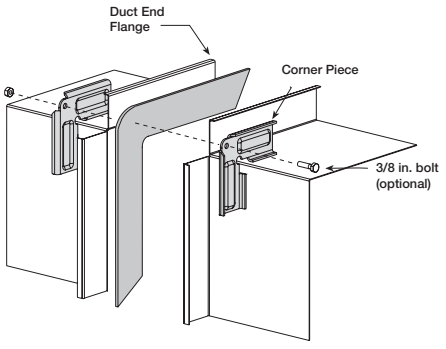

Figure 21

Actuator and Temperature Response Device Connections

Actuator Connections

Electrical and/or pneumatic connections to damper actuators should be made in accordance with wiring and piping diagrams developed in compliance with applicable codes, ordinances and regulations (see **Electrical Guidelines**).

Temperature Response Device Connections

RRL - The RRL (resettable link device) incorporates a single thermostat. When the thermostat temperature is reached the sensor interrupts power to the actuator and the actuator's spring return mechanism causes the damper to close. Refer to **Figure 22** for wiring of the RRL thermostat.

OCI - The OCI (open or closed indicator) option contains two single pole single throw switches used to indicate the damper blade position. The switches provide a positive open and closed signal and can be used in conjunction with remote indicator lights. Refer to **Figure 23** for wiring of the OCI option.

RRL /OCI - The RRL/OCI performs the function of an RRL and OCI (see description above). Refer to **Figure 24** for wiring of the RRL/OCI option.

TOR - The TOR (temperature override device) option incorporates two thermostats with fixed settings (usually 165°F [74°C] and 350°F [177°C]). The primary sensor (the sensor with the lower temperature setting) can be bypassed by an external contact closure allowing the damper to reopen until the secondary temperature is reached (the sensor with the higher temperature setting). See **Figure 25.**

The TOR assembly contains two single pole single throw switches used to indicate damper blade position. The switches provide a positive open and closed signal and can be used in conjunction with remote indicator lights. See **Figure 25** for wiring of the TOR thermostats and indicator switches.

If either the TOR or the RRL is ordered with a pneumatic actuator, an EP switch is required with an appropriate electric power circuit to allow the electric thermostat to control the pneumatic actuator.

Ratings (Figure 22, 23, 24, & 25)

Integral Switch Type: Single Pole, double throw

Electrical Capacity: 10 Amps, 1/3 hp, 120 or 240 Vac
½ Amp, 125 Vdc;
¼ Amp 250 Vdc
5 Amps, 120 Vac “L” (lamp load)
1.0 Amps, 24 Vac
1.5 Amps, 24 Vdc

Temperature Limit: 165° F (standard primary sensor)
212° F (optional primary sensor)
250° F (secondary sensor)*
350° F (secondary sensor)*

* based on actuator temperature rating

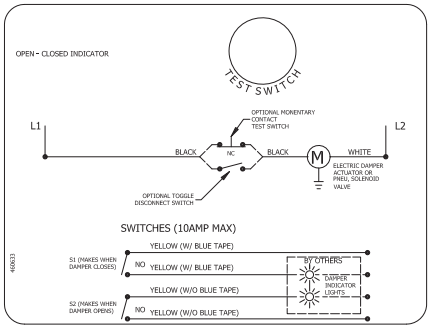

Figure 23: OCI

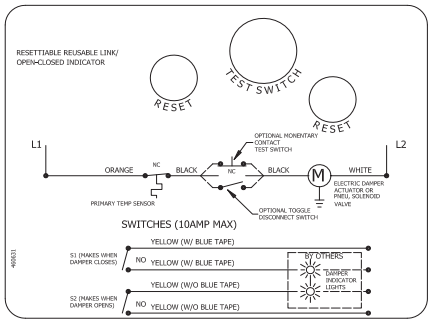

Figure 24: RRL/OCI

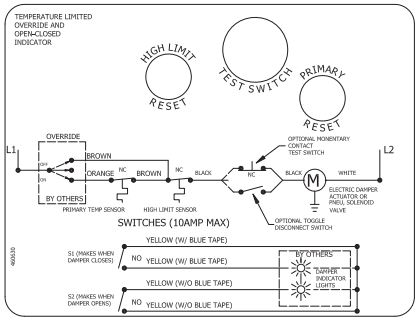

Figure 25: TOR

Damper Maintenance

Dampers do not typically require maintenance as long as they are kept dry and clean. If cleaning is necessary, use mild detergents or solvents. If lubrication is desired for components such as axle bearings, jackshaft bearings and jamb seals, do not use oil-based lubricants or any other lubricants that attract contaminants such as dust.

Dampers and their actuator(s) must be maintained, cycled, and tested a minimum in accordance with:

- The latest editions of NFPA 80, 90A, 92A, 92B, 101, 105, UL864, AMCA 503-03 and local codes.
- Actuator manufacturer recommendations.

Damper Troubleshooting

The following is a possible cause and correction list for common concerns with the dampers.

Symptom	Possible Cause	Corrective Action
Damper does not fully open and/or close	Frame is 'racked' causing blades to bind on jamb seals	Adjust frame such that it is square and plumb
	Actuator linkage loose	Close damper, disconnect power, adjust and tighten linkage
	Defective motor	Replace
	Screws in damper linkage	Damper installed too far into wall. Move out to line as designated on damper label
	Contaminants on damper	Clean with a non-oil based solvent (see Damper Maintenance)
RRL or TOR sensor tripped	Heat	Push reset button located on backside of RRL or TOR
Damper does not operate	No power supplied to the actuator	Add power supply

Our Commitment

As a result of our commitment to continuous improvement, Greenheck reserves the right to change specifications without notice.
Specific Greenheck product warranties can be located on greenheck.com within the product area tabs and listed in the Library under Warranties.

1½ Hour
Vertical and Horizontal Mount

Installation, Operation and Maintenance Manual

Please read and save these instructions for future reference. Read carefully before attempting to assemble, install, operate or maintain the product described. Protect yourself and others by observing all safety information. Failure to comply with instructions could result in personal injury and/or property damage!

These instructions apply to 1½ hour rated fire and combination fire smoke dampers mounted in: 1) masonry, block, or stud walls and 2) concrete floors or ceilings. Specific requirements in these instructions are mandatory. Dampers must be installed in accordance with these instructions to meet the requirements of UL 555 and/or UL 555S.

Receiving and Handling

Upon receiving dampers, check for both obvious and hidden damage. If damage is found, record all necessary information on the bill of lading and file a claim with the final carrier. Check to be sure that all parts of the shipment, including accessories, are accounted for.

Dampers must be kept dry and clean. Indoor storage and protection from dirt, dust and the weather is highly recommended. Do not store at temperatures in excess of 100°F (38°C).

Safety Warning

Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury or death. Read the installation, operating, and maintenance instructions thoroughly before installing or servicing this equipment.

This manual is the property of the owner and is required for future maintenance. Please leave it with the owner when the jobs is complete.

Electrical Guidelines

Electrical Guidelines

All wiring shall be done in accordance with the National Electrical Code ANSI/NFPA-70 latest edition, any local codes that may apply, and wiring diagrams developed in compliance with the job or project design and specifications.

Important!

Electrical input may be needed for this equipment. This work should be performed by a qualified electrician. Verify power before wiring actuator. Greenheck is not responsible for any damage to, or failure of the unit caused by incorrect field wiring. To avoid causing death or serious bodily harm to building occupants, follow all instructions carefully. Dampers must close completely to preserve the integrity of the fire smoke separation.

Pre-Installation Guidelines

The following items will aid in completing the damper installation in a timely and effective manner.

1) Check the drawings for proper damper locations within the building. Visually inspect the damper for damage and verify that the Reusable Resettable Link (RRL) is in place and has not activated if provided. These electric links have a button for resetting. Visually inspect the link to verify its not missing or broken. Replace link as necessary.
2) Lift or handle damper using sleeve or frame. Do not lift damper using blades or actuators.
3) Damper has label on outside of sleeve indicating a 'No Screw' area. Do not install screws into this area as screws may interfere with unexposed blade linkage and prevent damper blades from opening and/or closing.
4) Damper has label indicating position of damper and sleeve assembly in the wall. Install accordingly to comply with manufacturer's appropriate UL Classification file number.
5) Damper must be installed into duct or opening square and free of twist or other misalignment. Out of square, racked, twisted or misaligned installations can cause excessive leakage and/or torque requirements to exceed damper/actuator design.
6) Damper and actuator must be kept clean and protected from dirt, dust and other foreign materials prior to and after installation. Examples of such foreign materials include but are not limited to:
    a) Mortar dust
    b) Drywall dust
    c) Firesafing materials
    d) Wall texture
    e) Paint overspray
7) Damper should be sufficiently covered as to prevent overspray if wall texturing or spray painting will be performed within 5 feet of the damper. Excessive dirt or foreign material deposits on the damper can cause excessive leakage and/or torque requirements to exceed damper/actuator design.
8) Caulking is not necessary, nor is it allowed, between the damper sleeve and the wall or floor opening (annular space). However, caulking may be applied to the retaining angles.
9) ACCESS: Suitable access (such that RRL's and actuators can be maintained, etc.) must be provided for damper inspection and servicing. Where it is not possible to achieve sufficient size access, it will be necessary to install a removable section of duct. (Refer to NFPA 90A).
10) The Code Authority Having Jurisdiction (AHJ) must evaluate and provide approval of final installation where variations to these instructions are necessary.

Preparation of Openings

- Frame wall openings as shown below (**see Figure 1 & 2**).
- Gypsum wall board must be fastened 12 in. (305mm) on center to all stud and runner flanges surrounding opening.
- Prepare opening between studs and sleeve assembly as shown below (**see Figure 3**).
- All construction and fasteners must meet the requirements of the appropriate wall design (See UL Fire Resistance Directory) and/or local codes.

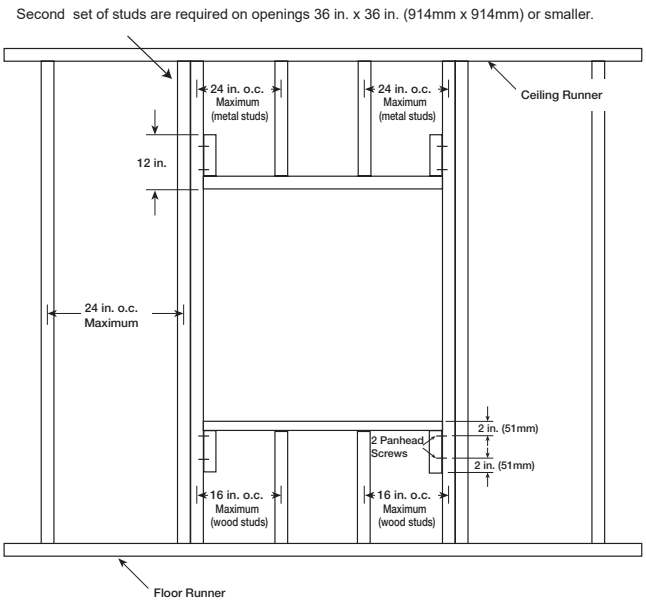

Figure 1

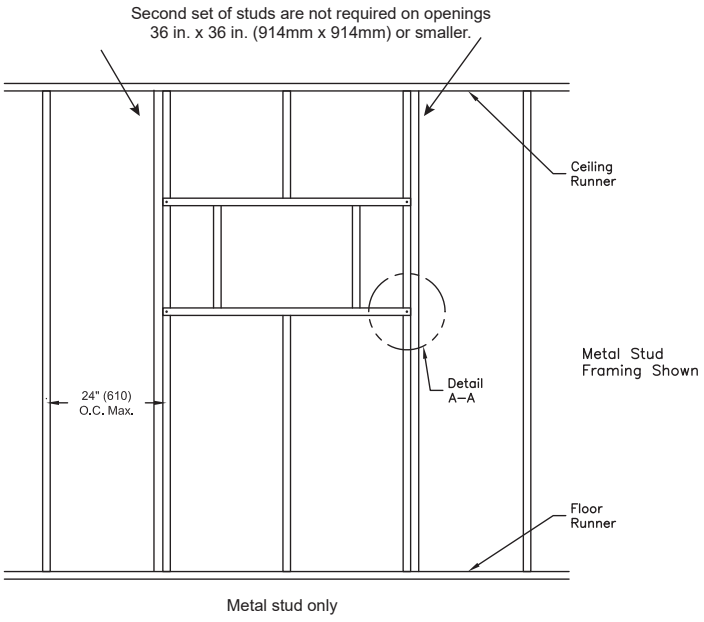

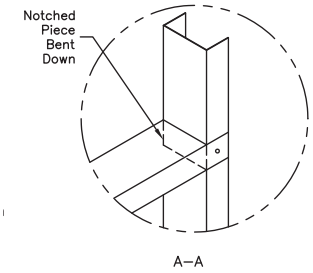

Figure 2

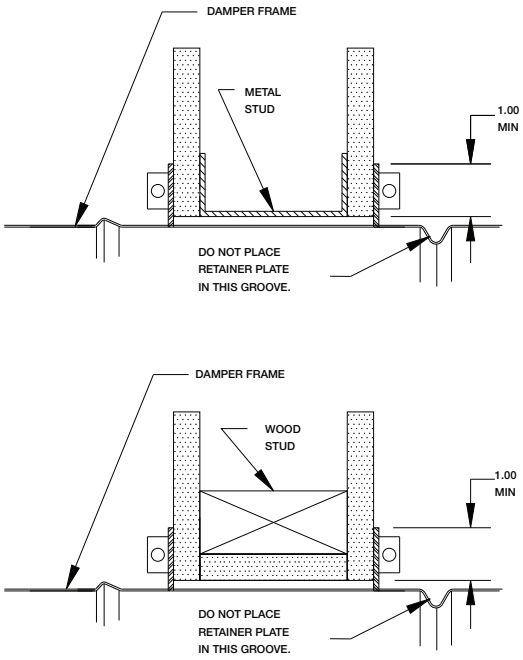

Figure 3

Clearances Required Between Damper Sleeves and Wall/Floor Openings

Fire damper assemblies expand during periods of intense heat. Therefore, it is essential that openings in walls or floors be larger than the fire or combination fire smoke damper assembly to allow for this expansion. The wall/floor opening must be a minimum of ⅞ in. (22mm) larger than the outside diameter of the damper.

Maximum Size Table

Damper Model	Maximum Size
DFDR-510	24 in. (610mm)
FDR-510	
FSDR-511	
FSDR-512	
SEDFDR-510	
SEFSDR-511	
SSDFDR-510	
SSFDR-510	
SSFSDR-511	

Inserting Damper into Wall/Floor Openings

Insert the damper assembly into the prepared opening, to appropriate depth (see **Figure 3 & 4**).

Recommended maximum and minimum insertion depth can be exceeded if:

Special attention must be paid to ensure the following:

1) The ℄ (centerline) of the damper frame remains within the plane of the wall or floor
2) The sleeve does not extend more than 16 in. (406mm) beyond the wall or floor on the actuator side of the damper and 6 in. (152mm) on the side opposite the actuator. The sleeve may also extend up to 16 in. (406mm) beyond the wall or floor if the damper has a factory supplied access door.

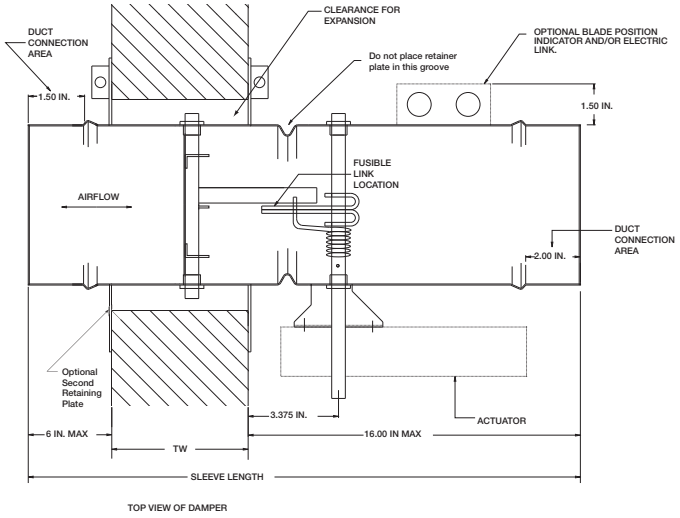

Figure 3: FSDR/SEFSDR/SSFSDR

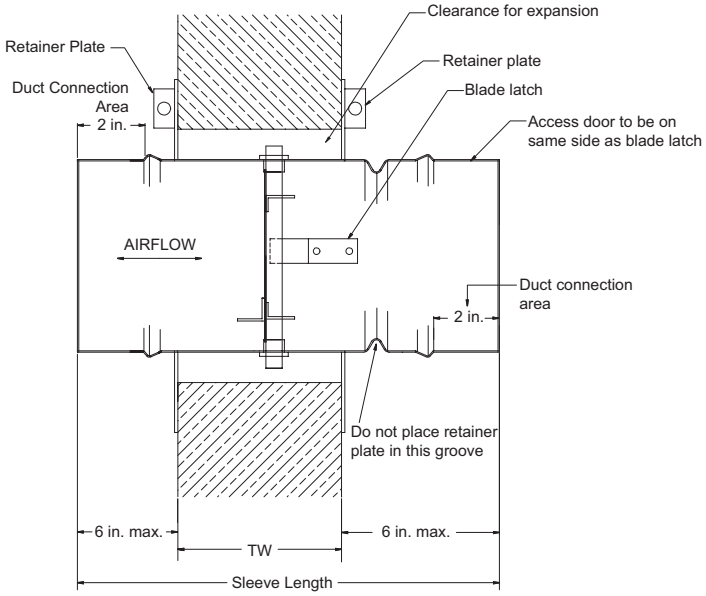

Figure 4: DFDR/FDR/SEDFDR/SSDFDR/SSFDR

Securing the Damper/Sleeve Assembly to Wall and Floor Openings

Damper assemblies must be installed in wall and floor openings using a single retaining plate on either side of the wall/floor or by using a retaining plate on both sides of the wall/floor. The use of a second retaining plate is provided with the dampers. A second retaining plate can be ordered as an option.

- The retaining plate(s) will open up for easy installation when the clamping screw is loosened. If necessary, remove the clamping screw and nut (see **Figure 5**).
- Position the retaining plate between the blade axle and the actuator shaft as shown in **Figure 3 & 4**. Do not place the retaining plate in the groove. IMPORTANT: The clamping mechanism should face away from the wall/floor.
- Place the damper and attached retainer plate into the wall/floor opening.
- If a second retaining plate is being used, secure it on the opposite side of the wall/floor.
- Verify position, blade orientation, and actuator clearance then tighten the retainer plate clamping screws.
- The retainer plate(s) must overlap the wall/floor opening a minimum of 1 inch (25mm).
- Secure the retainer plate(s) to the wall at the four corners of each plate when two retainer plates are used and also within ¾ in. (19mm) of the center of each side when one retainer plate is used. The following fasteners shall be used:
  - #8 or #10 screws of a length such that the screw engages the steel stud/track by ½ in. (13mm)(steel framing).
  - #8 or #10 screws of a length such that screw engages the wood stud by 1¾ in. (44mm) (wood framing)
  - Steel anchors or self tapping concrete screws penetrating masonry or block by 1¼ in. (32mm).

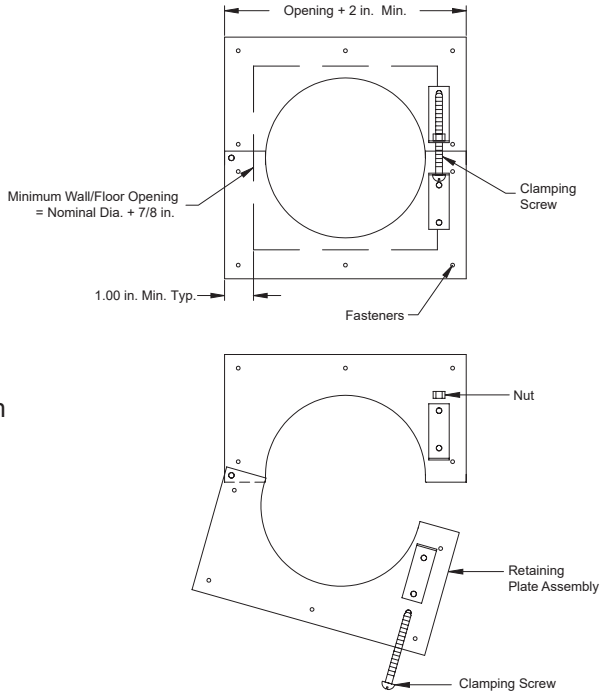

Figure 5: Retaining Plates

Duct to Sleeve Connections

Sleeve Gauge and Connection Type Requirements

Round duct connections to shall be attached with #8 or #10 sheet metal screws as follows:

- Ducts 22 in. (558mm) dia. and smaller shall have three screws.
- Ducts larger than 22 in. (558mm) dia. up to and iincluding 24 in. (610mm) dia. shall have five screws.

Note: All connections described may have duct sealant, PA2084T duct sealant adhesive manufactured by Precision, DP1010 water base duct sealant manufactured by Design Polymetrics, Grey Pookie, Ductmate PROseal®, or CL Ward S Seal applied in accordance with SMACNA recommendations.

Actuator and Temperature Response Device Connections

Actuator Connections

Electrical and/or pneumatic connections to damper actuators should be made in accordance with wiring and piping diagrams developed in compliance with applicable codes, ordinances and regulations (see **Electrical Guidelines**).

Temperature Response Device Connections

RRL - The RRL (resettable link device) incorporates a single thermostat. When the thermostat temperature is reached, the sensor interrupts power to the actuator and the actuator's spring return mechanism causes the damper to close. Refer to **Figure 6** for wiring of the RRL thermostat.

OCI - The OCI (open or closed indicator) option contains two single pole single throw switches used to indicate the damper blade position. The switches provide a positive open and closed signal and can be used in conjunction with remote indicator lights. Refer to **Figure 7** for wiring of the OCI option.

RRL /OCI - The RRL/OCI performs the function of an RRL and OCI (see description above). Refer to **Figure 8** for wiring of the RRL/OCI option.

TOR - The TOR (temperature override device) option incorporates two thermostats with fixed settings (usually 165°F [74°C] and 350°F [177°C]). The primary sensor (the sensor with the lower temperature setting) can be bypassed by an external contact closure allowing the damper to reopen until the secondary temperature is reached (the sensor with the higher temperature setting). See **Figure 9.**

The TOR assembly contains two single pole single throw switches used to indicate damper blade position. The switches provide a positive open and closed signal and can be used in conjunction with remote indicator lights. See **Figure 25** for wiring of the TOR thermostats and indicator switches.

If either the TOR or the RRL is ordered with a pneumatic actuator, an EP switch is required with an appropriate electric power circuit to allow the electric thermostat to control the pneumatic actuator.

Ratings (Figure 6, 7, 8, & 9)

Integral Switch Type: Single Pole, double throw

Electrical Capacity: 10 Amps, 1/3 hp, 120 or 240 Vac
½ Amp, 125 Vdc;
¼ Amp 250 Vdc
5 Amps, 120 Vac “L” (lamp load)
1.0 Amps, 24 Vac
1.5 Amps, 24 Vdc

Temperature Limit: 165° F (standard primary sensor)
212° F (optional primary sensor)
250° F (secondary sensor)*
350º F (secondary sensor)*

* based on actuator temperature rating

Safety Precautions

The operator should have carefully read and become familiar with the contents of this manual before installing, wiring, starting, operating, adjusting and maintaining the system. The operator is expected to use common sense safety precautions, good workmanship practices and follow any related local safety precautions.

In addition:

- **Before starting any installation or maintenance procedures, disconnect all power to the package.**
- All electrical procedures must be in compliance with all national, state and local codes and requirements.
- A certified electrician should connect all wiring.
- Refer to the electrical wiring diagram provided with the unit before starting any installation or maintenance work.
- Release all vacuum from the package before removing, loosening, or servicing any covers, guards, fittings, connections, or other devices.
- Notify appropriate personnel if repairs or maintenance will affect available vacuum levels.
- This is a high speed, rotating piece of machinery. Do not attempt to service any part while machine is in operation.
- To prevent automatic starting, disconnect all electrical power before performing any maintenance functions.
- Do not operate unit without guards, shields or screens in place.
- Make sure that all loose articles, packing material, and tools are clear of the package.
- Check all safety devices periodically for proper operation.
- **Do not add lubricating oil of any kind to the pump**.
- The "Hand" mode of operation should only be used for emergencies such as a PLC malfunction and should not be used for normal operation.
- Electrical service must be the same as specified on the control panel nameplate or damage to the equipment may occur.
- Vibration during shipment can loosen electrical terminals, fuse inserts, and mechanical connections. Tighten all electrical connections prior to energizing the control panel.

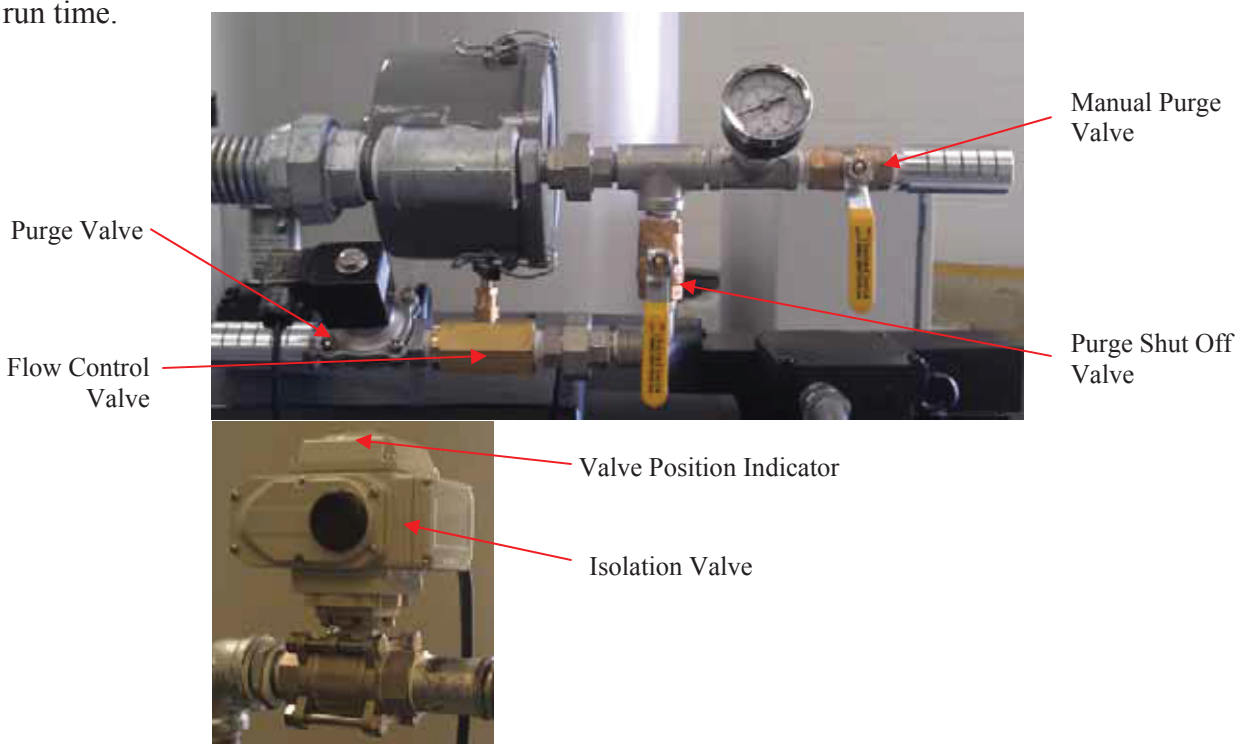
1.0 General Information

System Configurations
The Claw Lab Vacuum systems are either base mounted or tank mounted units in configurations of duplex, triplex, quadruplex or other multiplexed configurations. The systems are constructed as either single point connection (SPC) or modular packages. The complete package is pre-wired, pre-piped, and assembled either on one common base with single point connections for electrical, intake air, discharge air, and condensation drain or as a modular system with connection points for the above.

Vacuum Module
The vacuum pump is an oil-less rotary claw type direct-driven through a shaft coupling. The design is air-cooled, consisting of two claw-type, non-contacting rotors. Sealing fluid is not required. An oil change is required at approximately 5,000 operating hour intervals in the gearbox only. A built-in anti-suckback valve is mounted at the pump inlet and equipped with an inlet filter for removal of particulates.

Vacuum Drive and Motor
The pump is direct driven through a shaft coupling. The motor is a NEMA rated, C-faced TEFC, with 1.15 service factor suitable for 208 or 230/460V electrical service.

Intake Piping
Each vacuum pump has a piped intake with one "hospital type" inlet air filter. An inlet check valve and isolation valve is piped on each pump. The vacuum pumps are connected to a common manifold and piped to a receiver. A flexible connector is located between each pump and the manifold.



Vacuum Receiver
The vacuum system includes a vacuum receiver vertically or horizontally oriented in the package. The receiver is ASME Code stamped and National Board Certified. The receiver is rated for a minimum 200 psig design pressure and includes an integrally mounted valved bypass, manual drain, and vacuum gauge.

Control System
The mounted and wired control system is NEMA 12 and U.L. labeled. The control system provides automatic lead/lag sequencing with circuit breaker disconnects for each motor. The control panel also includes full voltage motor starter contactors with overload protection, redundant 120V control circuit transformers, visual and audible reserve unit alarm with isolated contacts for remote alarm, hand-off-auto selector switches, a vacuum indicator, and runtime hours indicator. Automatic alternation of vacuum pumps with provisions for simultaneous operation if required, automatic activation of the reserve unit if required. Visual and audible alarms indicators for a high discharge temperature shutdown, with isolated contacts for remote alarm, are included.

1.0 General Information (Continued)

Auto Purge Control (optional)

The Auto purge feature has three operating modes, Manual - Off - Auto Purge. Manual mode puts the selected pump in the purge mode, pump must be turned to the Hand position to operate. The Auto purge mode will purge a pump at the end of it's minimum run time for 15 minutes. The HOA switch need's to be in the Auto mode for the auto purge to operate. The purge feature consists of a purge valve, isolation valve and a manual purge valve. When the auto purge cycle starts the isolation valve will close, 20 seconds later the purge valve will open and flow ambient air at approx 22-23"hg thru pump, after 15 minutes the pump will turn off and wait for it's next run time.

A ***Signal 1*** **System touch screen gateway** is mounted in the control panel door. It includes:

- a vacuum display
- a runtime display
- a vacuum trend display
- a trend display showing number of pumps running
- an alarm history display
- ability to download trending and history files to PC
- a maintenance schedule and history display
- a service indicator
- a replacement parts display
- a battery backup for history data
- a vacuum set point adjustment display
- a system data display

2.0 Installation

2.1 Inspection Upon Receiving

The Claw Lab Vacuum system should be carefully inspected upon delivery. Any damage by the carrier should be noted on the delivery receipt, especially if the system will not be immediately uncrated and installed. The system may remain in its shipping container(s) until ready for installation. If the system is to be stored prior to installation, it must be protected from the elements to prevent rust and deterioration.

DO NOT REMOVE the protective covers from the inlet and discharge connection ports of the unit until they are ready for connecting to the lab's pipeline distribution system.

2.2 Handling

!!WARNING!!
USE APPROPRIATE LOAD RATED LIFTING EQUIPMENT AND OBSERVE SAFE LIFTING PROCEDURES DURING ALL MOVES.

The vacuum package can be moved with either a forklift or dollies. Keep all packing in place during installation to minimize damage. If disassembly of the unit is necessary to access doorways or low ceiling clearances, carefully label all electrical connections that are removed for easier re-assembling at the final destination. Units should be placed to ensure easy access to perform maintenance and high visibility of indicators and gauges.

2.3 Location

The Lab Vacuum system should be installed indoors in a clean, well-ventilated environment. Areas of excessive dust, dirt or other air-borne particulate should be avoided.

Secure the package to a flat, level surface capable of supporting the weight and forces of the unit. Make sure that the main base is not bowed, twisted, or uneven. Because of the internal flexible hose connections and vibration isolators, **no special foundation is required**. However, the unit base must be securely bolted using all mounting holes provided in the base. If a raised concrete pad is used, the base must not overhang the concrete pad. A method to drain away moisture is necessary. If a gravity drain is not available, a connection to a drain is necessary. After securing the unit to the floor, remove all packing material.

The area should have an ambient temperature of between 40^{o}F and 104^{o}F.
(If the maximum ambient exceeds 104°F, contact the factory for special instructions). The system should be located as close as possible to the point of usage to prevent excessive loss of operating vacuum due to pressure drop.

2.0 Installation (Continued)

2.4 Space Requirements

The Lab Vacuum system should be placed to ensure easy access to perform maintenance and high visibility of indicators and gauges. It is recommended that a minimum space of 24” be allowed on all sides of the compressor system for ventilation and maintenance. A minimum space of 36" in front of the control panel is required by NEC code. A vertical distance of 36” is required above the unit for ventilation and maintenance.

2.5 Locations Above Sea Level

All vacuum pumps above sea level have reduced flow and should be de-rated. After determining the correct flow needed for the Lab vacuum system, multiple this number by the adjustment factor in the following chart. After determining the new flow required, use this number to size the Lab vacuum system.

Altitude Adjustment Factor

Altitude (ft)	Normal Barometric Pressure (inches HG)	Multiplier Used for Required SCFM
0	29.92	1.00
500	29.39	1.02
1000	28.86	1.04
1500	28.33	1.06
2000	27.82	1.08
2500	27.32	1.10
3000	26.82	1.12
3500	26.33	1.14
4000	25.84	1.16
>4000	**Do NOT use Oil-less Vacuum Pumps. Contact Factory.**	

2.0 Installation (Continued)

2.6 Wiring

WARNING!
BE SURE TO DISCONNECT ALL ELECTRICAL POWER TO THE VACUUM SYSTEM BEFORE PERFORMING ANY ELECTRICAL PROCEDURES.

Refer to the electrical diagram provided with the unit before starting any installation or maintenance work.

Do not operate the vacuum system on a voltage other than the voltage specified on the system's nameplate.

All customer wiring should be in compliance with the National Electrical Code and any other applicable state or local codes.

Check the control voltage, phase and amp ratings before starting the electrical installation, and make sure the voltage supplied is the same.

The wire size should be able to handle peak motor amp load of all operating units, refer to the full load amperes on the wiring diagram.

Check all electrical connections within the vacuum system that may have loosened during shipment.

Only qualified electricians should make power connections to the control panel and any interconnecting wiring.

Ensure that the emergency generator system's electrical supply is consistent with the vacuum system's requirements.

Three-phase power supplied from the emergency generator(s) must match that of the normal supply to allow for correct direction of the motor rotation at all times.

2.0 Installation (Continued)

2.7 Intake Piping

Before connecting any piping, the plastic thread protector installed in the connection port must be removed. The main vacuum line to the receiver should not be reduced below that provided on the receiver. Long piping runs may need to be increased in size to minimize pressure drop. Improper line sizing may result in a loss of capacity. Ideally, piping should be constructed using long radius elbows and a minimum number of turns. All secondary lines should be taken from the top or side of the main line to prevent any accumulated moisture from draining towards the pumps. All lines should slope away from the pumps. Any low points in the piping should be equipped with pipe drains to remove accumulated moisture. All pipe must be either seamless copper tubing or other corrosion-resistant metallic tubing, such as galvanized steel or stainless steel.

2.0 Installation (Continued)

2.8 Exhaust Piping (Continued)

Minimum Pipe Sizes

Notes: 1. All pipe sizes are based on the following: copper pipe (Type L), 14.7 psia.
2. The minimum pipe size must be maintained for the total length of the exhaust pipe. Use next larger size pipe in the event the minimum size is not available.
3. When determining the total pipe length, add all the straight lengths of pipe together in addition to the number of elbows times the effective pipe length for that pipe size. (See the table and example below.)

Example:
Select the pipe size for a Duplex 6.4 HP with 100 feet of straight pipe and four elbows:
A) Select the pipe size of 4" diameter for 100 feet of straight pipe.
B) Determine the eff. pipe length for an elbow of 4" diameter (EPL = 10.0 ft / elbow).
C) Calculate the SYSTEM PIPE LENGTH {SPL (4.0" D) = 100 + (4 x 10.0) = 140 ft
D) Check this SYSTEM PIPE LENGTH to see if it exceeds the minimum pipe size.

Vacuum System	System Pipe Length (ft) - See Notes											
	25	**50**	**75**	**100**	**150**	**200**	**250**	**300**	**350**	**400**	**450**	**500**

3.0 Control Panel

1. Display Screen – Displays the systems operating screens.
2. LED's –Yellow PWR: Power is correctly supplied
Green CPU: Indicates the Signal 1 is operating correctly
Red COM: Indicates communication with PLC
Not lighted: Power is not supplied
3. HOA selector switch – Compressor control switch, Hand – Off – Auto.
4. Alarm horn – Sounds when an alarm condition occurs.
5. Alarm Reset/Horn Silence – Pushbutton to silence alarm and reset visual alarm on *Signal 1* screen after alarm condition is corrected.
6. Purge selector switch – Selects purge control mode.
7. **Motion sensor** – Turns Signal 1 back light on if movement is present
7. External Operators– Turns Circuit Breakers On - Off

3.0 Control Panel (Continued)

3.1 Signal 1 System touch screen gateway

The Scroll Lab Air system has a touch screen gateway to control and monitor the complete system operation as well as record service and alarm history of the unit and change pressure setting levels.

3.2 *Signal 1* Main Display Screen The main screen for systems will monitor and display the air receiver vacuum level, motor speed, run sequence, individual unit total run hours and run status (HOA switch position). Included on this screen is a service due alarm, transducer fault alarms and lag alarm for the system as well as individual alarms for each compressor unit (motor overload, and high discharge air temperature) . The "MENU" button in the upper right corner will allow the operator to navigate through the screens to view the system alarm history, service schedule and records, and vacuum trends, basic troubleshooting, vacuum settings, and system general information. When the ***Signal 1*** is powered up the main control window will appear on the display screen. This screen displays the systems current vacuum level, total hours run for each module, run sequence, HOA switch setting and status of service schedule and alarm conditions.

Main Screen (Duplex System shown)

3.0 Control Panel (Continued)

3.2 HMI Main Display Screen (Continued)

1. MENU: Displays menu screen which allows the operator to access the systems operating history, service requirements, and vacuum trends, troubleshooting info and main system info.
2. VACUUM (inches Hg): Display's the current vacuum level inside the air receiver.
3. SERVICE DUE: Service intervals and types of service are preprogrammed into the HMI. The button will flash yellow when service is due. Pressing the "service due" button when flashing will display the service schedule screen.
4. TDC FAULT: Indicator will flash red and horn will sound if the transducer fails. Vacuum reading on the display screen will default to "30" hg. Selecting the indicator when flashing red will open a trouble shooting window.
5. LAG ALARM: (Optional) Indicator will flash red and horn will sound when last available vacuum unit comes on. Press the reset button to silence the alarm. If the condition is corrected both the alarm and indicator will turn off. If a lag condition remains the indicating light on the HMI will remain on. Selecting the indicator when flashing red will open a trouble shooting window. Once the lag condition is corrected, press the reset button again to turn off alarm light.
6. UNIT RUN HOURS: Displays total run hours for each vacuum module.
7. HAND-OFF-AUTO: Displays status of each vacuum module. The green "HAND" displays when the vacuum is running and the HOA selector switch is in the HAND setting. The green "AUTO" displays when the vacuum is running in the normal sequencing mode. The "OFF" indicator is displayed when the HOA selector switch is in the "OFF" position for the pump that is not running.
8. MOTOR OVLD: Display will flash red and sound an alarm when overload switch is tripped in the control panel. The vacuum in question will not re-start until the reset button on the starter inside the main control cabinet is reset. Press the reset button on front panel to silence the alarm. Selecting the indicator when flashing red will open a trouble shooting window. The indicator on the HMI will remain on until motor starter is reset.
9. FAILED START: Display will flash red if the vacuum module failed to start/run when signaled to start. This alarm will also activate when a Motor Overload Shutdown occurs. Press the reset button on the front panel to silence the alarm. Selecting the indicator when flashing red will open a trouble shooting window. The indicator light on the HMI will remain on until the problem has been resolved and the reset button pushed again.

3.0 Control Panel (Continued)

3.3 Control Buttons

3.3.1 MENU

The MENU button in the upper right corner on the main screen when selected will display the "MENU" window that will allow the operator to access information shown on screen below. Each button will be explained in detail in this section.

3.3.2 – "MAIN" Button

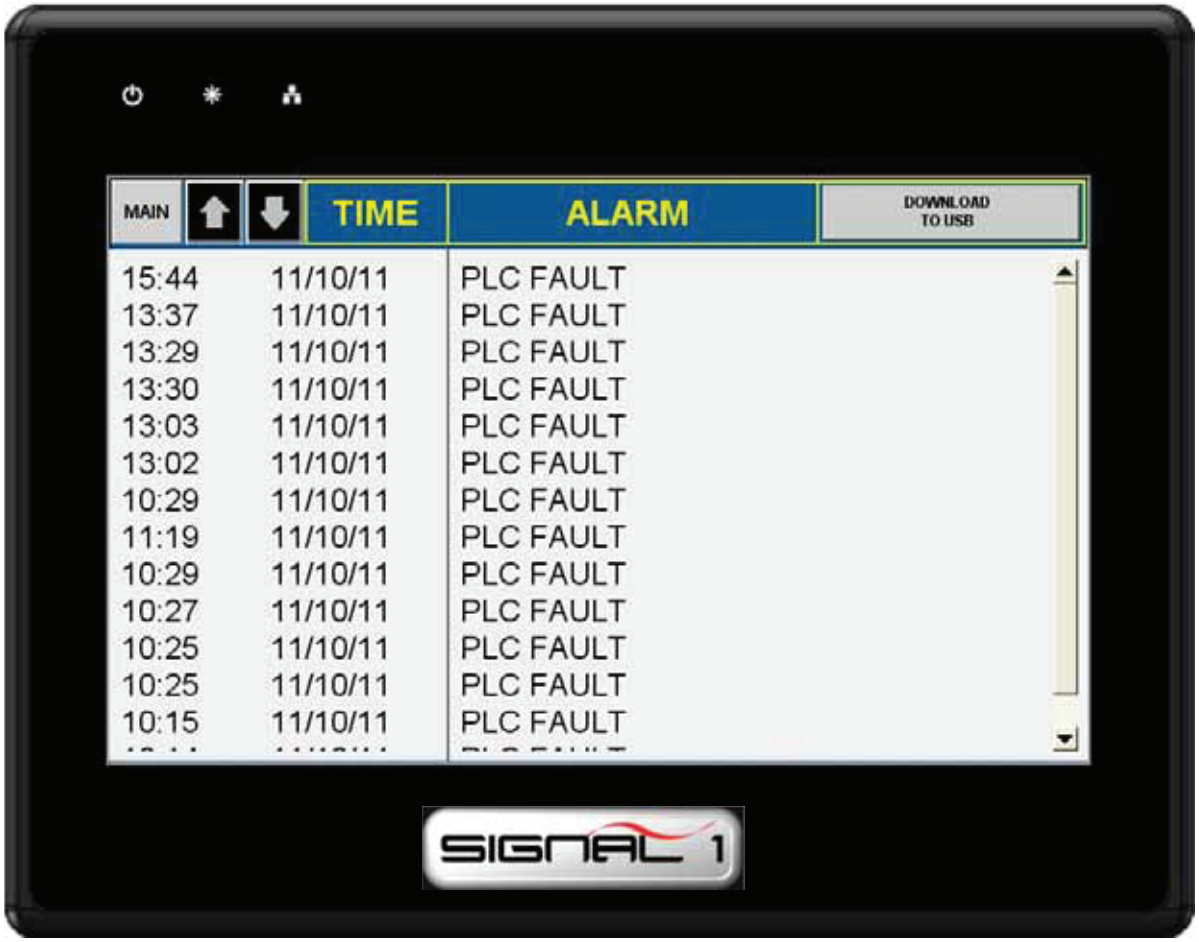
The main button can be found on many of the screens within the *Signal 1* Controller. At any time when the "MAIN" button is selected, the *Signal 1* display will return to the Main Display Screen.

3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

3.3.3 – "ALARM HISTORY" Button

The "ALARM HISTORY" button on the "Menu" screen will open a new window listing all the alarm conditions that have occurred as well as routine maintenance alerts. The list will show the date and time of the incident, type of incident and when the condition was cleared/corrected. This creates a permanent record of the history of the unit and cannot be reset.

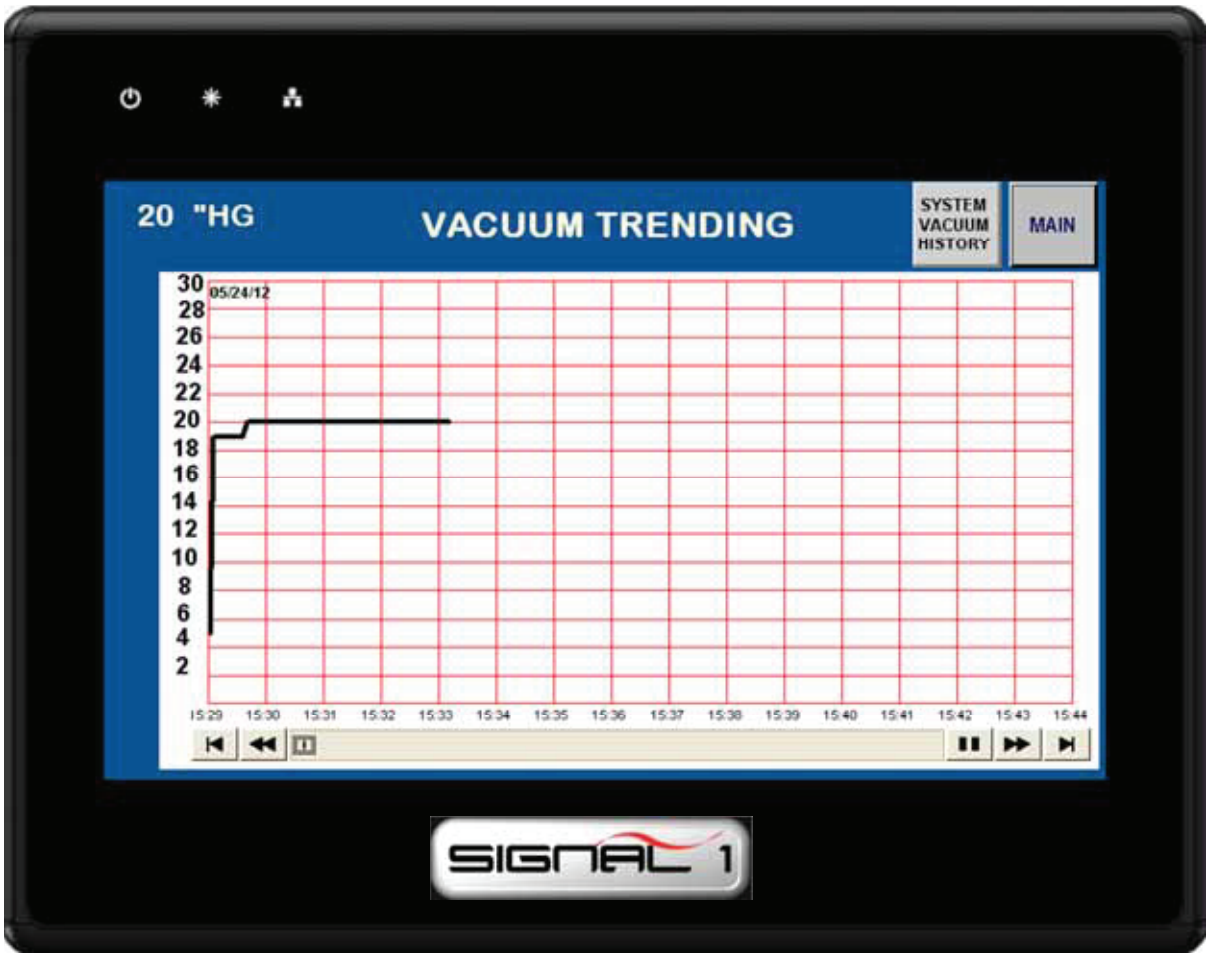


1. "MAIN" button will return you to the main screen.
2. "HISTORY" button will open a new History screen shown on the next page

3.0 Control Panel (Continued)

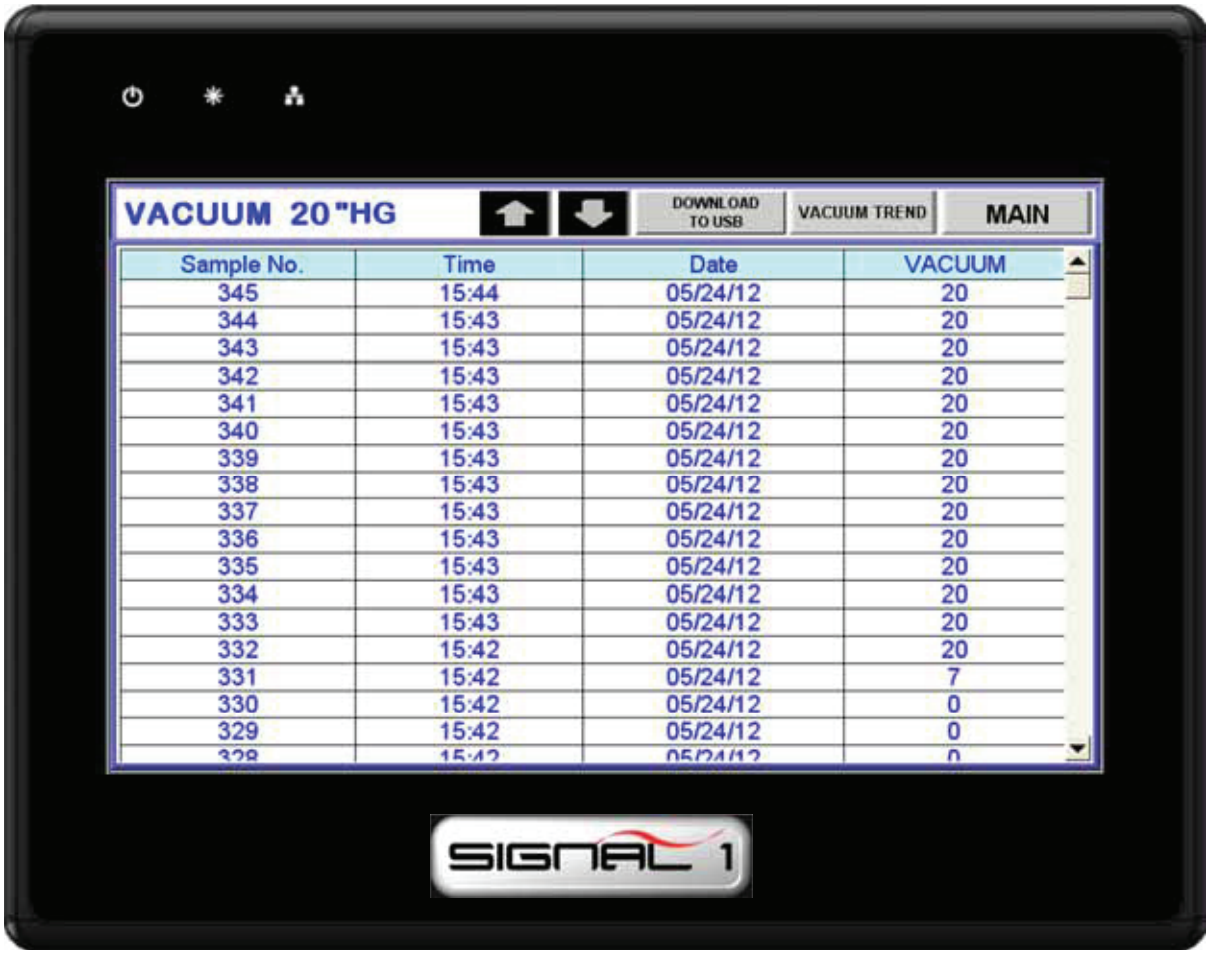
3.3 Control Buttons (Continued)

3.3.4 – "HISTORY" screen displayed from pressing "History" button on "Alarm History" screen shown below. Pressing the up and down arrows will display alarm/maintenance history one day at a time. History can be down loaded to a USB memory stick by inserting the memory stick into the USB slot on the back of the *Signal 1* and pressing the "Download To USB" button on the screen. Files can be saved to PC and viewed in an excel format.



3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

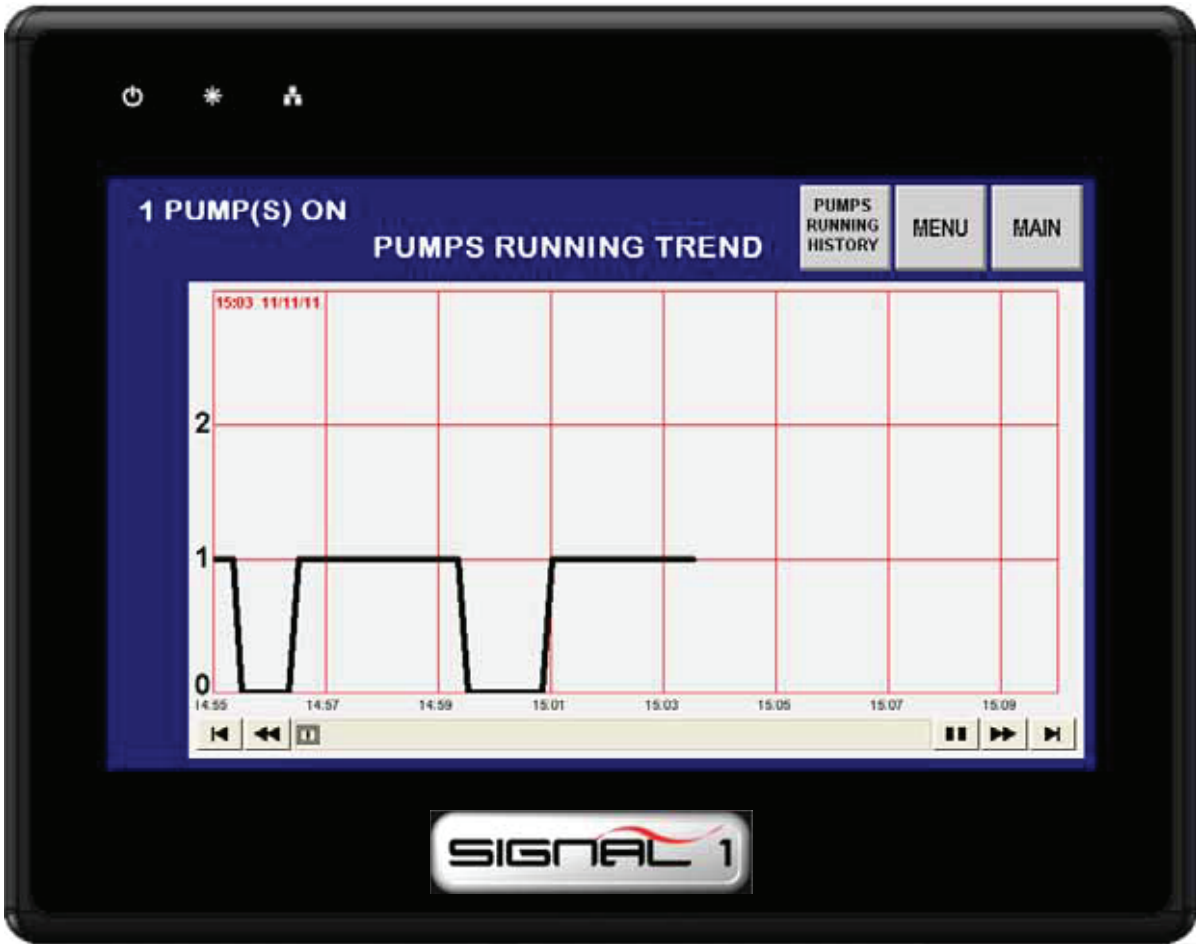


3.3.5 – "VACUUM TREND" Pressing the "Vacuum Trend" button on the "Menu" screen will display the screen below. Screen displays 15 minutes of trending and has a scroll bar on the bottom of screen to scroll to different time frame.
1. "MAIN" button will return you to the main screen.
2. "SYSTEM PRESSURE HISTORY" button will open a new screen shown on the next page

3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

3.3.6 – "VACUUM TREND HISTORY" screen shown below. Pressing the up and down arrows will display pressure trending history one day at a time. History can be down loaded to a USB memory stick by inserting the memory stick into the USB slot on the back of the *Signal 1* and pressing the "Download To USB" button on the screen. Files can be saved to PC and viewed in an excel format.



3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

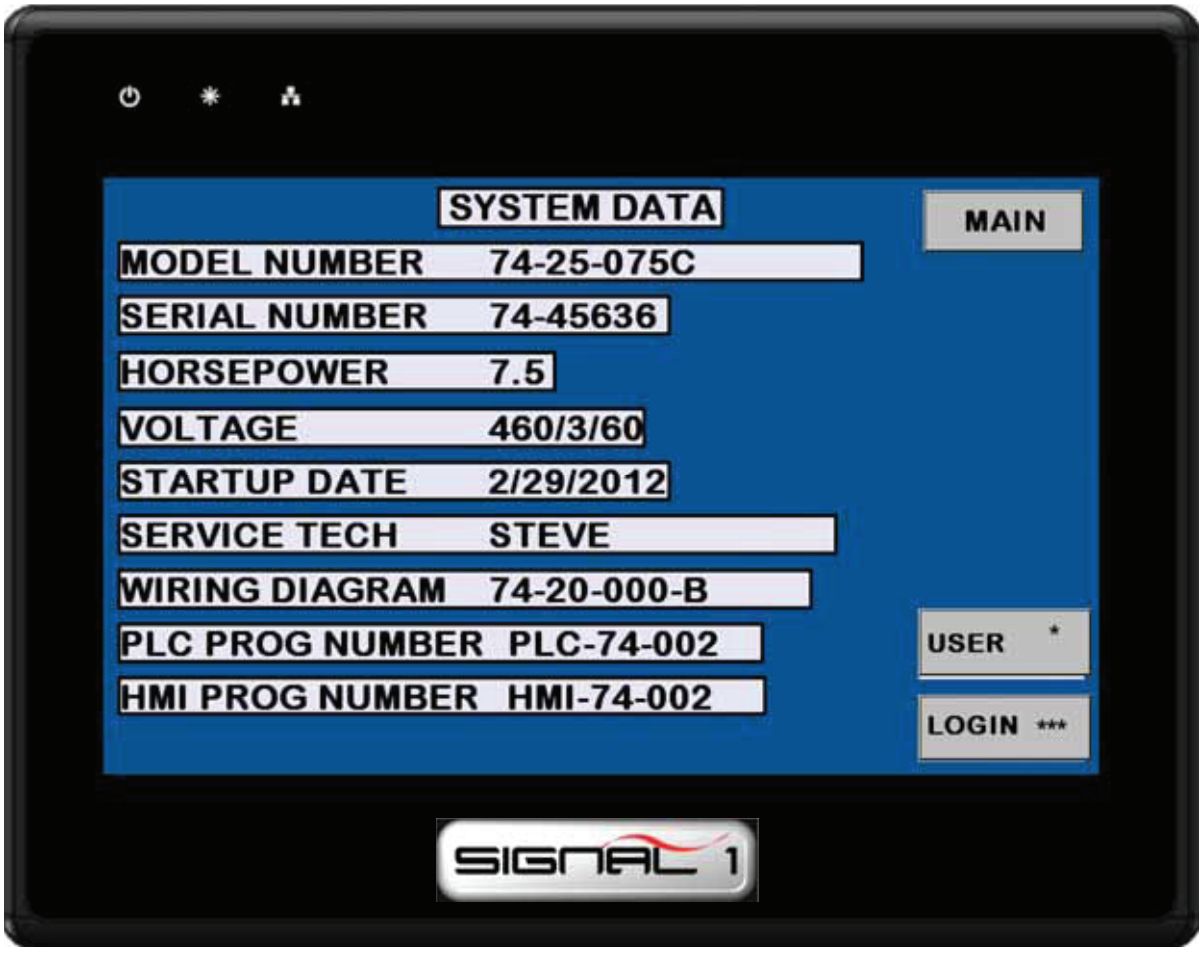
3.3.7 – "NUMBER PUMPS RUNNING TREND" Pressing the **"**NUMBER PUMPS RUNNING TREND" button on the "Menu" screen will display the screen below. Screen displays 15 minutes of trending and has a scroll bar on the bottom of screen to scroll to different time frames.

1. "MAIN" button will return you to the main screen.
2. "PUMPS RUNNING HISTORY" button will open a new screen shown on the next page

3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

3.3.8 – "PUMPS RUNNING HISTORY" screen shown below. Pressing the up and down arrows will display number of pumps running trending history one day at a time. History can be down loaded to a USB memory stick by inserting the memory stick into the USB slot on the back of the *Signal 1* and pressing the "Download To USB" button on the screen. Files can be saved to PC and viewed in an excel format.



3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

3.3.9 "SYSTEM DATA" Button

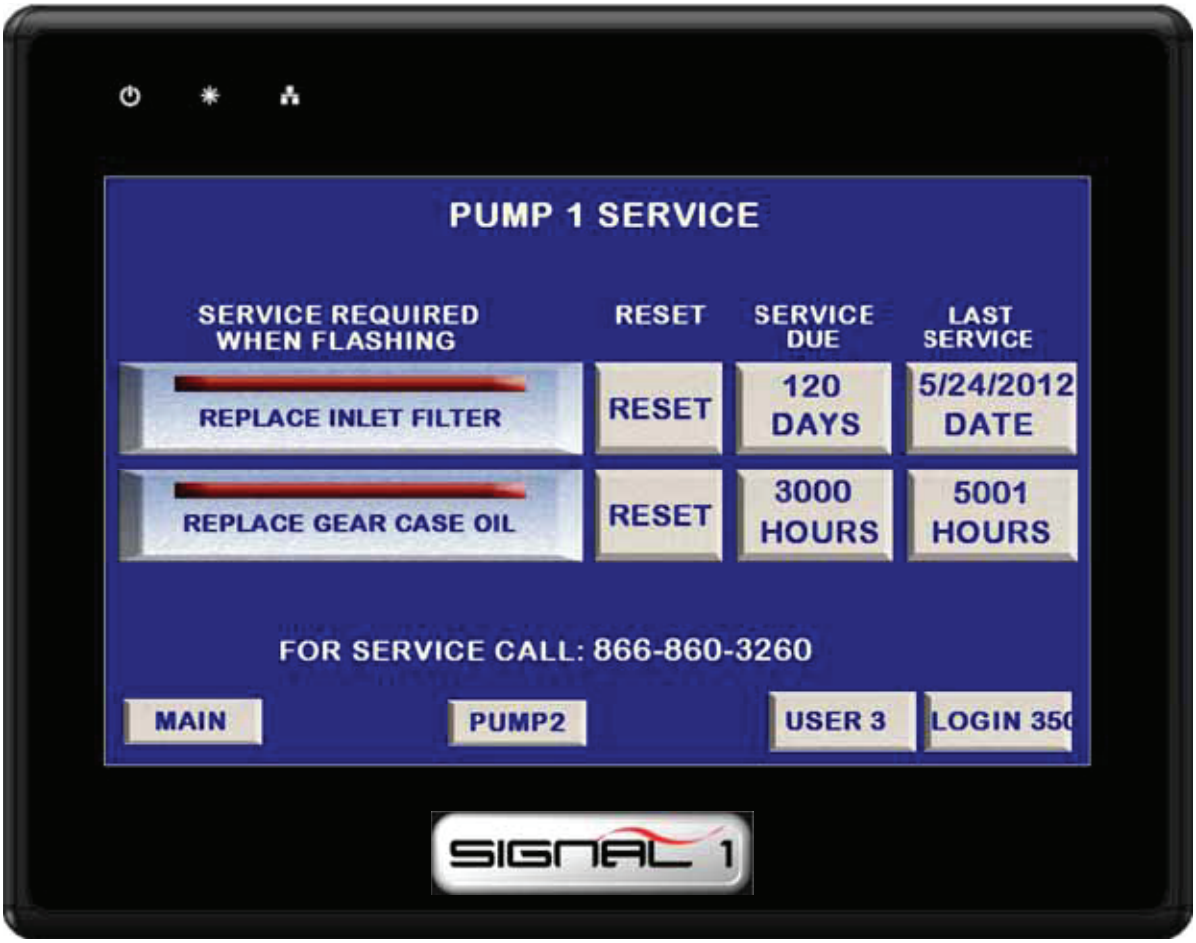
The "System Data" button displays all the system information required when scheduling maintenance or purchasing spare parts from Patton's Medical. The information includes model number, serial number, horsepower, system voltage, and unit start up date. This information will be programmed into the *Signal 1* at startup by a Patton's Medical authorized technician.

3.0 Control Panel (Continued)

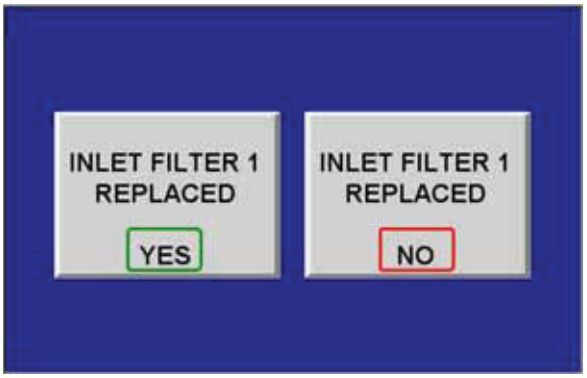
3.3 Control Buttons (Continued)

3.3.10 "PARTS MENU" Button

The "Parts Menu" button displays routine maintenance parts required when performing scheduled maintenance.



3.0 Control Panel (Continued)



3.3 Control Buttons (Continued)

3.3.11 – "PUMP SERVICE" Buttons

1. Select "**USER #**" button and enter "3" and press "enter".
2. Select "**LOGIN**" button and enter "350" and press "enter".
3. Press "**RESET**" button next to item requiring maintenance red light will be flashing.

4. Screen to right will display press "YES" to reset maintenance performed. Service due date and Last Service date will reset.

3.0 Control Panel (Continued)

3.3 Control Buttons (Continued)

3.3.12 – "VACUUM SETTING" Button

1. Select "**USER #**" button. Enter "2" and select "enter".
2. Select "**LOGIN**" button. Enter "327" and select "enter".
3. Press setting to be changed and screen to right will display. Enter pressure setting desired then "ENT".
4. Pressing "RESTORE DEFAULTS" at anytime will change all settings to original factory settings.

4.0 System Operation

4.1 Pre-start-up

The contractor should notify **Patton's Medical** two weeks prior to start-up date to schedule an appointment for an authorized technician to review the installation prior to start-up.

WARNING:

CAUTION: Failure to install the unit properly and have an authorized technician from **Patton's Medical** start-up the system can void the manufacturer's warranties.

WARNING:

Have more than one person on hand during prestart-up and start-up procedures to ensure safety and to facilitate certain checks.

Prestart-up and start-up procedures should be performed for a new installation or when major maintenance has been performed.

The main power source to the control panel should be OFF for the duration of the visual inspection.

Ensure that the equipment is installed on a solid level surface. Walk around the system to ensure that there is enough clearance on all sides to perform operational checks/actions and maintenance. The temperature of the area containing the modules should be approximately 70°F (21.1°C) with a minimum ambient temperature of 40°F (4.4°C) and a maximum ambient temperature of 104°F (40°C).

Check the inlet piping for proper size and connection to the vacuum system.

Check all piping system joints that might have come loose during shipment and installation to ensure they are tight.

Check the vacuum receiver, controls, and vacuum pumps for damage.

Check the drain valves on the receiver.

4.0 System Operation (Continued)

4.1 Prestart-up (Continued)
Check all valves for full open and full close travel. Ensure that the system's valves are positioned for proper operation. (Refer to indicators on the valve handles.)

Remove all packing material from the unit.

Check the electrical connections to the control cabinet.

Verify electrical service. Before starting the Lab Vacuum system, check to see that voltage, amperage, and wire size are appropriate.

CAUTION: Electrical service must be as specified or damage to equipment may occur.

WARNING:
To prevent electrical shock, ensure that ALL electrical power to the system is OFF, including the disconnect switches and H-O-A switches on the control panel. The facility's supply circuit breaker should also be locked out.

Open the electrical cabinet by loosening the fasteners on the front.

CAUTION: Vibration during shipment and installation can loosen electrical terminals, fuse inserts, and mechanical connections. Tighten as necessary.

Check the electrical cabinet for any broken switches, lights, etc.

Check that all motor starter connections are tight and that there are no loose objects such as terminal lugs, screws, nuts, etc., in the cabinet.

4.0 System Operation (Continued)

4.2 Initial Start-up

CAUTION: Complete the prestart-up procedure before continuing with the initial start-up procedure

WARNING:
To prevent electrical shock, ensure that ALL electrical power to the system is OFF, including the disconnect switches and H-O-A switches on the control panel. The facility's supply circuit breaker should also be locked out.

4.2.1 Lubrication

The pump's synchronizing gears are oil lubricated, but **there is no lubricant or sealing fluid inside the pumping chamber**. All Claw vacuum pumps are shipped with the required amount of oil for start-up already in the pumps. The level should be slightly above the middle of the sight glass.

NOTE: DO NOT ADD OIL TO THE VACUUM PUMP.

WARNING:
Ensure that all loose articles, packing material, and tools are clear of the system.

Set the H-O-A switches are to "O" (OFF).

Check all voltages supplied to the system to ensure they are the required value and phases needed by the control panel.

Open the inlet isolation valve on each vacuum pump.

Open the outlet isolation valve on each vacuum pump.

Open the receiver isolation valves.

Close the receiver bypass valve.

Apply power to the system and turn the disconnect switches to "On".

4.0 System Operation (Continued)

4.2 Initial Start-up (Continued)

4.2.2 Pump Rotation

Prior to actual operation, the pumps must be checked for correct rotation.

Using the Hand-Off-Auto switch on the door of the control panel, jog the motor of the specific pump that is to be checked by momentarily turning the switch to "Hand" and back to "Off". By observing the cooling fan of the motor, you can determine the rotation of the pump. Pump rotation should be counterclockwise when looking at the rear of the motor. Directional arrows are located on each pump.

If the pumps are rotating in the wrong direction, rotation can be reversed by switching any two main power leads to the panel. Correct rotation should be confirmed in the previous manner.

WARNING:
REMOVE POWER BEFORE WORKING ON ANY ELECTRICAL CONNECTIONS.

4.3 Initial Operation

Run the pump for two minutes in the correct rotation. Stop the pump and check for correct oil level in the sight glass. Add oil if necessary. The pump is shipped with oil in the gear case. **DO NOT OPEN THE FILLER PORT WHILE THE PUMP IS RUNNING.**

WARNING!
Pumps that have reached operating temperature may have a high surface temperature on the top of the exhaust muffler.
DO NOT TOUCH!

4.4 General Operation

WARNING!
NEVER RUN THE PUMP WITHOUT LUBRICATING OIL!

4.4.1 Electrical Control Panel

The Lab Vacuum's **multiplex** control panel includes a visual and audible lag pump alarm and a 0-30"Hg vacuum gauge. It also has the following for **each pump**: 120V control transformer with fuses, hour meter, vacuum control switch, high discharge air temperature switch with alarm, high vacuum switch, with alarm, illuminated Hand-Off-Auto switch, motor starter and circuit breaker. All components are enclosed in a NEMA 12 enclosure.

4.4 General Operation (Continued)

4.4.1 Electrical Control Panel (Continued)

During normal operation, all H-O-A switches should be turned to the "Auto" position so that the PLC can effectively control the system. The PLC monitors the condition of the vacuum transducer, starts and stops the pumps depending on changing vacuum level and minimum run time values, and automatically alternates the lead position between units.

In a typical **duplex** system, one pump will be able to handle the system load. The PLC will signal the lead pump to start when system's vacuum level reaches the cut-in set point. If the one pump can carry the load, then the vacuum level will rise to the vacuum set point. At this point, if the minimum run timer for that pump has been satisfied, the PLC will turn off the lead pump. If the minimum run timer for that pump has not been satisfied, the lead pump will continue to run until the timer expires. When the system vacuum drops again, the PLC will automatically sequence the lead role to the other pump and will start it. If the lead pump runs continuously in lead for more than the adjustable minimum run time, the PLC will automatically sequence the pump attempting to evenly distribute the run time among all available pumps. If during operation, the second pump is required to come on in addition to the lead pump, the PLC will turn on the "Lag Alarm" (see section 4.5).

In a **triplex** or **quadruplex** system, the operation is very similar to the duplex operation described above with the following differences. With a triplex or a quadruplex system, the lag unit running alarm may not necessarily correspond to the third or fourth pump coming on. To determine when the PLC turns on the lag alarm, it counts the number of units in the "Auto" position and makes a decision based on the vacuum transducer conditions. For instance, in a quadruplex system with only 2 H-O-A switches in the "Auto" position, the lag alarm will turn on when the second unit is started.

On the **initial** system start-up, when the system vacuum level is below the set points of the vacuum transducer, the first pump will start. After a time delay, the next pump will start if required. The time delay is to prevent high inrush current after a power failure or emergency power switch over. During this initial system start-up, the lag alarm could come on at this point and is normal. It can be reset once the vacuum level has reached the transducer's set point and the lag pump has cut off after it's minimum run time has expired.

In an Auto Purge system, The minimum run time is fixed can be set to run from 1 to 8 hours. At the end of a pumps minimum run time with the pump in auto purge mode the pump will purge for 15 minutes before shutting off.

4.0 System Operation (Continued)

4.4 General Operation (Continued)

4.4.2 Minimum Run Timer(s)

All vacuum systems incorporate minimum run timers to minimize the starts and stops on the vacuum pumps. The timers are adjustable or self adjusting and can be adjusted to suit the load of the facility.

4.5 Tank Drain

The standard tank drain consists of a manually operated ball valve.

To drain the liquid from the tank, open the tank bypass valve and close the tank isolation valves. Then open the drain valve. When draining is complete, close the drain valve first, then open the tank isolation valves and close the tank bypass valve.

4.6 Emergency Shutdown / Alarms

The following conditions may arise during operation.

Motor Overload Shutdown - This will shut down the pump in question and will not re-start until the reset button on the starter inside the main control cabinet is reset. See Section 4 for troubleshooting information.

High Discharge Air Temperature Shutdown - This will shut down the vacuum pump in question and will not restart until the appropriate red push button is pressed on the main control panel. Before allowing the unit to re-start, the condition should be checked. Even after pushing the button, the unit may not re-start, depending on system sequencing and system vacuum.

4.0 System Operation (Continued)

4.6 Emergency Shutdown / Alarms (Continued)

Lag Unit Running Alarm (Optional) - This alarm will activate if the last available vacuum pump comes on. In the case of a duplex system, it will activate when the second pump turns on. In the case of a multiplex system, the lag alarm will activate when the last available unit is required to come on. For example, in a quadruplex system, if all four (4) H-O-A switches are set to "Auto", then the lag alarm will trigger when the fourth unit comes on. If on the same system, three (3) of the four (4) H-O-A switches are set to "Auto" and the other to "Off" or "Hand", then the lag alarm will activate when the third unit comes on. To silence the alarm, press the alarm reset button. In the event the lag alarm is persistent, check to see if any leaks or valves are open downstream or reduce the system load.

4.7 Relief Valve

The pump is built with an integral vacuum relief valve. The purpose of this relief valve is to prevent the pump from operating at a vacuum level that is too high. The maximum operating point varies by model and is factory set before shipping.

The function of the relief is very important to the successful long-term operation of the vacuum system. Since these pumps have no oil or water to carry away the heat of compression, an adequate flow of air *through* the pump, as well as air circulation *around* the pump, is vital.

NEVER SET THE VACUUM RELIEF VALVE AT A POINT THAT EXCEEDS THE FACTORY RECOMMENDED LEVELS!

5.0 Troubleshooting

Problem	Possible Causes	Solution
Failure to start	Main power disconnected	Turn on main power
	Power failure	Restore power
	Main fuse blown	Replace fuse
	Fuse blown in control circuit	Replace fuse
	Overload tripped on starter	Reset & check for system overload
	High temperature switch activated	Allow unit to cool; reset switch & check for over temperature condition
Power failure	Main fuse blown	Replace fuse
	Fuse blown in control circuit	Replace fuse
Unit lacks sufficient vacuum or lag alarm has occurred	Clogged Filters	Clean filters
	Vacuum relief valves need adjusting	Re-calibrate relief valve
	Restrictions in piping	Open pipe connections and examine for internal contamination or buildup
	Leaks in piping	Tighten all piping connections
	Insufficient pump speed (RPM)	Check voltage and amperage to motor
		Inspect motor and coupling halves
		Check that the pump shaft turns freely

5.0 Troubleshooting (Continued)

Problem	Possible Causes	Solution
Unit lacks sufficient vacuum or lag alarm has occurred	Line losses too high	Piping diameter too small replace with larger diameter pipe
	Unit is operating at an elevated altitude	Contact the factory for assistance. Performance may be reduced when operating well above sea level.
Motor breakers trip constantly	Defective motor	Test motor and replace if necessary
	Heaters incorrectly adjusted too small, or defective	Adjust or replace with correctly sized heaters
	Low motor voltage	Check at motor terminals. Contact electric service provider.
	Ambient temperature too high	Reduce ambient temperature
Unit runs rough and cannot be rotated manually	Worn Coupling	Remove motor and inspect coupling element. Replace if necessary.
	Worn bearings	Contact factory for assistance
Pump overheats	Cooling ducts blocked	Clean cooling ducts
	Cooling fan broken	Replace fan
	High ambient temperature	Ventilate or cool room
	Vacuum too high	Adjust vacuum settings or relief valve

5.0 Troubleshooting (Continued)

Problem	Possible Causes	Solution
Pump overheats	Inlet restricted Exhaust restricted The oil tank may be low/empty of oil, has contaminated oil or was filled with an incorrect type of oil	Remove restriction Remove restriction If the oil level is found to be low, immediately shut off the pump, drain the remaining oil form the tank and replenish with fresh oil. If an incorrect oil type or contamination is found, make sure the pump has reached its operating temperature before replacing with fresh oil.
High vacuum level	Vacuum relief valves need adjusting	Re-calibrate relief valve
Excessive noise level	The coupling rubbers may be worn Internal pump damage	See “worn coupling” above Call factory for assistance

For any operational problems not listed here, please contact your local **Patton’s Medical Service** representative.
1-866-960-0087

6.0 Maintenance

6.1 Maintenance Schedule

WARNING:
BEFORE STARTING ANY MAINTENANCE PROCEDURES, DISCONNECT ALL POWER TO THE PACKAGE.

WARNING:
PUMPS THAT HAVE REACHED NORMAL OPERATING TEMPERATURE MAY HAVE A HIGH SURFACE TEMPERATURE OF MORE THAN 70°C (158°F).
DO NOT PERFORM ANY MAINTENANCE UNTIL AFTER A SUFFICIENT COOL DOWN PERIOD.

Never perform any maintenance functions while the unit is in operation.

Maintenance Schedule

Item	Frequency	Action
Exhaust drip leg	Daily	Check for accumulated moisture
Check inlet air filter(s)	Annually	Replace elements
Synchronizing Gear Oil Level	Weekly	Top off when pump is off
Check nuts, bolts, fittings, etc.	Monthly	Inspect and tighten
Synchronizing Gear Oil	Weekly 5,000 hours/Annually	Check oil Change oil
Pump Bearings 2-8.7 hp 15 hp	 Not Required 6 months	 Not required Grease B side bearings
Motor Coupling	Annually	Remove motor to inspect coupling for wear. Replace as needed.

6.0 Maintenance (Continued)

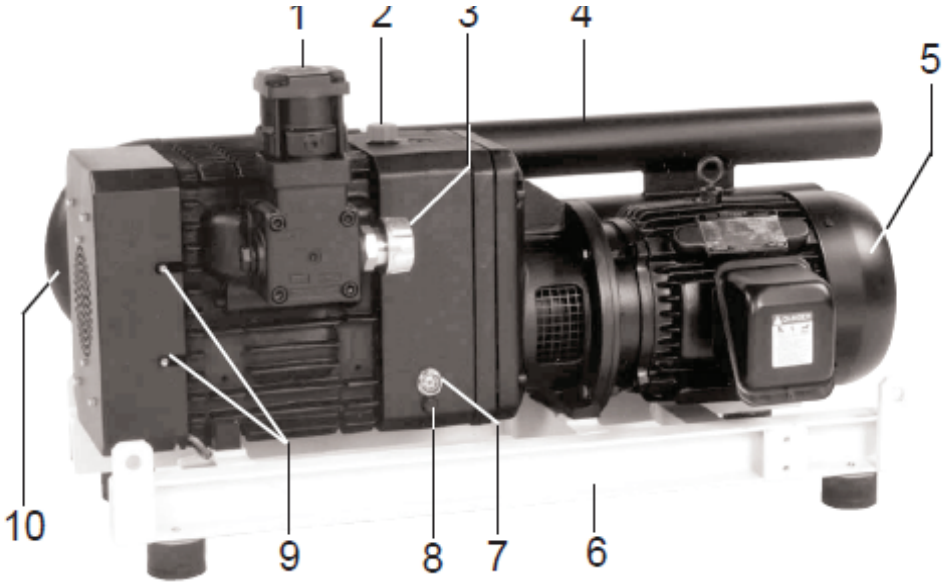
6.2 General Maintenance for All Units

Pumps
Maintain the pump regularly to achieve the best operating results. Maintenance intervals will depend on the pump's use and ambient conditions. Each pump has oil-lubricated synchronizing gears but there is no lubricant in the pumping chamber.

Do not run pumps without synchronizing gear lubricating oil.

Oil Type
The basic specification for the recommended oil is **non-detergent**. The viscosity must correspond to ISO-VG 220.
The recommended oil is Patton's # 43-01-004 for **Standard units**
The recommended oil is Patton's # 43-01-017 for **Oxygen safe units**
Please contact **Patton's Medical** for more information.

Note: If changing brands, it is important to completely drain out all oil from the pump.



Changing Synchronizing Gear Oil
Check the oil level regularly by observing the built-in sight glass. Each pump requires the proper oil to operate correctly. The oil should be changed every 5,000 hours of operation or more frequently when operating at ambient temperatures of 104°F.

To Change the oil:
1. Make sure the vacuum pump is shut down and locked against inadvertent start up.
2. Prior to draining the oil, always depressurize the gearbox by removing the oil fill plug, located on top of the gear box.
3. Place a drain tray underneath the drain plug and drain the oil.
4. Firmly reinsert the drain plug in the drain valve.
5. Fill with new gear oil until the level is slightly above the middle of the sight glass.
6. Dispose of the used oil in compliance with applicable regulations.

Oil Quantity per Vacuum Pump

System	Oil Quantity (liters)
2 hp	.85
3 hp	.85
4 hp	.85
5.4 hp	.85
6.4 hp	1
7.5 hp	1
8.7 hp	1
10 hp	1
15 hp	.63

6.0 Maintenance (Continued)

6.2

1 Inlet	5 Motor	9 Grease fittings
2 Oil fill	6 Frame	10 Cooling fan
3 Vac. relief valve	7 Oil sight glass	
4 Silencer	8 Oil drain plug	

"B-side" Bearing Lubrication (Standard Claw)
The "B-side" bearings of the Standard 15 HP vacuum unit needs to be greased twice a year with the high melting-point grease, Kluber Asonic HQ 72-102. **Patton's # 43-02-007**
Grease can be added to the bearings by charging the bearings with grease through the grease fittings (9) until grease comes out of the opening.

"B-side" Bearing Lubrication (Oxygen Safe Claw)
The "B-side" bearings of the Oxygen Safe 15 HP vacuum unit needs to be greased twice a year with Oxygen Safe Grease **Patton's # 43-02-014**
Cover plates will need to be removed to add grease to the bearings.

Pump Fan/Motor Fan Openings
Periodically inspect the pump for accumulation of debris and dirt. Keep the ventilation grills of the motor fan and the pump fan clear of excessive debris. Overheating of the pump or motor could result if these openings are blocked.

Inlet Filters

The inlet filter elements should be checked monthly initially. If filter elements are dirty replace with new elements. Elements should be replaced yearly or after 4000 hrs of operation..

Exhaust Drip Leg Valve

Each pump should have a drip leg installed by others at the exhaust port on the pump. This valve should be checked daily at first, then depending on the moisture accumulated could be checked less frequently.

WARNING:
BEFORE STARTING ANY MAINTENANCE PROCEDURES,
DISCONNECT ALL POWER TO THE PACKAGE.

7.0 Inspection/Replacement Procedures

7.1 Air Intake Filter

Never perform any maintenance functions while the unit is in operation.

The air intake filter element should be changed every 4,000 hours of operation or annually under normal operating conditions. To change the filter:

1. Turn off the vacuum pump being serviced and lock open the appropriate disconnect switches.
2. Close intake isolation valve
3. Remove the protective cover by loosening the latches.
4. Remove the element.
5. Clean inside of housing.
6. Insert a new element (note orientation of the element).
7. Replace protective cover and tighten wing nut (if applicable) and latches.
8. Open intake isolation valve
9. Turn on the vacuum pump.

8.0 Replacement Parts

9.0 Warranty

Lab Vacuum System Warranty

Patton's Medical warrants the total Lab Vacuum system to be free of defects in material and workmanship under normal use for a period of twenty-four months from start-up, not to exceed thirty months from date of shipment. This warranty covers all necessary parts used in repair as well as all reasonable labor expense. Normal consumable parts required for routine scheduled maintenance (such as filters) are not covered under this warranty.

This warranty does not apply to products that are damaged by external causes, or are improperly warehoused, used, installed, serviced, misapplied or maintained by the customer. The sole liability for **Patton's Medical** under this warranty is limited to repairing, replacing, or crediting, at its election, any such products provided that:

- **Patton's Medical** is notified promptly within the warranty period above of any warranty claim.

- The examination of such items by an authorized representative of **Patton's Medical** will disclose to their reasonable satisfaction that claimed products defect has not been caused by misuse, neglect, improper handling, installation, repair, alteration, or accidents.

- **Patton's Medical** requires that all equipment be commissioned by an authorized **Patton's Medical** distributor and requires a start-up report to be filed within 30 days of equipment start-up. Failure to submit a start-up report to **Patton's Medical** will void the warranty.

- Simplex units 5Hp and below do not include factory assisted start-up in their base price unless specifically noted otherwise. Failure to submit a start-up report to Patton's Medical will void the warranty.

Product modification performed by the customer without prior written approval by **Patton's Medical** will invalidate the above warranty.

This warranty is given in lieu of all other warranties, expressed or implied, including implied warranties of fitness for a particular purpose and merchantability. In no event shall Patton's Medical be liable for damages in excess of the value of the defective product or part, nor shall Patton's Medical be liable for any indirect, special or consequential damages, loss of profits of any kind, or for loss of use of the products.

Patton's Medical shall not be liable to the customer for any claims, loss of damage of any kind whatsoever arising from the nonperformance of **Patton's Medical** of any part of this agreement occasioned by acts of God, fire, war, labor difficulties, governmental regulations, or action of government. **Patton's Medical** shall not be liable to the customer for any other cause, whether of a similar or dissimilar nature beyond its reasonable control.

Patton's Medical Systems Warranty

Patton's Medical warrants that all systems to be free of defects in material and workmanship under normal use for a period of twenty-four months from start-up, not to exceed thirty months from date of shipment. This warranty covers all necessary parts used in repair as well as all reasonable labor expense. Normal consumable parts as well as parts requiring calibration as part of routine scheduled maintenance (such as filters, Dewpoint/CO sensors/monitors) are not covered under this warranty.

This warranty does not apply to products that are damaged by external causes, or are improperly warehoused, used, installed, serviced, misapplied or maintained by the customer. The sole liability for **Patton's Medical** under this warranty is limited to repairing, replacing, or crediting, at its election, any such products provided that:

- **Patton's Medical** is notified promptly within the warranty period above of any warranty claim.
- The examination of such items by an authorized representative of **Patton's Medical** will disclose to their reasonable satisfaction that claimed products defect has not been caused by misuse, neglect, improper handling, installation, repair, alteration, or accidents.
- **Patton's Medical** requires that systems above 5 Hp simplex be commissioned by an authorized **Patton's Medical** distributor and requires a **legible** start-up report **and distributor invoice** to be filed within 30 days of equipment start-up, **late documentation will not be considered**. **Failure to submit a start-up report to Patton's Medical will void the warranty.**
- **Replacement Parts** including pumps and motors carry a limited warranty based upon manufacturer specific terms. Labor for these warranties is not included or implied and is at the sole discretion of Patton's Medical.
- Simplex units 5Hp and below as well as retrofit dryer packages do not include factory assisted start-up in their base price unless specifically noted otherwise.
- **Invoices for work performed, freight, and equipment must be received promptly within 60-days of performance. Invoices received after this date will not be considered.**

Product modification performed by the customer without prior written approval by **Patton's Medical** will invalidate the above warranty.

This warranty is given in lieu of all other warranties, expressed or implied, including implied warranties of fitness for a particular purpose and merchantability. In no event shall Patton's Medical be liable for damages in excess of the value of the defective product or part, nor shall Patton's Medical be liable for any indirect, special or consequential damages, loss of profits of any kind, or for loss of use of the products.

Patton's Medical shall not be liable to the customer for any claims, loss of damage of any kind whatsoever arising from the nonperformance of **Patton's Medical** of any part of this agreement occasioned by acts of God, fire, war, labor difficulties, governmental regulations, or action of government. **Patton's Medical** shall not be liable to the customer for any other cause, whether of a similar or dissimilar nature beyond its reasonable control.

1.0 General Information

The NFPA99 compliant dome biased fully-automatic dual line medical manifold offers continuous, fail-safe pressure and flow control from high pressure medical cylinders. The manifold provides an uninterrupted supply to the facility at a constant pressure. Signal contacts are provided to indicate when the "Secondary" Bank is in use. No manual resetting is required when the Primary Bank is replaced and system pressure level returns to the Primary Bank.

Power Requirements
100-240/1/50-60 VAC
Maximum Inlet Pressure
3,000 PSIG (210 BAR)
Temperature Range
0 to 140°F (-18° to 60°C)
Weight
54 lbs.

Filter
40 micron
Inlet Connection
CGA 1340
Outlet Connection
1/2" NPT for Main Valve (included)
Flow Capacity
1200 SCFH @80psi

Materials:

Bodies
Brass barstock
Seats
Viton®, Neoprene

Seals
PTFE, Neoprene and Viton®
Enclosure
Powder Coated Steel NEMA 1 Enclosure, removable front cover for ease of service.

Features:

- High Flow Regulators
- NEMA 1 enclosure
- Micro-processor control
- Master alarm interface(Secondary in Use)
- Service button allows technician to manually alternate banks
- Simple Installation and set-up
- Pushbutton for transducer calibration
- Pushbutton bleed valves to aide in setting primary regulators
- Primary Source Valve included (1/2" NPT male x brazed in field)
- Separate Wall Mounting bracket included for ease of installation by single technician
- NFPA 99 compliant

Note: A transfer or manifold room shall maintain a temperature not greater than 52°C (125°F) and not less than –7°C. (per NFPA 9.3.6.8)

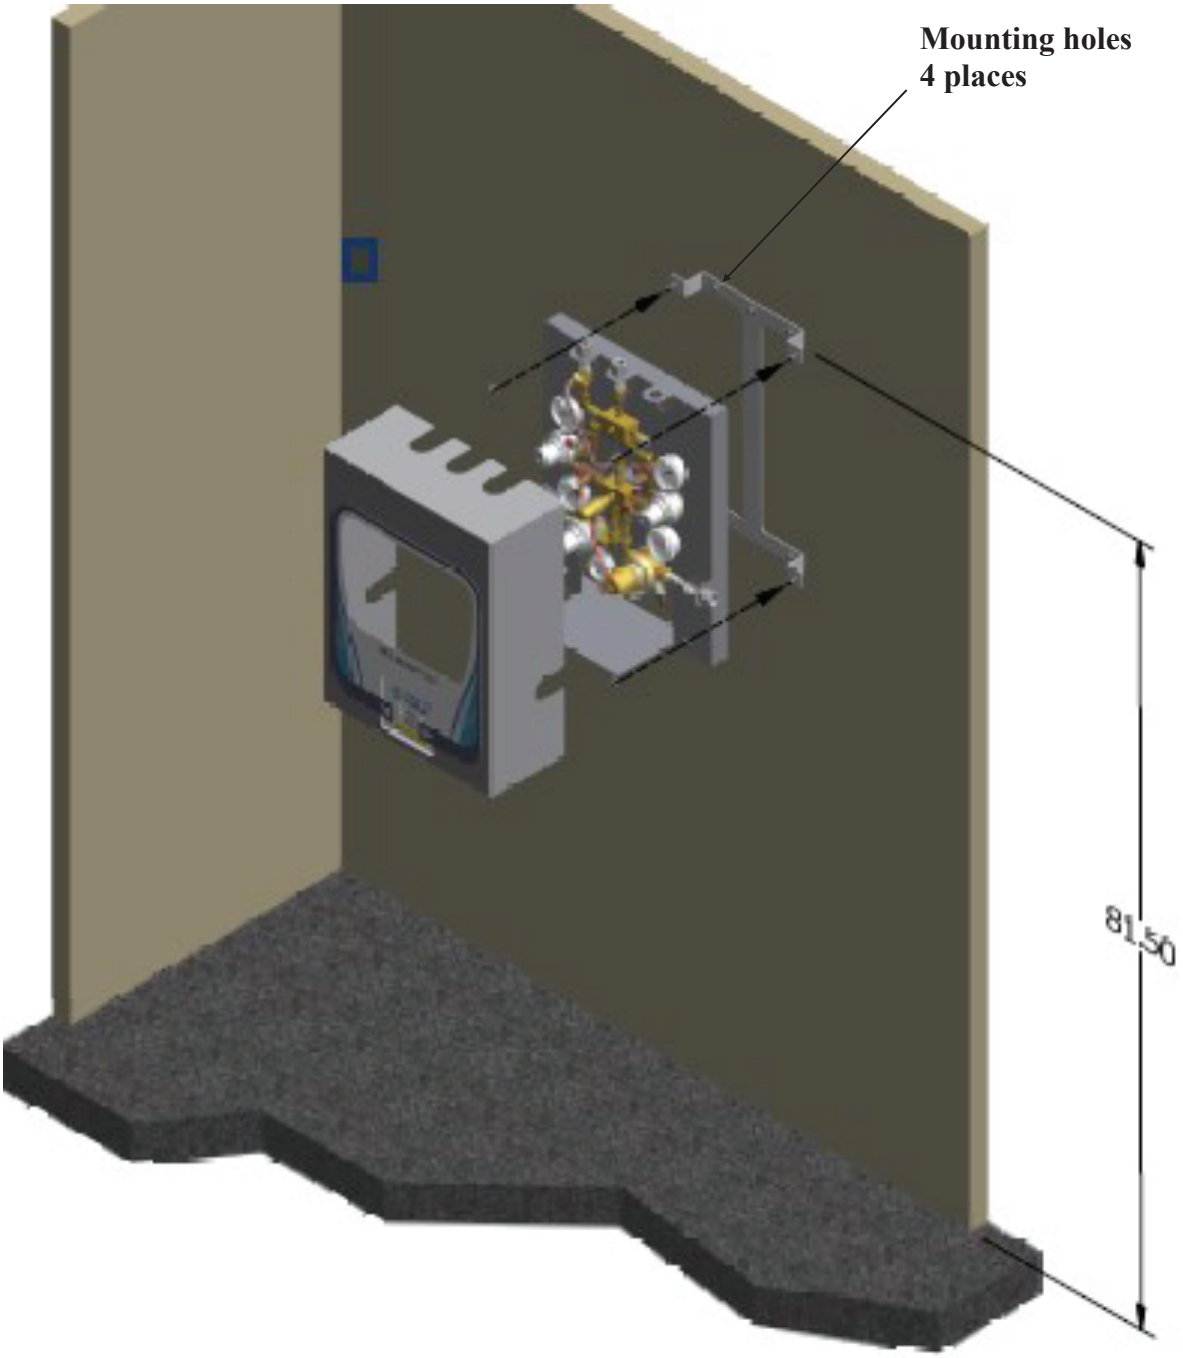
2.0 Description

Patton's Medical dome loaded manifold is manufactured to supply an uninterrupted source of gas to a medical facility. Manifold will have multiple cylinders divided into two equal banks on the left side and right side. One bank is the primary side the other is the secondary side. One side will be online or "in use" the other will be in secondary or "ready".

Indicator lights will display the status of the gas supply. When the primary bank of cylinders reaches the low setting the red light will display to "Replace" that bank of cylinders. The normally closed alarm contacts will open sending a signal to the remote indicator (Master Alarm - NFPA).

When cylinders are replaced the red light will go out and green light will illuminate automatically. Alarm contacts will close sending remote signal indicating the cylinders have been replaced.

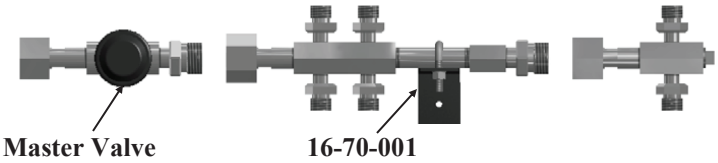
Supply voltage of 100-240 VAC is converted to 12 VDC to power the manifold. Two sets of remote alarm contacts are supplied.



3.0 Shipping Details

The manifold system will be shipped in two or more boxes. The manifold cabinet will be in one box, the wall mounting bracket, CGA fittings, 3/8" washers and nuts for attaching to mounting bracket, 3/4" source valve and Installation and operation manual in another box. Additional boxes may contain appropriate number of header extensions and pigtails. Pigtails for Oxygen and Helium are pre-bent rigid copper. All other gases are use stainless steel flex type. The manifold is made for wall mounting but can be ordered with floor mounting bracket as well.

4.0 Cabinet Mounting Instructions



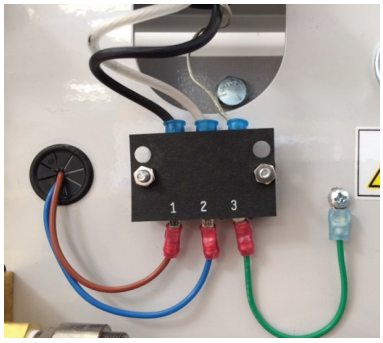
1. Remove manifold from shipping carton and place on cardboard insert face up.
2. Remove manifold cover by removing two screws on sides of the manifold enclosure.
3. Mark top holes in mounting brackets 81.5" from floor. This will allow clearance for "H" size bottles. If taller bottles are used adjust accordingly. Mark all four mounting holes. (See Drawing next page)
4. Drill holes for anchors to mount the bracket (3/8" anchors) supplied by others. Mount bracket to wall.
5. Lift manifold onto four 3/8" studs on mounting bracket. Secure manifold to mounting bracket using four 3/8" washers and nuts.

4.0 Cabinet Mounting Instructions (continued)

5.0 Header Bar Installation

1. Attach the Master Valve assembly to both sides of the manifold (Do not use Thread sealant on connections)
2. Attach the header bar assembly's using the union nuts to the master valve's. If header bar is larger than a 5x5 a wall mounting bracket (part number 16-70-001) is included on each side for each additional 4th or 5th cylinder (see below). Attach wall bracket to wall using 3/8" anchors (supplied by others). Tighten u-bolts to header pipe.

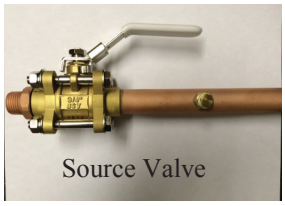
3. Secure cylinders to wall with optional wall mounting brackets and chain. (see be low)



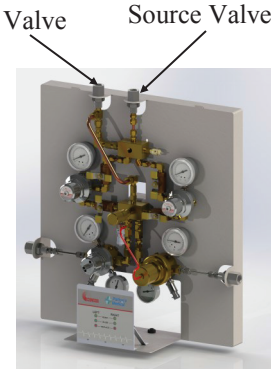
4. Remove plastic caps from header bar and install pigtails to the header bar connections and cylinders.

6.0 Power Supply Connection

1. Supply 100 VAC to 240 VAC 12 to 14 AWG copper wire. Circuit breaker 15 amp max. A 1/2" conduit connection is provided at the top of enclosure. Current draw is .55 amps.



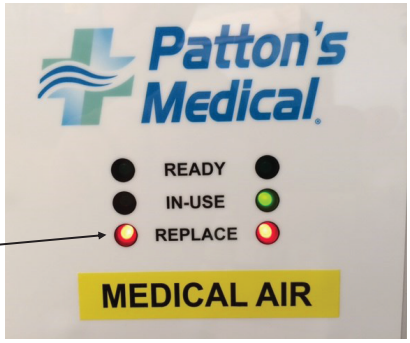
Brown	Hot	1
Blue	Common	2
Green	Ground	3



7.0 Master Alarm Contacts (NFPA) " switch-over has occurred"

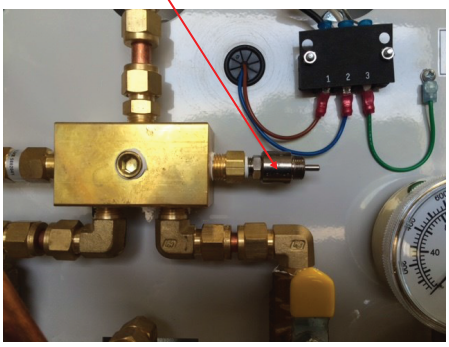
Two sets of remote alarm contacts are provided for building automation systems. Contacts will open if a switching failure occurs or a loss of power. The alarm contacts are rated for 0.4 amps @ 24VDC. Connection is made through bottom of enclosure.

8.0 Outlet Valve and Relief Valve Connection



The Source Valve is shipped loose. The source valve is supplied with 1/2" NPT fitting for connection to top of manifold and 3/4" nominal copper for facility connection. A 1/8" plugged port is provided on top of the source valve and can be removed for purging. The relief valve connection is 1/2" NPT located on top of the manifold.

9.0 Initial Start-up

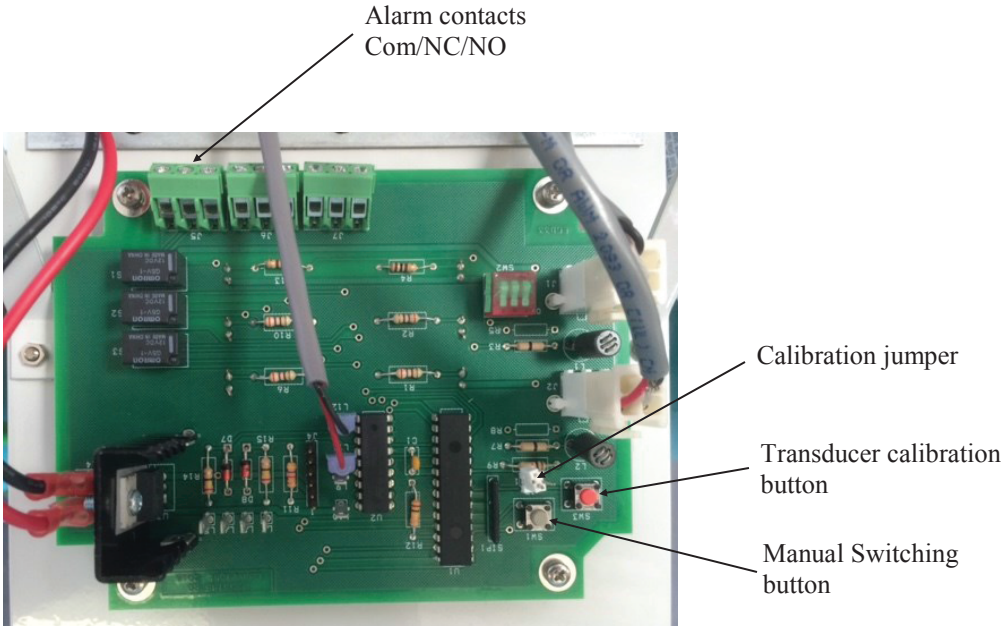


1. Close 3/4" Source Valve.
2. Fully open master valve on both sides of manifold.
3. Open all four regulator isolation valves.
4. Apply power to manifold.
5. "Replace" lights illuminated on both sides.
6. Slowly open one cylinder on right side.

9.0 Initial Start-up (continued)

7. "Ready" and "In use" lights illuminate.
8. Slowly open one cylinder on left side of manifold.
9. "Ready" light illuminates on left side.
10. Slowly close right side cylinder that is open.
11. Press relief valve and drop pressure slowly.

12. When the right side drops below the low limit the red "Replace" light will illuminate, alarm contacts will open and left side "In Use" green light will illuminate. Manifold is now flowing gas from left bank.
13. Slowly reopen one cylinder from right side. Red light turns off and green "Ready" light turns on.
14. Slowly close left side cylinder that is open.
15. Press relief valve and drop pressure slowly.
16. When the left side drops below the low limit the red "Replace" light (local signal) will illuminate, alarm contacts (Remote signal-NFPA to master alarm) will open and right side "In Use" green light will illuminate. Manifold is now flowing gas from the right bank.
17. Reopen one cylinder from left side. Red light goes out and green "Ready" light is illuminated. Alarm contacts should reclose at this time.



Note:

If a power loss occurs the switching alarm contact will open sending an alarm to master control panel.

The manifold will continue to supply gas until all cylinders are empty.

10.0 Control board

1. Manual switching can be accomplished by pressing gray button on control board.
2. Transducers are calibrated by moving jumper to connect both pins and pressing red calibration button with 0 PSI on transducers. (Required only when replacing trans ducers). Remove jumper from 1 pin after calibration.
3. Three sets of remote alarm contacts are supplied for connection to master alarm panel or other BMS systems. **(Normally open contact will be closed if no alarm condition is present)**

11. Testing for leaks

1. Close 3/4" source shut-off valve.

2. Make sure master valve is open on the right and left side of manifold.

3. Slowly open a cylinder on both sides of the manifold.

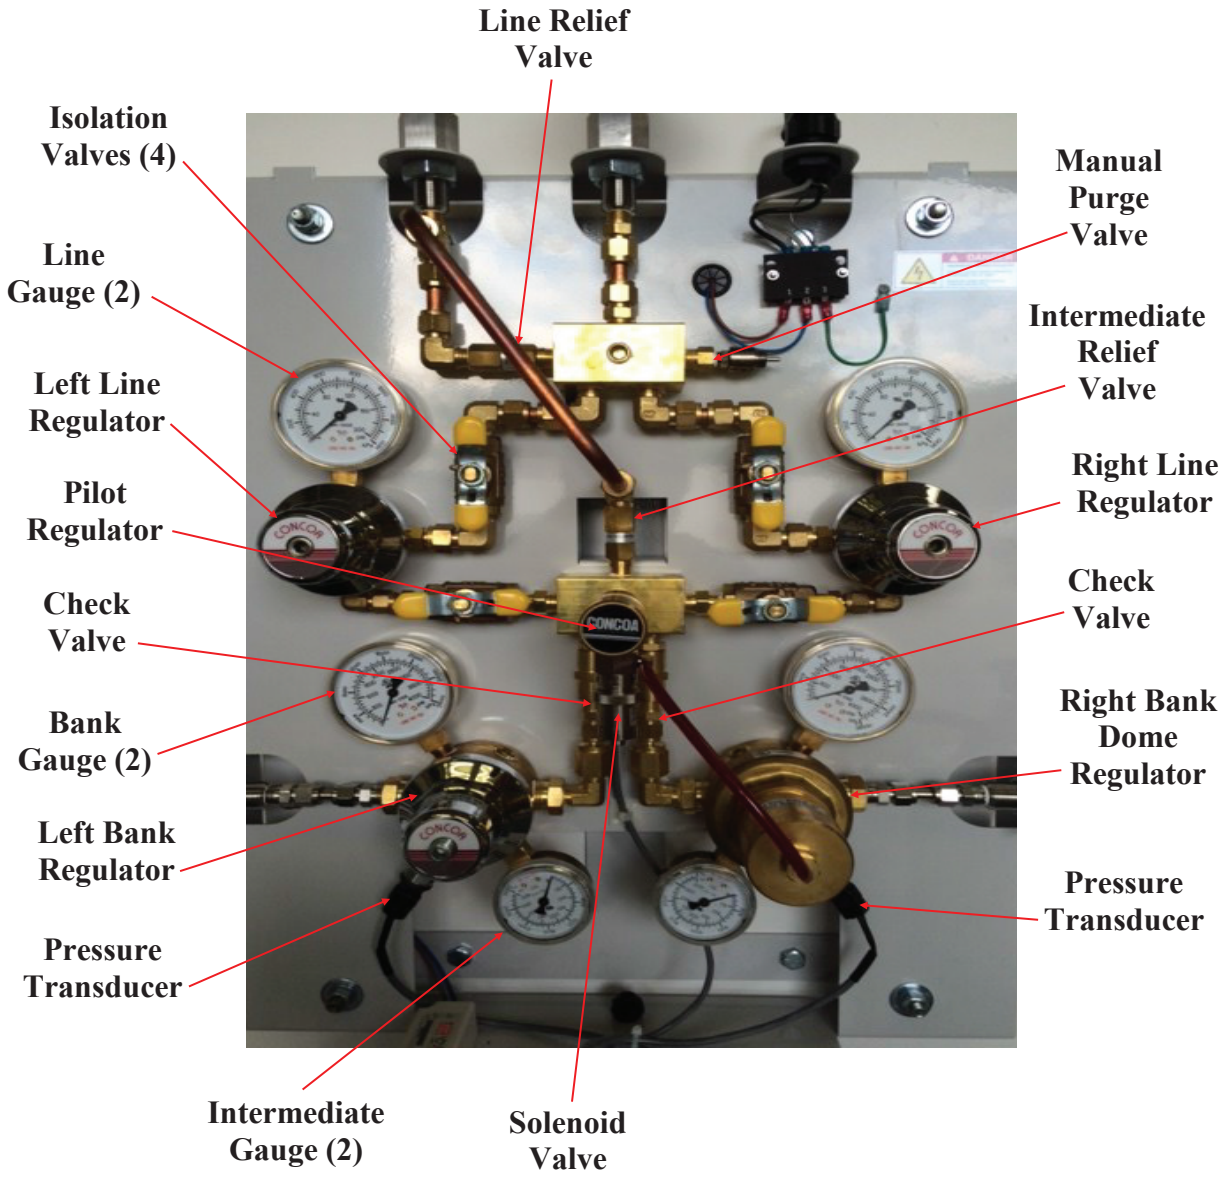
4. Check for leaks at all cylinder extension joints using a commercial leak detector which is compatible with oxygen.

5. If leaks are detected close valves on cylinders that were opened. Repair leaks and verify leaks are eliminated.

6. Wipe off excess leak detector after testing. Avoid getting leak detector on electrical components or connections.

12. Specifications

The Patton's Medical Automatic Changeover Manifold is designed in accordance with the latest revision of NFPA 99.
Three types of Patton's Medical manifolds are available depending on the delivery pressure and gas type.



55 PSI Delivery Pressure
- Oxygen, Nitrous Oxide, Medical Air, Carbon Dioxide, Helium, Argon

100 PSI Delivery Pressure
- Medical Air, Oxygen, Carbon Dioxide

180 PSI Delivery Pressure
- Nitrogen, Instrument Air

Delivery Pressure	55	100	180
Intermediate Pressure - Ready Bank	190 PSI	230 PSI	260 PSI
Intermediate Relief Valve	375	375	375
Line Pressure Relief Valve	225 PSI	225 PSI	375 PSI
Maximum Inlet Pressure	3000 PSI	3000 PSI	3000 PSI

INTRODUCTION

The Patton's Medical gas alarm system monitors the status of the medical gas distribution system and provides audible and visual indicators. The master alarm can be furnished with Relay (BIM) building management system. The alarm can be used in conjunction with the Patton's Medical optional Ethernet compatible system to monitor the status of all alarm and manifold systems on a PC. The Patton's Medical alarm system monitors the status of the medical gas sources in accordance with NFPA 99 and CSA Z7396.1.

The Patton's Medical gas alarm system is a two or three section assembly comprised of a rough-in box, a front panel and transducers (only if it is an area alarm or combination alarm).

Rough-in Box

The rough-in box houses the power supply, fuse, on/off switch, and a terminal strip for electrical wiring. An isolated transformer reduces the 110V or 220V AC input to low voltage DC.

Front panel

The front panel includes enclosed printed circuit boards with programming circuitry.

The **Push Button Module** includes a power on indicator, programming buttons and an audible alarm.

The **Remote Signal Module(s)** can monitor up to 16 signals per circuit board. Multiple remote signal modules can be ordered in a single alarm. The signals can be configured to display an abnormal condition on either a normally closed (NC) or a normally open (NO circuit. Each signal may also be turned off it is not being utilized.

The **Remote Signal Module(s) with Relay (BIM module)** are equipped with all of the above described features as standard Remote Signal module(s) described above. In addition, the r emote signal module(s) with Relay (BIM) are equipped with an extra set of remote signal dry contacts to interface with a building management system.

The **Gas (Area) module(s)** on the front panel are identified with gas specific, color coded labels (per NFPA 99 or CSA Z7396.1). The gas displays include LED's which indicate high/normal/ low pipeline pressure. A digital LED display shows the actual gas pressure. The gas pressure may be displayed in PSI and In Hg, or BAR or kPa. The unit is pre-programmed to display PSI / In Hg from the factory, but may be re-programmed in the field to display BAR of kPa. In addition there are LED's which illuminate to indicate System and Program failures. Each module is supplied with dry contacts for remote signaling of high and low pipeline pressure.

Transducers

The transducers converts pressure to an electrical signal and supplies the electrical signal to the alarm circuit board gas module panels. **After the initial 24 hour 150 psi standing pressure test (required per NFPA 99) has been completed** the pressure/vacuum transducers may be connected to the medical gas pipeline. The transducers may be remotely attached to the piping system at distances up to 5,000 feet using standard 18 gauge stranded twisted pair wire. Patton's Medical recommends mounting the transducers in the zone appropriate zone valve box or in the alarm back box. Should a transducer required service or replacement it is considerably more of a safety issue and more time consuming to locate and replace transducers which have been remotely located above the ceiling and eliminates contamination issues - such as having to set up a tent in order to remote ceiling tiles.

Features & Benefits

Microprocessor controlled
State of the art maintenance free electronics provide excellent reliability

Easy to program

One man adjustable digital pressure display
(at the panel, not the transducer)

Remote signal modules
Each circuit board provides monitoring of 16 separate remote devices

Self test program - alarm code display
LED display reveals the nature of the malfunction and reduces maintenance time

Three year PC board warranty
A quality product you can buy with confidence

Independent multiple master alarms
When service is interrupted to one alarm the other(s) continue to operate independently

Transient signal filter
Prevents or reduces nuisance (false) alarms signals (less than 0.7 seconds) created by EMI/RFI interference

Audio & Visual signal indicators
Audible alarm and visual display of both normal and abnormal status of each signal monitored assures prompt and informative indication of a problem

Optional building management interface circuit board(s) - Relay (BIM) boards
Allow communication of remote signals (master alarm points) with building management system

Easy to install and service
Hinged frame with lanyards for easy accessibility

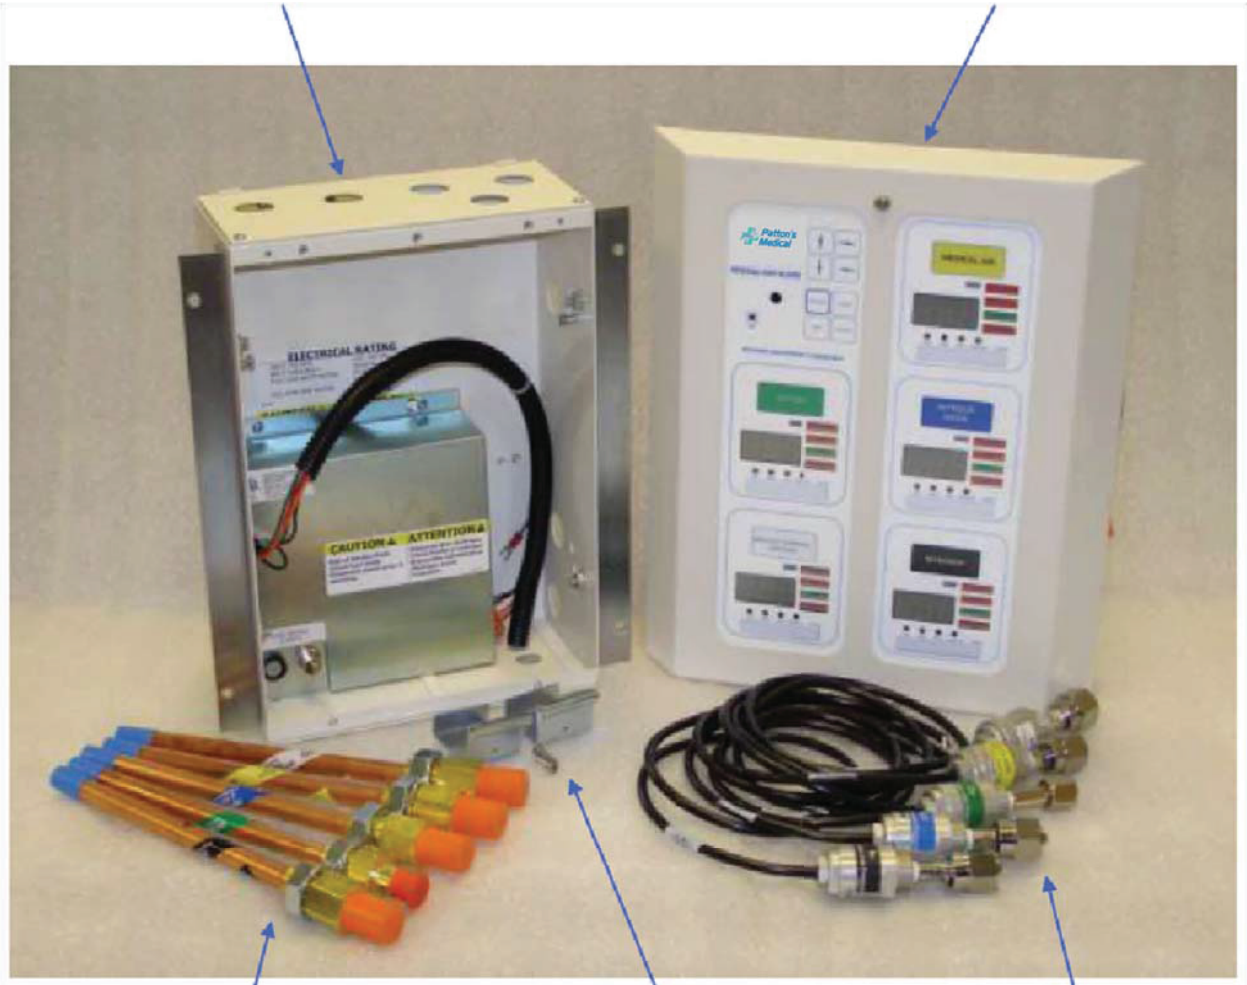
Dry remote signal contacts (high & low) for each gas module
Dry contacts are provided so that both the high & low line pressure alarms may be remotely wired to a remote or master alarm

Programmable remote signals (Master module)
Configure wach remote signal independently (either normally closed, normally open or turn unused signals off).

Digitized transducers
Allow remote locating of transducers up to 5,000 feet away from alarm panel. Extremely resistant to RFI

Programmable gas module high and low set points
Pre-programmed from factory at 60/40 psig for 50 psig delivery pressure gases, 200/140 for N2 and 12 in Hg for Medical Vacuum & WAGD/EVAC. Programmable in 0.5 psig or In Hg increments from 0.5 psig or In Hg up to 30 In Hg or 100 psig or 250 psig (depending on which type of transducer is used).

Compact Unit
Requires minimal wall space. Monitors up to 14 area alarm signals or 64 remote (master) signals in one 5 slot panel.



Alarm history recall
Can recall previous alarm signals (both area and master alarms) even after the alarm condition has been corrected and the alarm panel has been cleared

Area Alarm repeat feature
Adjustable from 1 minute to 240 minutes (factory programmed for 10 minutes).

Major Components

Rough-in box or back box

Front panel or front

Riser assemblies (for installing transducers in alarm back box)

Hinges and screws for attaching front panel to back box

Transducer assemblies

Alarm Installation

Installation of the Patton's Medical alarm involves installing the rough-in box, the risers & the transducers (if it is an area alarm or combination alarm) and front panel and making the necessary conduit, plumbing and electrical connections. All installation and testing should be done in accordance with NFPA 99 or CSA Z7396.1.

WARNING: Electrical power intended for the alarm to be installed should be disconnected prior to installation.

WARNING: This device should only be installed by qualified personnel. Installation should not be attempted by anyone not having general experience with the installation of devices of this nature.

Rough-In Box Installation

(Side/end view of rough-in back box)

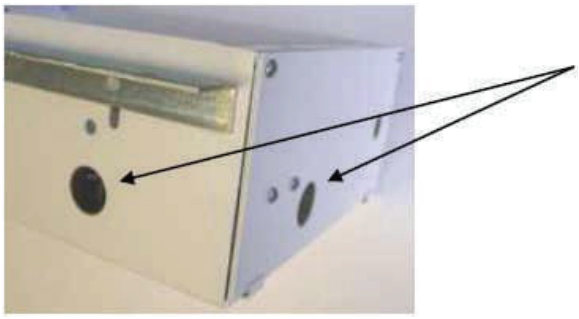
This is a rough-in box for a combination alarm. Your rough-in box should look the same or similar to this unit. The risers are shipped loose, for protection during shipment, and must be installed. If transducers are to be mounted remotely, it is recommended that they be connected to the DISS demand check valves installed in the corresponding zone valve box.

Refer to the building plans to determine the location of the alarm.

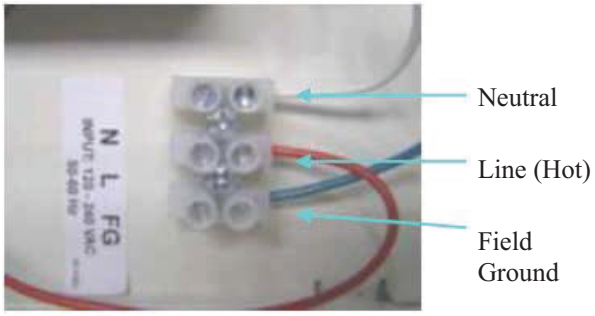
The contractor is to provide rigid mounting that will support the alarm box on both sides. The metal flanges provided on both sides of the rough -in box are to rest against the rigid mounting brackets. Screws (contractor provided) are to be driven thru the holes in the metal flanges into the mounting brackets. Flanges are adjustable to allow for a drywall depth of 1/2" to 1 1/8".

Mount alarm rough-in box so it will be flush or just below the finished wall surface using the adjustment feature on the flanges. Recommended mounting height of alarms is generally 66" (generally accepted) from floor to top of finished alarm unless specifically detailed otherwise.

Alarm Installation

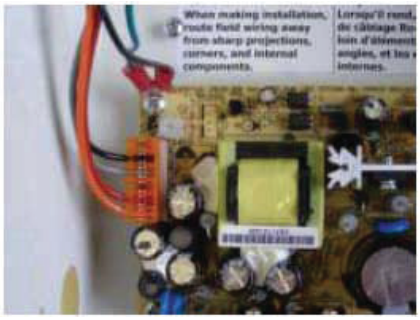


The power supply hole is located in the bottom (left side) of the rough-in box. Remove the plastic cover and panel covering the power supply. Remove the plug from the hole. Make conduit connections for wiring from the facility **emergency power source.**



To remove the power supply cover, loosen the two screws at the top of the cover and slide the cover to the right, then lift the cover over the screw heads. Slide the wiring harness strain relief to the left until it is free from the cover.

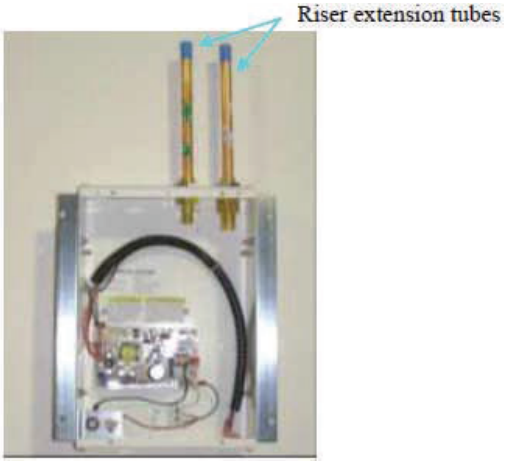
Wiring



Use either of the two 1/2" conduit knock-outs provided on the lower left side and bottom of the rough-in box to route conduit to supply either 120 or 240 VAC to the power supply. **Note: Separate conduit should be used for low voltage wires (use knock outs provided on the top of the box).**

Route wires through the power supply conduit installed in the bottom and left side of the rough-in box. Connect the 120 or 240 VAC facility **emergency power source** electrical wiring to the terminal strip provided on the lower left side of the box. (N = neutral, L = Line (hot), FG = field ground)

Alarm Installation



The wiring harness will be provided pre-wired to the power supply. If by chance you are replacing a wiring harness, the single green ground wire should be fastened to the screw on the top left corner of the power supply board. The wiring plug in connector (which should contain the rest of the wires), plugs into the connector terminal on the upper left corner of the power supply board. The black wire will be on the top.

This is how the power supply should look when the wiring is completed.

Replace the power supply cover and plaster cover (to protect the unit while the drywall and wall covering work are being done) after wiring is complete

Plumbing the Riser Extension Tubes

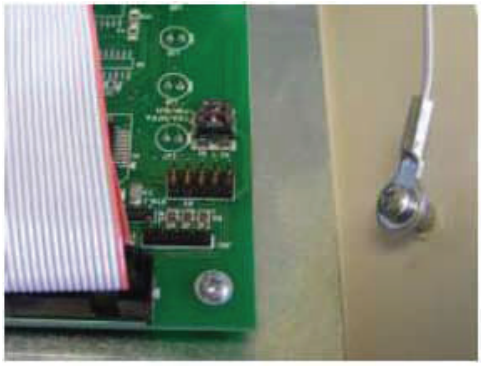
Install the risers in the top of the back box as shown. After removing the protective plastic caps, connect the riser extensions tubes to the gas piping system per NFPA 99. Make sure the drop is for the proper gas service. Using a purge gas to insure cleanliness in the tubes, silver braze the joints. Do not use soft solder. Conduct heat away from the check valves. (A purge kit is required for purge equipment connection to the system). The 150 psi standing pressure test of the piping system must be successfully completed and all pressure removed from the system before connecting the transducers to the system. **Attaching transducers without depleting the 150 psi standing pressure first will result in damage to the transducers.**

Note: It is recommended that gas piping system tubing be connected from the extension tube to the ceiling for a future or blank gas display even though a transducer is not being installed. Cap the unused tube above the ceiling. This will simplify future expansion.

Note: It is possible to install the transducers remotely (not in the alarm box). In this type of installation the risers are connected to the gas piping system up to 5,000 feet away from the alarm panel.

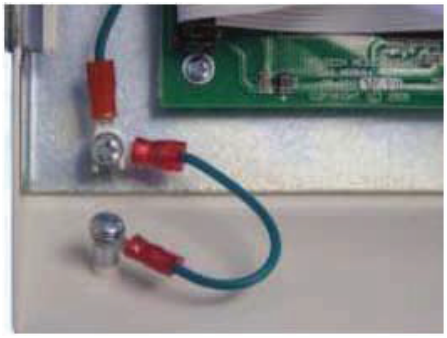
Note: Patton's Medical recommends mounting the transducers either in the zone valve box (remote) in or in the alarm back box - not remotely above the ceiling. Should a transducer require service or replacement it is considerably more time consuming to locate and replace or service transducers remotely located above the ceiling.

Installing the Hinges



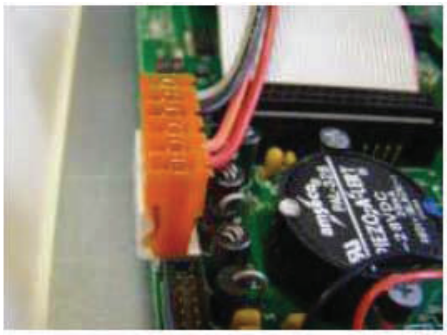
After the walls are finished, the hinges may be installed onto the rough-in box. The two hinges should be fastened to the lower front edge of the rough-in box using the screws provided. The hinge should rest flat against the surface of the drywall.

Installing the Alarm Front Panel



Slide the rectangular holes cut into the bottom edge of the front panel over the front catch of the hinges. Support the front panel in the open position to attach the lanyards.

Attach the two (left & right side) lanyard cables to the alarm front panel using the screws provided.



Wiring the Alarm Front Panel to the Power Supply

Attach the green ground wire, which is in the wiring harness, to the ground screw on the left corner of the front panel - just in front of the power supply.

Attach the plug connector at the end of the wiring harness to the appropriate connector located at the top left corner of the button module circuit board. The plug should lock into place. The plug can only be inserted on way.

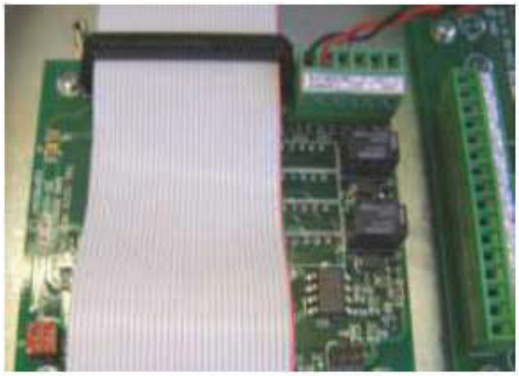
This is how the wiring harness plug connector should look when properly installed on the back of the button module board.

Installing the Transducers (non remote)

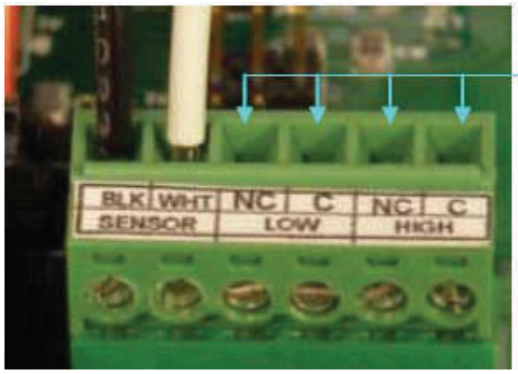
After depressurizing the 150 psig standing pressure from the piping system, install the appropriate transducers to the appropriate riser extension tube connectors inside the rough-in box. Hand tighten then torque lightly with a wrench.

Installing the Transducers (remote)

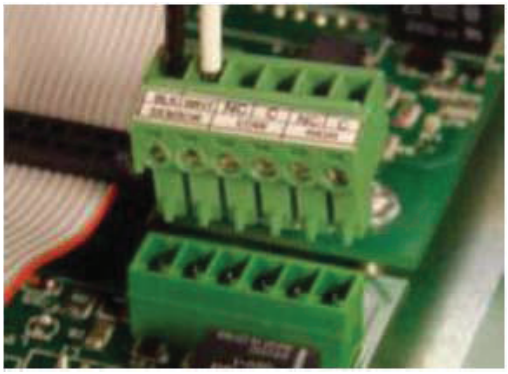
Transducer assemblies with DISS gas specific fittings have also been provided and, after the 24 hour standing pressure test is completed and normal operating pressure has been restored to the medical gas piping system, they must be connected to the DISS demand valves. Note: maximum mounting distance of each remote transducer is 5,000 feet away from the alarm panel to which it will be wired. Follow the wiring instructions in Appendix F.



The transducers have been designed so that they may be installed in a standard 4”x 4”x 2 1/8” electrical junction box for added protection.



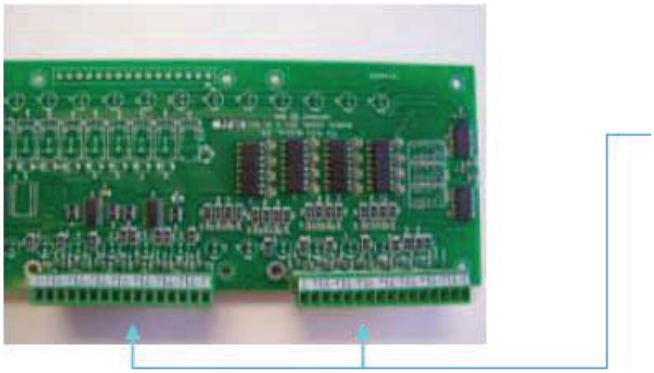
A panel mount feature has been provided to allow mounting of the transducer using standard 1/2” conduit connections and 4”x 4”x 2 1/8” junction boxes. Note: The DISS nut & nipple will need to be removed to allow installation of the conduit nut and the re-installed using oxygen safe Teflon tape.



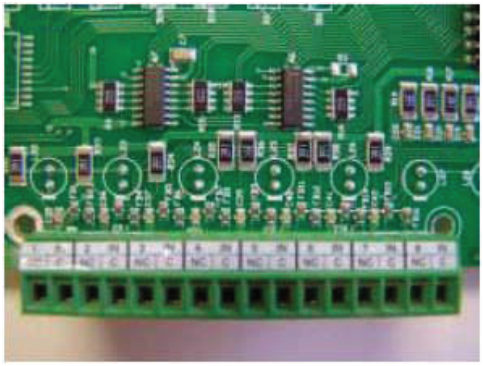
Connecting the Transducer Wiring to the Alarm Front Circuit Board

The wire terminal connector on the gas board has six wire connection slots. The two wires from the transducer should be installed in the BLK & WHT SENSOR slots. These are the two slots closest to the center of the gas board (as shown). It is preferred that the black wire be closest to the center of the gas board.

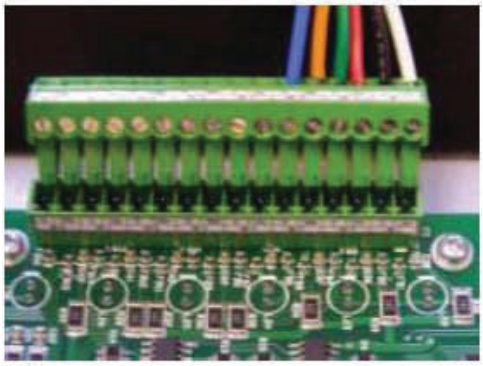
The other four connection slots are for optional remote signals of the low and high line pressure alarms.



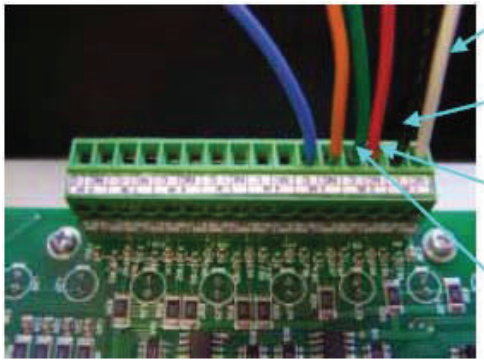
The transducer plug may be removed from the gas module to make it easier to install the wires.



Visually verify that the appropriate transducer wire pair has been attached to the appropriate gas module by looking at the front of the alarm panel. If there is *not* an Error Condition and a System alarm, the proper (matching gas service) transducer has been connected to the gas board.

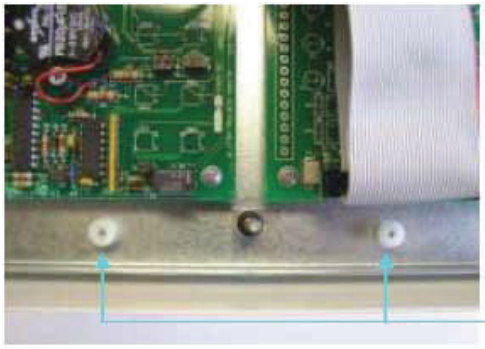


Wiring the Remote Devices to the Remote Signal (Master) Board



Locate the two banks of 16 terminal connectors on the back of the remote signal (master) board.

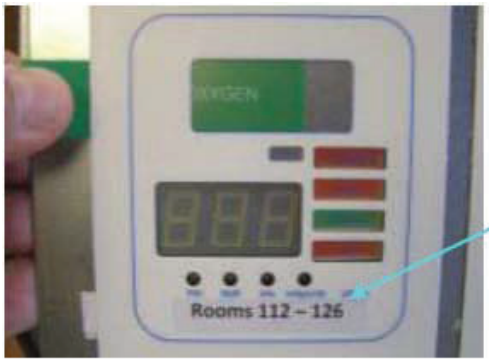
There are a total of 32 connection points - two connection points for each remote signal. The pairs are labeled 1 IN thru 16 IN on the circuit board. **The NC (normally closed) labeled terminal of each pair is where the signal wire should be landed.**



The connector terminal may be unplugged from the circuit board - to simplify installation of the remote signal wires.

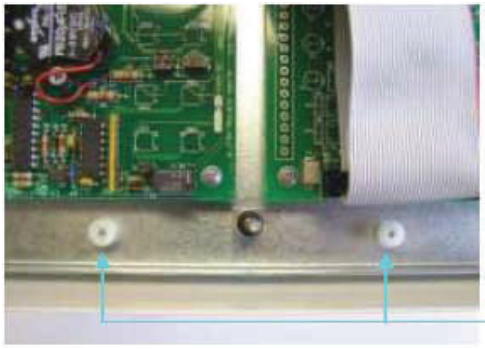
Land the corresponding common wire on the C (common) terminal of each pair of terminal connectors.

Labeling the Alarm Front



After all remote signal (master) wires have been landed, identified & cataloged (using appendix C in this manual), you are ready to apply the remote signal labels. Remove by unthreading the two nylon nuts shown here from the back of the alarm front panel.

The panel will now lift out of the white frame. Provided in the packaging with the alarm front panel is a long white card and a pre-printed sheet of labels for the remote alarm signals. **Wash your hands before handling these labels and cards!** Apply the labels to the appropriate position on the card using the guide lines on the card. When complete, insert the card into the "Monitored Signals" label pocket of the "Monitored Signals" label.



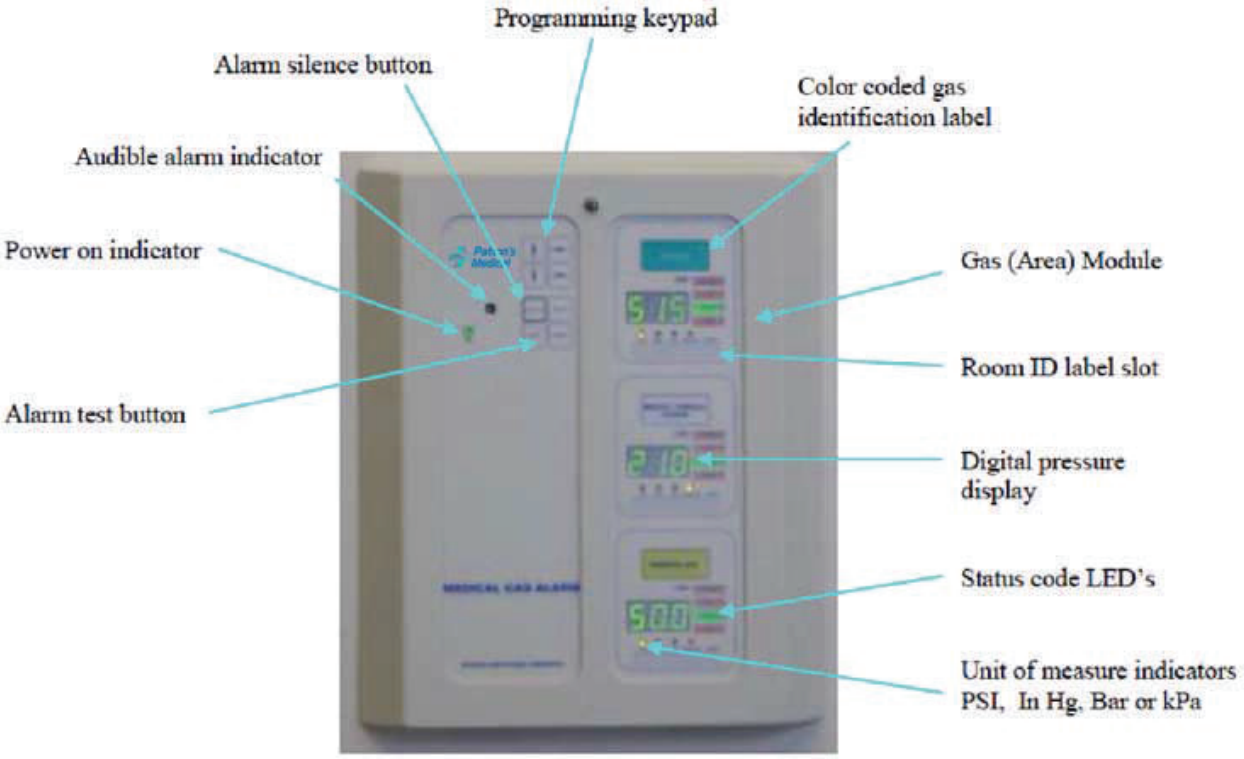
The gas modules are shipped pre-labeled from the factory. If a gas service is changed to a different gas or added to the alarm, it will be necessary to insert the appropriate label in the pocket of the gas module. The new gas label supplied by Patton's Medical will slide into the gas module label pocket of the gas module label.

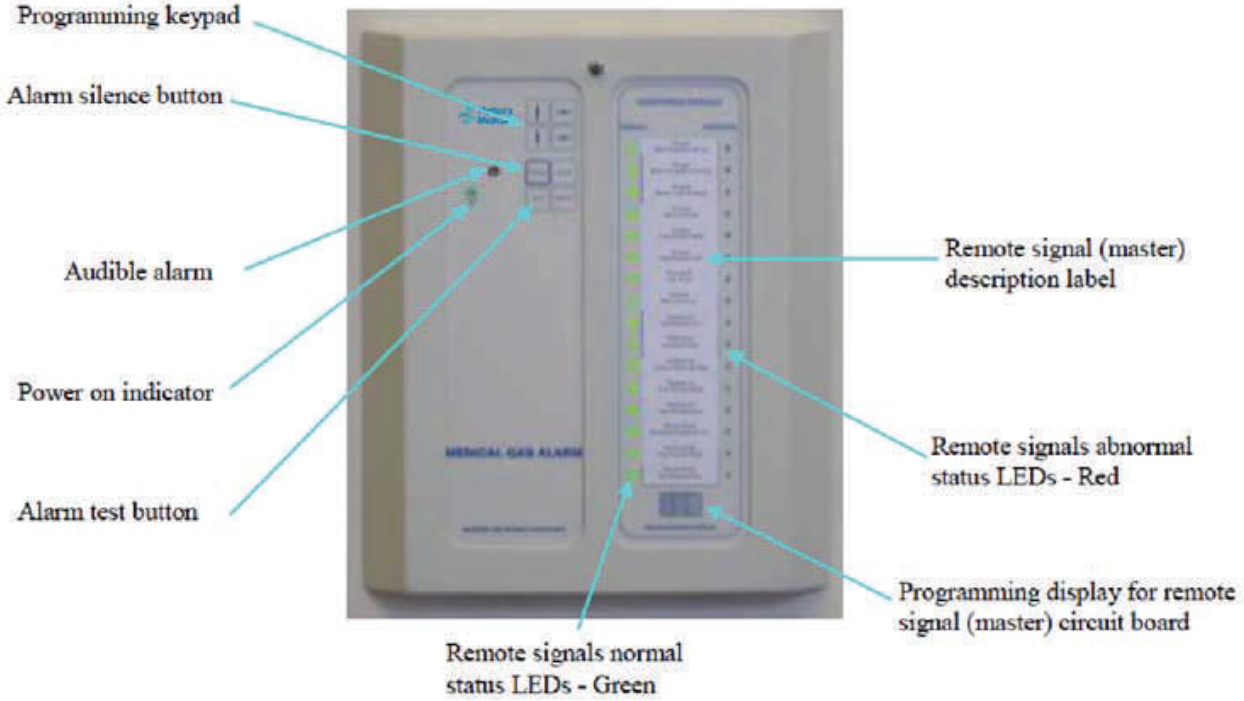
A blank label has been provided at the bottom of each gas module for room identification. You may type directly onto this label or apply a pre-printed label. The label supplied by Patton's Medical will slide into the gas module label pocket of the gas module label.

Alarm Installation

When the labeling is complete, install the plate into the white frame and re-attach with the two nylon nuts.

You are now ready to supply power to the alarm. Restore power to the circuit feeding this alarm panel. The toggle switch on the front of the power supply should be placed in the ON position.





Check the green power LED indicator on the front of the button module. It should be illuminated.

If you haven't already, you are now ready to pressurize the piping system to normal operating pressures. The alarm is shown here with Oxygen & Medical Air at normal operating pressures. All remote signal points (master alarm signals) are shown in normal condition.

Area and Master Alarm Displays & Functions

Alarm Displays & Functions

Button Module

Power on Indicator
The power on indicator (green LED) is illuminated whenever electrical power (120 or 240 VAC) is connected to the alarm and the on/off switch is turned on.

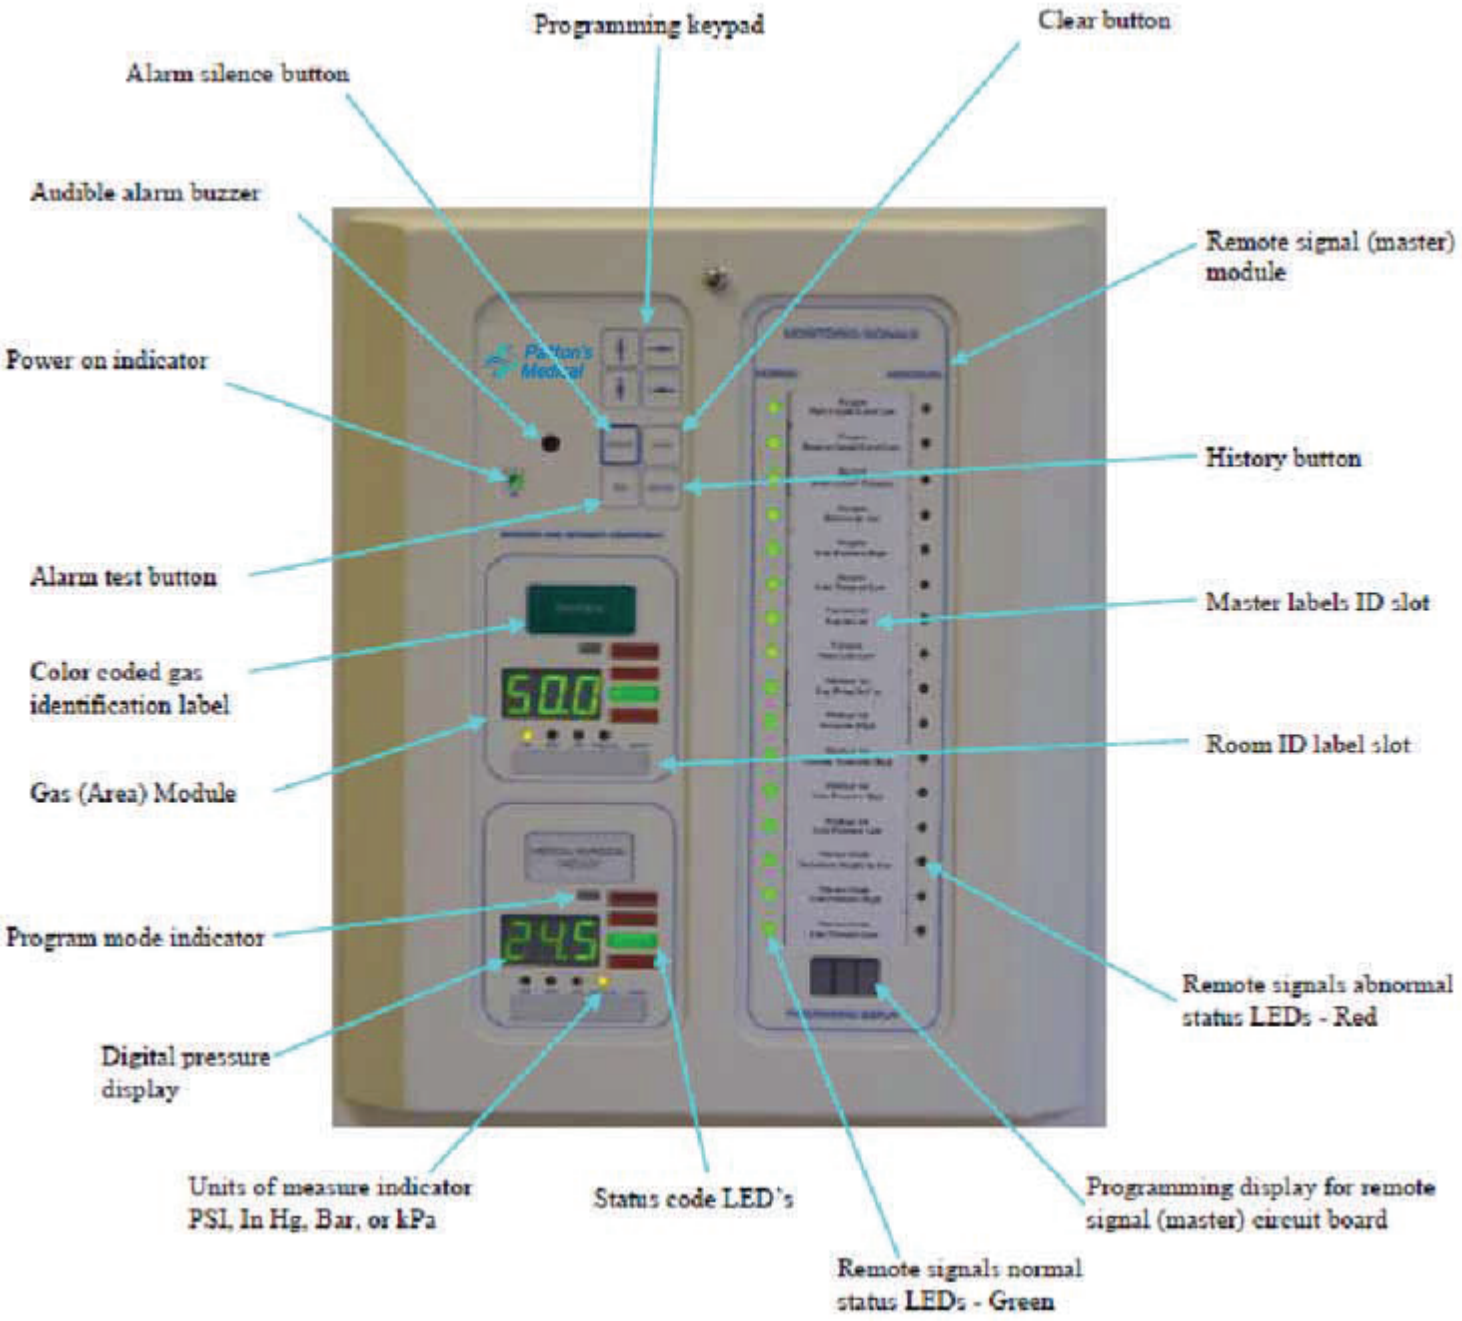
Test Button
When the Test button on the front panel is pressed, the alarm illuminates all segments of all lights and LED's and sounds the buzzer.

Alarm Silence
In the event of an alarm condition an audible alarm sounds. The audible alarm can be silenced by pressing the alarm silence button. The high or low pressure LED or the remote signal LED will remain illuminated until the alarm condition is rectified. If a gas module (area alarm) had alarmed, depressing the silence button will silence the alarm for approximately 10 minutes (factory setting). After approximately 10 minutes, the audible alarm will sound again.

History Button
The History button may be pressed and held at any time to view alarm history. Viewing alarm history is only active while the History button is pressed, releasing the button returns the alarm to normal operation. Pressing the History Button will display the following:
Gas (Area) Module - If there was an alarm condition for any gas (area) module, the High and/or Low Pressure LED's will be illuminated. If both the High and Low Pressure LED's are illuminated, the gas has had both a High and Low alarm.

Remote Signal (Master) Module - If there was an alarm condtion for any Remote Signal the Red LED will be illuminated. All other LED's will be off.

Clear Alarm History - To clear alarm history you simply press the history button, hold it down and simultaneously press the clear button.



↑ (up arrow)
The up arrow may be pressed & held at any time to display the high line pressure alarm set points of the gas module (area) boards. When in the program mode, the up arrow is used to raise the high line pressure alarm set point on gas module (area) boards and to toggle between your choice of Green condition, Red condition or Disabled condition on remote signal (master) boards.

↓ (down arrow)
The down arrow may be pressed & held at any time to display the low line pressure alarm set points of the gas module (area) boards. When in the program mode, the down arrow is used to lower the low line pressure alarm set point on gas module (area) boards and to toggle between your choice of Green condition, Red condition or Disabled condition on remote signal (master) boards.

→ (right arrow)
The right arrow may be pressed & held at any time to display the gas service for which the gas module (area) board is currently programmed. When in the program mode, the right arrow is used to toggle between the various options of services on the gas module (area) boards and to toggle to the next remote signal point on the remote signal master boards.

← (left arrow)
The left arrow may be pressed & held at any time to display the type of transducer that is connected to each gas module (area) board. The 3 types are 0 - 30 In Hg, 0 - 100 psig and 0 - 250 psig. When the left arrow is pressed "30" will be displayed for a 0 - 30 In Hg transducer, "100" will be displayed for a 0 - 100 psig transducer and "250" will be displayed for a 0 - 250 psig transducer. When in the program mode, the left arrow is used to save the updated programming information. After the changes have been made and the left arrow is pressed three horizontal lines will appear on the digital pressure display of the gas module being programmed or on the programming display for the remote signal (master) board being programmed.

Combination Alarm - Displays & Functions

Alarm Displays & Functions

Gas Module (Area Alarms)

Pressure Reading Display
The LED Digital Pressure Display displays the pressure as indicated by the transducer. The gas pressure may be displayed in PSIG/In Hg, BAR or kPa. PSIG and In Hg is the factory setting.

Note: Vacuum & EVAC/WAGD are actually displayed as inches of Hg in the PSI mode. In kPa mode the Nitrogen gas display indicates one tenth of the actual pressure when the pressure exceeds 999 kPa (i.e. 1100 kPa is displayed as 110 and the kPa and (x 10) LED is lit).

Note: Alarm settings are maintained even if power is interrupted.

Units of Measure Indicator
The Units of Measure Indicator illuminates PSIG/In Hg, BAR or kPa (whichever is selected during programming - PSIG and In Hg is a factory setting) providing the unit of measure displayed on the LED pressure reading. In the kPa model the Nitrogen gas display indicates one tenth of the actual pressure when the pressure exceeds 999 kPa (i.e. 1100 kPa is displayed as 110 and the kPa and (x 10) LED is illuminated).

High / Normal / Low Status Lights
Should the line pressure of a gas exceed the programmed alarm set points for low or high line pressure LED will be illuminated simultaneously with the buzzer sounding to announce an alarm condition has occurred. When the line pressure is neither high nor low it is considered within the normal range and the green Normal LED is illuminated. These indications are relative to the high and low pressure set points which have been programmed into the alarm. These high and low set points should be set in accordance with NFPA 99 and CSA Z7396.1 at ± 20% of the normal operating pressure.

System LED
The System LED illuminates in the event of a system problem or malfunction. The following codes will be displayed when a System Error or Failure is detected, or when the History button is pressed:

Code	Error
0	No error (History only)
1	Flash EE corrupt, defaults
2	Sensor: open or broken line
3	Sensor: com timeout, data not received when expected
4	Sensor: Noise on line, or data errors
5	Sensor: Gas type/range mismatch
Actual low psig	Low pressure (history only)
Actual high psig	High pressure (history only)

Remote Signal Status LED's (Master Module)

Normal Status Light (Green)
The normal green status light when illuminated signifies that the equipment being monitored is not in an alarm condition.

Abnormal Status Light (Red)
The abnormal status light when illuminated signifies that the equipment being monitored is in an alarm condition

Note: If no LED is illuminated the remote signal status LED's have probably been set in the disabled or off position. This can be verified by placing the Remote Signal circuit board in the programming mode and pressing the → to view the status of the remote signal point in question or by simply pressing the Test button to verify that the LED's are functional.

Program Mode
When a circuit board is placed in the program mode (see Programming Modules - page 23) the board may be re-programmed. The brightness level of the circuit boards other than the one in the program mode is decreased. In addition, on Gas Displays (Area Modules) the PGM (Program) LED is illuminated, on Remote Signal Displays (Master Modules) the first Remote Signal point will blink.

Alarm Operation

This section deals with the daily operational aspects of the alarm panel. *The Programming The Alarm* section covers the procedures to follow in order to configure the alarm if the preprogrammed settings are not appropriate, a module is added or deleted or if the alarm is being incorporated into a T-Net system. After installation has been completed and the alarm has been properly configured, it is ready for operation.

Master Alarm Panels

Remote Signal (Master Module)
With electrical power applied to the alarm, it will monitor the status of the medical gas distribution system and the remote equipment connected to it.

The remote signals (master module displays (via LED indicators) the normal/abnormal status of the remote equipment connected to the alarm. All alarm panels are pre-programmed upon leaving the factory to monitor normally closed signals (per NFPA 99). In normal operation all active signals will be green. Whenever an abnormal status signal is detected the corresponding green LED will illuminate. Simultaneously an audible alarm will sound. Pressing the Silence button silences the audible alarm (the Red LED continues to be lit). The appropriate personnel should be notified immediately of the alarm condition. When the alarm condition has been rectified the Red LED is automatically extinguished and the Green LED illuminates. *Note: master alarm signals do not repeat - only area (gas) modules are equipped with the Repeater Delay feature.*

Silencing the Alarm
Press the **Silence** button when the alarm is sounding and the alarm will be silenced.

Testing the Alarm
Pressing and holding the **Test** button initiates a self-test of the alarm. All LED's and seven segment displays will illuminate for as long as the Test button is depressed. In addition the buzzer will sound. If any LED or seven segment display does not illuminate - it is faulty and the circuit board should be replaced. If the buzzer does not sound, it is faulty and the circuit board should be replaced.

Note: The alarms (both Area & Master) are programmed to ignore transient signals that are less than 0.7 seconds in duration.

Area Alarm Panels

Gas Modules
With the electrical power applied to the alarm and the gas systems adequately pressurized, the following indicators are illuminated: 1) the Power On LED, 2) the pressure readings of the gas on each gas display, 3) the Normal LED (green) on each gas display.

If the pressure of one of the gases drops below the programmed low limit setting, the following events take place simultaneously: 1) the Normal LED will be extinguished, 2) the Pressure Low LED (red) will illuminate, 3) an audible alarm will sound.

If the pressure of one of the gases rises above the programmed high limit setting, the following events take place simultaneously: 1) the Normal LED will be extinguished, 2) the Pressure High LED (red) will illuminate, 3) an audible alarm will sound.

Silencing the Alarm
Press the **Silence** button when the alarm is sounding and the alarm will be silenced.

The area alarm is equipped with a **Repeater Delay** feature which monitors only the Gas Module (area) alarms. The Repeater Delay has been factory programmed to make the alarm re-sound every 10 (ten) minutes as long as the alarm condition exists. Note: Remote Signal (master) alarms are **not** monitored by the Repeater Delay.

Alarm Operation

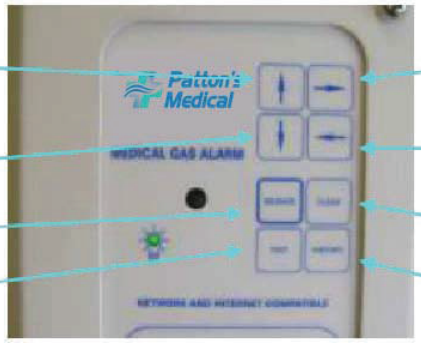
System Alarm

The audible buzzer will sound, the System LED will illuminate and an Error Code "Err" will be displayed on the digital pressure display when a system failure occurs or the history button is depressed. The System LED and "Err" will illuminate and flash on and off and alternate with a number (per table below) being displayed on the digital display.

Note: If "Err" should be displayed on the Gas Pressure Display of any gas module, this indicates a problem. Some possible problems and corrective actions are:
The transducer is not connected to the Gas Module. To correct, check the transducer connection to the back side of the Gas Module.

A transducer for a different gas service has been connected to the Gas Module. To correct, check the transducer and the Gas Module gas identification labels and make sure they match.

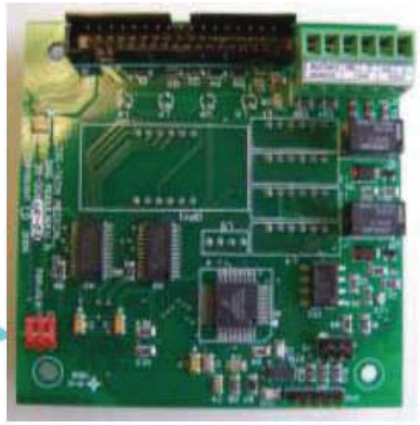
If the above corrective actions do not correct the problem, contact the factory for assistance.



Code	Error
0	No error (History only)
1	Flash EE corrupt,defaults loaded
2	Sensor: open or broken line
3	Sensor: Com timeout, data not received when expected
4	Sensor: Noise on line, or data errors
5	Sensor: Gas type/range mismatch
Actual Low psig	Low pressure (history only)
Actual high psig	High pressure (history only)

PGM Notification

The **PGM** (program mode) LED will flash off & on when a gas module circuit board is manually placed in the program mode. *It is important to note that while a gas module is in the program mode, it is not monitoring the medical gas pipeline.* See the "Programming the Alarm" section of this manual for instructions on programming the gas module.

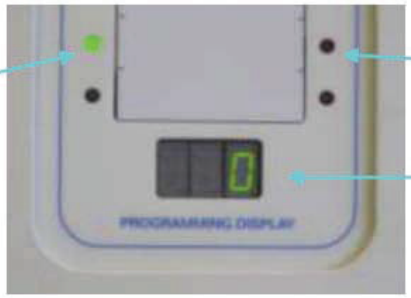


Programming the Alarm

Button Label

Gas Board (back view - showing dip switch)

DIP Switch PGM/RUN
(only outer switch labeled
PGM/RUN should be used)



Gas Board

Remote Signal (Master) Board

Green LED Normal Remote
Signal indicators

Programming the Alarm

The alarm has been programmed at the factory prior to shipment. Programming of the alarm may be necessary if:

A) the high or low pressure limits for a gas need to be modified
B) if a future gas module is being put into service for an added gas service
C) if a gas service is being deleted
D) if a gas service is being changed
E) if a remote signal alarm point needs to be re-configured
F) if a remote signal module is being added in the place of a blank module
G) if the alarm identification number needs to be changed
H) you wish to change the repeater delay time
I) you wish to change the units of measure
J) the alarm panel is being set up on the T-NET system

Note: Only authorized personnel should program the alarm! It is important to note that while the alarm is in the program mode, it is **not** monitoring the medical gas system and alarm conditions will **not** trigger an alarm.

Accessing the Alarm Program Mode

To program the alarm, the circuit boards must be placed individually, one at a time in the program mode. To place a circuit board in the programming mode, the dip switch located on the back side of the circuit board to be re-programmed, must be changed from the "run" to the "pgm" position.

After this is done, the gas module (area) board being reprogrammed will be brighter than the rest of the gas module (area) boards (when viewed from the front) and the yellow "PGM" LED indicator will be flashing to indicate that the alarm is in the program mode and the board which is illuminated more brightly and has the flashing "PGM" LED is ready to be reprogrammed.

The remote signal (master) board being reprogrammed will have the top (first) signal point flashing and the programming display LED's (at the bottom of the board) will illuminate displaying either an "O" (open circuit) or a "C" (closed circuit) or a "d" (disabled).

The programming buttons, located on the front of the alarm, upper left corner (see photo on page 22) may now be used to make the needed program changes.

When you have successfully accessed the program mode, it is important to note that some of the buttons revert to their sub-functions:

When programming a gas (area) module:
The UP key ↑ is used to raise the pressure set point and / or to toggle upward thru the list of sub- options.
The DOWN key ↓ is used to lower the pressure set point and / or to toggle downward thru the list of sub-options.
The RIGHT key → is used to toggle (scroll) thru the list of major options.
The LEFT key ← is used to SAVE the new programming options after they are selected.

When programming a remote signal (master) module:
The UP key ↑ is used to toggle between the choices of the green LED or the red LED or both the green & reds illuminated (disabled).
The DOWN key ↓ is used to toggle between the choices of green LED or the red LED or both the green & reds illuminated (disabled).
The RIGHT key → is used to toggle (scroll) down to the next remote signal point.
The LEFT key ← is used to SAVE the new programming options after they are selected.

Note: In order to perform any of the following programming features you must first set the alarm in the program mode.

Programming the High & Low Gas Pressure set points

Immediately upon entering a gas module (area) board in the program mode, the high line pressure set point major option is displayed. If the gas module being programmed is a typical 50 psig delivery pressure gas, the board has been pre-programmed at the factory with the high line pressure set point at 60 psig, so the display should show the number 60. If you wish to raise or lower this setting, simply use the up ↑ or down ↓ keys to adjust the pressure setting.

Programming the Alarm

After the setting has been changed to the new desired setting, press the LEFT key ← (SAVE) to save the new setting. Note: if the SAVE ← LEFT key is not pressed after making the change to the programming and before pressing any other keys, the new setting will not be saved and the alarm will revert to the previously saved setting(s). When the SAVE key ← is depressed, three horizontal dashes will appear in the display.

Press the → key to move on to the low line pressure and repeat the above procedure.

Note: The alarm is designed with a safety feature so that the high and low set points must be at least 0.5 (psig / in Hg), 0.05 (bar) or 5 (kPa) increments apart. The high set point will not be able to be set below the low set point and visa versa.

Programming the Remote Signal (Master) Alarm Points

While in the program mode, the top signal point LED will be blinking. At the bottom of the same remote signal board, the Programming Display LED set will display the contact state for the blinking signal point. "O" = open, "C" = closed and "d" = disabled. The contact point that is flashing is capable of being re-programmed. (Note: in compliance with NFPA 99, all contacts are programmed as closed contact equals a normal condition from the factory). If it is necessary to re-program a signal point; press the → key to view the next Remote Signal Alarm Point, when the desired Remote Signal (Master) point is flashing, use the ↑ or ↓ keys to alter the point to the desired status, after the desired change is achieved, press the ← to save the change.

Note: Any contact point that has been disabled will have both the green (normal) and red (alarm) LED illuminated only when in the programming mode, to make it easy to identify them. In the normal mode of operation, both LED's of a disabled signal point will not illuminate nor will this signal point trigger an alarm.

Note: *When an alarm condition occurs the audible buzzer sound simultaneously with the corresponding red LED illuminating and the green corresponding LED being extinguished. When the silence button is depressed, the audible buzzer is silenced and remains silenced until another alarm condition occurs.*
Master Alarm signals do not repeat.

Programming the Gas Alarm Repeater Delay

After placing a gas board in the program mode, press → until "dLY" is displayed on the digital display of the gas module then let go of the → key. A number will be displayed on the digital display. This number is the setting (in minutes) of the repeater delay. Using the ↑ or ↓ keys, adjust the repeater delay to the desired length of time (0 - 240 minutes). (Note: the repeater delay is preprogrammed from the factory at 10 minutes - per NFPA 99). To save the change and return the alarm to the normal alarm mode, press the ← button, then change the dip switch back to the "run" setting. ***Note: this procedure must be repeated for all gas boards on the alarm panel.***
Note: master alarm signals do not repeat.

Note: If a valve of 0 (zero) is programmed and saved for any board, the repeater is disabled. If left programmed this way after 72 hours, the board(s) will automatically revert back to the preprogrammed factory setting of 10 minutes.

Programming the Units of Measure Displays

While in the program mode, press the → button until "-U-" is displayed on the digital display of the gas module then let go of the → key. The letters "PSI" or "bAŕ" or "PA" will be displayed on the digital display. This is the unit setting that the gas board is set to display. If you wish to alter the unit display, use the ↑ or ↓ keys to select the desired unit display, then press the ← SAVE key.
Note: *this procedure must be repeated for all gas boards on the alarm panel.*

Note: Vacuum & EVAC / WAGD Gas Modules will automatically display in in/Hg when PSI is selected.
Note: The kPa and x10 LED's will both illuminate on all high delivery pressure Gas Modules (i.e. - Nitrogen and Instrument Air) when kPa is selected. Because the Gas Pressure LED Display is only able to display three digits and high delivery pressures viewed in kPa are four digits, the Gas Pressure LED must be read as a four digit number by multiplying the displayed number by ten. I.E. - the Gas Pressure LED Display is displaying 125 in kPa. The pressure should be read as 1,250 kPa (125 x 10).

Programming the Alarm

Adjusting the Digital Line Pressure

The digital line pressure may be adjusted slightly (per the chart below) by following the simple procedure below. This can be done by one person at the alarm panel - no need to open/adjust the transducers!

1. Put the gas module you want to adjust into the PROGRAM MODE.
2. Using the TOGGLE → (right arrow) button go to the CAL mode.
3. Use the UP ↑ ARROW button to increase the pressure reading and the DOWN ↓ ARROW to decrease the pressure reading. The adjusted reading will be displayed as the changes are made.
4. Press the SAVE button ← (left arrow) to save the setting.
5. You can return to the original calibration setting by pressing CLEAR then press the SAVE button ← (left arrow) while at CAL in the PROGRAM MODE. This should be done if a transducer is ever replaced, as the reading offset will be applied to the new transducer readings.

Range of adjustment

VAC or EVAC / WAGD ± 0.5 In Hg
100 psig transducers ± 2.5 psig
250 psig transducers ± 6.0 psig

Programming the Board Identification

Note: This feature is only used when the alarm is used in conjunction with a Patton's Medical T-Net system.

Note: Each gas and master (remote signal) circuit board must have a unique Identification Number - no two can share the same number.

After placing a gas board in the program mode, press → until "Cld" is displayed on the digital display of the gas module then let go of the → key. A number will be displayed on the digital display. This number is the board identification # assigned to the circuit board. Using the ↑ or ↓ keys, select the desired board identification #. Use the ← SAVE button when you are finished.

Note: Each gas and master (remote signal) circuit board must have a unique Identification Number - no two can share the same number.

Note: Valid identification numbers are 1 - 999. The alarm is pre-programmed at the factory with 0 (zero) as the zone identification number.

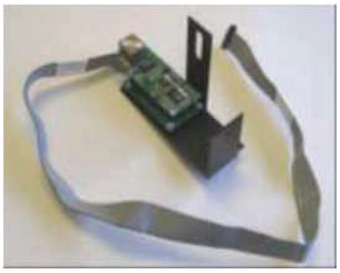
Adding/Removing Modules or Changing the Gas Service of a Gas Board

To remove either a gas board or a remote signal master board from an alarm - you simply need to turn off the power to the alarm panel (using the switch on the outside of the power supply in the back box), unplug the ribbon cable from the board being removed and then turn the power back on. The alarm will automatically reset itself.

To add a remote signal master board to an alarm - you follow the same instructions above.

Note: The following feature is only used if; an additional gas service is being added to an area alarm, a future gas module is being set up for a new gas service or and existing gas module board is being changed to a different gas service.

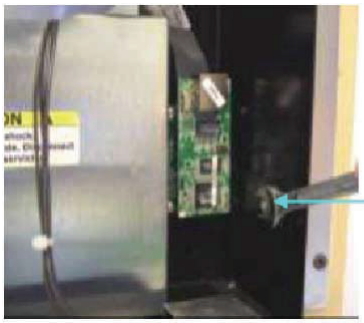
The gas boards are pre-programmed for a specific gas service from the factory. After placing a gas board in the program mode, it is possible to change the gas service of the board. The following list cross references the number that is actually displayed on the gas board numeric display with the full names of the gases:



Gas # Displayed	Gas Service	Transducer Type
12	Nitrogen	250
24	Oxygen	100
04	Nitrous Oxide	100
08	CO2 or CO2-O2 mix	100
22	Medical Vacuum	30
32	WAGD / AGSS	30
16	Medical Air	100
06	Helium or Heliox	100
H16	Instrument Air	250
H24	Hyperbaric Oxygen	100
H08	Medium pressure Carbon Dioxide	100
SP	Gas Mixture	100
HSP	High Pressure gas mix	250
3SP	Tri-Gas	100

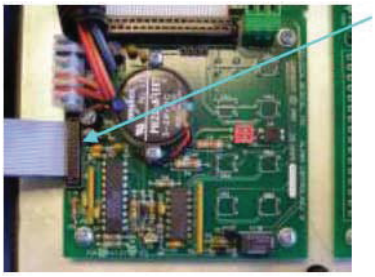
T-Net ™ Interface, Circuit Board Installation

Patton's Medical A1A/A1M series alarms may be ordered without T-Net Interface Circuit boards. The T-Net Interface Circuit boards may be installed later.

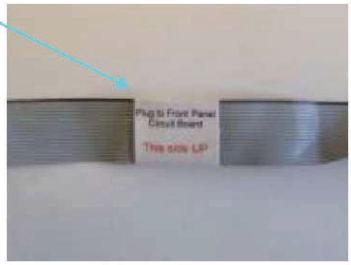


The toggle switch on the front of the power supply should be placed in the OFF position.

You will be installing one of three types of interface circuit boards, bracket and cable connector; RS485, Ethernet or Wireless. The Ethernet Interface board is shown here left and the Wireless board is shown here right.



Note: Units incorporating the wireless interface circuit board - contains FCC ID OUR-9XTEND. The enclosed device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference and (2) this device just accept any interference received, including interference that may cause undesired operation.

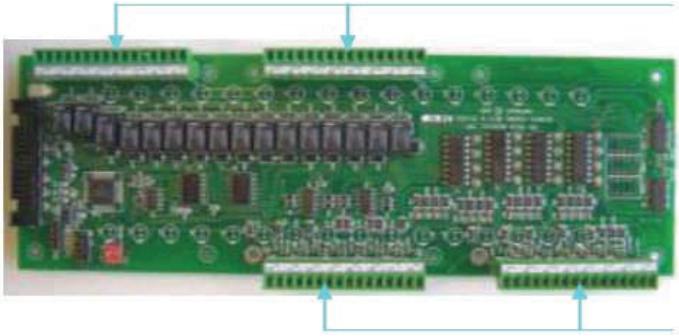


Any of the three types installs into the bottom right corner of the alarm back box. The wireless antenna drops thru a hole in the bottom of the back box.

The bracket mounts to the existing flange nut.

The cable must be installed into the socket on the Button Board properly - per the instructions of the cable.

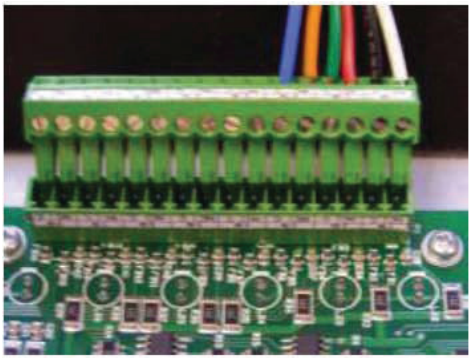
All of the gas boards and remote signal (master boards) will need to be reprogrammed with a unique identification number and set up in the T-Net software per the T-Net installation instructions provided with the T-Net software.



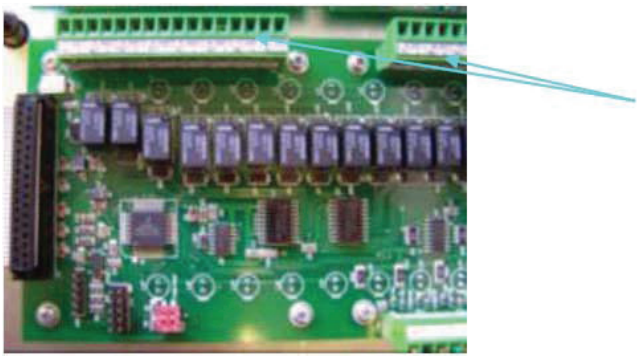
The power may now be restored to the alarm. The alarm is fully functional - even if the T-Net software is not yet installed or is out of service.

Building Management Interface, Relay (BIM) Board Wiring

Patton's Medical A1A/A1M series alarms may be ordered with standard remote signal circuit board(s) or with the building management interface circuit board(s). The building management interface circuit board(s) may be installed later, replacing the standard remote signal circuit board(s). It is only necessary to install building management interface board(s) in one of the master alarm panels.



The toggle switch on the front of the power supply should be placed in the OFF position.



Outlet connections - to building management system

Refer to Wiring Remote Devices to Remote Signal (Master) Board page 13 - the building management interface circuit boards (Relay boards) are wired the same way as the standard remote signal circuit boards. The additional two sets of connection terminal are the connection points for the wires outputting the signal information to the building management system.

Input connections - from remote signal devices

The connector terminals may be un-plugged from the circuit board - to simplify installation of the remote signal wires. There is no need to remove the wires, simply unplug the connectors from the standard remote signal board and plug them back into the new building management interface circuit board. Be certain to match the label on the socket with the label on the plug.

The additional connector terminals are labeled 1 OUT thru 16 OUT are located on the left edge of the new building management interface circuit board. These correspond with the pairs labeled 1 IN thru 16 IN on the right edge of the circuit board. **The NC labeled terminal of each pair is where the signal wire should be landed. The C labeled terminal of each pair is where the common wire should be landed.**

Appendix A

Glossary of Terms

AC ***Alternating Current***
An electric current that reverses direction or polarity at regular intervals.

DC ***Direct Current***
An electric current that flows in one direction. The current can be steady or pulse.

IN Hg ***Inches of Mercury***
A measurement of the force in a gas vacuum system.
1 IN Hg = 3.38 kPa.

kPa ***Kilopascals***
A measurement of the force in a compressed gas system.
1 kPa = .14 PSI

LED ***Light Emitting Diode***
A semiconductor diode that converts applied voltage to light.

NFPA ***National Fire Protection Association***
The National Fire Protection Association is an association engaged in standards development.

NO ***Normally Open***
An electrical circuit in which the switch is normally open. No current flows through the circuit in normal operation. Only when the switch is closed is the flow of current started.

NC ***Normally Closed***
An electrical circuit in which the switch is normally closed. Current flows through the circuit in normal operation. Only when the switch is opened is the flow of current stopped.

PSI ***Pounds per Square Inch***
A measurement of the force in a compressed gas system.
1 PSI = 6.9 kPa

Transducer
A device that converts pressure into an electrical signal.

V ***Voltage***
Voltage is electrical pressure or force. One volt is equal to the difference of electrical potential between two points on a conducting wire carrying a constant current of one ampere when the power dissipated between the points is one watt.

Transient Signal
An intermittent and brief signal that quickly corrects and returns the alarm to a normal operating mode before monitoring personnel can silence the alarm.

Appendix B - Medical Gas Alarm Specifications

Operating Ambient Temperature range: +10C (50F) to +50C (122F)

Storage Temperature: -20C (-4F) to +85C (185F)

AC Input: 120 - 240 volts AC - 50-60 Hz

DC output (to remote signal devices): 5 VDC

Input Fuse: 5 amp input AC line fuse protects the input wiring to power supply

Power Consumption: 45W maximum @ 120 V
50W maximum @ 240 V

Pressure Measurement Accuracy: 0-30 inHg transducer +/-1%
Vacuum, Gas Evacuation

0-100 PSIG transducer +/-1%
Oxygen, Nitrous Oxide, Medical Air, Carbon Dioxide

0-250 PSIG transducer +/-1%
Nitrogen

Dimensions

Rough-in Box - All dimensions are in inches and cover the basic box only (mounting flange excluded)

Two Vertical Slot Panel
8.125W x 11.875H x 4.000D

Three Vertical Slot Panel
13.625W x 11.875H x 4.000D

Five Vertical Slot Panel
19.625W x 11.875H x 4.000D

Front Panel

Two Vertical Slot Panel
8.125W x 11.875H x 4.000D

Three Vertical Slot Panel
13.625W x 11.875H x 4.000D

Five Vertical Slot Panel
19.625W x 11.875H x 4.000D

Transducers: Housing dimensions: 1.990W x 1.990H x 3.625L including inlet fittings

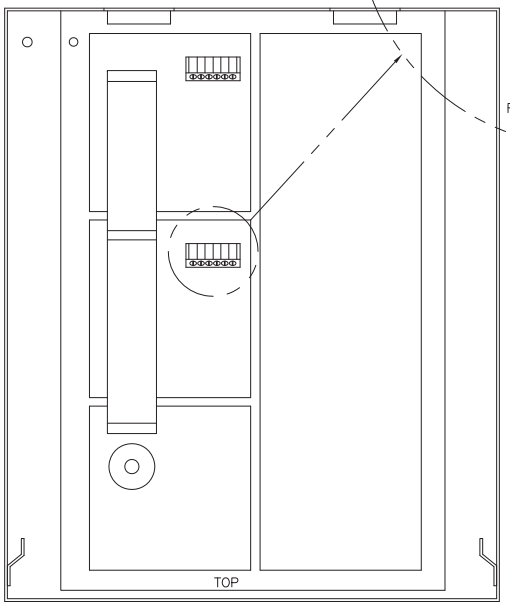
NOTES: THE ORDER OF THE SIGNALS WIRED INTO THE ALARM IS DETERMINED BY THE PERSON LANDING THE WIRES TO THE MASTER ALARM TERMINAL BOARD.



THE NUMBER OF ALARM SIGNALS WILL VARY DEPENDING ON HOW MANY GASES ARE PIPED INTO EACH FACILITY. A LIST OF SIGNALS REQUIRED BY NFPA99 CAN BE FOUND IN NFPA99C.

A THOROUGH REVIEW OF NFPA99C SHOULD BE DONE TO ENSURE YOU HAVE MET ALL NFPA REQUIREMENTS.

NOTE: REMOTELY MOUNTING THE TRANSDUCER AND CABLE IN AN ELECTRICAL JUNCTION BOX AND CONDUIT IS NOT REQUIRED. IT DOES HOWEVER PROVIDE MAXIMUM PROTECTION FROM UN–INTENTIONAL DAMAGE BY PERSONNEL WORKING AROUND THIS EQUIPMENT AFTER IT IS INSTALLED. THE TRANSDUCER NUT AND NIPPLE MUST BE REMOVED FROM THE BRASS CONNECTOR TO INSTALL IT IN THE JUNCTION BOX. USE ONE OF THE 1/2 CONDUIT KNOCKOUTS FOR MOUNTING. REINSTALL THE PROPER GAS SPECIFIC NUT AND NIPPLE BACK INTO THE ORIGINAL TRANSDUCER BRASS CONNECTOR USING TEFLON TAPE THREAD SEALANT AND WRENCH TIGHTEN. LEAK TEST THIS JOINT AFTER FINAL INSTALLATION.

Safety Precautions

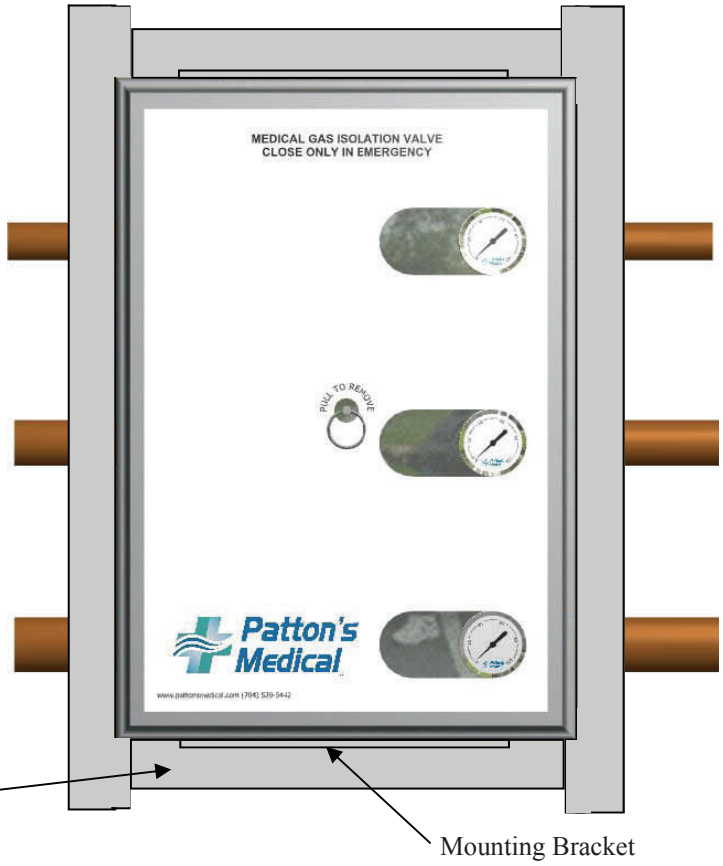
Pressurized air from the system may cause personnel injury or property damage if the unit is improperly operated or maintained. The operator should have carefully read and become familiar with the contents of this manual before installing, operating, and maintaining the product. The operator is expected to use common sense safety precautions, good workmanship practices and follow any related local safety precautions.

Patton's Medical explicitly excludes all responsibility and liability for damage and/or injury caused by failure to follow the instructions described in this manual, or by failing to pay necessary attention when operating handling or servicing this product, even if not specifically stated in individual cases.



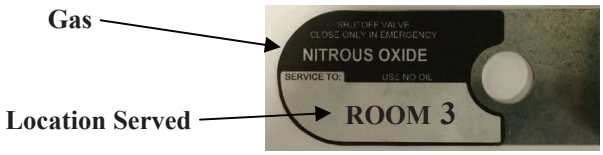
1.0 General Information

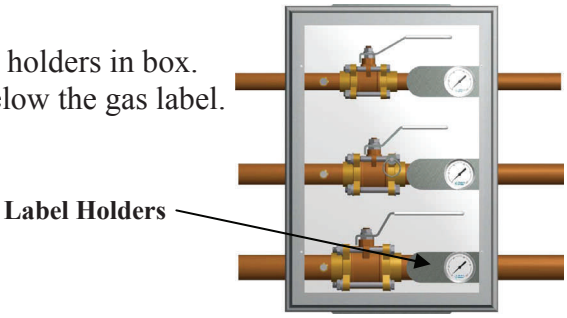
Zone valve box assemblies are assembled in single and multiple configurations. Assemblies should be installed in specified locations per NFPA 99 or CSA Z7396.1. All Valves Supplied are cleaned for oxygen. Care should be taken during installation to keep debris from entering valves and pipeline assemblies.

2.0 Installation

Allow sufficient space to accommodate the zone valve box. The rough-in of the zone valve box comes with a cardboard shield covering it's front. The cardboard shield will need to be remove to install the box but needs to be replaced before the walls are finished. Anchor the valve box to the structural frame supports so that the front edge will be flush or slightly recessed with the finished wall. Box mounting height is suggested at 66" from floor to top of finished box. Box should be level and installed a specified height and location on wall.

Note: The valve handles should point downstream for pressurized gases.



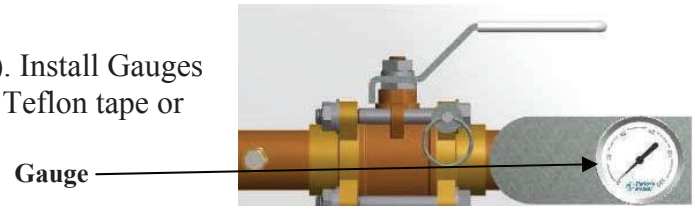


3.0 Brazing

Braze tube extensions to piping per NFPA 99. Use heat sink techniques appropriate to protect the valve seals and sealing material in gauge port plug. Purge with oil-free dry nitrogen while brazing.

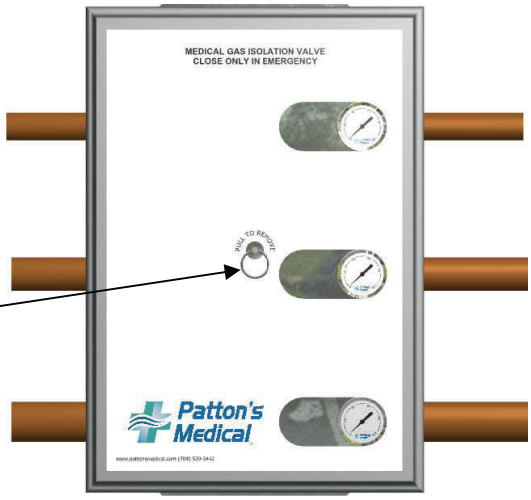
4.0 Gas Identification

Install the correct gas identification label to the label holders in box. Mark location serviced by each valve in the space below the gas label.



5.0 Pressure Test

Test each system per NFPA. After pressure test is finished replace cardboard shield until wall is finished to keep dust and debris out of box.



6.0 Gauge Installation

Remove cardboard shield (keep screws). Install Gauges (if required) after wall is finished using Teflon tape or oxygen compatible pipe sealant.

7.0 Install Aluminum Frame

Pull ring to remove window from frame. Secure aluminum frame to box using screws from cardboard shield. Replace window into frame. Clean Window with soap and water, do not use strong solvents that will damage the window.

INTRODUCTION

Patton's Inc., now owned and operated by ELGi USA, began selling custom medical air packages to hospitals in 1980. For years we sold Quincy compressors to the local medical market. Knowing we had to expand our product line, we became a distributor for Powerex in 2003. For the next five years, we were one of their leading distributors for medical gas equipment. In 2012 ELGi USA purchased Patton's Inc. and Patton's Medical as an entre into the US marketplace for their industrial products as well diversification into the medical equipment business.

Deciding to sell and service our own medical gas equipment nationwide, we created Patton's Medical in 2008. This does not mean Patton's Medical is the "new kid on the block."We hired some of the best in the medical gas business with extensive backgrounds in sales, marketing, manufacturing and engineering. Within a short period of time, we were able to create a company and product line that is second to none in the industry. Although the influx of this new talent brought new ideas, products and direction to the company, our "old fashion" commitment to customer service is steadfast.

In order to provide the best equipment for the expanding medical market, we acquired collaborative developmental rights to sell Hitachi Bebicon and Scroll compressors. We knew these compressors had been used for over twenty years in the medical market and had proven to be extremely reliable. With this came the ability to sell parts and service for existing equipment that utilize the Hitachi pumps.

In addition to medical air compressors, we knew we had to offer medical vacuum. After extensive research of vacuum companies and vacuum pumps we chose Busch Vacuum pumps for their excellent reputation in the medical arena. We build multiplex vacuum packages utilizing oil-less rotary vane, lubricated rotary vane and oil-less rotary claw pumps.

Today, a premier offering of medical air and vacuum equipment is manufactured in our Charlotte facility. Additionally, we have embarked on a complete Medical Gas pipeline offering as Patton's Medical. Our products meet or exceed NFPA 99 and CSA standards in addition to being U.L. listed. If our standard products do not exactly fit your requirements, we will work with you to develop special packages to comply with your particular specifications or applications.
Our mission is to be the leading innovator, deliverer, and manufacturer in the world of Medical Gas products. We strive to do this through constant examination of our processes and service to our customers.

We are committed to quality and innovation; we look forward to working with you and your needs to be your preferred partner for Medical Gas Equipment.

While we strive to grow our business, we know the importance of customer relationships, business relationships and providing the best equipment to meet the customer's needs. Our focus will continue to be on our customers. Lead by our product knowledge, experience and dedication to you, we will strive to provide the right equipment for any medical gas application that is specified by you.

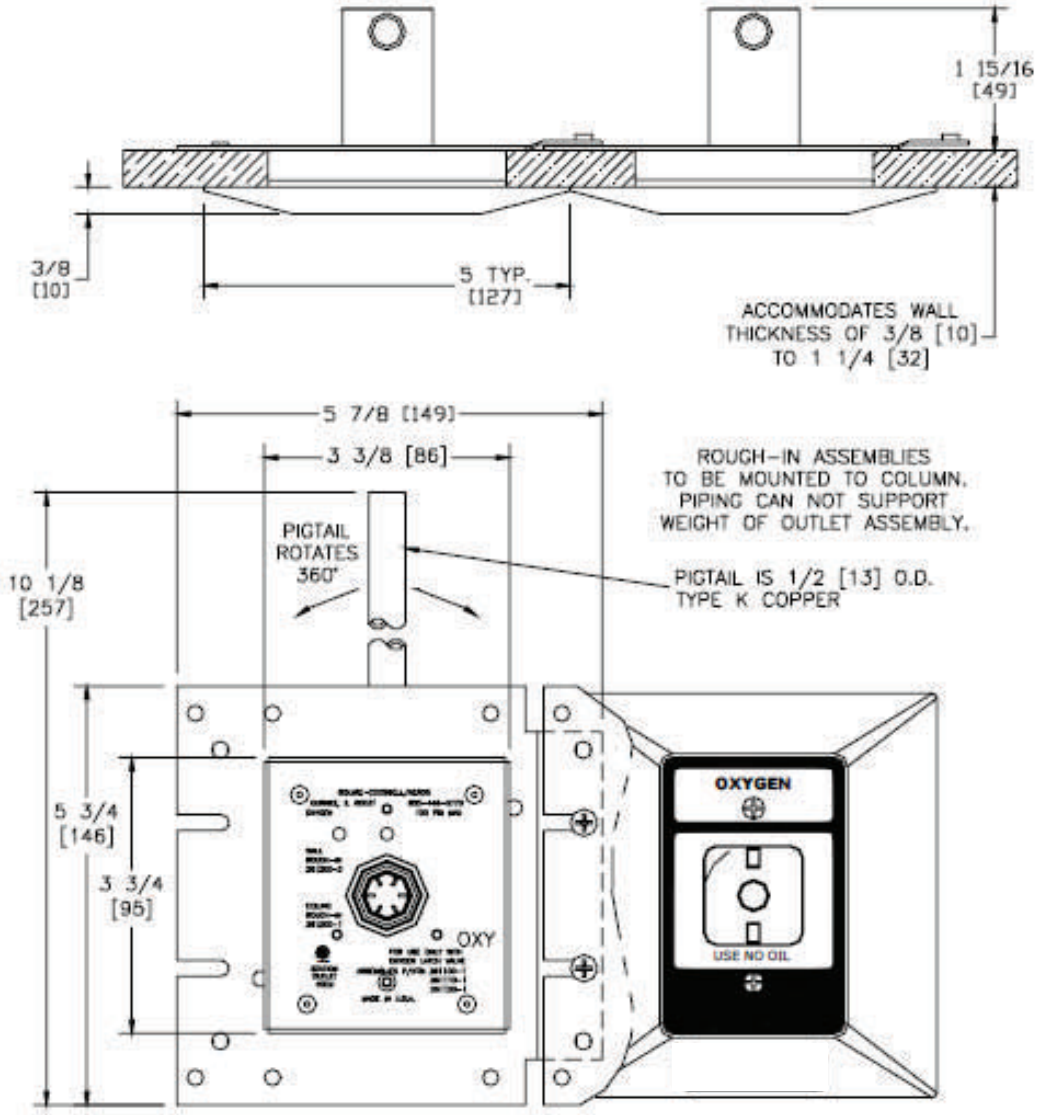
Product Description

A complete Patton's Medical Outlet is made up to two separate components, the "Back-Body Assembly" and the "Latch-Valve Mechanism". The "Back-Body Assembly" is designed to be unique to each specific gas but is interchangeable within all "same-gas" outlet types (D.I.S.S, Ohmeda, Puritan-Bennett or Chemetron compatibles).

The gas specific "Back-Body Assembly" includes a check valve that permits removal of the "Latch-Valve Mechanism" for service without requiring the pipeline to be shut down.

A 6" long, 3/8" nom. dia. Medical gas copper tube, per NFPA specifications, is brazed into the body for external pipeline connections. The "Back-Body Assembly" is marked with color-coded labeling on the front plate and on the copper pipe so that the installer can easily identify the correct gas when making the installation. The Patton's Medical gas outlet is designed with a gas specific dual pin indexing arrangement to prevent an incorrect gas "Latch-Valve Mechanism: from being installed into a "Back-Body Assembly".

Patton's Medical Gas Outlets (wall and ceiling styles only may be ganged together in 5" [127mm] center to center assemblies providing one attractive module of all medical gases without the additional expense of a headwall or console.



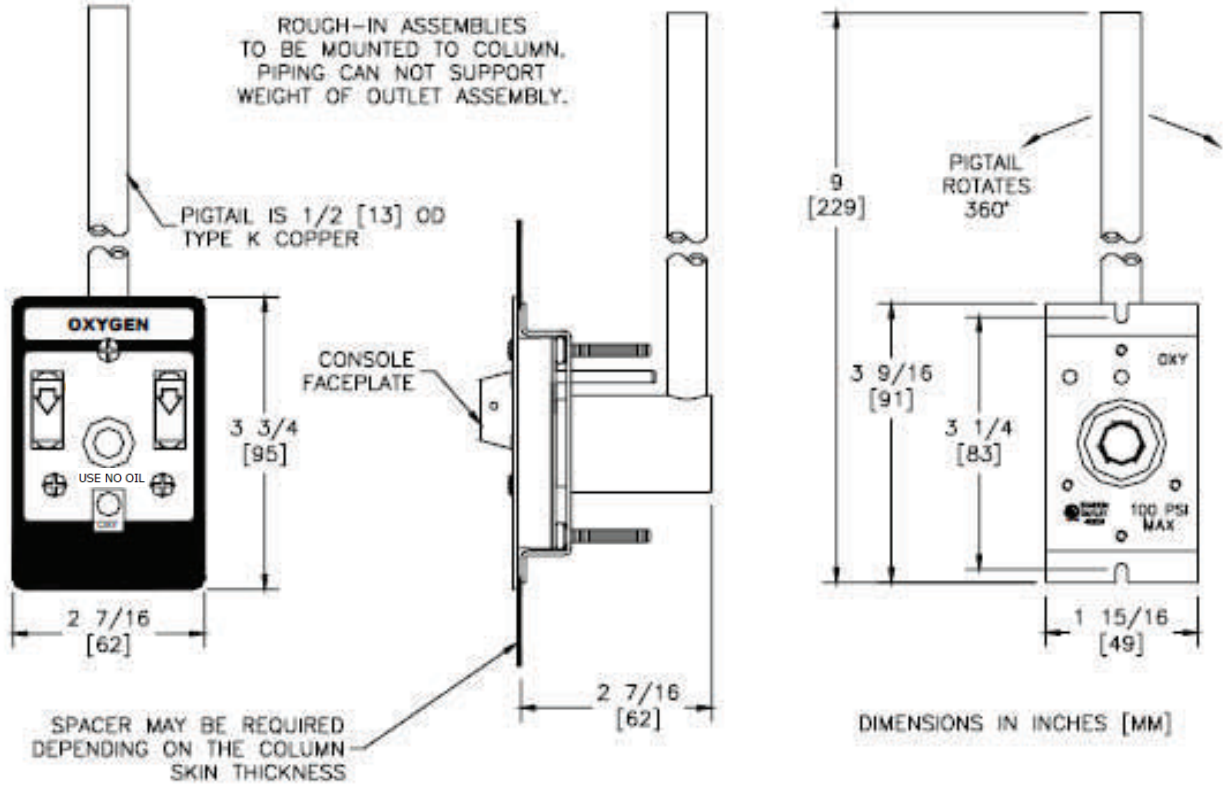
It is the "Latch-Valve Mechanism" which determines which type of adapter that the completed outlet assembly will accept. The "Latch-Valve Mechanism" is available in four different offerings; D.I.S.S. Type, Quick-Connect Ohmeda Compatible, Puritan-Bennett Compatible and Quick Connect Chemetron Compatible. The "Latch-Valve Mechanism" consists of a connector with an internal check valve, an indexing assembly and a color-coded gas specific front plate. A trim plate is also included for wall and ceiling outlets. The "Latch-Valve Mechanism" is designed and manufactured so that its gas specific characteristics cannot be altered during normal use, service or maintenance. The "Latch-Valve Mechanism" is inserted into the "Back-Body Assembly" and secured with plated steel screws to complete the outlet assembly.

The Quick-Connect models are compatible with Ohmeda Diamond, Puritan-Bennett or Chemetron Quick-Connect adapters and only the correct corresponding gas type of adapters can be used with the Quick-Connect outlets.

Since the "Back-Body Assembly" is the same for all types of "Latch-Valve Mechanisms" of the same gas, the Patton's Medical Gas Outlets can easily be converted from one adapter type to another by simply replacing the "Latch-Valve Mechanism".

WALL OUTLETS

D.I.S.S TYPE, OHMEDA COMPATIBLE, PURITAN-BENNETT COMPATIBLE AND CHEMETRON COMPATIBLE

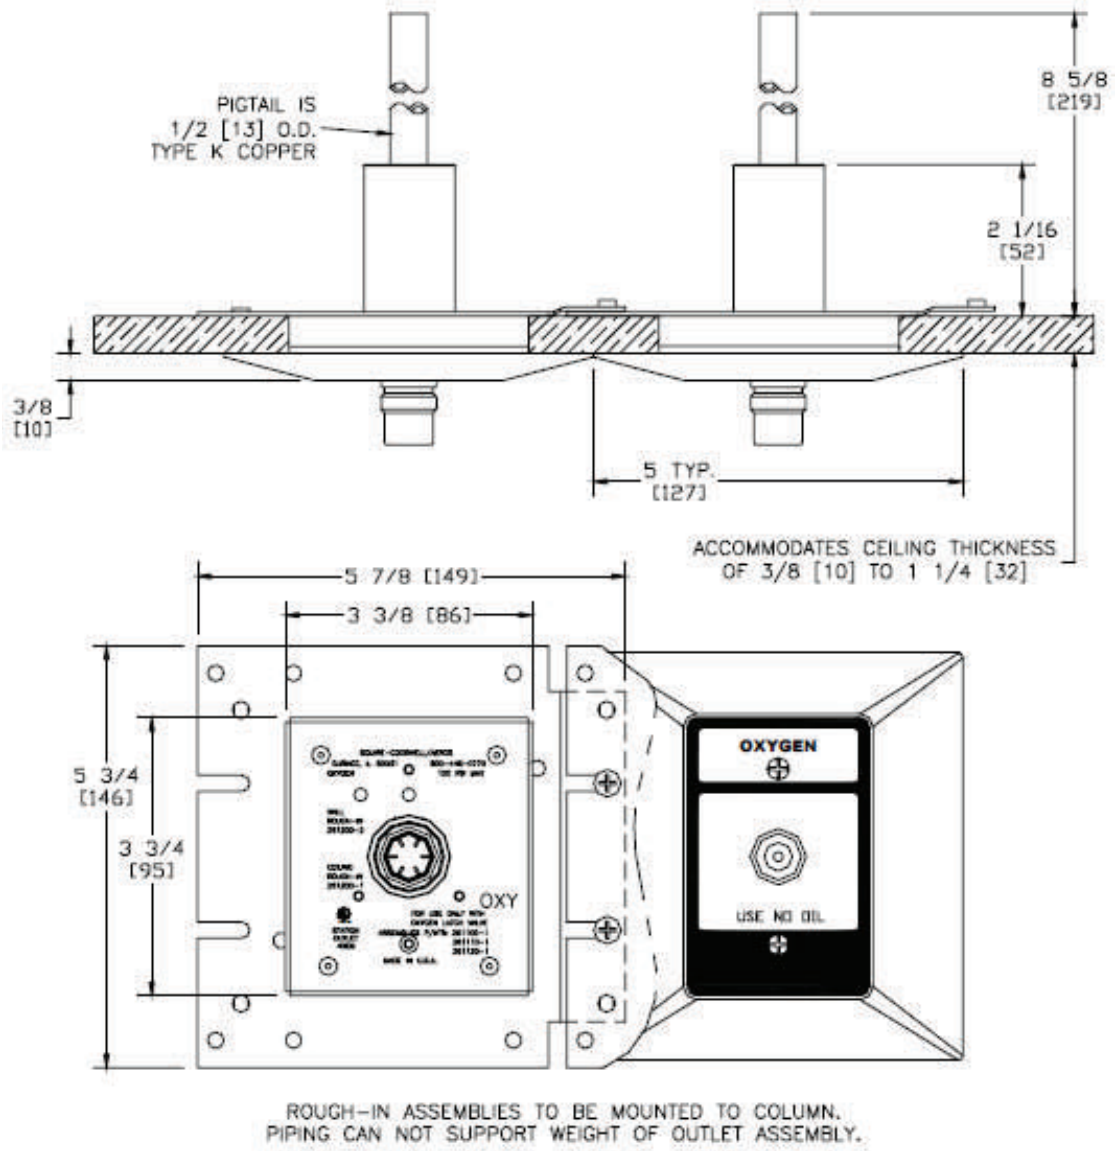


NOTES:

1. Do not cover over the Back-Body Assembly during the drywall and plaster application. Ensure that the clear plastic cover over the Back-Body Assembly is securely in place until the " Latch-Valve Mechanism" can be installed.
2. For W.A.G.D. (Evacuation) and vacuum gases, a round tubing plug and a plug retainer plate are in stalled on the Back-Body Assembly since a secondary check valve does not exist for these gases. Do not remove these components until the latch valve mechanism is to be installed.

CONSOLE OUTLETS

D.I.S.S TYPE, OHMEDA COMPATIBLE, PURITAN-BENNETT COMPATIBLE AND CHEMETRON COMPATIBLE

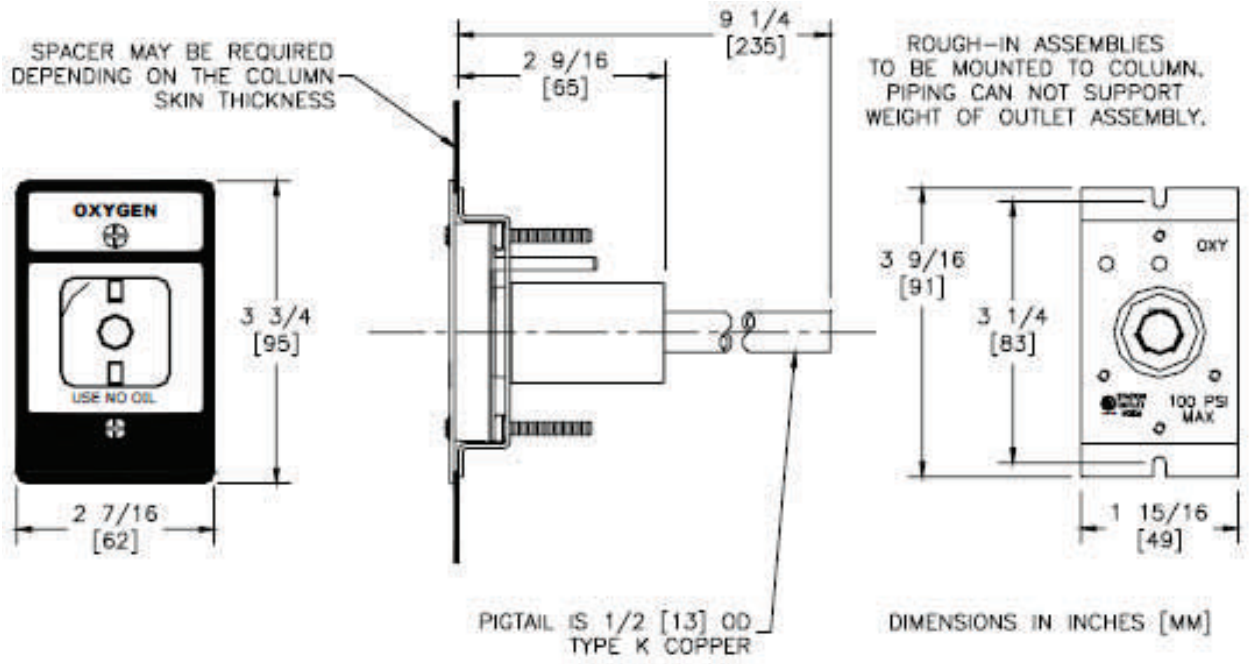


NOTES:

1. For W.A.G.D. (Evacuation) and vacuum gases, a round tubing plug and a plug retainer plate are in stalled on the Back-Body Assembly since a secondary check valve does not exist for these gases. Do not remove these components until the latch valve mechanism is to be installed.

CEILING OUTLETS

D.I.S.S TYPE



ROUGH-IN ASSEMBLIES TO BE MOUNTED TO COLUMN.
PIPING CAN NOT SUPPORT WEIGHT OF OUTLET ASSEMBLY.

NOTES:

1. Do not cover over the Back-Body Assembly during the drywall and plaster application. Ensure that the clear plastic cover over the Back-Body Assembly is securely in place until the " Latch-Valve Mechanism" can be installed.
2. For W.A.G.D. (Evacuation) and vacuum gases, a round tubing plug and a plug retainer plate are in stalled on the Back-Body Assembly since a secondary check valve does not exist for these gases. Do not remove these components until the latch valve mechanism is to be installed.

CEILING COLUMN OUTLETS

D.I.S.S TYPE, OHMEDA COMPATIBLE, PURITAN-BENNETT COMPATIBLE AND CHEMETRON COMPATIBLE

NOTES:

1. For W.A.G.D. (Evacuation) and vacuum gases, a round tubing plug and a plug retainer plate are in stalled on the Back-Body Assembly since a secondary check valve does not exist for these gases. Do not remove these components until the latch valve mechanism is to be installed.

INSTALLATION NOTES

- On all wall and console outlets the connecting pipe can be rotated a full 360 degrees for ease of connection to the facility gas piping.

- Excessive heat during soldering may damage the secondary check valve; when soldering the pipe connection take extreme care not to apply heat to the check unit body.

- When installing wall outlets, it is very important to keep the plastic protective cover on the "Back-Body Assembly" in place during construction, to protect the outlet from drywall compound or other contaminants.

- For W.A.G.D. (Evacuation) and vacuum gases, a round tubing plug and a plug retainer plate are installed on the Back-Body Assembly since a secondary check valve does not exist for these gases. Do not remove these components until the latch valve mechanism is to be installed.

- When installing the "Latch-Valve Mechanism", remove the protective cover from the "Back-Body Assembly" and inspect for dirt or debris in the outlet body. Carefully clean out any contaminants necessary.

- The "Latch-Valve Mechanism" should slide smoothly into the "Back-Body Assembly". If it does not, inspect to verify that there has been no damage to the indexing pins. If the indexing pins are bent or damaged the gas specific characteristics of the outlet may be compromised. In this instance the entire "Latch-Valve Mechanism" should be replaced.\

- All "Latch-Valve Mechanisms" with the exception of Nitrogen D.I.S.S. have a maximum pressure rating of 100 PSI [690 kPa]. The Nitrogen D.I.S.S. Latch-Valve Mechanism has a maximum pressure rating of 200 PSI [1,380 kPa].

- After the installation medical gas pipeline systems should be tested in accordance with the NFPA recommendations and/or in compliance with local requirements.

- The "Back-Body Assemblies" may be pressure tested up to a maximum of 200 PSI [1,380 kPa] without the "Latch-Valve Mechanism" installed. DO NOT PRESSURE TEST THE PIPELINE OVER 100 PSI [690 kPa] IF THE "LATCH VALVE MECAHNISM" HAS BEEN INSTALLED.

SERVICING CAUTIONS

Before performing any service or maintenance on any outlet, the appropriate hospital maintenance or engineering personnel should be notified.

The "Latch-Valve Mechanism" can be removed without interrupting service to other outlets on the same pipeline for all gases other than vacuum, however when servicing the "Back-Body Assembly" the supply pressure must be shut off to the entire zone.

SERVICING INSTRUCTIONS
D.I.S.S. TYPE "LATCH-VALVE MECHANISM"

1. Unscrew the two retaining screws **(I)** until the "Latch-Valve Mechanism" can be re moved from the outlet.

2. Remove the Adapter O-Ring seal **(A, B or C)** from the front and replace (NOTE: There is no O-Ring for Oxygen or Evac).

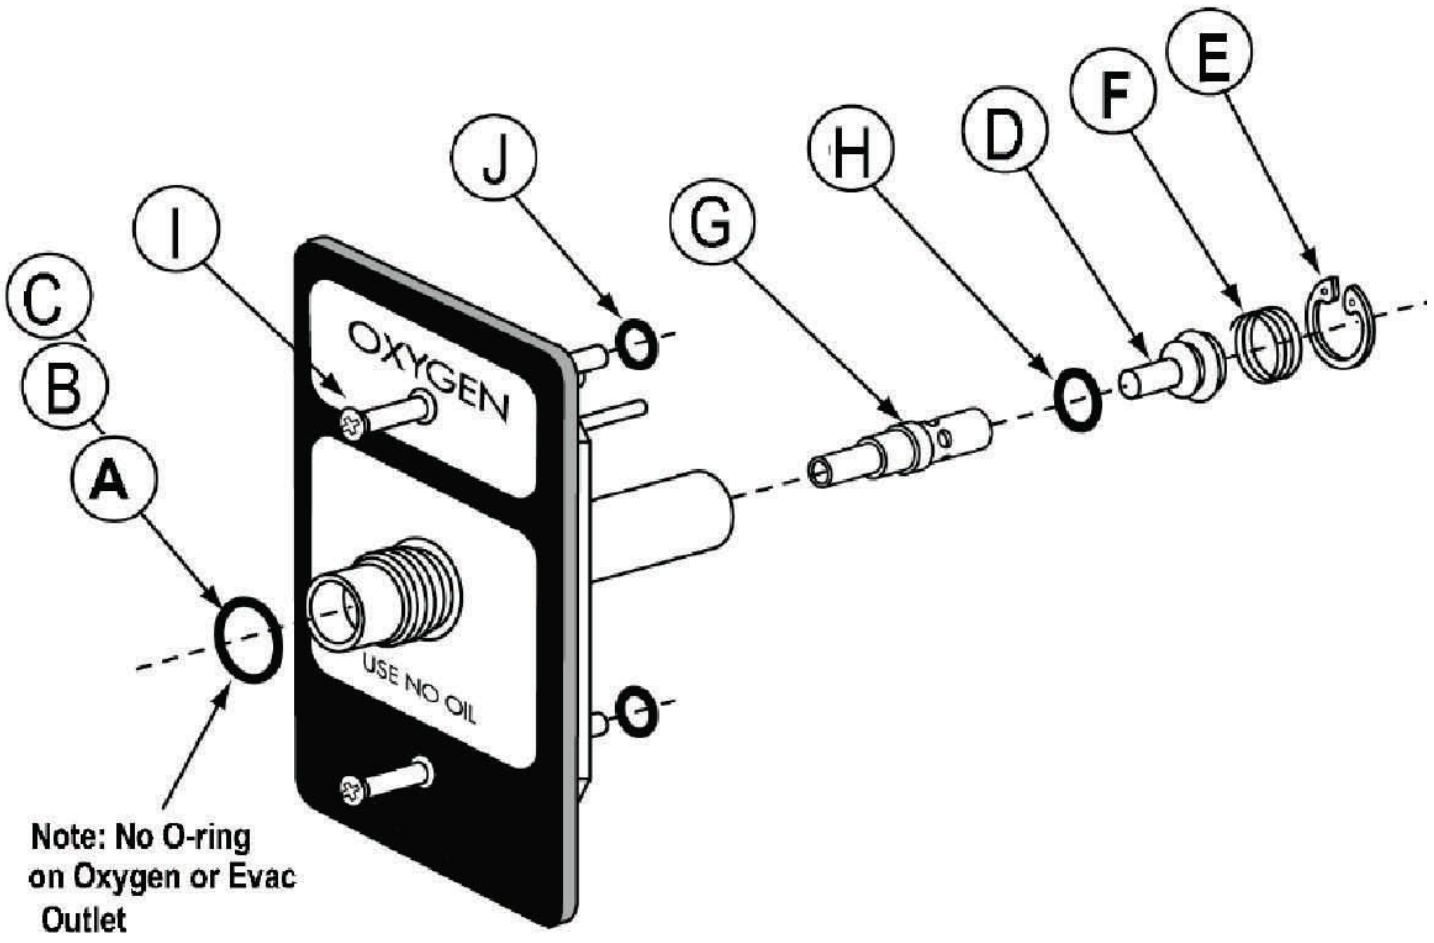
3. Remove the retaining ring **(E)** using the appropriate internal snap ring pliers.

4. Remove the valve stem **(G)**, Primary Check O-Ring **(H)**, primary check valve **(D)** and check valve spring **(F)**. Inspect the items for wear or damage and replace if needed. Re place the O-Ring.

5. Reinstall all internal components and lock in place with the retaining ring.

6. Reinstall the "Latch-Valve Mechanism" into the outlet. Coat the valve body, with a thin coat of oxygen compatible silicone lubricant to aid insertion. Tighten down the retaining screws, **DO NOT OVER TIGHTEN**, as this could damage the Latch-Valve.

7. Connect the proper gas specific adapter to the outlet. The connection should be smooth and hand tightening of the nut should be sufficient to allow the gas to flow without leak age.



CAUTION: Use caution relative to the type and pressure of the gas so as not to cause injury.

8. If the assembly does not perform correctly with the adapter installed, replace the entire "Latch-Valve Mechanism".

REPLACEMENT PARTS

LATCH-VALVE MECHANISMS – D.I.S.S. TYPE OUTLETS

ITEM	DESCRIPTION	PART NUMBER
A	Adapter O-Ring - Vac	O1-DIARINGV
B	Adapter O-Ring - N2O	O1-CVORING

J	Screw Retaining O-Ring (2 Req'd)	O1-SRORING

SERVICING INSTRUCTIONS
OHMEDA COMPATIBLE "LATCH-VALVE MECHANISM"

1. Unscrew the two retaining screws **(L)** until the entire "Latch-Valve Mechanism" can be removed from the outlet.

2. Remove the four screws **(O)** holding the connector retaining plate **(A)** in place. Remove the plate.

3. Remove the valve body **(B)** from the valve assembly.

4. Remove the U-spring **(N)**, inspect for wear or damage, reinstall or replace the U-spring as necessary.

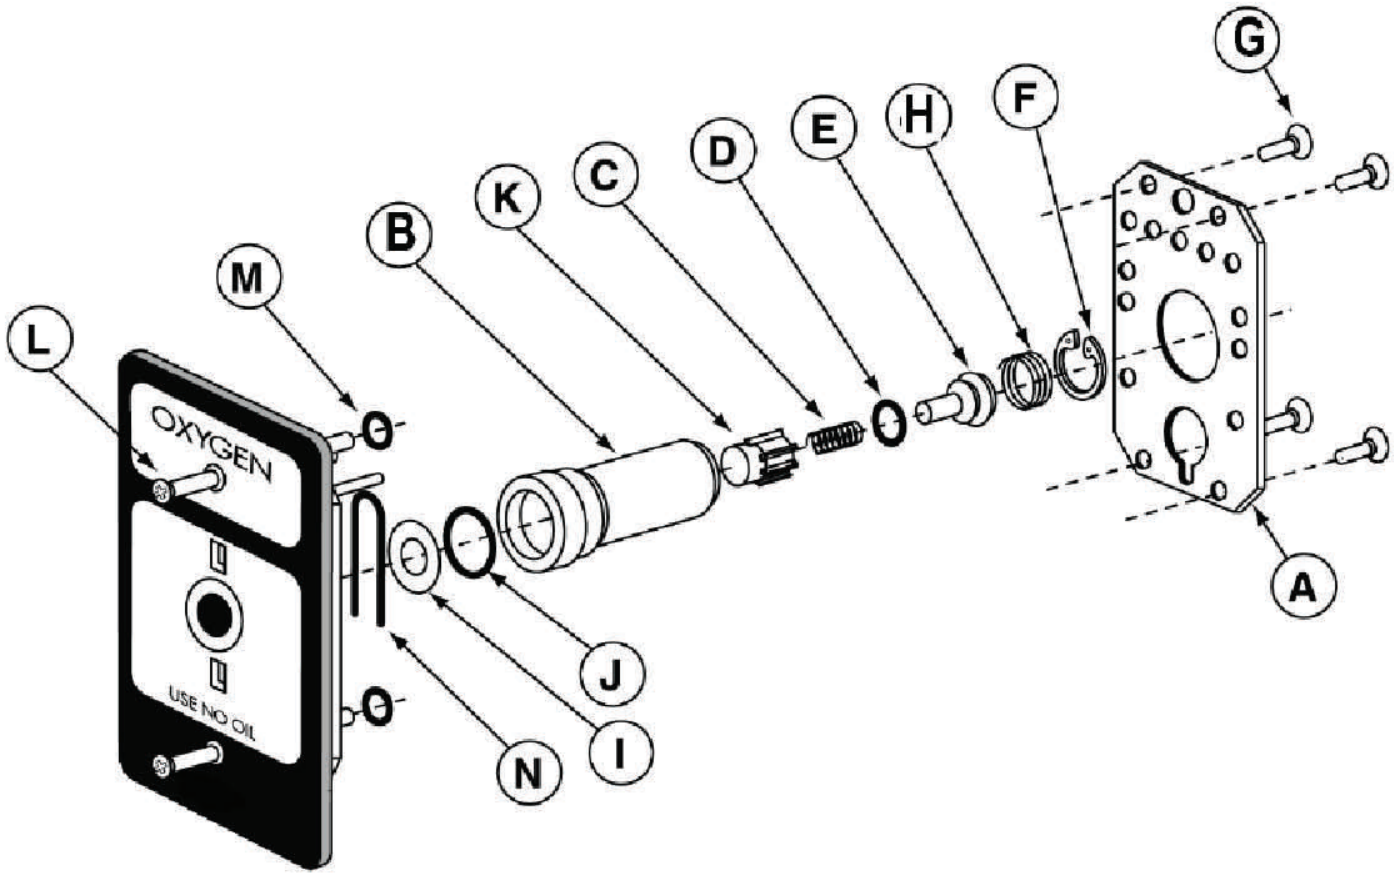
5. Remove the flat washer **(I)** and valve body O-Ring **(J)** from the front of the valve body. Inspect the items for wear or damage and replace the O-Ring seal **(J)**.

6. Remove the retaining ring **(F)** using appropriate snap ring pliers. Remove the primary cap **(K)**, primary cap spring **(C)**, primary check valve O-Ring **(D)**, primary check valve **(E)** and spring **(H)**. Inspect all items for wear or damage and replace as necessary. Re place the O-Ring **(D)**.

7. Reinstall all internal components and lock in place with retaining ring **(F)**. Insert the valve body **(B)** into the latch valve body. Check that the U-Spring **(N)**, flat washer **(I)** and valve body O-Ring **(J)** are in place. Reinstall the retaining plate **(A)** and secure with four screws **(O)**, do not over tighten.

8. Reinstall the "Latch-Valve Mechanism" into the outlet. Coat the valve body **(B)**, with a thin coat of oxygen compatible silicone lubricant to aid insertion. Tighten down the retaining screws **(L)**, **DO NOT OVER TIGHTEN**, as this could damage the Latch-Valve.

9. Connect the proper gas specific adapter into the outlet. The connection should be smooth and the adapter should lock and remain in place allowing gas to flow.



CAUTION: Use caution relative to the type and pressure of the gas so as not to cause injury.

10. If the assembly does not perform correctly with the adapter installed, replace the entire "Latch-Valve Mechanism".

SERVICING INSTRUCTIONS
"BACK-BODY ASSEMBLY" - ALL OUTLETS

Inside the "Back-Body Assembly" is a secondary check valve that performs the function of shutting off the gas flow for all pressurized gases when the "Latch-Valve Mechanism" is removed. This seat/seal also prevents leaks around the latch-valve connector.

Back-Body Assemblies for vacuum and evacuation gases do not contain a secondary check valve. If it becomes necessary to remove the Latch Valve mechanism from these outlets for service, the Back-Body Assembly must be plugged with a 3/4" round tubing plug (or equivalent) to prevent excessive draw on the vacuum pump.

The secondary seal will rarely need replacement. However, if the seat/seal does need replacement follow the following procedure:

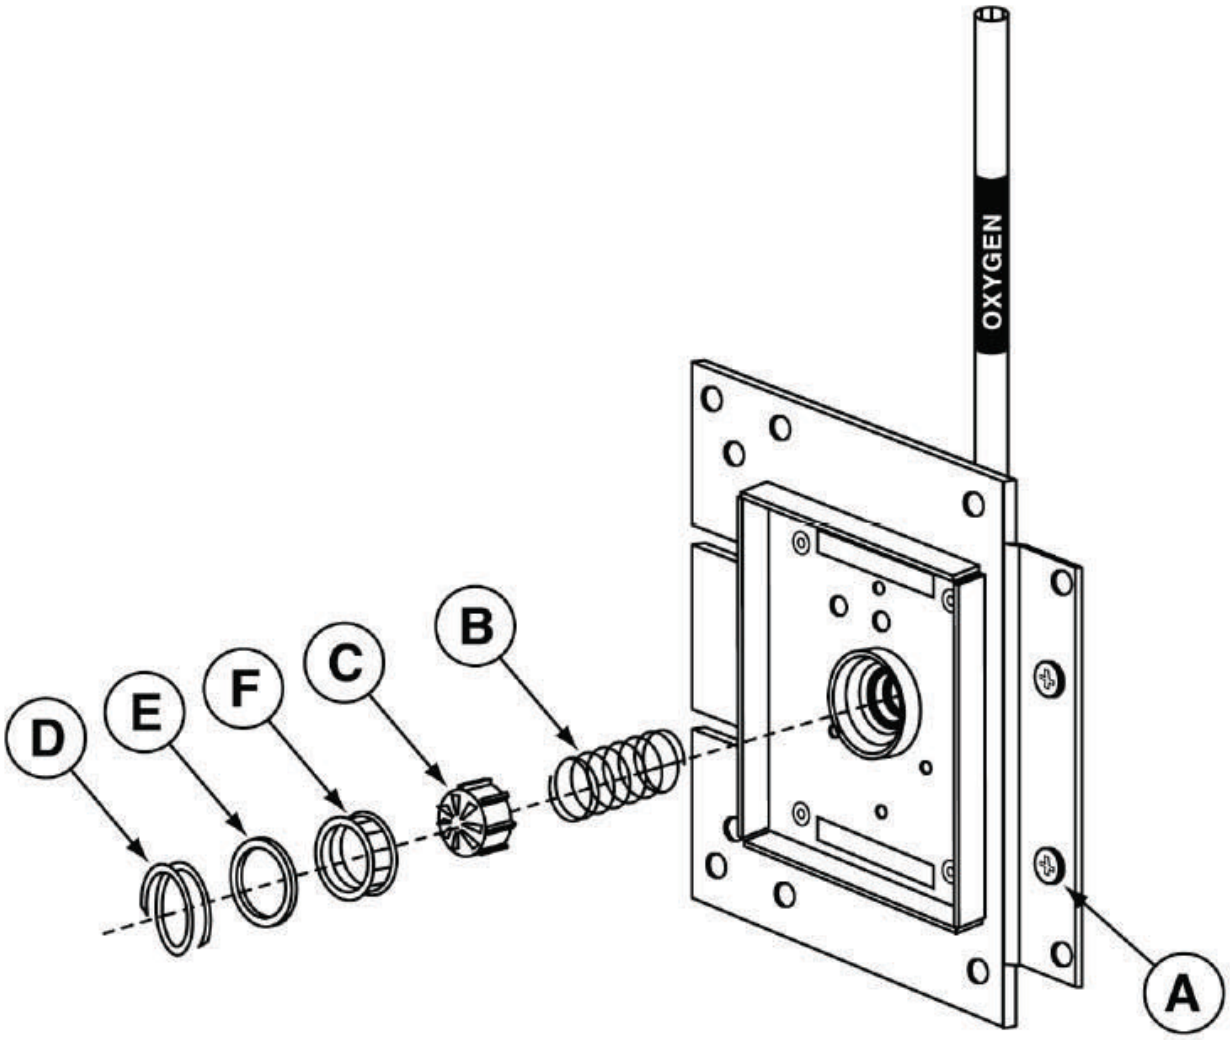
CAUTION: Ensure that the supply pressure is shut off before performing maintenance on the "Back-Body Assembly".

1. **Ensure that no pressure exists in the assembly or pipeline by depressing the secondary check valve (C) until all gas pressure has been relieved from isolated piping zone. Nitrous Oxide and Carbon Dioxide must not be vented near staff or patients.**

2. Remove the retaining ring **(D)** from the inside of the outlet body.

3. Remove the washer **(E)**, seat/seal **(F)**, secondary check valve ***(C)** and secondary check valve spring ***(B)**. Inspect all items for wear or damage and replace the seat/seal **(F)**; replace other components as necessary.

4. Reinstall the spring ***(B)**, secondary check valve ***(C)**, seat/seal **(F)** and the washer **(E)**. Insert the retaining ring **(D)** into the slot and ensure that the ring is seated properly.



5. Carefully restore pressure to the pipeline and check for leaks.

9. Reinstall the "Latch-Valve Mechanism" and perform appropriate inspection and testing as recommended by NFPA and local requirements.

REPLACEMENT PARTS

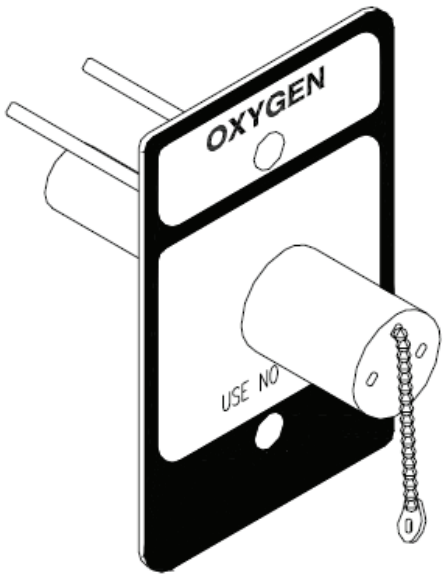
OPTIONAL EQUIPMENT:

Ohmeda Locking Device



The Locking Kit shall prevent tampering of the internal primary check valve, located in the latch valve assembly.

The locking kit consists of a chrome plated locking cap which plugs into the Ohmeda outlet. Inserting and turning the key will pop off the lock and allow flow of the gas.

Part Numbers:

O1-LOCK-QD	Ohmeda Locking Kit (all gases)
O1-LOCK-QD-KEY	Key for Ohmeda Locking Kit

D.I.S.S. Locking Device

The Locking Kit shall prevent tampering of the internal primary check valve, located in the latch valve assembly.

The locking kit consists of a chrome plated threaded cap which screws into the DISS outlet. Inserting and turning the key will pop off the lock and allow flow of the gas.

Part Numbers:

O1-LOCK-DISS	DISS Locking Kit (all gases except Oxygen and Evac)
O1-LOCK-DISS-OXY	DISS Locking Kit for Oxygen
O1-LOCK-DISS-KEY	Key

Patton's Medical Pipeline Equipment Warranty

Patton's Medical warrants the Medical Gas Pipeline Equipment to be free of defects in material and workmanship under normal use for a period of twenty-four months from date of shipment or twelve months from the date of start-up, whichever occurs first. Patton's Medical will repair replace any part or component, at their sole discretion, which is proven to be defective in either material or workmanship.

This warranty does not apply to products that are damaged by external causes, or are improperly warehoused, used, installed, serviced, misapplied or maintained by the customer. Installation of user replaceable items will be the user's responsibility. The sole liability for **Patton's Medical** under this warranty is limited to repairing, replacing, or crediting, at its election, any such products provided that:

- **Patton's Medical** is notified promptly within the warranty period above of any warranty claim.
- The examination of such items by an authorized representative of **Patton's Medical** will disclose to their reasonable satisfaction that claimed products defect has not been caused by misuse, neglect, improper handling, installation, repair, alteration, or accidents. .
- The user will be required to issue a purchase order for replacement items. Upon receipt and inspection of defective items, **Patton's Medical** will determine if a credit is due and if so determined will issue credit in the amount equal to the replacement parts.

Product modification performed by the customer without prior written approval by **Patton's Medical** will invalidate the above warranty.

This warranty is given in lieu of all other warranties, expressed or implied, including implied warranties of fitness for a particular purpose and merchantability. In no event shall Patton's Medical be liable for damages in excess of the value of the defective product or part, nor shall Patton's Medical be liable for any indirect, special or consequential damages, loss of profits of any kind, or for loss of use of the products.

Patton's Medical shall not be liable to the customer for any claims, loss of damage of any kind whatsoever arising from the nonperformance of **Patton's Medical** of any part of this agreement occasioned by acts of God, fire, war, labor difficulties, governmental regulations, or action of government. **Patton's Medical** shall not be liable to the customer for any other cause, whether of a similar or dissimilar nature beyond its reasonable control.

General Safety Information

Only qualified personnel should install this fan system. Personnel should have a clear understanding of these instructions and should be aware of general safety precautions. Improper installation can result in electric shock, possible injury due to coming in contact with moving parts, as well as other potential hazards. Other considerations may be required if high winds or seismic activity are present. If more information is needed, contact a licensed professional engineer before moving forward.

1. Follow all local electrical and safety codes, as well as the National Electrical Code (NEC), the National Fire Protection Agency (NFPA), where applicable. Follow the Canadian Electrical Code (CEC) in Canada.
2. The rotation of the wheel is critical. It must be free to rotate without striking or rubbing any stationary objects.
3. Motor must be securely and adequately grounded.
4. Do not spin fan wheel faster than maximum cataloged fan rpm. Adjustments to fan speed significantly effects motor load. If the fan RPM is changed, the motor current should be checked to make sure it is not exceeding the motor nameplate amps.
5. Do not allow the power cable to kink or come in contact with oil, grease, hot surfaces or chemicals. Replace cord immediately if damaged.
6. Verify that the power source is compatible with the equipment.
7. Never open access doors to a duct while the fan is running.

DANGER
Always disconnect power before working on or near a fan. Lock and tag the disconnect switch or breaker to prevent accidental power up.
CAUTION
When servicing the fan, motor may be hot enough to cause pain or injury. Allow motor to cool before servicing.
CAUTION
Precaution should be taken in explosive atmospheres.

Receiving

Greenheck model Vektor-MH, Vektor-MD and Vektor-MS fans are thoroughly inspected, test run at the factory, and shipped on a skid or packaged to minimize damage during shipment. Warranty period begins at the time of shipment. The transportation carrier has the responsibility of delivering all items in their original condition as received from Greenheck. The individual receiving the equipment is responsible for inspecting the unit for obvious or hidden damage and recording any damage on the bill of lading before acceptance of the equipment. All claims (if necessary) shall be filed with the final carrier.

Unpacking

Verify that all required parts and the correct quantity of each item have been received, including accessory kit containing gasketing, etc. If any items are missing, report shortages to your local representative to arrange for obtaining missing parts. Sometimes it is not possible that all items for the unit be shipped together due to availability of transportation and truck space. Confirmation of shipment(s) must be limited to only items on the bill of lading.

Handling

The Vektor-MH, Vektor-MD and Vektor-MS laboratory exhaust system is shipped in subassembly sections for easy rigging and installation. Depending on the fan size, the sections can include: Blower Assembly, Stack Extension, Discharge Nozzle, and Bypass Air Plenum.

The Vektor-MH, Vektor-MD and Vektor-MS are designed to be self-supporting and standing (without the use of guy wires) when assembled per the instructions provided within this manual. If additional components are supplied, contact factory or reference submittal if additional supports or guy wires are required. All subassembly sections have lifting lugs as shown.

Storage

Fans are protected against damage during shipment. If the unit cannot be installed and operated immediately, precautions need to be taken to prevent deterioration of the unit during storage. The user assumes responsibility of the fan and accessories while in storage. The manufacturer will not be responsible for damage during storage. These suggestions are provided solely as a convenience to the user.

INDOOR - The ideal environment for the storage of fans and accessories is indoors, above grade, in a low humidity atmosphere which is sealed to prevent the entry of blowing dust, rain, or snow. Temperatures should be evenly maintained between 30° and 110°F. (*-1°C and 43°C*). Wide temperature swings may cause condensation and “sweating” of metal parts. All accessories must be stored indoors in a clean, dry atmosphere.

Remove any accumulations of dirt, water, ice or snow and wipe dry before moving to indoor storage. To avoid “sweating” of metal parts allow cold parts to reach room temperature. To dry parts and packages use a portable electric heater to get rid of any moisture build up. Leave coverings loose to permit air circulation and to allow for periodic inspection.

The unit should be stored at least 3½ in. (*89 mm*) off the floor on wooden blocks covered with moisture proof paper or polyethylene sheathing. Aisles between parts and along all walls should be provided to permit air circulation and space for inspection.

OUTDOOR - Fans designed for outdoor applications may be stored outdoors, if absolutely necessary. Roads or aisles for portable cranes and hauling equipment are needed.

The fan should be placed on a level surface to prevent water from leaking into the fan. The fan should be elevated on an adequate number of wooden blocks so that it is above water and snow levels and has enough blocking to prevent it from settling into soft ground. Locate parts far enough apart to permit air circulation, sunlight, and space for periodic inspection. To minimize water accumulation, place all fan parts on blocking supports so that rain water will run off.

Do not cover parts with plastic film or tarps as these cause condensation of moisture from the air passing through heating and cooling cycles.

Fan wheels should be blocked to prevent spinning caused by strong winds.

Inspection and Maintenance during Storage

While in storage, inspect fans once per month. Keep a record of inspection and maintenance performed. **Failure to inspect and maintain during storage may void the warranty.**

If moisture or dirt accumulations are found on parts, the source should be located and eliminated. At each inspection, **rotate the wheel by hand ten to fifteen revolutions** to distribute lubricant on motor and fan bearings. **Bearings should be lubricated at three month intervals. The quantity of grease should be per the lubrication label.**

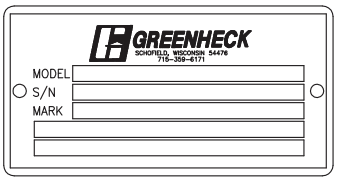
If paint deterioration begins, the affected areas should be touched-up and repainted. Fans with special coatings may require special techniques for touch-up or repair.

Machined parts coated with rust preventive coating should be restored to good condition promptly if signs of rust occur. Immediately remove the original rust preventive coating with petroleum solvent and clean with lint-free cloths. Polish any remaining rust from surface with crocus cloth or fine emery paper and oil. Do not destroy the continuity of the surfaces. Wipe clean thoroughly with Tectyl® 506 (Ashland Inc.) or the equivalent. For hard to reach internal surfaces or for occasional use, consider using Tectyl® 511M Rust Preventive or WD-40® or the equivalent.

REMOVING FROM STORAGE

As fans are removed from storage to be installed in their final location, they should be protected and maintained in a similar fashion, until the fan equipment goes into operation.

Prior to assembly and installation of the Vektor fan and system components, inspect the fan assembly to make sure it is in working order.



1. Check all fasteners, set screws on the fan, wheel, bearings, drive, motor base and accessories for tightness.
2. Rotate the fan wheel(s) by hand and assure no parts are rubbing. Access to the wheel is obtained through a bolted panel located on the side of the fan housing.
3. Ensure proper wheel settings for radial gap and alignment (see page 18).

General Information

To ensure a successful installation, the instructions in this manual should be read and adhered to. **Failure to comply with proper installation procedures may void the warranty.**

Unit and System Identification Tags

Each fan has a permanently affixed manufacturer's engraved metal nameplate containing the model number and individual serial number.

The tag shown is an example of an identification nameplate on the fan. The information provides general details about the fan, as well as containing specific information unique to the unit. When contacting your Greenheck representative with future needs or questions, please have the information on this label available. Tags are mounted in an area which is clearly visible, usually on the side of the fan cabinet.

Vektor fan systems may arrive in component pieces due to shipping restrictions. Individual components of a system have matching identification tags which should be used to identify and assemble the complete system. Assembling systems with different identification tags can cause reductions in the fan(s) performance.

Prior to fully assembling and installing the Vektor-MH, Vektor-MD or Vektor-MS fans, inspect bypass air plenums and the fan assembly to make sure they are in working order.

Pre-Installation Information

Before installation, it is important to be certain the mounting surface will bear the operating weight of the unit. Structural soundness may impact fan performance. For proper unit operation, it is also important that it be operated in a completely level position.

For further details on safety practices involving industrial and commercial fans, please refer to AMCA Publication 410.

Electrical Disconnects

All fan motors should have disconnects located in close visual proximity to turn off electrical service. Service disconnects shall be locked-out when maintenance is being performed.

Moving Parts

All moving parts must have guards to protect personnel. Refer to local codes for requirements as to the number, type and design. Fully secure fan wheel before performing any maintenance. The fan wheel may start "free wheeling" even if all electrical power has been disconnected. Before the initial start-up or any restart, check the following items to make sure that they are installed and secure.

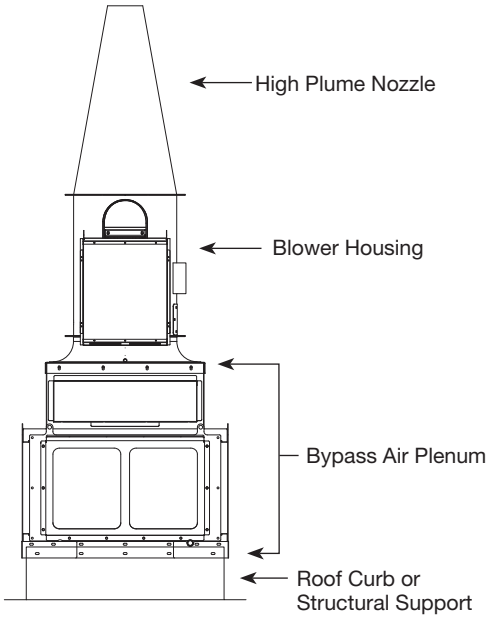
- Do not spin fan wheel faster than the maximum cataloged fan rpm.
- Adjustments to fan speed significantly affects motor load. If the fan RPM is changed, the motor current should be checked to make sure it is not exceeding the motor nameplate amps.

Guards (Motor Cover, Weatherhoods, Actuator Cover)

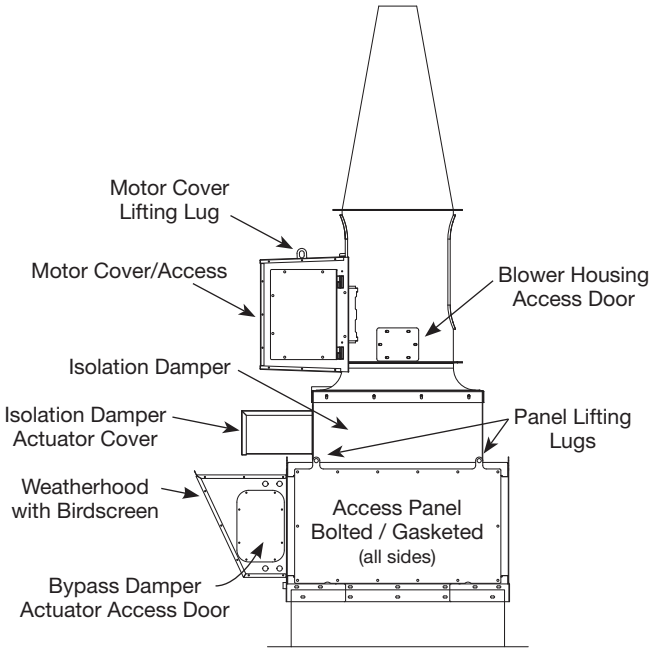
Do not operate fans without proper protective devices in place. Failure to do so may result in serious bodily injury and property damage. Check local codes to ensure compliance for all protective devices.

Plenum Access Doors

Before opening access doors, ensure the fan wheel has stopped moving and that the wheel has been secured from being able to rotate. Do not operate fan without access door in its fully closed position.



Air Pressure and Suction

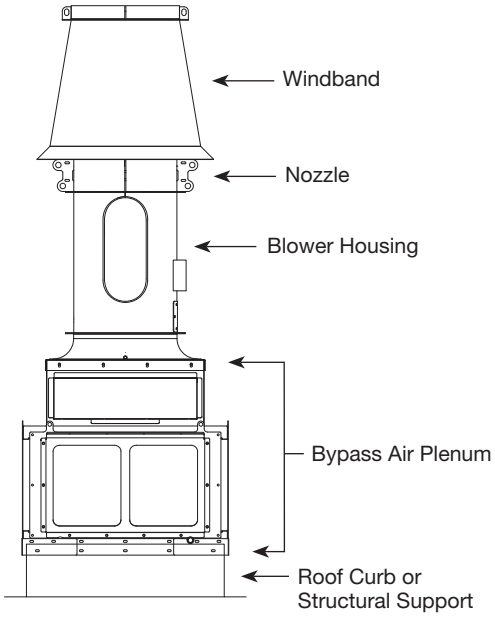


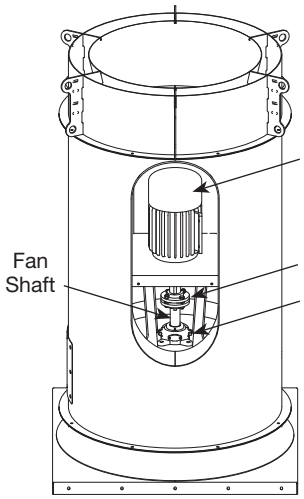
In addition to the usual hazards associated with rotating machinery, fans also create a dangerous suction at the inlet. Special caution needs to be used when moving around a fan, whether it is in operation or not. Before start-up, make sure the inlet area is clear of personnel and loose objects.

System Components

Vektor-MH Assembly View - Belt Drive

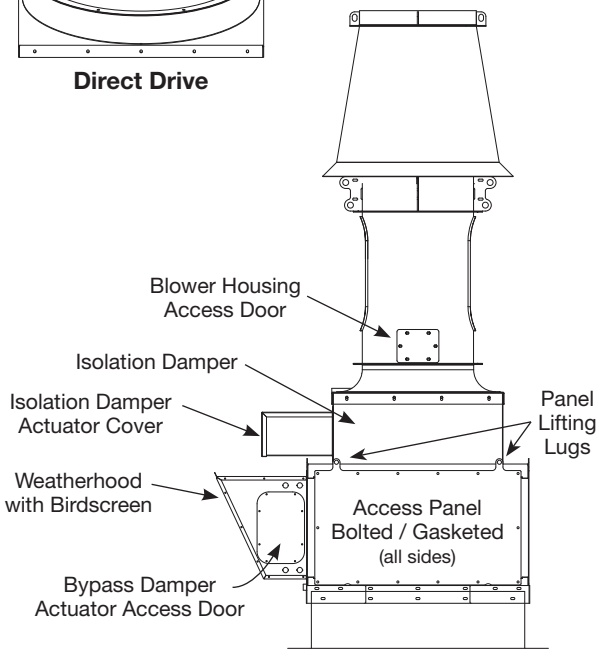
Belt and direct drive units share similar system components and assembly configuration.





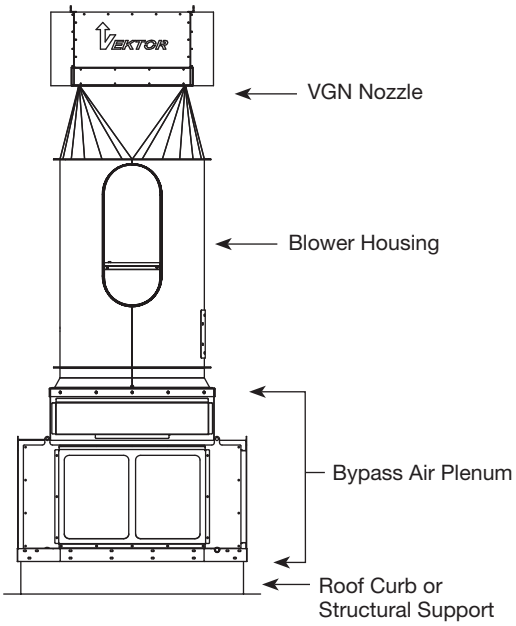
NOTE

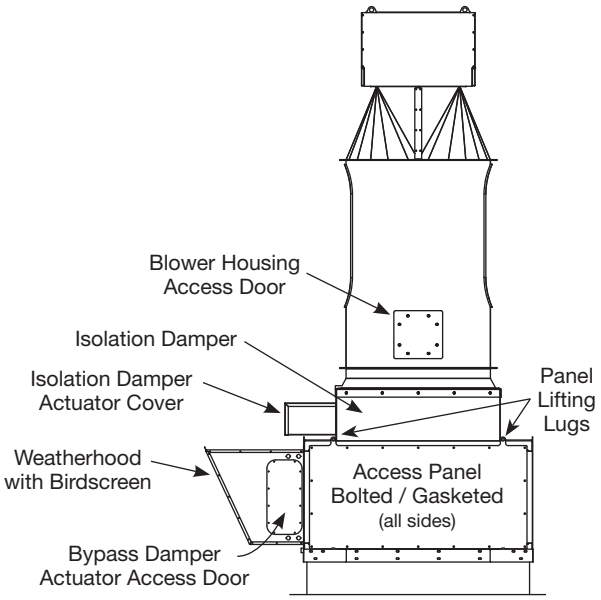
Actual component pieces may vary from these images. Refer to your project submittal drawing.



Vektor-MD Assembly View - Direct Drive

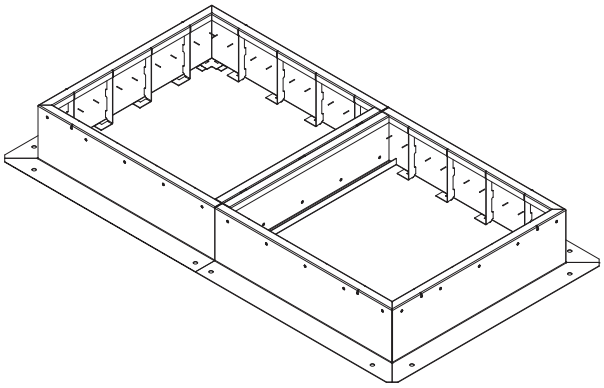
Belt and direct drive units share similar system components and assembly configuration.





Direct Drive

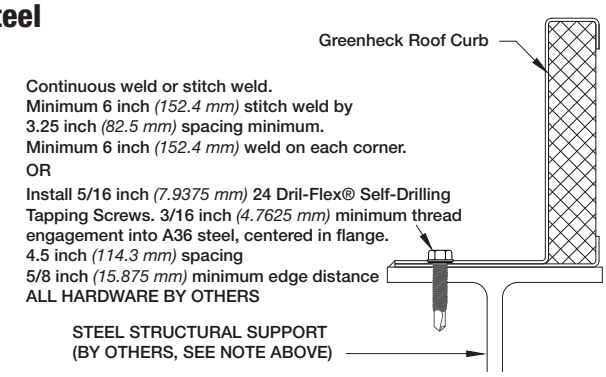
Vektor-MS Assembly View - Direct Drive



Belt and direct drive units share similar system components and assembly configuration.

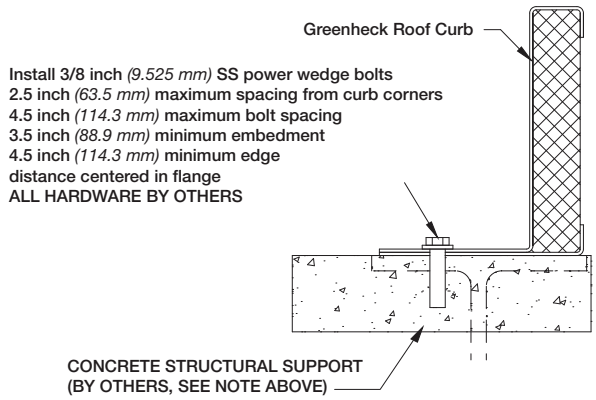
Roof Curb and Mounting Details

Refer to VKCURB Assembly Instructions for additional details. Document 475588.



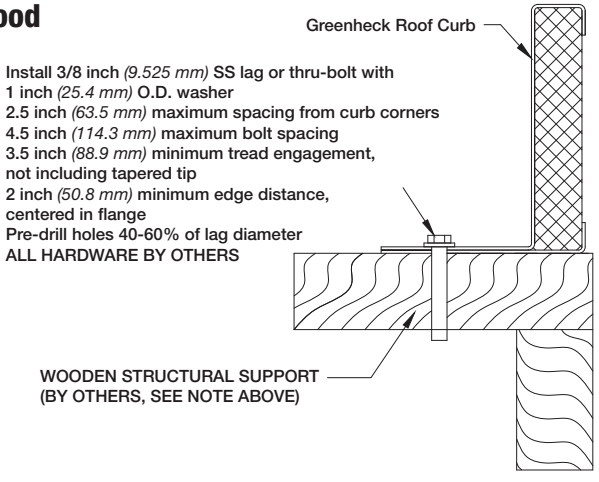
NOTE

Steel, concrete or wood roof support is per structural engineer and in accordance with load requirements and applicable building codes.



Refer to stand-alone Vektor Roof Curb Assembly Instruction found on greenheck.com within the Laboratory Exhaust section. Chose applicable product model.

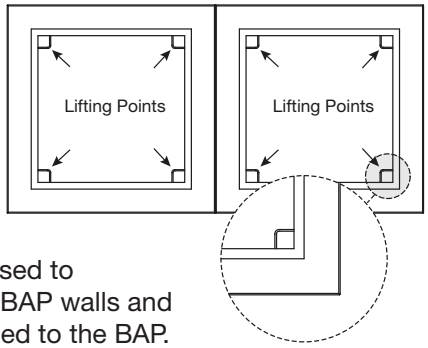
The figures illustrates three common methods used to install Vektor systems. Methods used to attach a Vektor unit are dependent on local codes, roof construction design and roof construction materials. Consult an architect or structural engineer for proper means of attachment.



Steel

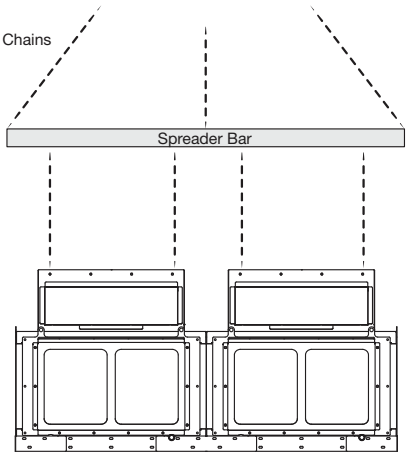
Concrete

Wood



Bypass Air Plenum - Rigging, Lifting and Installation

Prior to lifting any components, verify the weights on the project submittal drawings for each component or contact factory. Do not lift weights beyond the capacities of the on-site lifting equipment. Proper handling of the equipment is critical to avoid damage to the unit.



Prior to setting the bypass air plenum (BAP), secure 1/4-inch thick by 3/4-inch wide EPDM gasket (provided) around the perimeter of the roof curb top edge, if mounting on a roof curb.

Bypass Air Plenum - Rigging and Lifting

Each section will have four (4) lifting points. All lifting points must be used when lifting. Spreader bars of sufficient length need to be used to prevent damage to BAP walls and components mounted to the BAP.

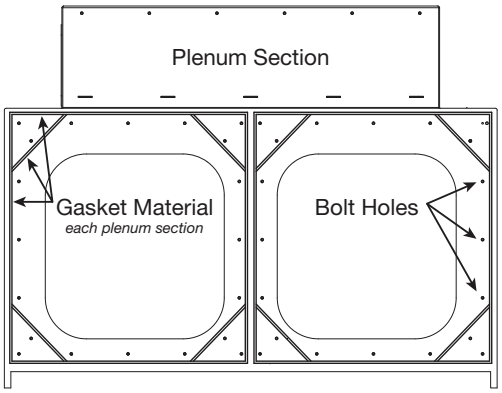
1. **Always use all lifting lugs provided by manufacturer. Failure to do so may result in dropping the BAP and voiding the warranty.** Lifting lugs are located around the perimeter of each section.
2. A spreader bar must be used when lifting each section to distribute the weight evenly and to prevent the unit from being over-torqued. Avoid unnecessary jarring or rough handling.
3. Care must be taken to keep the unit in the upright position during rigging.

Two fan bypass air plenum shown. Plenums may be single sections or up to six in length

4. Care must be taken to not damage the watertight seams in the unit casing.
5. Avoid damage to the curb and curb gasketing when rigging onto a curb.
6. Only use trained professional riggers when moving equipment.

Bypass Air Plenum Installation

Bypass air plenums (BAP) are delivered fully assembled unless shipping restrictions require multiple sections. If delivered in sections, all materials required to join plenum sections together are provided.



Bypass air plenums are modular in construction and can be disassembled to provide allowances for lower on-site lifting capacities. Plenum sections are joined using stainless steel fasteners. These are removed to separate sections for lifting purposes. Save hardware as these will be required to join the BAP sections together again.

If moving separate sections onto a roof curb or support structure, each section should be joined to its mating section after moving into position and before lifting any additional section(s) into position.

Steps for joining multiple BAP sections together:

1. Lift / place first BAP section making sure that mounting holes are positioned with curb mounting holes or to structure BAP will be secured.
2. Attached provided gasket to plenum section using the pattern shown in the image.
3. Ensure bolts are removed from both mating sections to being joined together. Plenum will ship with hardware in one section's bolt holes or were removed to disassemble BAP to reduce lifting load.
4. Lift / place next section into position using similar lifting procedure.
5. Align holes between two mating sections.
6. Use fasteners (provided) to join the two sections together, this will involve utilizing the nutserts in each section on the inside perimeter. The fasteners are tightened until the sections are pulled together and the gasket material is compressed.
7. Caulk joint (provided) on the top and two sides between sections for enhanced water protection.
8. Repeat steps 1 – 7 until all plenum sections are lifted and joined together.

Any side panels removed to gain access to the interior of the plenum should be reattached.

NOTE

Components that are shipped separately should be lifted separately due to weight and dimensions.

Securing the Bypass Air Plenum

After bypass air plenum (BAP) has been lifted into position, plenum should be secured to roof curb, structural steel or concrete pad. Bottom of the BAP has a removable skirt section with pre-punched holes. These holes will align with holes and nutserts in the roof curb if the roof curb was provided by Greenheck. If the roof curb is from another supplier use the holes in the skirt as a template.

Allow gasketing to compress before securing. When securing BAP to curb install using moly-coated 316 stainless steel screws (provided) in all holes.

If BAP is not being mounted on a roof curb, it can be secured to either structural steel or concrete pad. Full perimeter and cross support under the BAP is required. Method used to secure the BAP to either structural support(s) or concrete pad is determined by site or structural engineer. If BAP is welded to support structure, repair the area where coating was burnt off. See coatings repair section of this manual for details involving touch-up of damaged surfaces.

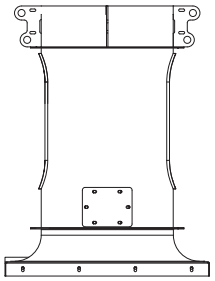
Mounting the BAP to roof curbs from manufacturers other than Greenheck Fan Corporation or not following proper mounting instructions may impact fan performance and void warranty.

Fans – Rigging, Lifting and Installation

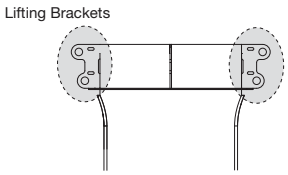
CAUTION

Fans should never be lifted by the shaft, motor, motor cover or accessories.

Prior to setting fan(s) on plenum, place 1/4-inch thick x 3/4-inch wide EPDM gasket around the perimeter of top edge of BAP where fans mount, adhesive side down (gasket provided).

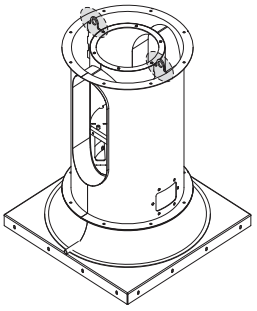


Fans - Rigging and Lifting

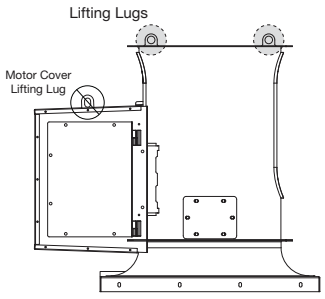


Fans are to be rigged and moved by the lifting brackets provided or by the skid when a forklift is used. Location of brackets varies by model and size. Handle in such a manner as to keep from scratching or chipping the coating. Damaged finish may reduce ability of fan to resist corrosion. See coating repair section of this manual for details involving touch-up of damaged surfaces. Scratches and chipped paint are not covered by warranty.

Vektor-MD fans size 40 and larger and all MH and MS fans are shipped with the nozzle separate from the main housing. For these sizes the nozzle should be lifted separate from the fan. For MD models with the nozzle attached the main fan housing can be lifted using the brackets on the nozzle.

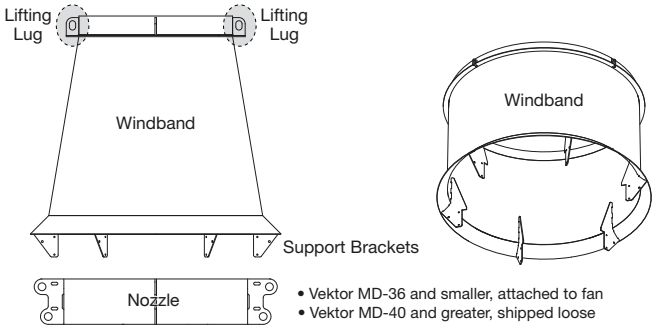


- Use standard lifting and rigging practices.
- **ALL** lifting lugs (brackets) on each component must be utilized at the same time.
- Fan to be kept level during lifting and installation.



Vektor MD - sizes 36 and smaller

Vektor MD - sizes 40 and greater
Vektor MH and MS - all sizes

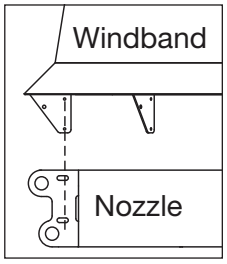


Fan Housing Installation

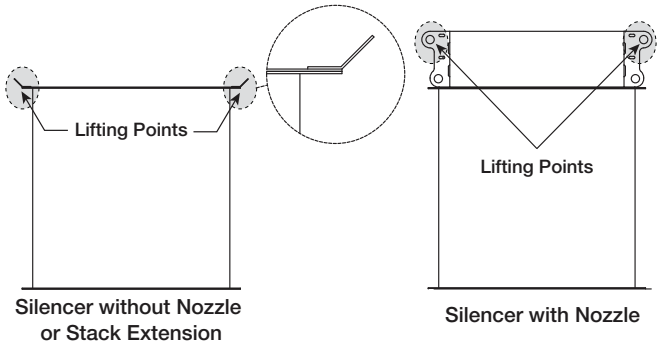
Lower Vektor fan housing into place. Allow gasket to become compressed before securing to plenum.

Install moly-coated 316 stainless steel screws (provided) in all holes in plenum cap.

Nozzle and Windband Lifting and Installation for Vektor-MD



Vektor MD - sizes 36 and smaller, nozzle is attached to the fan housing

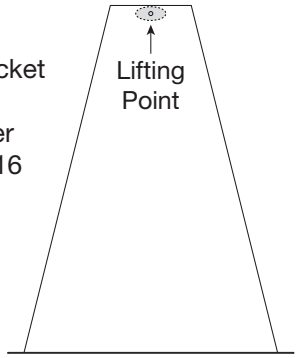


Using the windband lifting lugs, lift and place over the nozzle attached to the fan housing discharge. The windband has support brackets welded around the interior perimeter. Align the windband support bracket bolt holes with the bolt holes in the nozzle. Using the provided moly-coated 316 stainless steel bolts and nuts, securely attach these pieces together.

Vektor MD - sizes 40 and greater, windband and nozzle ship as individual pieces

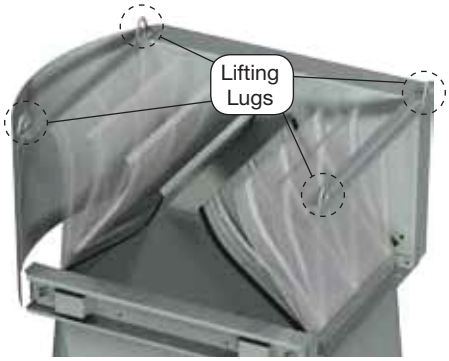
Using the nozzle lifting brackets, lift and place over the fan discharge. Secure nozzle using moly-coated stainless steel hardware (provided). Align support bracket holes with bolt holes in the nozzle. Attach windband using the provided moly-coated 316 stainless steel bolts through the support brackets welded to the inside of the windband.

Silencer and Stack Extension Lifting and Installation for Vektor-MH / Vektor-MD



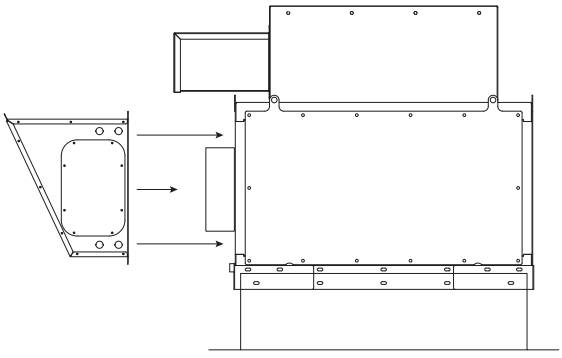
Systems supplied with inline discharge silencers always have the nozzle section ship separate. The silencer is installed between the fan housing and nozzle.

Lift the silencer with provided lifting points. When systems are supplied with silencers, guy wires or independent supports are recommended (by others). Refer to project specific submittal drawings for details.



Nozzle Lifting and Installation for Vektor-MH

Using the nozzle lifting points, place nozzle over blower discharge, aligning support bracket holes with bolt holes in blower housing. Attach nozzle to blower discharge using moly-coated 316 stainless steel bolts and nuts provided through the flange.



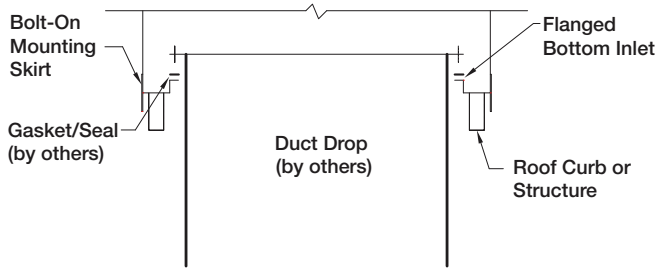
Nozzle Lifting and Installation for Vektor-MS

Using the nozzle lifting lugs, place nozzle over blower discharge, aligning support bracket holes with bolt holes in blower housing. Attach nozzle to blower discharge using moly-coated 316 stainless steel bolts and nuts provided through the flange.

Weatherhood Installation

Shipping constraints may require weatherhoods to be delivered separate from the BAP. The weatherhood bolt hole pattern matches the side panel bolt pattern. Use supplied hardware to secure the weatherhood to the BAP over the bypass air damper.

Duct Connections to the Bypass Air Plenum (BAP)



Connecting primary inlet exhaust air ducts is allowed through the roof curb or through one or more of the side access panels. To reduce the potential for system effects in the plenum, the duct connection should be sized to have no more than a maximum air velocity of 1500 fpm when entering. Higher velocities may impact fan performance and void warranty. When attaching ductwork to the plenum, care should be taken to ensure a tight fit and proper seal to prevent leakage from the contaminated airstream.

Side Inlet Duct Connections

Ductwork that has a different size than the removable access panel(s) can either have a transition to the plenum's opening size or the access panel can be field modified by cutting an opening to the size of the ductwork.

Bottom Inlet Duct Connections

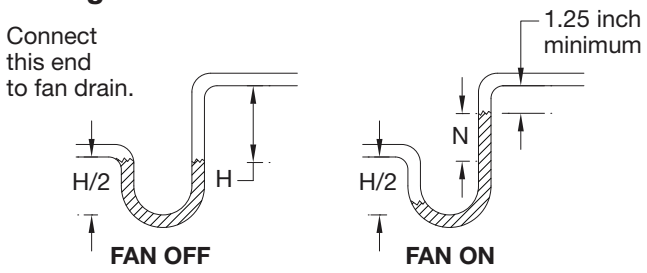
Bottom inlet duct connects should be made by attaching the duct to the inside panel edge of the plenum. Ducting to multiple fan plenums may either be split below the roof level and connected to duct drops from the inside the plenum or having the ducting notched for fitting around roof curb and plenum cross support members.

Plenum bottom section view for single fan system. Repeated for multiple fan plenums.

Duct connections are to be sealed from air leakage and water penetration.

Plenum Drainage Piping / Trap Detail (By Others)

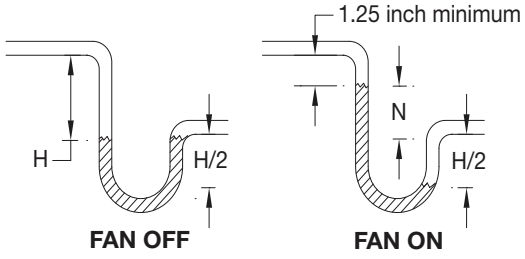
Fan Drain Connection



Plenum Drain Connection

There is a location for a pipe connection on each tubular fan housing and bypass air plenum. Each drain may need to be connected to a drainage system to ensure proper disposal of any water or condensate that may occur.

- Drain connections are 0.5 inch FNPT and 1.0 inch MNPT
- Installed piping to have a downward angle to allow for drainage
- Fill traps to recommended level before start-up



Note: A conservative method of trap design is to set N = total static pressure.

Positive Pressure Trap on Tubular Fan Housing

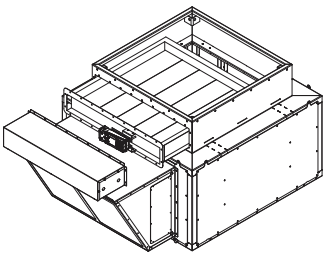
N = Negative fan pressure (inches W.C.)
H = N - 0.5 inches minimum)

Negative Pressure Trap on Bypass Air Plenum

N = Negative fan pressure (inches W.C.)
H = N - 0.5 inches minimum

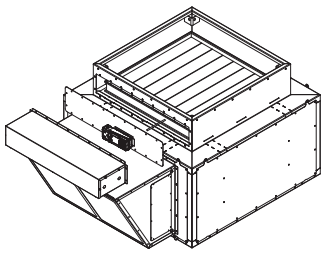
Check local codes for proper disposal of drain water which has been in contact with the exhaust air.

Bypass Air Plenum (BAP) and Isolation Damper Access and Actuator Mounting



Bypass Air Plenum

Depending on the configuration and intended operation of the system supplied, a Vektor plenum section may not have a weatherhood and bypass damper. If the unit is intended to run at all times, in rare cases the fan may not include an isolation damper. Typically, systems that include a fan which is on standby will have one less weatherhood and BAP damper assembly than plenum sections. Refer to submittal drawings for additional information.



Isolation Damper Access and Actuator Mounting

For all Vektor-M Series units with a Bypass Air Plenum and Isolation damper, access to the isolation damper, actuator(s) (optional from factory) and voltage transformer (optional from factory) can be achieved through the removal of the front panel of the isolation damper cover. The cover is located on the side of the top plenum section. The entire isolation damper assembly can be slid out through the opening.

All Vektor-M systems are available with HCD isolation dampers to be utilized for low to high pressures. Vektor-M, sizes 15 – 33, offer an additional option, the VCD dampers as an option for lower pressure systems. To remove the VCD damper, the actuator must first be removed from the front plate. The HCD damper can be pulled out without removing the actuator.

HCD Isolation Damper

VCD Isolation Damper

Bypass Damper Access and Actuator Mounting

For Vektor fans with bypass air, access to the bypass air damper and actuator (optional from factory) is gained through the removal of the weatherhood or bypass damper actuator access door on the side of the weatherhood.

NOTE

If the Vektor units were not supplied with optional actuators, the dampers have an extended jackshaft for field mounting a customer supplied actuator.

Field Coating Touch-Up Procedure for Scratched Areas

Standard coating and color for the Vektor laboratory exhaust system is Greenheck's LabCoat™. The procedure below details the correct method for repairing minor scratches in the coating.

Failure to perform touch-ups may result in rust or corrosion and accelerate the fade in color and is not covered under warranty.

TOUCH-UP PAINT REPAIR KIT CONTENTS

- One pint of Kem Kromik primer
  - including a technical data sheet
- One pint of industrial enamel
  - RAL7023 Concrete Grey
  - includes a technical data sheet
- Four disposable foam brushes
- One sheet sandpaper
- Repair procedure details

1. Scuff affected area to be repaired using medium sandpaper (provided) or medium scotch brite pad. Feather the edges.
2. Clean affected area to be touched up using an alkaline based cleaner and rinse.
3. Apply Kem Kromik primer using 1 inch foam brush (provided). Follow technical data sheet instructions.
4. Allow primer to dry a minimum of 2 1/2 hours before top coating.
5. Apply topcoat with industrial enamel using 1 inch foam brush (provided). Follow technical data sheets instructions. Allow painted units to air-dry and cure before putting into service. See enclosed Technical Data sheets for detailed drying and cure schedules at different temperatures.

To order additional coating repair kits, please reference Greenheck's part number HAZ2597 RAL7023 CONCRETE GRAY FIELD REPAIR kit. Please contact factory with your fan's serial number for colors other than our standard concrete gray RAL7023.

Electrical Connections

Before electrical connections are made, the supply voltage, phase and ampere capacity must be checked for compatibility with the fan motor. In addition, the supply wiring must be properly fused and conform to local and national electrical codes. If the unit is supplied with a safety disconnect switch, ensure proper wiring to the fan motor. Be sure the disconnect is switched to the “OFF” position before connecting supply wires. If no disconnect is supplied, ensure the supply wire is not live before connection. Supply wires are then connected to the optional safety disconnect switch (if supplied) or motor.

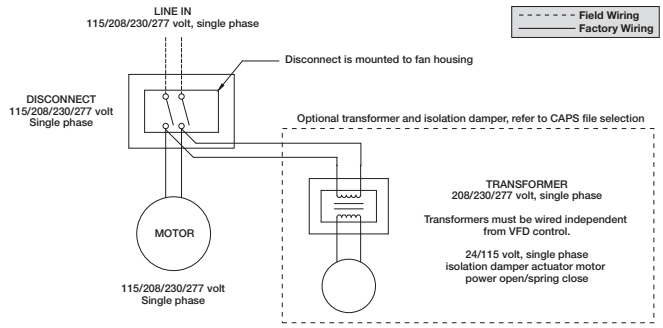
Vektor-MH and Vektor-MD Motor Disconnect and Isolation Damper Wiring Diagram

Disconnect is mounted to fan housing. Transformers are mounted to bypass air plenum with damper actuator motors. For systems that ship unassembled because of physical size, this connection at disconnect from transformers must be field-installed. Wires with conduit and fittings are provided pre-connected to transformers.

Vektor-MH and Vektor-MD Applications with Variable Frequency Drives (VFD)

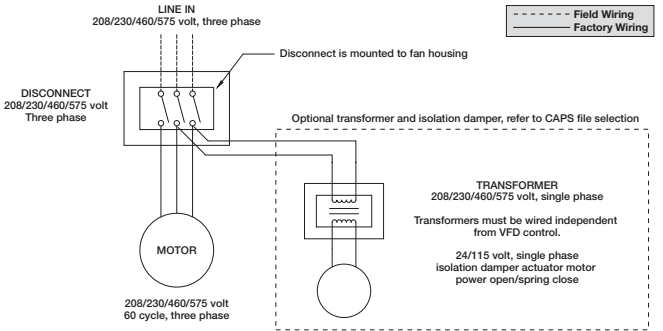
For Vektor systems with single-point, three-phase wiring per blower, the isolation damper actuator will be powered via a step-down transformer, which is wired to the fan disconnect, as shown in the appropriate diagram.

If fan flow (motor speed) is to be controlled using a variable frequency drive with this wiring, the reduced voltage and frequency supplied to the fan will cause control problems with the isolation damper actuator.



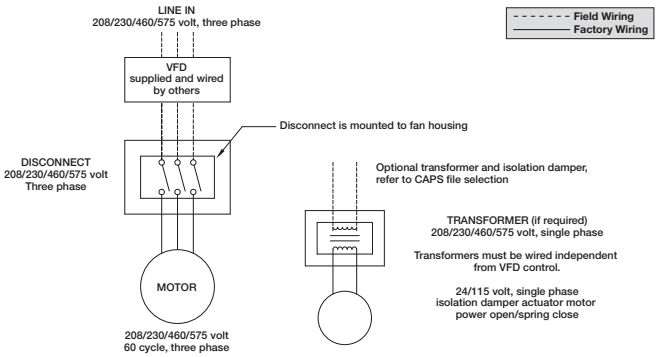
When a project’s Vektor control sequence requires the use of a VFD, it is suggested that the control contractor supply the isolation damper actuator voltage — independent of the power supplied to the Vektor fan motor.

NOTE

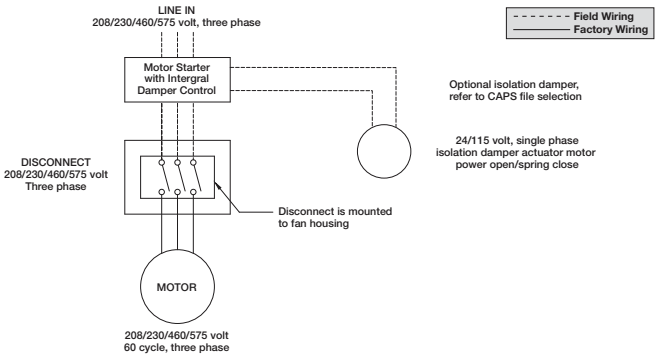


For Vektor-MS fans refer to the Vektor VGN controls Installation, Operation and Maintenance Manual for electrical wiring and connection information.

Improper wiring may damage electrical components and void the warranty.



Single Phase Layout



Three Phase Layout

Three Phase with Variable Frequency Drives Layout

Three Phase Motor Starter with Integral Damper Control Layout

Start-Up

WARNING

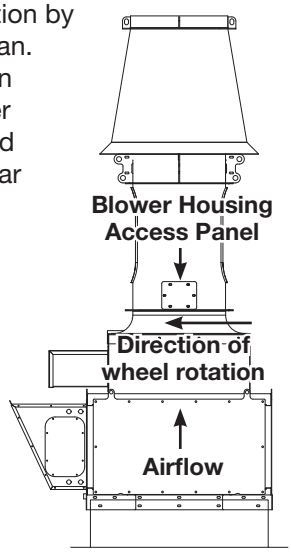
Disconnect and secure to the **OFF** position all electrical power to the fan prior to inspection or servicing. Failure to comply with this safety precaution could result in serious injury or death.

Visual Inspection of Equipment

The equipment type and arrangement should be verified as ordered at once when it arrives at the jobsite. When a discrepancy is found, the local Greenheck Fan Corporation Sales Representative must be notified immediately so that corrective action may be investigated, also verify electrical conformance to specifications. Unauthorized alterations and unauthorized backcharges will not be recognized by Greenheck Fan Corporation.

After the unit has been assembled, installed and all utilities have been hooked up, the unit is now ready for operation.

Check



Before starting the unit, check the following:

1. Confirm that building supply voltage matches the voltage for which the unit is wired.
2. Check all piping and wiring penetrations made by contractors for water tightness. All penetrations must be made watertight to prevent water damage to the unit and building.
3. Rotate the fan wheel manually to be sure that it is free to operate. Remove any dirt or debris that may have accumulated during installation.
4. Check the fan bearing setscrews for tightness.
5. Check alignment of sheaves and V-Belts (See maintenance section).
6. Inspect all fasteners to ensure that none have loosened during shipment.
7. Check flex coupling for proper alignment and connect between motor shaft and fan shaft (direct drive).
8. Check all guarding to ensure that it is securely attached and not interfering with rotating parts.
9. Check operation of isolation and bypass dampers (if supplied) for freedom of movement.
10. Check all electrical connections for proper attachment.
11. Check housing and ductwork, if accessible, for obstructions and foreign material that may damage the fan wheel.
12. Fill drainage piping trap.

Additional steps for initial start-up

1. Check for proper wheel rotation by momentarily energizing the fan. Access to view the wheel can be gained through the blower housing access panel located on the side of the fan's tubular housing.

One of the most frequently encountered problems are motors that are wired to rotate the wheel in the wrong direction. This is especially true with 3-phase installations where the motor will run in either direction, depending on how it has been wired. To reverse rotation of a 3-phase motor, interchange any two of the three electrical leads. Single phase motors can be reversed by changing internal connections as described on the motor label or wiring diagram.

2. Fans with multi-speed motors should be checked on low speed during initial start-up.
3. Check for unusual noise, vibration or overheating of bearings. Refer to the "Troubleshooting" section of this manual if a problem develops.
4. Grease may be forced out of the bearing seals during initial start-up. This is a normal self-purging feature for the type of bearing used on this product.

Vibration

On start-up and during operation, the unit should operate smoothly with minimal vibration. It is possible that a higher degree of vibration may be experienced. **Excessive vibration if left unchecked, can cause a multitude of problems, including structural and/or component failure.** The most common sources of vibration are listed.

1. Wheel Unbalance
2. Drive Pulley Misalignment
3. Foundation Stiffness
4. Poor Inlet/Outlet Conditions
5. Incorrect Belt Tension
6. Bearing Misalignment
7. Mechanical Looseness
8. Drive Component Unbalance
9. Faulty Belts

Many of these conditions can be discovered by careful observation. Refer to the troubleshooting section of this manual for corrective actions. If observation cannot locate the source of vibration, a qualified technician using vibration analysis equipment should be consulted. If the problem is wheel unbalance, in-place balancing can be done through the access panel located on the side of each fan's tubular housing. Any correction weights added to the wheel should be welded to either the wheel back or to the wheel back and wheel cone.

Routine Maintenance and Operation

CAUTION

When performing any service to the fan, disconnect the electrical supply and secure fan impeller.

Once the unit has been put into operation, a routine maintenance schedule should be set up to accomplish the following:

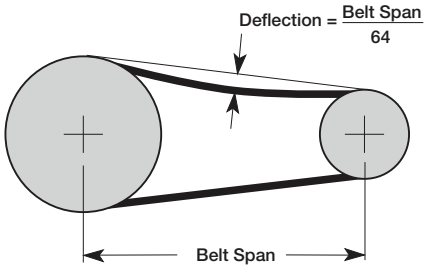
1. Lubrication of bearings and motor.
2. Bypass air dampers should be checked for freedom of operation and wear.
3. Wheel, housing, bolts and set screws on the entire fan should be checked for tightness.
4. Any dirt accumulation on the wheel or in the housing should be removed to prevent unbalance and possible damage.
5. Inspect fan impeller and housing looking for fatigue, corrosion, or wear.
6. Examine unit for areas needing paint touch-up.

Fan Operation

Each fan should be run every thirty (30) days as this causes all electrical and mechanical components to get up to temperature, displacing any formed condensation, redistributes load on bearings, and redistributes grease in the bearings (motor and shaft bearings).

CAUTION

When operating conditions of the fan are to be changed (speed, pressure, temperature, etc.), consult manufacturer or your local representative to determine if the unit can operate safely at the new condition.



V-Belt Drive

V-belt drives must be checked on a regular basis for wear, tension, alignment and dirt accumulation. Premature or frequent belt failures can be caused by improper belt tension (either too loose or too tight) or misaligned sheaves. **Abnormally high belt tension or drive misalignment will cause excessive bearing loads and may result in failure of the fan and/or motor bearings.** Conversely, loose belts will cause squealing on start-up, excessive belt flutter, slippage and overheated sheaves. Either excessively loose or tight belts may cause fan vibration.

When replacing V-belts on multiple groove drives all belts should be changed to provide uniform drive loading. Use a set of matched belts whenever possible. Do not pry belts on or off the sheave. Loosen belt tension until belts can be removed by simply lifting the belts off the sheaves. After replacing belts, ensure that slack in each belt is on the same side of the drive. Belt dressing should never be used.

Do not install new belts on worn sheaves. If the sheaves have grooves worn in them, they must be replaced before new belts are installed.

The proper tension for operating a V-belt drive is the lowest tension at which the belts will not slip at peak load conditions. Belts are adjusted by swinging out the motor pivot plate. For initial tensioning, the proper belt deflection halfway between sheave centers is 1/64 inch for each inch of belt span. For example, if the belt span is 64 inches, the belt deflection should be 1 inch using moderate thumb pressure at mid-point of the drive.

Check belt tension two times during the first 24 hours of operation and periodically thereafter.

Motors

Motor maintenance is generally limited to cleaning and lubrication. Cleaning should be limited to exterior surfaces only. Removing dust and grease buildup on the motor housing assists proper motor cooling. Never wash-down motor with high pressure spray.

Greasing of motors is only intended when fittings are provided. Motors supplied with grease fittings should be greased in accordance with the manufacturer's recommendations. When motor temperature does not exceed 104ºF (40ºC), the grease should be replaced after 2000 hours of running time.

Direct drive systems have extended grease lines to lubricate the motor without removal of any guarding.

Bearings

The bearings for Greenheck fans are carefully selected to match the operating conditions of the specific class, arrangement, and fan size. The instructions provided in this manual and those provided by the bearing manufacturer will minimize any bearing problems. Bearings are the most critical moving part of the fan, therefore, special care is required when mounting them on the unit and maintaining them.

Refer to the chart on page 15 and the manufacturer's instructions for grease types and intervals for various operating conditions. Never mix greases made with different bases. This will cause a breakdown of the grease and possible failure of the bearing.

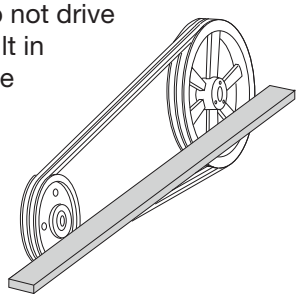
Failure to follow recommendations may result in premature bearing failure and is not covered under warranty.

Recommended Bearing Lubrication Schedule Relubrication Schedule in Months* Synthetic Grease								
Fan RPM	Bearing Bore (inches)							
	½ - 1	1⅛ - 1½	1⅝ - 1⅞	1 15/16 - 2 3/16	2 7/16 - 3	3 3/16 - 3½	3 15/16 - 4½	4 15/16 - 5½
To 250	12	12	12	12	12	12	12	12
500	12	12	12	12	12	12	12	12
750	12	12	12	12	12	12	10	7
1000	12	12	12	12	12	9	6	4
1250	12	12	12	12	9	6	4	2
1500	12	12	12	10	7	4	2	
2000	12	10	8	6	3	1.5	.5	
2500	12	7	5	4	1	.5		
3000	12	5	3	2	.5			
3500	12	3	2	.75				
4000	12	2	.5					
5000	12	1						
Number of shots**	4	8	8	10	16	25	41	57

* Lubrication interval is based on 12 hour day operation and maximum 160°F housing temperature. For 24 hour per day operation, the interval should be cut in half.

** Lubricant should be added with the shaft rotating and until clean grease is seen purging from the bearing. The lubrication interval may be modified based on the condition of the purged grease. If bearing is not visible to observe purged grease, lubricate with number of shots indicated for bore size.

- For conditions including high temperatures, moisture, dirt or excessive vibration, consult the factory for a specific lubrication interval for your application.
- Lubricant should be a high quality lithium complex synthetic grease conforming to NLGI Grade 2. Factory recommends synthetic Mobilith SHC100.
- The use of non-synthetic lubricants will decrease lubrication intervals by approximately three times.
- Storage periods of three months or longer require monthly rotation of the shaft and purging grease prior to storage and start-up.



Vektor-MS Nozzle Bearings

The bearings for the MS nozzle assembly are permanently lubricated and do not require additional grease.

V-Belt Drive Installation

Belt Drive

1. Remove the protective coating from the end of the fan shaft using mineral spirits or another similar solvent. Check to ensure that the shaft is free of nicks and burrs.
2. Slide sheaves on shafts - do not drive sheaves on as this may result in bearing damage and void the warranty.
3. Align fan and motor sheaves with a straight-edge or string and tighten.
4. Place belts over sheaves. Do not pry or force belts, as this could result in damage to the cords in the belts.

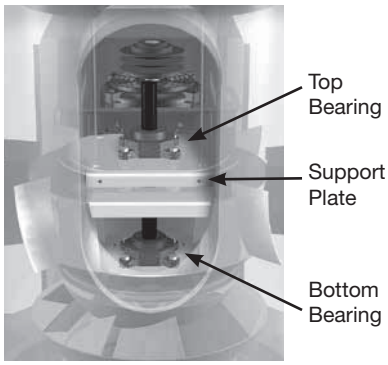
Aligning Sheaves with a Straight Edge

5. Adjust the tension until the belts appear snug. Run the unit for a few minutes and allow the belts to “Set” properly.
6. With the fan off and disconnect locked out, adjust the belt tension by moving the motor pivot plate. When in operation, the tight side of the belts should be in a straight line from sheave to sheave with a slight bow on the slack side.

Bearing Replacement

The intent of this Vektor fan design with its large side access openings is to allow a field service technician to replace bearings with the fan remaining in place in its intended application. All work can be conducted by accessing the bearings through the blower housing side access openings. This procedure assumes power source has been locked out prior to removing guards and covers, belts and pulleys have been loosened and removed properly and extended lubrication lines have been disconnected at the bearing. In some cases it may be necessary to remove the motor and mounting plate.

Belt Drive



This procedure assumes proper safety measures have been taken and the driven sheaves and belts have already been removed. Shaft black coating can be removed with a solvent similar to brake cleaner. Read through these directions completely prior to starting this procedure.

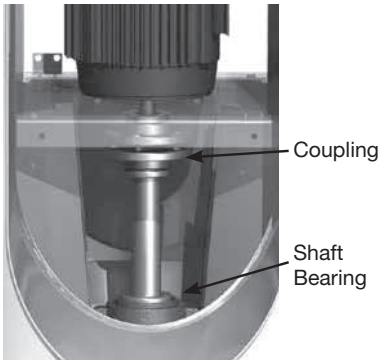
1. Scribe line at the top of both the top and bottom bearings. These marks are used to locate the proper mounting position for the new bearings
2. Loosen and remove top bearing from fan shaft. Use spanner wrench or blunt punch to loosen bearing.

EQUIPMENT REQUIRED
• Four shaft collars • Emery cloth • Caulk • Replacement bearings • Spanner wrench and sockets

Follow bearing manufacturer's instructions on removal. An emery cloth may be required to clean and remove burrs off shaft. Finish removing top bearing.

3. Install two shaft collars flush with the top support plate to hold and support the shaft when removing bottom bearing.

4. Loosen bottom bearing. Caulk seal may need to be broken around perimeter of flange housing and bottom support plate. Use emery cloth to clean shaft and remove any burrs.
5. Install second set of shaft collars flush with top of bottom support plate.
6. Remove shaft collars on top support plate and finish removing bottom bearing.
7. Install new bottom bearing in reverse of this procedure. Remember to re-install top set of shaft collars prior to removing lower shaft collars.
8. Align the top of the bearing with the scribed mark indicating the correct mounting location. Secure lower bearing to bottom support plate. Do not secure the bearing to the fan shaft.
9. Turn the wheel approximately 20 – 30 rotations to allow the shaft to properly set in the bottom bearing.
10. Finish installing bearing on fan shaft according to bearing manufacturer's installation procedure. Rotate the wheel again for 20 rotations. If resistance is felt the bearing did not set properly. Reset the shaft in the bearing.
11. Remove top set of shaft collars and install top bearing according to bearing manufacturer's instructions making sure the top of the bearing lines up with scribed mark indicating the correct mounting location.
12. Connect extended lube lines to new bearings. Zerk fittings from old bearings may need to be installed in replacement bearings
13. Reinstall drive sheave and belts. Check for alignment.
14. Caulk around bottom bearing flange for an improved water tight seal.



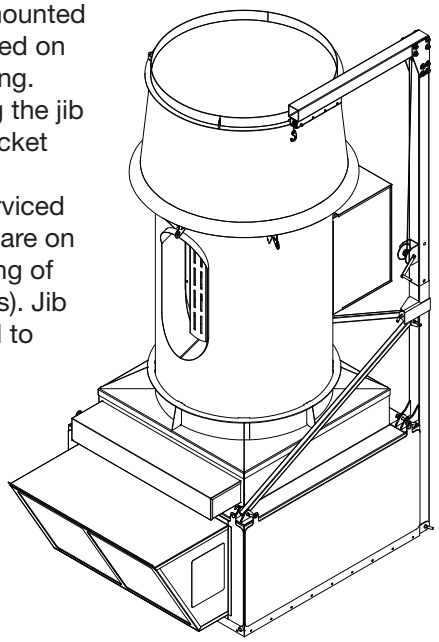
Direct Drive

This procedure assumes proper safety measures have been taken and power locked out prior working on fan shaft / motor assembly. Shaft black coating can be removed with a solvent similar to brake cleaner. Read through these directions completely prior to starting this procedure.

EQUIPMENT REQUIRED
• Blocking materials • Emery cloth • Caulk • Replacement bearing • Spanner wrench and sockets

1. Scribe line at the top of the shaft bearing and also under the lower coupling halve on the fan shaft. These marks are used to locate the proper mounting positions when reassembling the fan.
2. Open side access panel and place blocking materials under wheel to prevent it from shifting down during bearing replacement.

3. Remove coupling assembly from fan shaft. Upper coupling bushing may need to be removed and / or motor might also need to be tilted to remove old bearing and install new bearing. Coupling mounting locations should be scribed on any component loosened or removed.



4. Loosen and remove bearing from fan shaft. Follow bearing manufacturer's instructions on removal. Caulk seal may need to be broken around perimeter of flange housing and bottom support plate. Use an emery cloth to clean and remove any burrs on fan shaft.
5. Slide new bearing onto fan shaft, but do not tighten to fan shaft
6. Reinstall coupling bushings and flex pack to fan shaft and motor shaft. This should be done according to manufacturer's instructions making sure the components line up with scribed mark(s) indicating the correct mounting location.
7. Remove blocking from under fan wheel.
8. Turn the wheel approximately 20 – 30 rotations to allow the shaft to properly set in the bearing and alignment between motor shaft and fan shaft.
9. Finish installing bearing on fan shaft according to bearing manufacturer's installation procedure. Rotate the wheel again for 20 rotations. If resistance is felt the bearing did not set properly. Reset the shaft in the bearing.
10. Connect extended lube lines to new bearings. Zerk fittings from old bearings may need to be installed in replacement bearings. Purge non-synthetic grease from new bearing.
11. Caulk around bottom bearing flange for an improved water tight seal.

Jib Crane Assembly (Optional Accessory)

NOTE

Complete assembly instructions for the jib crane are documented in Assembly Instruction #472081, Jib Crane for Vektor. Instructions are shipped with the jib crane or can be found on greenheck.com

The jib crane is mounted to sockets provided on the plenum housing. When assembling the jib crane, use the socket closest to the fan which is to be serviced (multiple sockets are on plenums consisting of three or more fans). Jib crane is designed to lift windband and motor only. Any other use may result in serious injury. Jib crane must not be used to lift the fan from the plenum.

Motor Change-Out Procedure

Direct Drive

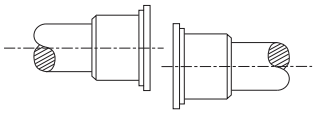
To remove the motor:

1. Install jib crane* in plenum mounting socket using Greenheck supplied hardware.
2. Position jib crane boom above windband.
3. Utilizing windband lifting lugs, rig windband to jib crane cable.
4. Remove all bolts used to secure windband to nozzle.
5. Lift off windband and lower to rooftop.
6. Reposition jib crane boom above fan.
7. Lower jib crane cable through center of fan until it reaches the motor.
8. Remove bolts securing the motor to its horizontal mounting plate.
9. Decouple motor shaft from wheel shaft by disassembling coupling.
10. Rig motor to jib crane cable.
11. Lift motor out of fan body and lower to rooftop.

To install the new motor:

1. Rig new motor to jib crane cable.
2. Attach coupling half to motor shaft. Make sure coupling hub is flush with the end of the motor shaft.
3. Position motor above fan body and carefully lower to its intended mounting position.
4. Ensure motor is positioned correctly so mounting bolts can be re-installed.
5. Install all coupling bolts to attach the motor shaft to the fan wheel shaft.
6. Install all bolts to attach motor to fan body mounting plate.

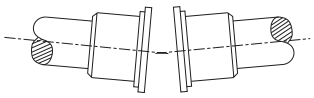
The Vektor fan was designed to ensure that when the new motor is installed, the relative angular alignment of the motor shaft to fan wheel shaft will be within +/-1 degree.



*If jib crane was not supplied with the Vektor system, a portable crane or hoist can be used.

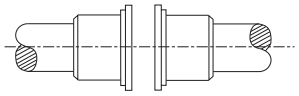
High Strength Metal Disc Coupling Installation and Alignment

Direct Drive



Check for misalignment between the two coupling hubs. The three types of misalignment (parallel, angular, and separation gap) are illustrated below. To minimize misalignment between the hubs, a straight edge can be used as a quick guide in aligning the shafts.

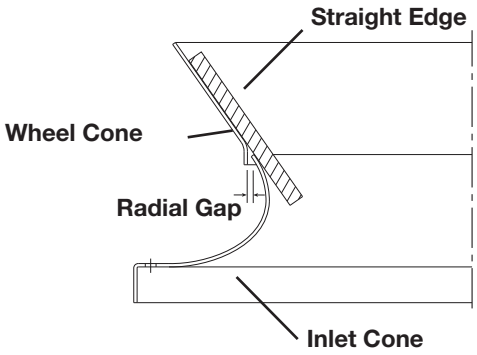
The Vektor direct drive single shaft bearing permits the shaft to swivel and essentially eliminates parallel misalignment.



Parallel

But an excessive angle in the fan shaft will cause a higher degree of angular misalignment. It is best to have the motor shaft and fan shaft as close to parallel as possible. The coupling provided allows up to one degree of angular misalignment between the two joining hubs. No lubrication of the coupling is required.

Angular



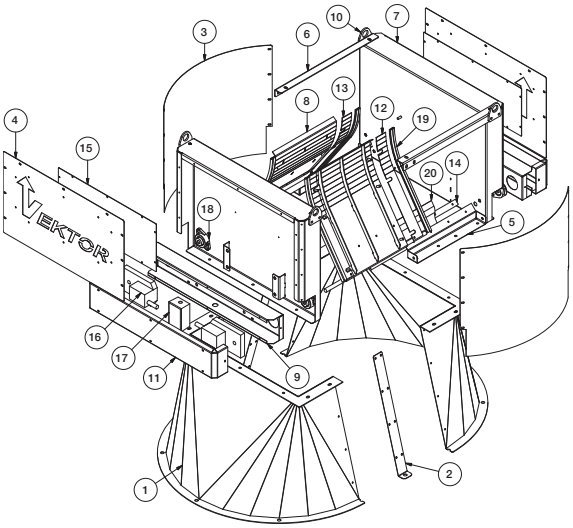
Separation

Refer to the coupling manufacturer's information / installation instruction sheet provided with the fan for additional details. Coupling should not be installed to support the weight of the fan shaft and wheel.

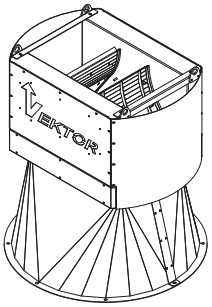
Radial Gap and Alignment

Efficient fan performance can be maintained by having the correct radial gap and alignment. These items should be checked before start-up when the unit has been disassembled.

Radial Gap: Adjust inlet cone position such that the radial gap between the wheel cone and inlet cone is evenly distributed around the wheel.



Alignment: If necessary, adjust wheel position by loosening the wheel hub from the fan shaft so that a straight edge held tight to the wheel cone just touches the inlet cone.



Troubleshooting

Problem	Cause	Corrective Action
Excessive Noise	Wheel Rubbing Inlet	Adjust wheel and/or inlet cone. Tighten wheel hub or bearing collars on shaft.
	V-Belt Drive	Tighten sheaves on motor/fan shaft. Adjust belt tension. Align sheaves properly (see procedure). Replace worn belts or sheaves.
	Bearings	Replace defective bearing(s). Lubricate bearings. Tighten collars and fasteners.
	Wheel Unbalance	Clean all dirt off wheel. Check wheel balance.
Low CFM	Fan	Check wheel for correct rotation. Check blade position of BAP damper, increase fan speed.*
	Duct System	Higher pressure than design. Filters need replacement.
High CFM	Fan	Decrease fan speed.
	Duct System	Increase BAP damper blade open position. Resize ductwork. Access door, filters, dampers not installed.
Static Pressure Wrong	Duct system has more or less restriction than anticipated	Remove obstructions in system. Use correction factor to adjust for temperature/altitude. Adjust set point used to control BAP damper modulation. Resize ductwork. Clean filters/coils. Change fan speed.*
High Motor Amp Draw	Fan	Check rotation of wheel. Reduce fan speed.
	Duct System	Resize ductwork. Check proper operation of isolation and bypass dampers. Check filters and access doors.
Fan Doesn't Operate	Electrical Supply	Check fuses/circuit breakers. Check for switches turned off or disconnected. Check for correct supply voltage.
	Drive	Check for broken belts. Tighten loose pulleys.
	Motor	Assure motor is correct horsepower and not tripping overload protector.
Overheated Bearing	Lubrication	Check for excessive or insufficient grease in the bearing.
	Mechanical	Replace damaged bearing. Relieve excessive belt tension. Align bearings. Check for bent shaft.
Excessive Vibration	Belts	Adjust tightness of belts. Replacement belts should be a matched set.
	System Unbalance	Check alignment of shaft, motor and pulleys. Check wheel balance, rebalance if necessary.
	Weak Roof Structure	Consult Structural Engineer to develop a plan to reinforce building structure.

*Always check motor amps and compare to nameplate rating. Excessive fan speed may overload the motor and result in motor failure. Do not exceed the maximum cataloged rpm of the fan.

Vektor-MS Nozzle Parts and Assembly

Item	Quantity	Description
1	2	Transition Weld
2	2	Transition side cover
3	2	Wind wrap round
4	2	Wind wrap flat
5	2	Frame bottom bar
6	2	Frame top bar
7	2	Frame weld
8	2	Blade weld
9	2 or 4*	Actuator mount
10	4	Lifting lug
11	2 or 4*	Actuator cover
12	2	Blade seal, right
13	6	Blade seal, left
14	4	Flex backing
15	2	Vektor backing
16	2 or 4*	Actuator
17	1	Electrical box
18	4	Bearing
19	4	Blade seal
20	2	Flex seal

*Quantity 2 for sizes 15 thru 24
Quantity 4 for sizes 27 thru 40

Our Commitment

As a result of our commitment to continuous improvement, Greenheck reserves the right to change specifications without notice.

Specific Greenheck product warranties are located on greenheck.com within the product area tabs and in the Library under Warranties.

Greenheck Vektor MD and MH catalog provides additional information describing the equipment, fan performance, available accessories, and specification data.

AMCA Publication 410-96, Safety Practices for Users and Installers of Industrial and Commercial Fans, provides additional safety information. This publication can be obtained from AMCA International, Inc. at www.amca.org.

Programming Sure-Aire™

Greenheck's Sure-Aire™ Differential Pressure Controller provides either a 2-10 Vdc or 4-20 mA electrical output signal. The output signal is linearly proportional to the pressure range of differential pressure controller. The ranges for Greenheck's Sure-Aire controllers are listed in the table.

Greenheck Part Number		Controller ΔP Range (inches W.C.)	P_{max} (inches W.C.)
100-240 VAC	24 VAC / VDC		
384799	384986	0-8.30	8.30
384800	384987	0-22.14	22.14
384801	384988	0-41.52	41.52
384802	384989	0-83.04	83.04
384803	384990	0-138.40	138.40

Calculating Flow from Differential Pressure

The volumetric flow through the fan (cfm) can be calculated from the equation:

$$CFM = K\sqrt{\frac{\Delta P}{\rho}}$$

where K is the K-factor for the specific fan model and size, ΔP is the measured differential pressure across the inlet cone (inches W.C.), and ρ is the air density (lb/ft^3). K-factors for Greenheck models are found on the back of this document.

Calculating Flow from Voltage Signal

If using a 2-10 Vdc output signal from a differential pressure controller, this equation can be used to calculate the flow:

$$CFM = K\sqrt{\frac{(V - 2)\ P_{max}}{8\rho}}$$

where V is the output voltage of a 2-10 Vdc transmitter and P_{max} is the maximum pressure range of the controller being used (inches W.C.).

Calculating Flow from Current Signal

If using a 4-20 mA output signal from a differential pressure controller, this equation can be used to calculate the flow:

$$CFM = K\sqrt{\frac{(mA - 4)\ P_{max}}{16\rho}}$$

where mA is the output current of a 4-20 mA transmitter and P_{max} is the maximum pressure range of the controller being used (inches W.C.).

Density Corrections

Air density, ρ, is affected by elevation and temperature. The Greenheck Sure-Aire Differential Pressure Controllers allow the user to input the elevation for the application. This elevation input automatically updates the density used for the flow calculation.

The Remote Temperature Sensor will adjust the air density value in the controller based on the sensor measurement when Temperature Compensation is set to 'Yes'. This density compensation will affect the flow rate displayed on the controller. If Temperature Compensation is set to 'No', the air density value will be a function of standard air (70°F/21°C).

The density being used by the Sure-Aire controller can be viewed on the main menu by scrolling up or down through the settings.

Document 475588
VKCURB Curb
for Vektor®-M Series

Assembly Instructions

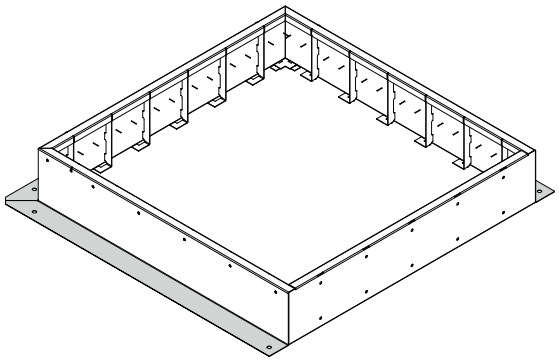
READ THROUGH THESE INSTRUCTIONS PRIOR TO STARTING ASSEMBLY.

Roof curbs are modular in construction and require field assembly.

Roof Curb Assembly Kit

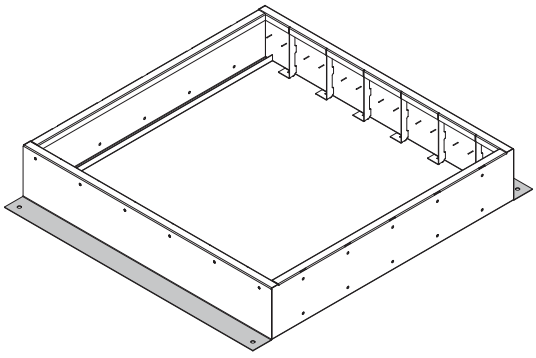
Each roof curb will arrive in sections along with an assembly kit for field installation. Verify all roof curb sections and assembly kit(s) have arrived for each fan mark and are in good condition prior to signing the shipping receipt.

ROOF CURB ASSEMBLY KIT	
Fan Size	Kit Number
15, 18, 20, 22	866271
24, 27, 30, 33	866272
36, 40, 44, 49, 54	866273



ASSEMBLY KIT CONTENTS	
Part Name	Part Description
Hex Head Cap Screw	316 SS, 3/8 x 1-1/4 inch
Hex Nut	316 SS, 3/8 inch
Flat Washer	316 SS, 3/8 inch
Lock Washer	316 SS, 3/8 inch
Gasketing	1/4 x 3/8 inch EPDM Tape with sticky back
Caulk*	Clear Seam Sealer

*One tube of caulk is supplied per **system**.

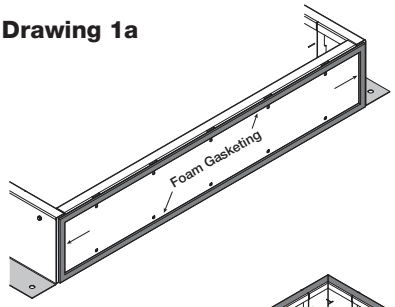


ROOF CURB SECTIONS			
Fan Quantity	End Section(s)	Center Section(s)	Quantity of Roof Curb Assembly Kit(s)
2	2	0	1
3	2	1	2
4	2	2	3
5	2	3	4
6	2	4	5

TOOLS REQUIRED

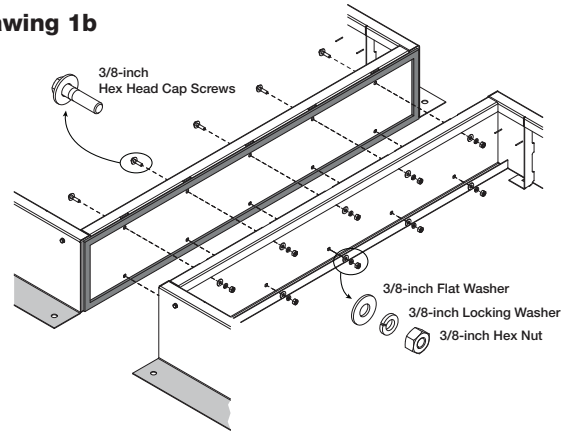
- Utility knife
- Caulk gun
- Box end wrench with 9/16 inch socket for 3/8 inch bolt with 9/16 inch head

End Section
Flashing on three sides



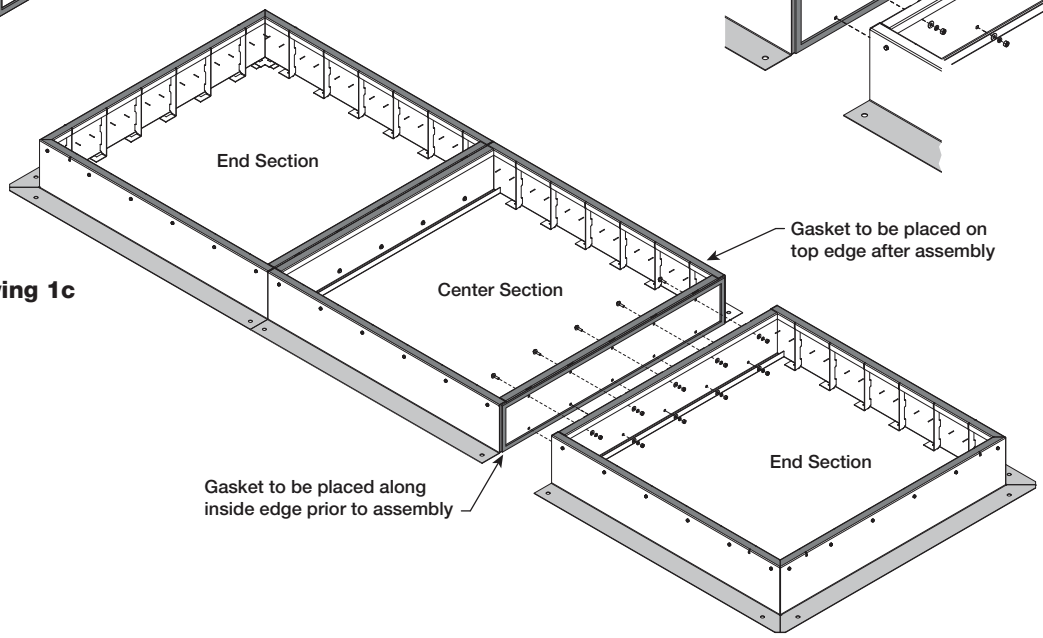
Center Section
Flashing on two sides

Assembly



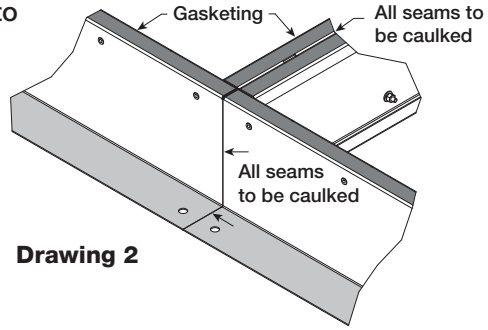
Use one Roof Curb Assembly Kit with gasketing and hardware for each section to be joined. Attach self-adhering foam gasketing (supplied) to one side of either joining section (see Drawing 1a). Gasketing should be placed to form a continuous seal. Corner locations may need second strip to cover seam joints. Supplied hardware should then be used to secure the two sections together as shown (see Drawing 1b). Hold nut with wrench while bolt is tightened.

Drawing 1c shows two end panels and single center section. All sections and configurations are assembled in a similar manor.



Drawing 1a

Drawing 1b



Drawing 1c

Sealing

After all sections have been assembled, caulk (supplied) all seam joints to provide final sealing of roof curb sections. Drawing 2 shows seams to be caulked. Follow caulk manufacturers recommendations for proper application.

Drawing 2

Lifting

Roof curb can be assembled at installation location on the roof deck or at ground level and lifted into position. To lift from ground to roof deck, use spreader bar and support both end and center sections when lifting assembled curb.

Mounting

Attach curb to roof deck or support structure as specified by structural engineer.

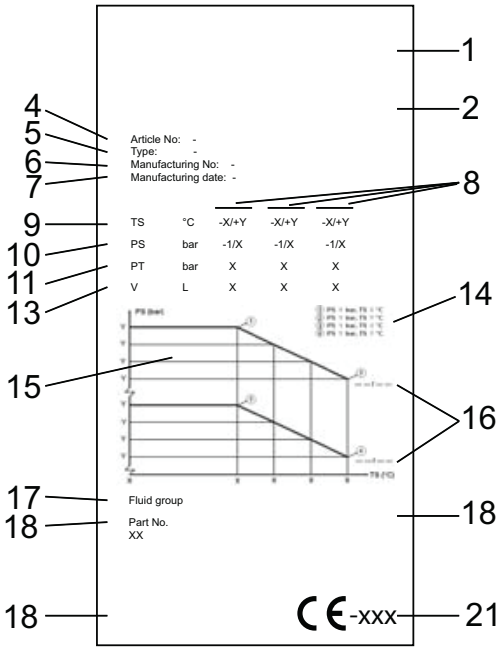
Name plate type 1, PED standard



Name plate type 2, PED stainless steel, optional

Name plate type 3, ASME

Name plate type 4, PED Customer designed, optional

Intended use

The brazed heat exchangers (BHE) have been designed to perform heat transfer to meet the requirements of a wide range of applications such as refrigeration, comfort heating, industrial heating and cooling and the process industry.

Definitions

Warning: *Type of hazard*

⚠ *WARNING indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury.*

Caution: *Type of hazard*

⚠ *CAUTION indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury.*

Note:

NOTE indicates a potentially hazardous situation that, if not avoided, may result in property damage.

Nameplates

There are different types of nameplates depending on the type of pressure vessel approval.

Note:

- *Other types of nameplates may be used. For detailed information contact an Alfa Laval representative.*
- *Some specifications are not used for all types of nameplates*

Nameplate shows:

1. Space for logotype.
2. Manufacturer's name.
3. Space for National Board stamp and serial number.
4. Article number.
5. Type.
6. Manufacturing or serial number.
7. Year or date of manufacture.
8. Locations of connections for each fluid.
9. Max. permissible operating temperatures.
10. Max. permissible operating pressures.
11. Test pressure.
12. Date of test pressure.
13. Volume of each space.
14. Permissible operating temperatures and pressures.
15. Operating area.
16. Description of each space.
17. Fluid group.
18. Information unique to the customer.
19. Possible locations of connections.
20. Bar code information.
21. Space for mark of approval. (CE marks below are not valid for nameplate type 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Original instruction

© COPYRIGHT 2010 Alfa Laval Lund AB. All rights reserved

Requirements

Warning: *The heat exchanger must be installed and operated in such a manner that no risk of injury to personnel and damage to property will be incurred.*

Note: *Unless otherwise specified, product data for normal refrigerants, i.e. HFC and HCFC, are applicable to refrigeration applications. Before the heat exchanger is used for flammable, toxic or dangerous liquids (e.g. hydrocarbons) the relevant safety rules for handling such liquids must be used. For further information, please refer to the Internet site of the supplier.*

Installation

The installation must be provided with equipment that protects the heat exchanger against pressures and temperatures outside the approved minimum and maximum values shown on the nameplate.

Caution: *To avoid hand injuries from sharp edges, protective gloves should always be worn when handling the brazed heat exchangers.*

For best possible heat transfer performance, the heat exchanger should be connected so that the media flow through the heat exchanger in opposite directions (in counter-flow).

Note: *Before connecting any piping, make sure all foreign objects have been flushed out of the system.*

Caution: *Take into account the risk of fire during the installation work, i.e. bear in mind the distance to flammable substances.*

Caution: *Never lift by the connections. Straps should be used when lifting. Place the straps according to figure 1.*

Note: *In evaporator applications and in applications in which a phase change of the media occurs, the heat exchanger must be installed vertically with a straight pipe (at least 150-200 mm in length) between the expansion valve and refrigerant inlet.*

Mounting

In a rigid pipe system, small heat exchangers (weighting 1–6 kg) can be suspended directly in the pipework (Figure 2A). Larger heat exchangers should be secured with support mountings (Figure 2D) intended for a specific heat exchanger (accessory), or be secured with straps (Figure 2C) or by means of mounting bolts (Figure 2B). For special orders, mounting bolts can be welded to the front or rear. The tightening torque for M6 bolts is 3.8 Nm, M8 bolts is 9.5 Nm, and for M10 bolts 19.0 Nm.

Note: *If there is risk of vibrations, use anti-vibration mountings as shown in Figure 2A.*

Note: *Heat exchangers with refrigerant distributors should be mounted with the distributor at the bottom.*

Note: *During installation the connection loads must not exceed values according to the table “Limits for Connection loads during installation” on the inside of the cover page.*

Note: *The pipework should be well-anchored and done in a way that no loads are transferred to the plate heat exchanger during operation.*

Connections (Figure 3)

Threaded connections – Use a torque wrench when connecting the pipe and observe the specified limits. Some models are supplied with connections type Victaulic.

Brazed connections – Clean by rubbing down and degreasing the various surfaces. Use a brazing metal grade that is suitable for the materials being brazed, and use the correct brazing temperature. For detailed information refer to the document “Brazing tubes for brazed heat exchanger” or contact an Alfa Laval representative.

Welded connections – TIG or MIG welding. Grind inside and outside of the pipe and, if bevelled, also the bevelled edge at least 25 mm from the pipe edge and inward. This should be done to avoid contamination of copper in the welded area, which might cause the weld to crack.

Note: *Protect the heat exchanger against overheating by wrapping a piece of wet cloth around the connection whenever any brazing or welding is being done. Excessive heating could melt the internal brazing metal inside the heat exchanger. Refer to figure 3.*

⚠ ***Caution:*** *When disconnecting the heat exchanger from the piping system use proper protective equipment, such as safety boots, safety gloves and eye protection, depending on the type of media in the heat exchanger.*

Risk of freezing

⚠ ***Caution:*** *Bear in mind the risk of freezing at low temperatures to avoid damage to the Heat exchanger. Heat exchangers that are not in operation should be emptied and blown dry whenever there is a risk of freezing.*

Note: *To avoid damage due to freezing, the medium used must include an anti-freeze agent at operating conditions below its freezing point.*

Note: *When used as an evaporator*

- *Use a flow switch and a low-pressure switch.*
- *Use an anti-freeze thermostat and flow monitor to ensure a constant water flow before, during and after the compressor has been running.*
- *Avoid "pump-down", i.e. emptying the evaporator by running the compressor after shutdown until a preset refrigerant pressure is reached. The temperature could then drop below the brine freezing point, which could damage the evaporator.*

Protection against clogging

Use a filter as protection against the possible occurrence of foreign particles. If you have any doubt concerning the maximum particle size, consult your nearest representative of the supplier or look under Product information on the supplier’s Internet site.

Control and operation

⚠ ***Caution:*** *Do not use the heat exchanger for media (e.g. de-ionized water)/installations (e.g. galvanized pipes) that (chemically/electrochemically) could affect or be affected by the plates (Stainless steel) and the brazing material (Copper).*

Note: *Copper may generate corrosion in installation with mixed materials*

Protection against thermal or/and pressure fatigue
Sudden temperature and pressure changes could cause fatigue damage to the heat exchanger. Therefore, the following must be taken into consideration to ensure that the heat exchangers operate without swinging pressures/temperatures.

- Locate the temperature sensor as close as possible to the outlet from the heat exchanger.
- Choose valves and regulation equipment which give stable temperatures/pressures for the heat exchanger.
- To avoid water hammer, quick-closing valves must not be used, e.g. on/off valves.
- In automated installations, the stopping and starting of pumps and actuation of valves should be programmed so that the resulting amplitude and frequency of the pressure variation will be as low as possible.

Insulation
Heating and cooling insulations are available as accessories.

Note: *Be aware that temperature limits of insulation and the heat exchanger can be different.*

Troubleshooting
To ensure the correct performance of the heat exchanger, check that:

- the piping system has been connected to the heat exchanger according to the instructions in this manual
- the heat exchanger is perfectly clean and free from deposits.

Note: *Particles and fibers could clog the heat exchanger. An increase in pressure drop or a drop in thermal efficiency indicates that the heat exchanger is fouled.*

- the control circuit is correctly preset and no freezing occurs.

Cleaning
The equipment is suitable for cleaning in place. For advice on suitable cleaning processes, consult the representative of the supplier or visit the Internet site of the supplier. The person responsible for operation should ensure that the correct cleaning method is used and should decide on suitable cleaning intervals.

Note: *The plate package is not meant to be opened.*

Einsatzbereich

Die gelöteten Wärmeübertrager (BHE) wurden dazu konzipiert, die Wärmeübertragung in Hinblick auf unterschiedliche Anwendungen zu gewährleisten, beispielsweise in den Bereichen Kühlung, Heizanwendungen, industrielle Heiz- und Kühltechnik und Prozessindustrie.

Originalanleitung

© COPYRIGHT 2010 Alfa Laval Lund AB. Alle Rechte vorbehalten

Anforderungen

Vorsicht: *Der Wärmeübertrager ist so zu installieren und zu betreiben, dass kein Risiko für Verletzungen oder Sachschäden entsteht.*

Hinweis: *Wenn nicht anders angegeben, gelten Produktdaten für normale Kältemittel, d.h. H-FKW und H-FCKW, für Kälteanwendungen. Bevor der Wärmeübertrager für brennbare, toxische oder gefährliche Flüssigkeiten (z.B. Kohlenwasserstoffe) verwendet wird, müssen die relevanten Sicherheitsvorschriften in Bezug auf den Umgang mit solchen Flüssigkeiten beachtet werden. Weitere Informationen erhalten Sie auf der Internetseite des Lieferanten.*

Einbau

Beim Einbau muss die Ausrüstung angebracht werden, die den Wärmeübertrager vor Drücken und Temperaturen außerhalb der zulässigen Mindest- und Höchstwerte, die auf dem Namensschild angegeben sind, schützt.

Achtung: *Zur Vermeidung von Verletzungen an der Hand durch scharfe Kanten sollten bei der Handhabung der gelöteten Wärmeübertrager stets Schutzhandschuhe getragen werden.*

Zur bestmöglichen Wärmeübertragung muss der Wärmeübertrager so angeschlossen sein, dass die Medien gegeneinander (in entgegengesetzte Richtungen) fließen können.

Hinweis: *Vor dem Anschluss von Leitungen kontrollieren, dass die Anlage durchgespült wurde, um Fremdkörper zu beseitigen.*

Achtung: *Während der Installationsarbeiten ist die Brandgefahr zu berücksichtigen, d.h. zu brennbaren Stoffen ist ein ausreichender Abstand einzuhalten.*

Achtung: *Niemals an den Anschlüssen anheben. Beim Heben sollten Hebeseile verwendet werden. Seile gemäß Abbildung 1 anbringen.*

Hinweis: *Bei Verdampferanwendungen und Anwendungen, bei denen eine Phasenänderung der Medien stattfindet, muss der Wärmeübertrager vertikal mit einem geraden Rohr installiert werden (Mindestlänge von 150-200 mm), das zwischen dem Expansionsventil und dem Kältemittelzulauf verläuft.*

Montage

In einem starren Rohrsystem können kleine Wärmeübertrager (Gewicht von 1–6 kg) direkt an den Rohrleitungen aufgehängt werden (Abbildung 2A). Größere Wärmeübertrager sollten mit Stützhalterungen (Abbildung 2D) abgesichert werden, die für einen spezifischen Wärmeübertrager vorgesehen sind (Zubehör), oder mit Gurten (Abbildung 2C) oder mit Hilfe von Montagebolzen (Abbildung 2B) abgesichert werden. Auf Wunsch können Montageschrauben an die Vorder- oder Rückseite geschweißt werden. Das Anzugsmoment für M6-Schrauben beträgt 3,8 Nm, für M8-Schrauben 9,5 Nm und für M10-Schrauben 19,0 Nm.

Hinweis: *Falls das Risiko von Vibrationen besteht, verwenden Sie Anti-Vibrationsbefestigungen wie in Abbildung 2A gezeigt.*

Hinweis: *Wärmeübertrager mit Kältemittelverteilern sollten mit dem Verteiler an der Unterseite montiert werden.*

Hinweis: *Während der Installation dürfen die Anschlusslasten die Werte laut der Tabelle “Grenzwerte für Anschlusslasten während der Installation” auf der Innenseite des Deckblattes nicht überschreiten.*

Hinweis: *Die Rohrleitungen sollten gut verankert und so ausgeführt sein, dass keine Lasten zum Plattenwärmeübertrager hin auftreten, während er in Betrieb ist.*

Verbindungen (Abbildung3)
Gewindeverbindungen – Verwenden Sie einen Drehmomentschlüssel, wenn Sie die Rohre anschließen und beachten Sie die vorgegebenen Grenzwerte. Einige Modelle verfügen über Verbindungen vom Typ Victaulic.
Gelötete Verbindungen – Reinigung durch Abreiben und Entfetten der verschiedenen Oberflächen. Verwenden Sie eine Lötmetallsorte, die für die zu lötenden Werkstoffe geeignet ist, und halten Sie die korrekte Löttemperatur ein. Detaillierte Informationen finden Sie in dem Dokument "Lötrohre für gelötete Wärmeübertrager" oder Sie kontaktieren einen Alfa Laval Vertreter.
Geschweißte Verbindungen – TIG- oder MIG-Schweißen. Innen- und Außenflächen des Rohrs müssen abgeschliffen werden. Falls der Rand abgeschrägt ist, muss auch er mindestens 25 mm vom Rohrrand und innen abgeschliffen werden. Dies erfolgt, um Kupferkontaminationen im geschweißten Bereich zu verhindern, die zum Platzen der Schweißnaht führen könnten.

Hinweis: *Der Wärmeübertrager muss bei allen Löt- oder Schweißarbeiten durch ein nasses Tuch, das um die Verbindung gewickelt wird, vor Überhitzung geschützt werden. Übermäßige Erwärmung kann das innere Lötmetall im Wärmeübertrager schmelzen lassen. Siehe Abbildung 3.*

⚠ ***Achtung:*** *Beim Trennen des Wärmeübertragers vom Rohrsystem muss die für die Art des Mediums im Wärmeübertrager geeignete Schutzausrüstung verwendet werden, beispielsweise Sicherheitsstiefel und -handschuhe sowie ein Augenschutz.*

Risiko des Gefrierens

⚠ ***Achtung:*** *Berücksichtigen Sie das Risiko des Gefrierens bei niedrigen Temperaturen, um Schäden am Wärmeübertrager zu vermeiden. Wärmeübertrager, die nicht in Betrieb sind, sollten immer entleert und trockengeblasen werden, wenn das Risiko des Gefrierens besteht.*

Hinweis: *Um Schäden aufgrund von Gefrieren zu vermeiden, muss das verwendete Medium mit einem Frostschutzmittel versehen werden, das für Betriebsbedingungen unterhalb des Gefrierpunkts geeignet ist.*

Hinweis: *Einsatz als Verdampfer*
- *Verwenden Sie einen Strömungswächter und einen Niederdruckschalter.*
- *Verwenden Sie ein Frostschutzthermostat und einen Strömungsmonitor, um einen konstanten Wasserstrom vor, während und nach dem Betrieb des Kompressors zu gewährleisten.*
- *Vermeiden Sie ein "Leerpumpen", d.h. das Leeren des Verdampfers durch Einsatz des Kompressors nach dem Abschalten, bis ein voreingestellter Kältemitteldruck erreicht ist. Die Temperatur kann dann unterhalb des Gefrierpunkts der Sole fallen, wodurch der Verdampfer beschädigt wird.*

Schutz vor Verstopfung
Zum Schutz vor möglicherweise auftretenden Fremdpartikeln sollte ein Filter verwendet werden. Wenn Sie Zweifel bezüglich der maximalen Partikelgröße haben, wenden Sie sich an den Vertreter Ihres Lieferanten oder informieren Sie sich in den Produktinformationen auf der Internetseite des Lieferanten.

Regelung und Betrieb

> ***Achtung:*** *Der Wärmeübertrager darf nicht mit Medien (z.B. entionisiertes Wasser)/Installationen (z.B. galvanisierte Rohre) verwendet werden, die sich (chemisch/elektrochemisch) auf die Platten (Edelstahl) und das Lötmaterial (Kupfer) auswirken können oder durch diese beeinträchtigt werden können.*

> ***Hinweis:*** *Kupfer kann in Installationen mit gemischten Werkstoffen zu Korrosion führen*

Schutz vor thermischer Belastung oder/und Druckermüdung

Plötzliche Temperatur- und Druckänderungen können am Wärmeübertrager Beschädigungen durch Ermüdung verursachen. Daher muss Folgendes in Betracht gezogen werden, um sicherzustellen, dass die Wärmeübertrager ohne wechselnde Drücke/ Temperaturen betrieben werden.

- Positionieren Sie den Temperatursensor so nah wie möglich am Auslauf vom Wärmeübertrager.
- Wählen Sie Ventile und Regulierungselemente, die für stabile Temperaturen/Drücke für den Wärmeübertrager sorgen.
- Um Wasserschläge zu vermeiden, keine Schnellschluss-Ventile, z.B. Ein-/Aus-Ventile, verwenden.
- In automatisierten Anlagen sollte das Stoppen und Starten von Pumpen und das Betätigen von Ventilen so programmiert sein, dass die daraus resultierende Amplitude und Frequenz der Druckunterschiede so gering wie möglich sind.

Isolierung

Wärmeisolierung und Kälteisolierung sind als Zubehör erhältlich.

> ***Hinweis:*** *Beachten Sie, dass die Temperaturgrenzen der Isolierung und des Wärmeübertragers unterschiedlich sein können.*

Fehlersuche

Um die korrekte Leistung des Wärmeübertragers sicherzustellen, überprüfen Sie Folgendes:

- Das Rohrsystem wurde gemäß den Anweisungen in diesem Handbuch an den Wärmeübertrager angeschlossen
- Der Wärmeübertrager ist völlig sauber und frei von Ablagerungen.

> ***Hinweis:*** *Partikel und Fasern können den Wärmeübertrager verstopfen. Ein stärkerer Druckabfall oder ein Abfall der thermischen Effizienz weist darauf hin, dass der Wärmeübertrager verschmutzt ist.*

- Der Steuerkreis ist korrekt voreingestellt und es ist nichts gefroren.

Reinigung

Die Ausrüstung ist für das Reinigen vor Ort (CIP-Reinigung) geeignet. Informationen über geeignete Reinigungsverfahren erhalten Sie vom Vertreter des Lieferanten oder auf der Internetseite des Lieferanten. Die für den Betrieb verantwortliche Person muss sicherstellen, dass die korrekte Reinigungsmethode verwendet wird, und sie muss über angemessene Reinigungsintervalle entscheiden.

> ***Hinweis:*** *Das Plattenpaket darf nicht geöffnet werden.*

Usage prévu
Les échangeurs thermiques brasés (BHE) ont été conçus pour assurer un échange thermique correspondant aux besoins d'une large gamme d'applications comme la réfrigération, le chauffage domestique, le chauffage et le refroidissement industriel et l'industrie de transformation.

Définitions

Mise en garde:*Type de risque*
MISE EN GARDE indique une situation potentiellement dangereuse qui peut entraîner la mort ou une blessure grave.

Attention:*Type de risque*
ATTENTION indique une situation potentiellement dangereuse qui peut entraîner la une blessure mineure ou de gravité moyenne.

Remarque :
REMARQUE indique une situation potentiellement dangereuse qui peut entraîner des dommages matériels.

Plaques signalétiques
Il existe différents types de plaques signalétiques, selon le type d'agrément du récipient sous pression.

Remarque :
- *Il est possible d'utiliser d'autres types de plaques signalétiques. Pour en savoir plus, contactez un représentant Alfa Laval.*
- *Certaines spécifications ne servent pas à tous les types de plaques signalétiques.*

La plaque signalétique présente :
1. un espace pour le logotype
2. le nom du constructeur
3. l'espace pour le tampon du bureau national et le numéro de série
4. la référence
5. le type
6. le numéro de fabrication ou de série
7. l'année ou la date de fabrication
8. les emplacements des raccords pour chaque liquide
9. les températures de fonctionnement maximum autorisées
10. les pressions de fonctionnement maximum autorisées
11. la pression d'essai
12. la date de la pression d'essai
13. le volume de chaque espace
14. les températures et pressions de fonctionnement autorisées
15. la zone de fonctionnement
16. la description de chaque espace
17. le groupe de liquide
18. les informations spécifiques à chaque client
19. les emplacements possibles des raccords
20. le code barre
21. l'espace pour le tampon d'agrément (les marquages CE ci-dessous ne conviennent pas aux plaques signalétiques de type 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Instructions originales
© COPYRIGHT 2010 Alfa Laval Lund AB. Tous droit réservés

Conditions requises

> ⚠ ***Mise en garde:*** *L'échangeur thermique doit être installé et utilisé de manière à ne présenter aucun risque pour le personnel ni dommage matériel.*

> ***Remarque:*** *Sauf mention contraire, les informations relatives aux réfrigérants normaux (HFC et HCFC) s'appliquent aux utilisations de réfrigération. Avant d'utiliser l'échangeur thermique pour des liquides inflammables, toxiques ou dangereux, (comme des hydrocarbures), il convient de respecter les règles de sécurité en vigueur pour la manipulation de tels liquides. Pour de plus amples informations, veuillez consulter le site Internet du fournisseur.*

Installation

L'installation doit être effectuée à l'aide d'un équipement susceptible de protéger l'échangeur thermique contre les pressions et les températures hors des valeurs maximales et minimales indiquées sur la plaque signalétique.

> ⚠ ***Attention:*** *Pour éviter de se blesser les mains sur des rebords tranchants, il convient de porter des gants lors de la manipulation des échangeurs thermiques brasés.*

Pour les meilleures performances possibles en matière d'échange thermique, l'échangeur doit être connecté de manière à ce que les liquides y coulent dans des sens opposés (à contre-courant).

> ***Remarque :****Avant tout raccordement de tuyauterie, vérifiez que le système a été rincé pour éliminer tout objet étranger.*

> ⚠ ***Attention:*** *Prenez en compte le risque d'incendie pendant le travail d'installation : n'oubliez pas la distance entre les substances inflammables*

> ⚠ ***Attention:*** *Ne soulevez jamais par les raccords. Utilisez des sangles de levage. Placez les sangles conformément à la figure 1.*

> ***Remarque:*** *Dans les applications d'évaporateur et dans les applications où se passe un changement de phase du produit, l'échangeur thermique doit être installé verticalement, avec un tuyau droit (d'au moins 150 à 200 mm de long) entre la vanne de détente et l'entrée du réfrigérant.*

Montage

Dans un système à tuyau rigide, il est possible de monter les petits échangeurs thermiques (de 1 à 6 kg) directement dans la tuyauterie (Figure 2A). Les échangeurs thermiques plus gros doivent être attachés avec des supports (Figure 2D) conçus spécifiquement pour chaque échangeur thermique (accessoire), ou avec des sangles (Figure 2C) ou à l'aide de boulons de montage (Figure 2B). Pour les commandes spéciales, les boulons de montage peuvent être soudés à l'avant ou à l'arrière. Le couple de serrage des boulons M6 est de 3,8 Nm, de 9,5 Nm pour les boulons M8 et de 19,0 Nm pour les boulons M10.

> ***Remarque :*** *S'il y a un risque de vibrations, servez-vous de supports anti-vibrations, comme indiqué à la figure 2A.*

> ***Remarque :*** *Les échangeurs thermiques comportant des distributeurs de réfrigérant doivent être montés avec le distributeur vers le bas.*

> ***Remarque :*** *pendant l'installation, les charges de connexion ne doivent pas dépasser les valeurs indiquées dans le tableau « Limites des charges de connexion pendant l'installation » à l'intérieur de la page de couverture.*

> ***Remarque :*** *la tuyauterie doit être solidement ancrée et exécutée de façon à ce qu'aucune charge ne puisse être transférée vers l'échangeur de chaleur à plaques pendant le fonctionnement.*

Raccords (Figure 3)
Raccords filetés - Quand vous effectuez le raccord du tuyau, servez-vous d'une clé dynamométrique et respectez les limites indiquées. Certains modèles disposent de raccords type Victaulic.
Raccords brasés - Nettoyez les surfaces en les frottant et en les dégraissant. Utilisez un matériau de brasage métal adapté aux matériaux brasés et respectez la bonne température de brasage. Pour en savoir plus, veuillez consulter le document "Brasage des tuyaux pour les échangeurs thermiques brasés" ou contactez un représentant Alfa Laval.
Raccords soudés - soudage TIG ou MIG. Polissez l'intérieur et l'extérieur du tuyau, et si ce dernier est conique, polissez également le bord conique sur 25mm en partant du bord du tuyau vers l'intérieur. Cette opération permet d'éviter une contamination par le cuivre dans la zone de soudure, évitant ainsi à la soudure de se fissurer.

Remarque: *Protégez l'échangeur thermique contre la surchauffe en enveloppant le raccord d'un bout de tissu humide, quand vous effectuez un brasage ou une soudure. Toute chaleur excessive pourrait faire fondre le métal de brasage interne à l'intérieur de l'échangeur thermique. Veuillez vous reporter à la figure 3.*

⚠ ***Attention:*** *Quand vous déconnectez l'échangeur thermique du système de tuyauterie, portez un équipement de protection adéquat, comme des bottes de sécurité, des gants de sécurité, des protections pour les yeux, selon le type de produit dans l'échangeur thermique.*

Risque de gel

⚠ ***Attention:*** *N'oubliez pas les risques de gel à basses températures, pour éviter tout dommage à l'échangeur thermique. Les échangeurs thermiques qui ne sont pas en fonction doivent être vidés et séchés à l'air pulsé en cas de risque de gel.*

Remarque: *Pour éviter tout dommage dû au gel, le produit utilisé doit comporter un agent antigel adapté aux conditions de fonctionnement sous son point de congélation.*

Remarque: *Quand vous l'utilisez comme évaporateur*
- *Utilisez un contacteur à débit et un interrupteur basse-pression.*
- *Utilisez un thermostat antigel et un détecteur de débit pour assurer un débit d'eau constant avant, pendant et après le fonctionnement du compresseur.*
- *Évitez d'effectuer une aspiration, c'est à dire vider l'évaporateur en lançant le compresseur après extinction, jusqu'à atteindre la pression prescrite pour le réfrigérant. La température pourrait chuter sous le point de congélation, ce qui pourrait endommager l'évaporateur.*

Protection contre les obstructions
Utilisez un filtre pour protéger l'appareil contre d'éventuels particules étrangères. Si vous avez un doute concernant la taille maximale des particules, consultez votre représentant du fournisseur le plus proche ou regardez sous les informations produit sur le site Internet du fournisseur.

Contrôle et utilisation

> ***Attention:*** *N'utilisez pas l'échangeur thermique pour des produits (comme de l'eau désionisée) ou des installations (comme des tuyaux galvanisés) qui (chimiquement ou électrochimiquement) pourraient affecter ou être affectés par les plaques (en acier inoxydable) et le matériau de brasage (en cuivre).*

> ***Remarque:*** *Le cuivre peut entraîner une corrosion des installations faites de matériaux composites.*

Protection contre la fatigue thermique et / ou de pression

Des modifications soudaines de température et de pression pourraient entraîner une fatigue de l'échangeur thermique. En conséquence, il convient de prendre en compte les éléments suivants pour s'assurer que l'échangeur thermique fonctionne sans que la température ou la pression change soudainement.

- Placez le capteur de température au plus proche de la sortie de l'échangeur thermique.
- Choisissez des vannes et un équipement de régulation qui assurent à l'échangeur thermique les températures et les pressions les plus stables possibles.
- Pour éviter les coups de bélier, vous ne devez pas utiliser de vannes à fermeture rapide, comme les vannes on/off.
- Dans les installations automatisées, l'arrêt et le démarrage des pompes et l'actionnement des vannes doivent être programmés de manière à ce que l'amplitude et la fréquence résultantes des variations de pression soient les plus faibles possibles.

Isolation

Des isolations thermiques de chauffage et de refroidissement sont disponibles en tant qu'accessoires.

> ***Remarque:*** *N'oubliez pas que les limites de température de l'isolant et de l'échangeur thermique peuvent être différentes.*

Dépannage

Pour s'assurer d'une bonne performance de l'échangeur thermique, vérifiez :

- que le système de tuyauterie a été connecté à l'échangeur thermique selon les instructions du présent manuel
- que l'échangeur thermique est parfaitement propre et sans dépôts.

> ***Remarque:*** *Des particules et des fibres peuvent obstruer l'échangeur thermique. Une augmentation de la chute de pression ou une chute de l'efficacité thermique indiquent que l'échangeur thermique est encrassé.*

- le circuit de contrôle correctement réglé et qu'il n'y a pas de gel.

Nettoyage

L'équipement est prévu pour être nettoyé sur place. Pour en savoir plus sur les processus de nettoyage qui conviennent, consultez le représentant du fournisseur ou visitez le site Internet du fournisseur. La personne responsable de cette opération doit s'assurer que l'appareil sera nettoyé selon la méthode qui convient et doit décider des intervalles de nettoyage à respecter.

> ***Remarque:*** *Le jeu de plaque n'est pas prévu pour être ouvert.*

Uso que corresponde
Los intercambiadores de calor soldados (BHE) se han diseñado para que la transferencia de calor cumpla los requisitos de una gran variedad de aplicaciones como la refrigeración, la calefacción, el calentamiento y la refrigeración industrial y la industria de transformación.

Definiciones

Advertencia: *Tipo de riesgo*
ADVERTENCIA indica una situación potencialmente peligrosa que, si no se evita, puede producir la muerte o lesiones graves.

Precaución: *Tipo de riesgo*
PRECAUCIÓN indica una situación potencialmente peligrosa que, si no se evita, puede producir lesiones leves o moderadas.

Aviso:
AVISO indica una situación potencialmente peligrosa que, si no se evita, puede producir daños en el equipo.

Placas de identificación
Hay tipos diferentes de placas de identificación en función del tipo de aprobación del recipiente de presión.

Aviso:
- *Se pueden utilizar otros tipos de placas de identificación. Para obtener información detallada póngase en contacto con un representante de Alfa Laval.*
- *Algunas especificaciones no se utilizan para todos los tipos de placas de identificación*

En la placa de identificación se muestra lo siguiente:
1. Espacio para el logotipo.
2. Nombre del fabricante.
3. Espacio para el sello de National Board y el número de serie.
4. N.º de artículo.
5. Tipo.
6. Número de fabricación o de serie.
7. Año o fecha de fabricación.
8. Ubicación de las conexiones para cada fluido.
9. Temperatura de funcionamiento máx. permitida.
10. Presiones de funcionamiento máx. permitidas.
11. Presión de prueba.
12. Fecha de la presión de prueba.
13. Volumen de cada espacio.
14. Temperaturas y presiones de funcionamiento permitidas.
15. Área de funcionamiento.
16. Descripción de cada espacio.
17. Grupo de fluidos.
18. Información exclusiva para el cliente.
19. Ubicaciones posibles de las conexiones.
20. Información de código de barras.
21. Espacio para marcar la aprobación (las marcas CE siguientes no son válidas para la placa de identificación de tipo 3)
    – CE-0409 BHE Manufacturing, Ronneby, Suecia
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italia.

Traducción de las instrucciones originales
© COPYRIGHT 2010 Alfa Laval Lund AB. Reservados todos los derechos

Condiciones requeridas

⚠ ***Advertencia:*** *El intercambiador de calor se debe instalar y poner en funcionamiento de forma tal que no existan riesgos de lesiones personales y de daños a la propiedad.*

Nota: *A menos que se especifique lo contrario, los datos del producto para los refrigerantes comunes (es decir, HFC y HCFC) corresponden a las aplicaciones de refrigeración. Antes de utilizar el intercambiador de calor para líquidos inflamables, tóxicos o peligrosos (por ejemplo, hidrocarburos) se deben utilizar las reglas de seguridad correspondientes para la manipulación de este tipo de líquidos. Para más información, consulte el sitio de Internet del proveedor.*

Instalación

Durante la instalación, se deben proporcionar equipos para proteger el intercambiador de calor contra presiones y temperaturas que estén fuera de los valores mínimos y máximos aprobados que se muestran en la placa de identificación.

⚠ ***Precaución:*** *Para evitar que los bordes cortantes le provoquen heridas en las manos, lleve siempre guantes cuando manipule los intercambiadores de calor soldados.*

Para obtener el mejor rendimiento posible en la transferencia de calor, el intercambiador de calor se debe conectar de forma tal que el flujo de medios que atraviesa el intercambiador de calor lo haga en direcciones opuestas (a contraflujo).

Aviso: *Antes de conectar cualquier tubería, asegúrese de que se hayan eliminado mediante lavado a presión todos los objetos extraños del sistema.*

⚠ ***Precaución:*** *Tenga en cuenta el riesgo de incendio durante el trabajo de instalación; es decir, considere la distancia respecto de sustancias inflamables.*

⚠ ***Precaución:*** *Nunca levante el equipo por las conexiones. Utilice correas cuando proceda a izar el equipo. Coloque las correas según la figura 1.*

Nota: *En aplicaciones con el evaporador y en aplicaciones en las que se produzca un cambio de fase en los medios, el intercambiador de calor se debe instalar verticalmente con una tubería recta (de al menos 150-200 mm de longitud) entre la válvula de expansión y la entrada de refrigerante.*

Montaje

En un sistema de tuberías rígidas, los intercambiadores de calor pequeños (que pesen de 1 a 6 kg) se pueden colgar directamente en las tuberías (Figura 2A). Los intercambiadores de calor más grandes se deben fijar con montajes de soporte (Figura 2D) diseñados para el intercambiador de calor específico (accesorio), con correas (Figura 2C) o mediante tornillos de montaje (Figura 2B). Para pedidos especiales, los tornillos de montaje se pueden soldar en la parte delantera o en la trasera. El par de apriete para los tornillos M6 es de 3,8 Nm, para los tornillos M8 es de 9,5 Nm, y para los tornillos M10, de 19,0 Nm.

Nota: *Si existe riesgo de vibraciones, utilice montajes antivibración como se muestra en la Figura 2A.*

Nota: *Los intercambiadores de calor con distribuidores de refrigerante deben montarse con el distribuidor en la parte inferior.*

Nota: *Durante la instalación, las potencias de conexión no deben exceder los valores de acuerdo a la tabla "Límites de potencias de conexión durante la instalación" que aparece en el dorso de la portada.*

Nota: *Durante el funcionamiento, las tuberías deben estar totalmente ancladas y se deben utilizar de manera que no llegue ninguna potencia al intercambiador de calor de placas.*

Conexiones (Figura 3)
Conexiones con rosca – Utilice una llave dinamométrica cuando conecte la tubería y respete los límites especificados. Algunos modelos se suministran con conexiones de tipo Victaulic.
Conexiones con soldado fuerte – Limpie frotando y desengrasando las diversas superficies. Utilice una calidad de metal de soldadura adecuada para los materiales que se vayan a someter a la soldadura fuerte, y utilice la temperatura de soldadura correcta. Para obtener información detallada consulte el documento “Tubos de soldadura para intercambiador de calor soldado” o póngase en contacto con un representante de Alfa Laval.
Conexiones soldadas – soldadura TIG o MIG. Rectifique el interior y el exterior del tubo y, si está achaflanado, rectifique también el perfil achaflanado como mínimo unos 25 mm desde el perfil del tubo y hacia dentro. Esta medida es necesaria para evitar una contaminación de cobre en el área soldada, que podría producir la rotura de la soldadura.

Nota: *Proteja el intercambiador de calor del recalentamiento envolviendo un trozo de tela húmedo alrededor de la conexión cuando se realiza una soldadura o soldadura fuerte. El calor excesivo puede fundir el metal de soldadura interno dentro del intercambiador de calor. Consulte la figura 3.*

⚠ ***Precaución:*** *Al desconectar el intercambiador de calor del sistema de tuberías, use equipos de protección como, por ejemplo, botas de seguridad, guantes de seguridad y protección ocular, dependiendo del tipo de medio que haya en el intercambiador de calor.*

Riesgo de congelación

⚠ ***Precaución:*** *Tenga en cuenta el riesgo de congelación a bajas temperaturas para evitar daños en el intercambiador de calor. Los intercambiadores de calor que no estén en funcionamiento se deben vaciar y secar con aire cuando exista riesgo de congelación.*

Nota: *Para evitar que se produzcan daños por congelación, el medio utilizado debe incluir un agente anticongelante cuando se utilice el equipo en condiciones de funcionamiento debajo del punto de congelación del medio.*

Nota: *Cuando se utiliza como evaporador*
- *Utilice un interruptor de flujo y uno de presión baja.*
- *Utilice un termostato anticongelante y un monitor de flujo para garantizar un flujo de agua constante antes de que se ponga en funcionamiento el compresor, durante el funcionamiento y después del funcionamiento de este.*
- *Evite la “evacuación mediante bombeo” (es decir, el vaciado) del evaporador haciendo funcionar el compresor después del apagado hasta que se alcance una presión de refrigerante preestablecida. La temperatura puede disminuir hasta alcanzar un valor inferior al punto de congelación del agua salada, y esto puede producir daños en el evaporador.*

Protección contra obstrucciones
Utilice un filtro como protección contra la posible presencia de partículas extrañas. Si tiene alguna duda respecto del tamaño máximo de las partículas, consulte a su representante más cercano del proveedor o consulte la información del producto en el sitio de Internet del proveedor.

Control y funcionamiento

> ***Precaución:*** *No utilice el intercambiador de calor para medios (por ejemplo, agua desionizada)/instalaciones (por ejemplo, tuberías galvanizadas) que (químicamente/electroquímicamente) puedan afectar las placas o verse afectador por ellas (acero inoxidable) y el material de soldadura (cobre).*

> ***Nota:*** *El cobre puede generar corrosión en una instalación con materiales mixtos*

Protección contra la fatiga térmica o de presión
Los cambios repentinos de temperatura o de presión pueden producir daños por fatiga en el intercambiador de calor. Por lo tanto, se debe tener en cuenta lo siguiente para garantizar que los intercambiadores de calor funcionen sin oscilaciones de presión/temperatura.

- Ubique el sensor de temperatura tan cerca como sea posible de la salida del intercambiador de calor.
- Seleccione válvulas y equipos de regulación que proporcionen temperaturas/presiones estables para el intercambiador de calor.
- Para evitar golpes de ariete, no se deben utilizar válvulas de cierre rápido (por ej., válvulas de encendido/apagado).
- En instalaciones automatizadas, la detención y el encendido de bombas, y la activación de válvulas se debe programar de modo que la amplitud y la frecuencia resultantes de la variación de presión sean lo más bajas posible.

Aislamiento
Se encuentran disponibles aislamientos de calefacción y enfriamiento como accesorios.

> ***Nota:*** *Tenga en cuenta que los límites de temperatura del aislamiento y del intercambiador de calor pueden ser diferentes.*

Solución de problemas
Para garantizar el rendimiento correcto del intercambiador de calor, compruebe que:

- el sistema de tuberías se haya conectado al intercambiador de calor según las instrucciones de este manual
- el intercambiador de calor esté perfectamente limpio y que no tenga depósitos.

> ***Nota:*** *Las partículas y las fibras pueden obstruir el intercambiador de calor. Un aumento de la caída de presión o una caída de la eficacia térmica indica que el intercambiador de calor está sucio.*

- el circuito de control se haya preestablecido correctamente y que no haya congelación.

Limpieza
El equipo se puede limpiar sin desmontarlo. Para obtener asesoramiento sobre los procesos de limpieza adecuados, consulte con el representante del proveedor o visite el sitio de Internet del proveedor. La persona responsable del funcionamiento debe garantizar que se utilice el método de limpieza correcto y debe decidir los intervalos de limpieza más adecuados.

> ***Nota:*** *El paquete de placas no debe abrirse.*

Impiego previsto
Gli scambiatori di calore brasati (BHE) sono stati progettati per eseguire un trasferimento di calore che soddisfi i requisiti di un'ampia gamma di applicazioni quali la refrigerazione, il riscaldamento di confort, il riscaldamento e il raffreddamento industriali e le applicazioni dell'industria di processo.

Definizioni

Avvertenza *Tipo di pericolo*
AVVERTENZA - indica una situazione potenzialmente pericolosa che, se non evitata, può causare lesioni gravi o addirittura letali.

Attenzione: *Tipo di pericolo*
ATTENZIONE - indica una situazione potenzialmente pericolosa che, se non evitata, può causare lesioni leggere o moderate.

Nota
NOTA - indica una situazione potenzialmente pericolosa che, se non evitata, può causare danni alle cose.

Piastrine identificative
Vi sono diversi tipi di piastrine identificative, a seconda del tipo di approvazione del contenitore a pressione.

Nota
- *Possono essere utilizzati altri tipi di piastrine identificative. Per informazioni dettagliate, entrare in contatto con un rappresentante Alfa Laval.*
- *Alcuni dati tecnici non vengono utilizzati in tutti i tipi di piastrine identificative.*

La piastrina identificativa reca:
1. spazio per il logotipo;
2. nome del produttore;
3. spazio per il timbro dell'ente nazionale preposto e il numero di serie;
4. codice articolo;
5. tipo;
6. numero di produzione o di serie;
7. anno o data di produzione;
8. posizioni delle connessioni per ciascun fluido;
9. temperature massime operative consentite;
10. pressioni massime operative consentite;
11. pressione di prova;
12. data della prova di pressione;
13. volume di ogni spazio;
14. temperature e pressioni operative consentite;
15. area operativa;
16. descrizione di ogni spazio;
17. gruppo di fluidi;
18. informazioni specifiche al cliente;
19. posizioni possibili per le connessioni;
20. dati del codice a barre;
21. spazio per il contrassegno d'approvazione
    (i contrassegni CE sottostanti non sono validi per la piastrina identificativa di tipo 3)
    – CE-0409 BHE Manufacturing, Ronneby, Svezia
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, Repubblica Popolare Cinese
    – CE-0948 Alfa Laval S.p.A. Alonte, Italia.

Istruzioni originali
© COPYRIGHT 2010 Alfa Laval Lund AB. Tutti i diritti riservati - All rights reserved

Requisiti

> ***Avvertenza*** *Lo scambiatore di calore deve essere installato e utilizzato in modo tale da prevenire qualsivoglia rischio di lesioni al personale e danni alle proprietà.*

> ***Nota:*** *se non diversamente specificato, i dati dei prodotti per refrigeranti normali, ad es. HFC e HCFC, sono applicabili ad applicazioni di refrigerazione. Prima che lo scambiatore di calore venga utilizzato per liquidi infiammabili, tossici o pericolosi (come ad esempio idrocarburi), si devono osservare le pertinenti regole di sicurezza per la manipolazione di tali liquidi. Per ulteriori informazioni, consultare il sito Internet del fornitore.*

Installazione

L'installazione deve essere eseguita con apparecchiature che proteggano lo scambiatore di calore da pressioni e temperature non conformi all'intervallo fra i valori massimo e minimo approvati, indicati sulla piastrina.

> ***Attenzione:*** *Per evitare lesioni dovute ai bordi appuntiti, indossare sempre guanti protettivi in caso di manipolazione degli scambiatori di calore brasati.*

Per un trasferimento termico ottimale, lo scambiatore di calore deve essere collegato in modo tale che il flusso dei fluidi nel nucleo avvenga in direzioni opposte (controflusso).

> ***Nota*** *Prima di collegare qualsiasi tubazione, accertarsi che non siano rimasti corpi estranei nell'impianto.*

> ***Attenzione:*** *Tenere in considerazione il rischio di incendio durante le operazioni di installazione (ad esempio, non dimenticare di mantenere a distanza le sostanze infiammabili).*

> ***Attenzione:*** *non sollevare mai tramite le connessioni. Per il sollevamento, avvalersi di imbracature. Sistemare le imbracature secondo quanto illustrato in Figura 1.*

> ***Nota:*** *nel caso delle applicazioni di evaporazione ed in quelle in cui avviene un cambiamento di fase del fluido utilizzato, lo scambiatore di calore deve essere installato in posizione verticale, con un tubo diritto (di lunghezza di almeno 150-200 mm) tra la valvola d'espansione e la bocchetta di immissione del refrigerante.*

Montaggio

Nel caso di un impianto a tubo rigido, gli scambiatori di calore di dimensioni ridotte (dal peso compreso tra 1 e 6 kg) possono essere sospesi direttamente alle tubazioni (Figura 2A). Gli scambiatori di dimensioni maggiori devono essere fissati mediante staffe di supporto (Figura 2D) previste per un tipo specifico di scambiatore (come accessorio) o assicurati per mezzo di bande (Figura 2C) o fissati da bulloni di montaggio (Figura 2B). Nel caso di ordini speciali, i bulloni di montaggio possono essere saldati alla parte anteriore o posteriore. La coppia di serraggio per i bulloni M6 deve essere di 3,8 Nm, per quelli M8 di 9,5 Nm ed ancora per i bulloni M10 di 19,0 Nm.

> ***Nota*** *nel caso di rischio di vibrazioni, utilizzare montaggi anti-vibrazioni come illustrato dalla Figura 2A.*

> ***Nota*** *gli scambiatori di calore con distributori di refrigerante devono essere montati con il distributore sul fondo.*

> ***Nota:*** *Durante l'installazione i carichi di collegamento non devono superare i valori riportati nella tabella "Limiti per i carichi di collegamento durante l'installazione" nella parte interna della prima pagina.*

> ***Nota:*** *Le tubazioni devono essere fissate in modo corretto ed eseguite in modo tale che nessun carico sia trasferito allo scambiatore di calore a piastre durante il funzionamento.*

Connessioni (Figura 3)
Connessioni filettate – Utilizzare una chiave dinamometrica per la connessione del tubo, rispettando i limiti specificati. Alcuni modelli vengono forniti con connessioni di tipo Victaulic.
Connessioni brasate – Pulire strofinando e sgrassando le varie superfici. Utilizzare una qualità di metallo per la brasatura che sia adatto per i materiali da brasare, mantenendosi alla corretta temperatura di brasatura. Per informazioni dettagliate, consultare il documento “Brasatura dei tubi per scambiatori di calore brasati” oppure mettersi in contatto con il rappresentante Alfa Laval.
Connessioni saldate – Saldatura TIG o MIG. Smerigliare internamente ed esternamente il tubo e, in caso di presenza di smussatura, anche il bordo smussato, per almeno 25 mm dal bordo del tubo e verso l'interno. Questo, per evitare la contaminazione di rame nell'area saldata, che potrebbe causare fessurazioni alla saldatura stessa.

Nota: *proteggere lo scambiatore di calore dal surriscaldamento avviluppando un panno umido attorno alla connessione, ogni volta che viene attuata una brasatura o una saldatura.Un riscaldamento eccessivo può provocare la fusione del metallo della brasatura all'interno dello scambiatore di calore. Consultare la Figura 3.*

⚠ ***Attenzione:*** *quando si sconnette lo scambiatore di calore dalle tubazioni, utilizzare un insieme di protezione adatto, composto da stivali di sicurezza, guanti ed occhiali protettivi, a seconda del tipo di prodotto che fluisce attraverso lo scambiatore di calore.*

Rischio di congelamento

⚠ ***Attenzione:*** *tenere in considerazione il rischio di congelamento alle basse temperature, per evitare danni allo scambiatore di calore. Qualora sia presente un rischio di congelamento, gli scambiatori di calore non operativi devono essere svuotati e asciugati mediante un flusso d'aria.*

Nota: *per evitare danni dovuti al congelamento, il fluido utilizzato deve comprendere un antigelo in condizioni operative inferiori al suo punto di congelamento.*

Nota: *se utilizzato come evaporatore*
- *Utilizzare un interruttore di flusso e un interruttore di bassa pressione.*
- *Utilizzare un termostato antigelo e un monitor di flusso, per garantire un flusso d’acqua costante prima, durante e dopo l’avvio del compressore.*
- *Evitare uno "spompaggio", come ad esempio nel caso dello svuotamento dell'evaporatore, facendo funzionare il compressore dopo l'arresto, fino al raggiungimento di una pressione del refrigerante preimpostata. La temperatura potrebbe scendere al di sotto del punto di congelamento della brina, danneggiando l’evaporatore.*

Protezione contro le ostruzioni
Utilizzare un filtro come protezione contro l’eventuale presenza di particelle estranee. In caso di dubbi riguardanti le dimensioni massime delle particelle, consultare il rappresentante di zona del fornitore oppure consultare le informazioni del prodotto sul sito Internet del fornitore.

Controllo ed operatività

> ***Attenzione:*** *non utilizzare lo scambiatore di calore per fluidi (ad esempio, acqua deionizzata)/installazioni (ad esempio, tubi galvanizzati) che potrebbero influire o subire un influsso (chimicamente/elettrochimicamente) da parte delle piastre (acciaio inossidabile) e del materiale di brasatura (rame).*

> ***Nota:*** *Il rame può provocare corrosione in installazioni dove coesistono materiali misti.*

Protezione contro la fatica da pressione e/o termica
Cambiamenti di pressione e temperatura improvvisi possono causare danni allo scambiatore di calore. Quindi, le indicazioni seguenti devono essere tenute in considerazione per garantire che lo scambiatore di calore operi senza cambiamenti di pressioni/temperature.

- Posizionare il sensore di temperatura il più vicino possibile all'uscita dallo scambiatore di calore.
- Utilizzare valore e apparecchiature di regolazione che consentano temperature/pressioni stabili nello scambiatore di calore.
- Per evitare il colpo d'ariete, non devono essere utilizzate valvole a chiusura rapida, ad esempio valvole on/off.
- In installazioni automatizzate, l'arresto e l'avvio delle pompe e l'attuazione delle valvole devono essere programmati in modo tale che l'ampiezza e la frequenza risultanti della variazione di pressione siano quanto minori possibili.

Isolamento
Isolamenti per riscaldamento e raffreddamento sono disponibili come accessori.

> ***Nota:*** *Tenere in considerazione che i limiti di temperatura dell'isolazione e dello scambiatore di calore possono essere differenti.*

Ricerca delle anomalie
Per assicurare la corretta operatività dello scambiatore di calore, verificare che:

- le tubazioni siano state connesse allo scambiatore di calore rispettando le istruzioni di questo manuale;
- lo scambiatore di calore sia perfettamente pulito ed esente da depositi.

> ***Nota:*** *particelle e fibre possono occludere lo scambiatore di calore. Un aumento della caduta di pressione o del decremento dell'efficienza termica indicano un'occlusione dello scambiatore di calore.*

- Verificare che il circuito di controllo sia predefinito correttamente e che non sia in atto alcun congelamento.

Pulizia e lavaggio
L'attrezzatura deve essere adatta per una pulizia in loco. Per consigli sui processi di pulizia adatti, consultare il rappresentante o il sito Internet del fornitore. La persona responsabile del funzionamento deve assicurare che venga impiegato un corretto metodo di pulizia e deve stabilire le frequenze di lavaggio adatte.

> ***Nota:*** *il gruppo piastre non deve essere aperto.*

Bestemd gebruik
De gesoldeerde warmtewisselaars zijn ontworpen om warmteoverdracht te verzorgen die voldoet aan de eisen van een groot aantal toepassingen zoals koelen, comfortverwarming, industriële verwarming en afkoeling en de procesindustrie.

Definities

Waarschuwing: *Soort gevaar*
WAARSCHUWING verwijst naar een mogelijk gevaarlijke situatie die indien niet vermeden de dood of ernstige verwondingen tot gevolg kan hebben.

Pas op: *Soort gevaar*
VOORZICHTIG verwijst naar een mogelijk gevaarlijke situatie die indien niet vermeden kleine of matige verwondingen tot gevolg kan hebben.

Opmerking:
NB verwijst naar een mogelijk gevaarlijke situatie die indien niet vermeden, schade aan eigendommen tot gevolg kan hebben.

Naamplaten
Afhankelijk van het goedkeuringstype voor het drukvat zijn er verschillende soorten naamplaten.

Opmerking:
- *Mogelijk worden andere soorten naamplaten gebruikt. Voor meer informatie kunt u contact opnemen met een Alfa Laval-vestiging.*
- *Sommige specificaties worden niet voor alle soorten naamplaten gebruikt*

De naamplaat toont:
1. Ruimte voor logo.
2. Naam van fabrikant.
3. Ruimte voor stempel nationale instantie en serienummer.
4. Artikelnummer.
5. Type.
6. Fabricage- of serienummer.
7. Fabricagejaar of -datum.
8. Locaties van aansluitingen voor elke vloeistof.
9. Max. toegestane bedrijfstemperaturen.
10. Max. toegestane bedrijfsdruk.
11. Testdruk.
12. Datum van testdruk.
13. Volume van elke ruimte.
14. Toegestane werktemperaturen en -druk.
15. Werkomgeving.
16. Beschrijving van elke ruimte.
17. Vloeistofgroep.
18. Informatie uniek voor de klant.
19. Mogelijke locaties van aansluitingen.
20. Barcode-informatie.
21. Ruimte voor keurmerk. (CE-markeringen hieronder zijn niet geldig voor naamplaat type 3)
    – CE-0409 BHE Manufacturing, Ronneby, Zweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italië.

Vertaling van oorspronkelijke instructies
© COPYRIGHT 2010 Alfa Laval Lund AB. Alle rechten voorbehouden

Vereisten

> ***Waarschuwing:*** *De warmtewisselaar moet zodanig worden geïnstalleerd, bediend en gebruikt dat er geen risico op letsel bij personeel en schade aan eigendommen bestaat.*

> ***Opmerking :*** *Tenzij anders is aangegeven, gelden de productgegevens voor normale koelmiddelen, d.w.z. HFC en HCFC, voor koeltoepassingen. Voordat de warmtewisselaar gebruikt wordt voor brandbare, giftige of gevaarlijke vloeistoffen (zoals koolwaterstoffen) moeten de relevante beveiligingsregels voor het verwerken van zulke vloeistoffen worden toegepast. Zie voor meer informatie de website van de leverancier.*

Installatie

De installatie moet zijn uitgerust met apparatuur die de warmtewisselaar beschermt tegen drukken en temperaturen buiten de goedgekeurde minimum- en maximumwaarden die zijn aangegeven op het typeplaatje.

> ***Pas op:*** *Ter voorkoming van verwondingen veroorzaakt door scherpe randen, dient men altijd handschoenen te dragen tijdens werkzaamheden aan de gesoldeerde warmtewisselaars.*

Voor optimale warmteoverdracht dient de warmtewisselaar zo te worden aangesloten dat de vloeistofstroom in tegenovergestelde richtingen (tegenstrooms) door de warmtewisselaar beweegt.

> ***Opmerking:*** *Zorg ervoor dat alle vreemde voorwerpen uit het systeem zijn gespoeld voordat buizen worden aangesloten.*

> ***Pas op:*** *Houd rekening met het risico van brand tijdens de installatiewerkzaamheden, d.w.z. let op de afstand tot ontvlambare stoffen.*

> ***Pas op:*** *Nooit aan de aansluitingen optillen. Voor het hijsen moeten hijsbanden worden gebruikt. Plaats de hijsbanden zoals in afbeelding 1.*

> ***Opmerking :*** *In verdampertoepassingen en in toepassingen waarin een faseverandering van de media plaatsvindt, moet de warmtewisselaar verticaal worden geplaatst met een rechte leiding (ten minste150-200 mm lang) tussen de expansieklep en de koelinlaat.*

Montage

In een systeem met starre leidingen kunnen kleine warmtewisselaars (met een gewicht van 1 tot 6 kg) rechtstreeks aan de leidingen worden opgehangen (afbeelding 2A). Grotere warmtewisselaars moeten met steunen worden vastgezet (afbeelding 2D) die voor een specifieke warmtewisselaar bedoeld zijn (toebehoren), of worden vastgezet met riemen (afbeelding 2C) of montagebouten (afbeelding 2B). Voor speciale opdrachten kunnen montagebouten aan de voor- of achterkant worden gelast. Het aandraaimoment voor M6 bouten is 3,8 Nm, M8 bouten 9,5 Nm, en voor M10 bouten 19,0 Nm.

> ***Opmerking:*** *Als er kans op trillingen bestaat, anti-trilsteunen monteren als in afbeelding 2A.*

> ***Opmerking:*** *Warmtewisselaars met koelmiddelverdeelkop met de verdeelkop aan de onderkant monteren.*

> ***Opmerking:*** *Tijdens de installatie mogen de aansluitbelastingen niet de waarden overschrijden zoals vermeld in de tabel “Limieten voor aansluitbelastingen tijdens de installatie” aan de binnenkant van de voorpagina.*

> ***Opmerking:*** *Het leidingwerk moet goed verankerd en uitgevoerd zijn zodat er tijdens de werking geen belasting wordt overgedragen op de platenwarmtewisselaar.*

Aansluitingen (afbeelding 3)
Aansluitingen met schroefdraad: gebruik een momentsleutel bij het aansluiten van de leiding en let op de opgegeven limieten. Sommige modellen zijn voorzien van aansluitingen van het type Victaulic.
Gesoldeerde aansluitingen: schoonmaken door de verschillende oppervlakken te schuren en ontvetten. Gebruik soldeer dat geschikt is voor de te solderen materialen en gebruik de juiste soldeertemperatuur. Zie voor meer informatie het document "Leidingen voor gesoldeerde warmtewisselaar solderen" of neem contact op met een vertegenwoordiger van Alfa Laval.
Gelaste verbindingen: TIG of MIG lassen. Slijp binnenkant en buitenkant van leiding en (indien afgeschuind) ook de schuine rand ten minste 25 mm van de leidingrand en naar binnen. Dit moet gebeuren om koperverontreiniging in het lasoppervlak te voorkomen, die ertoe kan leiden dat de las scheurt.

Opmerking : *Bescherm de warmtewisselaar tegen oververhitting door een natte lap om de aansluiting te wikkelen bij soldeer- of laswerkzaamheden. Teveel warmte kan de interne soldeer binnen de warmtewisselaar doen smelten. Raadpleeg afbeelding 3.*

⚠ ***Pas op:*** *Gebruik de juiste beschermende uitrusting bij het losmaken van de warmtewisselaar van de leidingen, zoals veiligheidsschoenen, veiligheidshandschoenen en oogbeschermers, afhankelijk van het type medium in de warmtewisselaar.*

Kans op bevriezen

⚠ ***Pas op:*** *Houd rekening met de kans op bevriezen bij lage temperaturen om schade aan de warmtewisselaar te voorkomen. Warmtewisselaars die niet in bedrijf zijn, dienen te worden geleegd en drooggeblazen wanneer er kans op bevriezing bestaat.*

Opmerking : *Om schade door bevriezing te voorkomen, moet het gebruikte medium bij bedrijfscondities onder het vriespunt van het medium een antivriesmiddel bevatten.*

Opmerking : *Indien gebruikt als verdamper*
- *Gebruik een stromingsschakelaar en een lagedrukschakelaar.*
- *Gebruik een antivriesthermostaat en stromingsmeter om voor, tijdens en na het draaien van de compressor een constante waterstroom te garanderen.*
- *Vermijd 'pump-down', d.w.z. het legen van de verdamper door de compressor na uitschakeling te laten draaien totdat een vooraf ingestelde koelmiddeldruk is bereikt. De temperatuur kan dan dalen tot onder het vriespunt voor koudedragers, waardoor de verdamper beschadigd kan raken.*

Bescherming tegen verstopping
Gebruik een filter als bescherming tegen eventuele vreemde deeltjes. Als u twijfels hebt over de maximale deeltjesgrootte, neem dan contact op met de dichtstbijzijnde vestiging van de leverancier of kijk onder Productinformatie op de website van de leverancier.

Bediening en gebruik

⚠ ***Let op :*** *Gebruik de warmtewisselaar niet voor media (zoals gedeïoniseerd water)/installaties (zoals gegalvaniseerde leidingen) die (chemisch of elektrochemisch) de platen (roestvrijstaal) en het soldeermateriaal (koper) kunnen beïnvloeden of daardoor beïnvloed kunnen worden.*

Opmerking : *Koper kan corrosie veroorzaken in installaties met gemengde materialen*

Bescherming tegen thermische vermoeidheid en drukvermoeidheid
Plotselinge temperatuur- en drukveranderingen kunnen vermoeidheidsschade aan de warmtewisselaar veroorzaken. Daarom moet op het volgende worden gelet om ervoor te zorgen dat de warmtewisselaars werken zonder sterk wisselende druk of temperaturen.

- Plaats de temperatuursensor zo dicht mogelijk bij de uitlaat van de warmtewisselaar.
- Kies kleppen en regelapparatuur die de temperaturen/drukken van de warmtewisselaar stabiel houden.
- Om waterslag te voorkomen mogen geen snelsluitende kleppen (zoals AAN/UIT-kleppen) worden gebruikt.
- Bij geautomatiseerde installaties dienen uit- en inschakeling van pompen en bediening van kleppen zodanig te worden geprogrammeerd dat de resulterende amplitude en frequentie van de drukschommeling zo laag mogelijk is.

Isolatie
Verwarmings- en koelingsisolatie is als toebehoren verkrijgbaar.

Opmerking : *Houd er rekening mee dat temperatuurlimieten van isolatie en de warmtewisselaar kunnen verschillen.*

Problemen oplossen
Controleer voor een goede werking van de warmtewisselaar:

- of het leidingsysteem volgens de aanwijzingen in deze handleiding op de warmtewisselaar is aangesloten
- of de warmtewisselaar perfect schoon en vrij van neerslag is.

Opmerking : *Deeltjes en vezels kunnen de warmtewisselaar verstoppen. Een toename in de drukval of een vermindering in de thermische efficiëntie geeft aan dat de warmtewisselaar vervuild is.*

- het bedieningscircuit correct is ingesteld en geen bevriezing plaatsvindt.

Reinigen
De uitrusting is geschikt voor schoonmaken ter plaatse. Neem voor advies over de geschikte manier van schoonmaken contact op met de vertegenwoordiger van de leverancier of bezoek de internetsite van de leverancier. Degene die voor de bediening verantwoordelijk is, moet er voor zorgen dat de juiste schoonmaakmethode wordt toegepast en moet de juiste schoonfrequentie bepalen.

Opmerking : *Het platenpakket mag niet worden geopend.*

Utilização prevista
Os permutadores de placas soldadas (PPS) foram concebidos para realizar a transferência de calor, cumprindo os requisitos de uma vasta gama de aplicações como, por exemplo, refrigeração, aquecimento de conforto, aquecimento e arrefecimento industriais e indústria transformadora.

Definições

Aviso:*Tipo de perigo*
⚠ *AVISO indica uma situação de perigo potencial que, se não for evitada, poderá resultar em morte ou ferimentos graves.*

Cuidado:*Tipo de perigo*
⚠ *CUIDADO indica uma situação de perigo potencial que, se não for evitada, poderá resultar em ferimentos leves ou médios.*

Nota:
NOTA indica uma situação de perigo potencial que, se não for evitada, poderá resultar em danos materiais.

Placas de identificação
Existem diferentes tipos de placas de identificação em função do tipo de aprovação de recipientes sob pressão.

Nota:
- *Poderão ser utilizados outros tipos de placas de identificação. Para obter informações detalhadas, contacte um representante da Alfa Laval.*
- *Nem todas as especificações são utilizadas para todos os tipos de placas de identificação*

A placa de identificação apresenta:
1. Espaço para o logótipo.
2. Nome do fabricante.
3. Espaço para a marca e o número de série do Instituto Nacional.
4. Número de artigo
5. Tipo.
6. Número de série ou de fabrico.
7. Ano ou data de fabrico.
8. Localizações das ligações para cada fluido.
9. Temperaturas de funcionamento máximas admissíveis.
10. Pressões de funcionamento máximas admissíveis.
11. Pressão de teste.
12. Data da pressão de teste.
13. Volume de cada espaço.
14. Pressões e temperaturas de funcionamento admissíveis.
15. Zona de funcionamento.
16. Descrição de cada espaço.
17. Grupo de fluidos.
18. Informações exclusivas para o cliente.
19. Localizações possíveis das ligações.
20. Informações de código de barras.
21. Espaço para a marca de aprovação. (As seguintes marcas CE não são válidas para o tipo de placa de identificação 3)
    – CE-0409 BHE Manufacturing, Ronneby, Suécia
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Cidade de Jiangyin, RPC
    – CE-0948 Alfa Laval S.p.A. Alonte, Itália.

Instruções originais
© COPYRIGHT 2010 Alfa Laval Lund AB. Todos os direitos reservados

Requisitos

Aviso: *O permutador de placas tem de ser instalado e operado de forma a evitar o risco de danos físicos e materiais.*

Nota: *Salvo especificação em contrário, os dados de produto para refrigerantes normais, ou seja, HFC e HCFC, são aplicáveis a aplicações de refrigeração. Antes da utilização do permutador de placas para líquidos inflamáveis, tóxicos ou perigosos (por exemplo, hidrocarbonetos), têm de ser utilizadas as regras de segurança relevantes para o processamento desses líquidos. Para obter mais informações, consulte o site da Internet do fornecedor.*

Instalação

A instalação tem de possuir equipamento de protecção do permutador de placas contra temperaturas e pressões que excedam os valores mínimos e máximos aprovados indicados na placa de identificação.

Cuidado: *Utilize sempre luvas de protecção ao manusear os permutadores de placas soldadas para não ferir as mãos em arestas vivas.*

Para obter o melhor desempenho de transferência de calor possível, o permutador de placas deve estar ligado de modo a que os agentes fluam através do permutador de placas em sentidos opostos (em contracorrente).

Nota:*Antes de ligar qualquer tubagem, verifique se foram lavados do sistema todos os corpos estranhos.*

Cuidado: *Tenha em atenção o risco de incêndio durante o processo de instalação, ou seja, a distância relativamente a substâncias inflamáveis.*

Cuidado: *Nunca ice pelas ligações. Devem ser usadas cintas para içar. Coloque as cintas de acordo com a figura 1.*

Nota: *Em aplicações de evaporadores e em aplicações nas quais ocorre uma mudança de fase dos agentes, o permutador de placas tem de ser instalado na vertical com um tubo direito (de, pelo menos, 150 a 200 mm de comprimento) entre a válvula de expansão e a entrada do refrigerante.*

Montagem

Num sistema de tubagem rígida, é possível suspender permutadores de placas pequenos (1 a 6 kg de peso) directamente nas tubagens (Figura 2A). Os permutadores de placas maiores devem ser fixados com suportes (Figura 2D) destinados a um permutador de placas específico (acessório), fixados com cintas (Figura 2C) ou através de parafusos de fixação (Figura 2B). No caso de encomendas especiais, é possível soldar parafusos de fixação às partes posterior ou frontal. O binário de aperto para parafusos M6 é de 3,8 Nm, para parafusos M8 de 9,5 Nm e para parafusos M10 de 19,0 Nm.

Nota: *Se existir risco de vibrações, utilize suportes antivibração, conforme indicado na Figura 2A.*

Nota: *Os permutadores de placas com distribuidores de refrigerante devem ser instalados com o distribuidor na parte inferior.*

Nota: *Durante a instalação, as cargas de ligação não devem exceder os valores de acordo com a tabela "Limites das cargas de ligação durante a instalação" no interior da página de capa.*

Nota: *A canalização devem ser bem fixada e executada de modo a não serem transferidas cargas para o permutador de calor do prato durante o funcionamento.*

Ligações (Figura 3)
Ligações roscadas – Utilize uma chave dinamométrica ao ligar o tubo e respeite os limites especificados. Alguns modelos são fornecidos com ligações de tipo Victaulic.
Ligações soldadas – Limpe, esfregando e desengordurando as diversas superfícies. Utilize um tipo de metal de soldadura adequado para os materiais a soldar e utilize a temperatura de soldadura correcta. Para obter informações detalhadas, consulte o documento “Soldar tubos para permutadores placas soldadas” ou contacte um representante da Alfa Laval.
Ligações soldadas – Soldadura TIG ou MIG. Lixe o interior e o exterior do tubo e, se for o caso, também o rebordo biselado a, pelo menos, 25 mm da extremidade e do centro do tubo. Este procedimento deve ser realizado para evitar a contaminação do cobre na zona soldada, que poderá causar fissuras na soldadura.

Nota: *Proteja o permutador de placas do sobreaquecimento colocando um pano húmido em redor da ligação sempre que efectuar qualquer soldadura. O aquecimento excessivo poderá derreter o metal de soldadura no interior do permutador de placas. Consulte a figura 3.*

⚠ ***Cuidado:*** *Ao desligar o permutador de placas do sistema de tubagem, utilize equipamento de protecção adequado como, por exemplo, botas de protecção, luvas de protecção e protecção ocular, em função do tipo de agentes presentes no permutador de placas.*

Risco de congelação

⚠ ***Cuidado:*** *Tenha em atenção o risco de congelação a temperaturas baixas, de forma a evitar danos no permutador de placas. Os permutadores de placas que não estejam a funcionar devem ser esvaziados e secados sempre que existir risco de congelação.*

Nota: *De forma a evitar danos resultantes de congelação, o agente utilizado tem de incluir um anticongelante em condições de funcionamento abaixo do respectivo ponto de congelação.*

Nota: *Quando utilizado como evaporador*
- *Utilize um interruptor de fluxo e um interruptor de pressão baixa.*
- *Utilize um termóstato e um controlador de fluxo anticongelante para garantir um fluxo de água constante antes, durante e após o funcionamento do compressor.*
- *Evite a "bombagem", ou seja, o esvaziamento do evaporador através da activação do compressor após a paragem até que se obtenha uma pressão de refrigerante predefinida. A temperatura poderá, em seguida, descer abaixo do ponto de congelação do anticongelante, o que poderá danificar o evaporador.*

Protecção contra entupimentos
Utilize um filtro como protecção contra a possível presença de partículas estranhas. Se tiver dúvidas relativamente ao tamanho máximo das partículas, consulte o representante do fornecedor mais próximo ou as informações do produto no site da Internet do fornecedor.
Controlo e funcionamento

⚠ ***Cuidado:*** *Não utilize o permutador de placas para agentes (por exemplo, água desionizada)/instalações (por exemplo, tubos galvanizados) que possam afectar ou ser afectados (quimicamente/electroquimicamente) pelas placas (aço inoxidável) e pelo material de soldadura (cobre).*

Nota: *O cobre poderá criar corrosão em instalações com materiais mistos*

Protecção contra fadiga térmica e/ou de pressão
Alterações bruscas de temperatura e pressão poderão causar danos por fadiga no permutador de placas. Assim sendo, tenha em atenção o seguinte para garantir que os permutadores de placas funcionam sem oscilações de pressão/temperatura.

- Instale o sensor de temperatura tão perto quanto possível da saída do permutador de placas.
- Opte por válvulas e equipamento de regulação que forneçam temperaturas/pressões estáveis ao permutador de placas.
- De forma a evitar o golpe de aríete, não devem ser utilizadas válvulas de fecho rápido como, por exemplo, válvulas de abertura/fecho.
- Em instalações automatizadas, a paragem e o arranque de bombas e o funcionamento de válvulas devem ser programados de forma a que a amplitude e frequência resultantes da variação de pressão sejam o mais baixas possíveis.

Isolamento
Os isolamentos de aquecimento e arrefecimento estão disponíveis como acessórios.

Nota: *Tenha em atenção que os limites de temperatura do isolamento e do permutador de placas poderão ser diferentes.*

Resolução de problemas
De forma a garantir o desempenho correcto do permutador placas, verifique se:

- o sistema de tubagem foi ligado ao permutador de placas de acordo com as instruções contidas neste manual
- o permutador de placas está completamente limpo e livre de depósitos.

Nota: *Partículas e fibras poderão entupir o permutador de placas. Um aumento da queda de pressão ou uma redução na eficiência térmica indicam que o permutador de placas está entupido.*

- o circuito de controlo está correctamente predefinido e não ocorre congelação.

Limpeza
O equipamento está preparado para limpeza no local. Para obter informações sobre processos de limpeza adequados, consulte o representante do fornecedor ou visite o site da Internet do fornecedor. A pessoa responsável pelo funcionamento deve garantir a utilização do método de limpeza correcto e definir intervalos de limpeza adequados.

Nota: *A pilha de placas não deve ser aberta.*

Avsedd användning
De lödda värmeväxlarna (BHE) är utformade för värmeöverföring som uppfyller kraven i ett stort antal tillämpningar som kylning, komfortvärme, industriell uppvärmning och kylning samt processindustri.

Definitioner

Varning! *Typ av risk*
VARNING anger en potentiellt farlig situation som, om den inte undviks, kan leda till dödsfall eller allvarliga skador.

Varsamhet: *Typ av risk*
VARSAMHET anger en potentiellt farlig situation som, om den inte undviks, kan leda till lindriga eller medelsvåra skador.

Obs!
OBS! anger en potentiellt farlig situation som, om den inte undviks, kan leda till egendomsskador.

Märkskyltar
Det finns olika typer av namnplattor som beror på typen av tryckkärlsgodkännande.

Obs!
- *Andra typer av märkskyltar kan användas. För detaljerad information, kontakta en Alfa Laval-representant.*
- *Vissa specifikationer används inte för alla typer av märkskyltar*

På märkskylten finns:
1. Plats för logotyp.
2. Tillverkarens namn.
3. Plats för myndighetsstämpel och serienummer.
4. Artikelnummer.
5. Typ.
6. Tillverknings- eller serienummer.
7. Tillverkningsår eller tillverkningsdatum.
8. Placering av anslutningarna för varje vätska.
9. Max. tillåtna drifttemperaturer.
10. Max. tillåtna drifttryck.
11. Provtryck.
12. Provtrycksdatum.
13. Volym hos varje utrymme.
14. Tillåtna drifttemperaturer och tryck.
15. Driftområde.
16. Beskrivning av varje utrymme.
17. Vätskegrupp.
18. Unik information för kunden.
19. Möjliga anslutningsplatser.

Krav

Varning! *Värmeväxlaren måste installeras och användas så att det inte finns någon risk för att det uppstår person- eller egendomsskador.*

OBS! *Om inget annat anges gäller produktdata för normala köldmedel, dvs. HFC och HCFC, i kylsystem. Innan värmeväxlaren används med lättantändliga, giftiga eller farliga vätskor (t.ex. kolväten) måste säkerhetsanvisningarna för hantering av sådana vätskor följas. För ytterligare information, se leverantörens webbplats.*

Installation

Installationen måste förses med utrustning som skyddat värmeväxlaren mot tryck och temperaturer utanför de godkända min- och maxvärdena på märkskylten.

Varsamhet: *Skyddshandskar ska alltid användas vid hantering av lödda värmeväxlare för att undvika att skarpa kanter orsakar skador.*

För bästa möjliga värmeöverföringskapacitet ska värmeväxlaren anslutas så att medierna flyter genom värmeväxlaren i motsatta riktningar (i motflöde)..

Obs! *Kontrollera att alla främmande föremål spolats ut ur systemet innan rören kopplas in.*

Varsamhet: *Tänk på brandrisken under installationsarbetet, dvs. tänk på avståndet till lättantändliga ämnen.*

Varsamhet: *Lyft aldrig anslutningarna. Använd istället lämpliga remmar vid lyft. Placera remmarna enligt bild 1.*

OBS! *I förångartillämpningar och i tillämpningar där en fasändring sker hos medierna måste värmeväxlaren installeras vertikalt med ett rakt rör (minst 150-200 mm långt) mellan expansionsventilen och köldmedieinloppet.*

Montering

I ett styvt rörsystem kan små värmeväxlare (med vikt på 1–6 kg) hängas upp direkt i rören (Bild 2A). Större värmeväxlare ska fästas med stödfästen (Bild 2D) som är avsedda för en specifik värmeväxlare (tillbehör) eller hållas fast med remmar (Bild 2C) eller med fästbultar (Bild 2B). Vid specialbeställningar kan fästbultar svetsas fast fram eller bak. Åtdragningsmomentet för M6-bultar är 3,8 Nm, för M8-bultar är det 9,5 Nm och för M10-bultar 19,0 Nm.

Obs! *Om det finns risk för vibrationer ska vibrationshämmande fästen användas enligt Bild 2A.*

Obs! *Värmeväxlare med köldmediefördelare ska monteras med fördelaren nederst.*

Obs! *Under installationen får inte anslutningslasterna överstiga värdena i tabellen ”Limits for Connection Loads during Installation” på omslagets insida.*

Obs! *Rörledningarna måste vara väl förankrade och rördragningen måste vara utförd så att inga laster överförs till plattvärmeväxlaren under driften.*

Anslutningar (Bild 3)
Gängade anslutningar – Använd en momentnyckel när du ansluter röret och följ de angivna gränserna. Vissa modeller är försedda med Victaulic-anslutningar.
Lödda anslutningar – Rengör genom att torka av och avfetta de olika ytorna. Använd en lödmetallkvalitet som är lämplig för de material som ska lödas och använd rätt lödningstemperatur. För detaljerad information, se dokumentet ”Lödrör för lödda värmeväxlare” eller kontakta en Alfa Laval-representant.
Svetsade anslutningar – TIG- eller MIG-svetsning. Slipa inuti och utanpå röret samt, om det är avfasat, även den fasade kanten minst 25mm från rörets kant och inåt. Detta ska göras för att undvika kopparrester i det svetsade området, som annars skulle kunna få svetsfogen att spricka.

***OBS!** Skydda värmeväxlaren mot överhettning genom att linda en våt duk runt anslutningen när lödning eller svetsning utförs. Kraftig upphettning kan smälta den interna lödmetallen i värmeväxlaren. Se bild 3.*

⚠ ***Varsamhet:** När värmeväxlaren kopplas från rörsystemet måste lämplig skyddsutrustning, som skyddskängor, skyddshandskar och skyddsglasögon användas, beroende på typen av media i värmeväxlaren.*

Frysrisk

⚠ ***Varsamhet:** Tänk på frysrisken vid låga temperaturer för att undvika skador på värmeväxlaren. Värmeväxlare som inte är i bruk ska tömmas och blåsas torra när det finns risk för minusgrader.*

***OBS!** För att undvika frysskador måste det använda mediet innehålla frysskyddsmedel vid användning under dess fryspunkt.*

***OBS!** Vid användning som förångare*
- *Använd en flödesomkopplare och en lågtrycksströmställare.*
- *Använd en frysskyddstermostat och flödesövervakare för att kontrollera att det finns konstant vattenflöde före, under och efter att kompressorn har körts.*
- *Undvik att tömma förångaren genom att köra kompressorn efter avstängning tills ett förinställt köldmedietryck uppnås. Temperaturen kan då sjunka under köldbärarens fryspunkt, vilket kan skada förångaren.*

Skydd mot igensättning
Använd ett filter som skydd mot eventuella främmande partiklar. Om du tvekar på den maximala partikelstorleken, kontakta leverantörens närmaste representant eller se Produktinformation på leverantörens webbplats.

Kontroll och drift

⚠ ***Försiktigt!** Använd inte värmeväxlaren för medier (t.ex. avjoniserat vatten)/installationer (t.ex. galvaniserade rör) som (kemiskt/elektrokemiskt) kan påverka eller påverkas av plattorna (rostfritt stål) och lodet (koppar).*

***OBS!** Koppar kan skapa korrosion i anläggningar med blandade material*

Skydd mot temperatur- och/eller tryckutmattning
Plötsliga temperatur- och tryckförändringar kaj leda till utmattningsskador på värmeväxlaren. Därför måste man ta hänsyn till följande för att se till att värmeväxlarna fungerar utan svängande tryck/ temperaturer.

- Placera temperaturgivaren så nära värmeväxlarens utlopp som möjligt.
- Välj ventiler och reglerutrustning som ger stabila temperaturer/tryck för värmeväxlaren.
- För att undvika tryckstötar får snabbstängande ventiler inte användas, t.ex. på/av-ventiler.
- I automatiserade installationer ska stopp och start av pumpar och aktivering av ventiler programmeras för att ge så låg amplitud och frekvens hos tryckvariationen som möjligt.

Isolering
Värme- och kylisolering finns som tillbehör.

OBS! *Tänk på att isoleringen och värmeväxlaren kan ha olika temperaturgränser.*

Felsökning
För att värmeväxlaren ska ha rätt prestanda, kontrollera att:

- rörsystemet har anslutits till värmeväxlaren enligt anvisningarna i den här handboken
- värmeväxlaren är ren och fri från avlagringar.

OBS! *Partiklar och fibrer kan sätta igen värmeväxlaren. Ökat tryckfall eller minskad termisk effektivitet tyder på att värmeväxlaren är förorenad.*

- reglerkretsen är korrekt inställd och att ingen frysning uppstår.

Rengöring
Utrustningen är lämplig för rengöring på plats. För råd om lämpliga rengöringsprocesser, kontakta leverantörens representant eller besök leverantörens webbplats. Den driftansvarige ansvarar för att rätt rengöringsmetod används och ska besluta om lämpliga rengöringsintervaller.

OBS! *Plattpaketet ska inte öppnas.*

Käyttötarkoitus
Kovajuotetut lämmönvaihtimet (BHE) on suunniteltu täyttämään monenlaisten sovellusten, kuten jäähdytyksen, lämmityksen, teollisen lämmityksen ja jäähdytyksen sekä prosessiteollisuuden lämmönsiirtotarpeet.

Määritelmät

Varoitus: *Vaaran tyyppi*
⚠ *VAROITUS tarkoittaa mahdollisesti vaarallista tilannetta,joka - jos tilannetta ei korjata - voi aiheuttaa kuoleman tai vakavan vamman.*

Huomautus: *Vaaran tyyppi*
⚠ *HUOMAUTUS tarkoittaa mahdollisesti vaarallista tilannetta, joka - jos tilannetta ei korjata - voi aiheuttaa pienen tai lievän vamman.*

Huom:
HUOM tarkoittaa mahdollisesti vaarallista tilannetta, joka – jos tilannetta ei korjata – voi aiheuttaa omaisuusvahingon.

Tyyppikilvet
Tyyppikilpiä on olemassa erilaisia paineastian hyväksyntätyyppien mukaan.

Huom:
- *Muun tyyppisiä tyyppikilpiä voidaan käyttää. Lisätietoja saat Alfa Lavalin edustajalta.*
- *Tiettyjä erittelyitä ei käytetä kaikissa tyyppikilvissä.*

Tyyppikilven sisältämät tiedot:
1. Logolle varattu tila
2. Valmistajan nimi
3. Keskuslautakunnan leimalle ja sarjanumerolle varattu tila
4. Tuotenumero
5. Tyyppi
6. Valmistus- tai sarjanumero
7. Valmistusvuosi tai -päivämäärä
8. Eri nesteiden yhteiden sijainti
9. Korkeimmat sallitut käyttölämpötilat
10. Korkeimmat sallitut käyttöpaineet
11. Koepaine
12. Koepaineen päivämäärä
13. Kunkin tilan tilavuus
14. Sallitut käyttölämpötilat ja -paineet
15. Käyttöalue
16. Kunkin tilan kuvaus
17. Nesteryhmä
18. Asiakaskohtaiset tiedot
19. Yhteiden mahdolliset sijainnit
20. Viivakooditiedot
21. Hyväksyntämerkille varattu tila (alla olevat CE-merkinnät eivät koske tyypin 3 tyyppikilpeä)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Alkuperäisten ohjeiden käännös
© COPYRIGHT 2010 Alfa Laval Lund AB. Kaikki oikeudet pidätetään.

Vaatimukset

Varoitus:*Lämmönvaihtimen asennuksessa ja käytössä on huolehdittava siitä, ettei henkilöille tai omaisuudelle aiheudu vahinkoja.*

Huom! *Ellei muuta mainita, tavallisten jäähdytysaineiden, esimerkiksi HFC :n ja HCFC:n, tuotetietoja voidaan soveltaa jäähdytyssovelluksissa. Kun lämmönvaihdinta käytetään syttyvien, myrkyllisten tai vaarallisten nesteiden (esimerkiksi hiilivetyjen) kanssa, kyseisten nesteiden käsittelyä koskevia turvaohjeita on noudatettava. Lisätietoja saat toimittajan Internet-sivustosta.*

Asennus

Asennusta varten on toimitettava varusteet, jotka suojaavat lämmönvaihdinta tyyppikilvessä määritetyt vähimmäis- ja enimmäispaineet ja -lämpötilat ylittäviltä arvoilta.

Huomautus:*Käytä aina suojakäsineitä kun käsittelet kovajuotettuja lämmönvaihtimia terävien reunojen aiheuttamien vammojen estämiseksi.*

Parhaan mahdollisen lämmönsiirtotehon takaamiseksi lämmönvaihdin on kytkettävä siten, että aine virtaa lämmönvaihtimen läpi vastakkaiseen suuntaan (vastavirtaan).

Huom: *Varmista ennen putkien liittämistä, että kaikki vieraat esineet on huuhdottu pois järjestelmästä.*

Huomautus: *Ota asennustyön aikana huomioon tulipalon vaara. Muista esimerkiksi huomioida riittävä etäisyys herkästi syttyviin aineisiin.*

Huomautus:*Älä koskaan nosta laitetta yhteistä. Nostamiseen on käytettävä hihnoja. Aseta hihnat kuvan 1 mukaisesti.*

Huom! *Höyrystinsovelluksissa ja sovelluksissa, joissa aineen vaihetta muutetaan, lämmönvaihdin on asennettava pystysuoraan (vähintään 150-200 mm:n pituinen) suora putki paisuntaventtiilin ja kylmäaineen tulon välille.*

Asennus

Jäykässä putkijärjestelmässä pienet (1-6 kg:n painoiset) lämmönvaihtimet voidaan ripustaa suoraan putkistoon (kuva 2A). Suuret lämmönvaihtimet on kiinnitettävä kyseiselle lämmönvaihtimelle tarkoitetuilla tukikiinnikkeillä (kuva 2D) (lisävaruste), hihnoilla (kuva 2C) tai kiinnityspulteilla (kuva 2B). Erikoistilauksesta kiinnityspultit voidaan hitsata laitteen etu- tai takaosaan. Kiristysmomentti M6-pulteille on 3,8 Nm, M8-pulteille 9,5 Nm ja M10-pulteille 19,0 Nm.

Huom:*Jos olemassa on tärinän vaara, käytä tärinää sietäviä kiinnikkeitä kuvassa 2A esitetyllä tavalla.*

Huom:*Kylmäaineen jakelulaitteilla varustetut lämmönvaihtimet on asennettava siten, että jakelulaite on yksikön alaosassa.*

Huom: *Asennuksen aikana liitäntäkuormat eivät saa ylittää kansilehden sisäpuolella olevan taulukon “Liitäntäkuormien rajat asennuksen aikana” arvoja.*

Huom: *Putkiston tulee olla hyvin ankkuroitu ja toteutettu niin, ettei kuormituksia välity levylämmönvaihtimeen käytön aikana.*

Yhteet (kuva 3)
Kierreyhteet – käytä momenttiavainta putken kytkemisessä ja noudata määritettyjä raja-arvoja. Tietyt mallit toimitetaan varustettuina Victaulic-tyyppisillä yhteillä.
Kovajuotetut yhteet – puhdista hiomalla ja poistamalla rasva eri pinnoilta. Käytä juotettaville materiaaleille sopivaa juottometallia ja asianmukaista juottolämpötilaa. Lisätietoa saat asiakirjasta “Brazing tubes for brazed heat exchanger” tai ottamalla yhteyttä Alfa Lavalin edustajaan.
Hitsausyhteet – TIG- tai MIG-hitsaus. Hio putkea sisä- ja ulkopuolelta ja, mikäli putki on viistetty, myös viisto kulma vähintään 23 mm:n matkalta putken reunasta sisäänpäin. Hiomisella vältetään hitsattavan alueen kuparijäämät, jotka voivat aiheuttaa hitsin vaurioitumisen.

***Huom!** Suojaa lämmönvaihdinta ylikuumenemiselta juottamisen tai hitsauksen aikana kietomalla märkä kangas yhteen ympärille. Liiallinen kuumuus voi sulattaa lämmönvaihtimen sisällä käytetyn juottometallin. Katso kuva 3.*

⚠ ***Huomautus:**Kun irrotat lämmönvaihtimen putkistosta käytä lämmönvaihtimessa käytetyn aineen edellyttämää suojavarustusta, kuten turvasaappaita, suojakäsineitä ja suojalaseja.*

Jäätymisriski

⚠ ***Huomautus:**Lämmönvaihtimen vaurioitumisen välttämiseksi on muistettava, että alhaisessä lämpötilassa on olemassa jäätymisriski. Kun lämmönvaihdinta ei käytetä ja olemassa on jäätymisriski, laite on tyhjennettävä ja puhallettava kuivaksi.*

***Huom!** Jäätymisen aiheuttamien vahinkojen välttämiseksi laitteessa käytetyssä aineessa on oltava jäätymisenestoainetta, kun ainetta käytetään sen jäätymispisteen alittavissa lämpötiloissa.*

***Huom!** Käyttö höyrystimenä*
- *Käytä virtauskytkintä ja matalapainekytkintä.*
- *Varmista veden tasainen virtaaminen ennen kompressorin käyttöä, sen aikana ja sen jälkeen käyttämällä jäätymisen estävää termostaattia ja virtausmonitoria.*
- *Vältä höyrystimen tyhjentämistä siten, että kompressoria käytetään virran katkaisun jälkeen, kunnes ennalta määritetty kylmäaineen paine on saavutettu. Tällöin lämpötila voi laskea jäähdytysliuoksen jäätymispisteen alapuolelle, mikä voi vaurioittaa höyrystintä.*

Tukkeumien ehkäiseminen
Käytä suodatinta suojaamaan laitetta mahdollisilta vierailta hiukkasilta. Jos sinulla on kysyttävää suurimmasta mahdollisesta hiukkaskoosta, ota yhteyttä lähimpään myyntiedustajaan tai toimittajaan, tai katso lisätietoja toimittajan Internet-sivujen tuotetiedoista.

Tarkastus ja käyttö

⚠ ***Varoitus:** Älä käytä lämmönvaihdinta sellaisten aineiden (esim. ionivaihdettu vesi) / asennusten (esim. galvanoidut putket) kohdalla, joihin levyt (ruostumaton teräs) ja juottomateriaali (kupari) voivat vaikuttaa (kemiallisesti/sähkökemiallisesti).*

***Huom!** Kupari voi aiheuttaa korroosiota eri materiaaleja sisältävissä asennuksissa.*

Lämpötilaan ja/tai paineeseen liittyvän väsymisen ehkäiseminen
Äkilliset lämpötilan ja paineen muutokset voivat aiheuttaa lämmönvaihtimelle väsymisvaurioita. Seuraavat asiat on siis otettava huomioon, jotta lämmönvaihdin toimisi ilman paineen/lämpötilan vaihteluita.

- Sijoita lämpötila-anturi mahdollisimman lähelle lämmönvaihtimen poistoaukkoa.
- Valitse sellaiset venttiilit ja säätölaitteet, joilla lämmönvaihtimen lämpötila/paine pysyy tasaisena.
- Paineiskujen välttämiseksi pikaventtiileitä, kuten kaksiasentoisia venttiilejä, ei pidä käyttää.
- Automatisoiduissa asennuksissa pumppujen pysäytys ja käynnistys ja venttiilien toiminta on ohjelmoitu siten, että paineenvaihteluiden amplitudi ja taajuus on mahdollisimman pieni.

Eristeet
Lämmitys- ja jäähdytyseristeitä on saatavana lisävarusteena.

Huom! *Huomaa, että eristeen ja lämmönvaihtimen lämpötilarajoitukset voivat erota toisistaan.*

Vianmääritys
Jotta lämmönvaihdin toimisi oikein, tarkista seuraavat asiat:

- Putkisto on kytketty lämmönvaihtimeen tämän oppaan ohjeiden mukaisesti.
- Lämmönvaihdin on täysin puhdas, eikä siinä ole saostumia.

Huom! *Hiukkaset ja kuidut voivat tukkia lämmönvaihtimen. Painehäviön nousu tai lämpöhyötysuhteen lasku osoittaa, että lämmönvaihdin on tukkeutunut.*

- Säätöpiiri on ajastettu oikein, eikä laite ole jäätynyt.

Puhdistus
Laite sopii kiertopesuun. Ohjeita sopivan puhdistusprosessin valintaan saat toimittajan edustajalta tai Internet-sivustosta. Laitteen käytöstä vastaavan henkilön on varmistettava, että käytössä on asianmukainen ja sopivin väliajoin toistettava puhdistusmenetelmä.

Huom! *Levyn pakkausta ei ole tarkoitettu avattavaksi.*

Tilsigtet brug

De loddede varmevekslere er beregnet til at udveksle varme for at opfylde kravene i et stort udsnit af anvendelser, for eksempel nedkøling, komfortopvarmning, industriopvarmning og -afkøling samt i procesindustrien.

Definitioner

Advarsel! *Risikotype*

⚠ *ADVARSEL indikerer en potentielt farlig situation, som, hvis den ikke undgås, kan medføre dødsfald eller alvorlig personskade.*

Forsigtig! *Risikotype*

⚠ *FORSIGTIG indikerer en potentielt farlig situation, som, hvis den ikke undgås, kan medføre mindre eller moderat personskade.*

Bemærk!

BEMÆRK indikerer en potentielt farlig situation, der, hvis den ikke undgås, kan medføre tingskade.

Navneplader

Der er forskellige typer af navneplader, afhængigt af typen af trykbeholdergodkendelse.

Bemærk!

- *Der kan benyttes andre typer af navneplader. Kontakt en Alfa Laval-repræsentant for at få detaljerede oplysninger.*
- *Nogle specifikationer benyttes ikke til alle typer navneplader*

Navnepladen viser:

1. Plads til logotype.
2. Navn på producenten.
3. Plads til den nationale myndigheds stempel og serienummer.
4. Varenummer.
5. Type.
6. Produktions- eller serienummer.
7. År og dato for fremstillingen.
8. Placeringer af tilslutninger for hver væske.
9. Maks. tilladte driftstemperaturer.
10. Maks. tilladte driftstryk.
11. Testtryk.
12. Dato for testtryk.
13. Indhold af hvert rum.
14. Tilladte driftstemperaturer og -tryk.
15. Driftsområde.
16. Beskrivelse af hvert rum.
17. Væskegruppe.
18. Entydige oplysninger om kunden.
19. Mulige placeringer af tilslutninger.
20. Stregkodeoplysninger.
21. Plads til godkendelsesmærke. (CE-mærkerne nedenfor er ikke gyldige for navneplader af type 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sverige
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin By, Kina
    – CE-0948 Alfa Laval S.p.A. Alonte, Italien.

Oversættelse af original instruktion

© COPYRIGHT 2010 Alfa Laval Lund AB. Alle rettigheder forbeholdes

Krav

Advarsel! *Varmeveksleren skal installeres og betjenes således, at der ikke opstår nogen risiko for personskade og tingskade.*

Bemærk: *Medmindre andet er angivet, gælder produktdata for normale kølemidler, dvs. HFC og HCFC, for kølingsanvendelser. Før varmeveksleren benyttes til brandbare, giftige eller farlige væsker (f.eks. kulbrinter), skal de relevante sikkerhedsforskrifter for håndtering af sådanne væsker træffes. For yderligere oplysninger henvises til leverandørens hjemmeside på internettet.*

Installation

Installationen skal udføres med udstyr, der beskytter varmeveksleren mod tryk og temperaturer uden for de godkendte minimum- og maksimumværdier, der er angivet på navnepladen.

Forsigtig! *Der skal altid bæres beskyttelseshandsker ved håndtering af loddede varmevekslere for at undgå skader på hænderne fra de skarpe kanter.*

For at opnå den bedst mulige varmeoverførsel skal varmeveksleren tilsluttes, så mediet strømmer gennem varmeveksleren i modsatte retninger (modstrøm).

Bemærk! *Inden der tilsluttes rør, skal du kontrollere, at alle fremmedlegemer er skyllet ud af systemet.*

Forsigtig! *Tag højde for risikoen for brand under installationen, dvs. vær opmærksom på brandbare stoffer.*

Forsigtig! *Løft aldrig i forbindelserne. Der skal anvendes stropper, når varmeveksleren løftes. Placer stropperne i henhold til figur 1.*

Bemærk: *Ved fordampningsanvendelser og ved anvendelser, hvor mediet undergår et faseskift, skal varmeveksleren installeres lodret med et lige rør (mindst 150-200 mm længde) mellem reduktionsventilen og kølemiddelindgangen.*

Montering

I et stift rørsystem kan mindre varmevekslere (vægt 1–6 kg) ophænges direkte i rørsystemet (figur 2A). Større varmevekslere skal sikres med støttemonteringer (figur 2D), der er beregnet til en bestemt varmeveksler (tilbehør), eller de skal sikres med stropper (figur 2C) eller ved hjælp af monteringsbolte (figur 2B). Ved særbestillinger kan monteringsbolte svejses på forsiden eller bagsiden. Tilspændingsmomentet for M6-bolte er 3,8 Nm, for M8-bolte er det 9,5 Nm, og for M10-bolte er det 19,0 Nm.

Bemærk! *Hvis der er risiko for vibrationer, skal du benytte antivibrationsmontering som vist i figur 2A.*

Bemærk! *Varmevekslere med kølemiddelfordelere skal monteres med fordeleren nederst.*

Bemærk: *Under installationen må belastningerne på forbindelserne ikke overskride værdierne i tabellen "Grænser for forbindelsesbelastninger under installation" på indersiden af forsiden.*

Bemærk! *Rørledningerne skal være solidt forankrede og ført således, at der ikke overføres belastninger til pladevarmeveksleren under drift.*

Forbindelser (figur 3)

Gevindforbindelser – Brug en skruenøgle ved tilslutningen af røret, og overhold de angivne grænseværdier. Nogle modeller leveres med Victaulic-tilslutningstypen.

Loddede forbindelser – Rengør ved at aftørre og affedte de forskellige flader. Brug en loddemetaltype, som er passende til de materialer, der loddes, og brug den rigtige loddetemperatur. For detaljerede oplysninger henvises til dokumentet “Brazing tubes for brazed heat exchanger”, eller kontakt en Alfa Laval-repræsentant.

Svejsede forbindelser – TIG- eller MIG-svejsning. Slib indersiden og ydersiden af røret samt, hvis røret er affaset, også den affasede kant mindst 25 mm fra rørets kant og indad. Dette bør gøres for at undgå kontaminering af kobber i det svejsede område, som kan forårsage sprækker i svejsningen.

Bemærk: *Beskyt varmeveksleren mod overopvarmning ved at lægge et stykke vådt stof om forbindelsen, hver gang der udføres lodde- eller svejsearbejde. For kraftig varme kan smelte det indvendige loddemetal inde i varmeveksleren. Se figur 3.*

⚠ ***Forsigtig!*** *Benyt korrekt beskyttelsesudstyr, når varmeveksleren fjernes fra rørføringssystemet, for eksempel sikkerhedsstøvler, beskyttelseshandsker og øjenbeskyttelse, afhængigt af typen af mediet inde i varmeveksleren.*

Risiko for frysning

⚠ ***Forsigtig!*** *Vær opmærksom på frysning ved lave temperaturer for at undgå beskadigelse af varmeveksleren. Varmevekslere, der ikke er i drift, skal tømmes og blæses tørre, når der er risiko for frysning.*

Bemærk: *For at undgå beskadigelse på grund af frysning skal det anvendte medie indeholde en antifrostvæske ved driftsforhold under frysepunktet for mediet.*

Bemærk: *Ved brug som fordamper*

- *Brug en gennemstrømningsafbryder og en lavtryksafbryder.*
- *Brug en antifrosttermostat og overvågning af gennemstrømningen for at sikre konstant vandgennemstrømning, før, under og efter at kompressoren har kørt.*
- *Undgå "lukning af pumpen", dvs. tømning af fordamperen ved at køre kompressoren efter lukning, før der er nået et forudindstillet kølemiddeltryk. Temperaturen kan i så fald falde til under frysepunktet for kuldebæreren, hvilket kan beskadige fordamperen.*

Beskyttelse mod tilstopning

Brug et filter som beskyttelse mod mulig tilstedeværelse af fremmedlegemer. Hvis du er i tvivl om den maksimale partikelstørrelse, skal du kontakte leverandørens nærmeste repræsentant eller se under Produktoplysninger på leverandørens hjemmeside på internettet.

Kontrol og betjening

⚠ ***Forsigtig!*** *Anvend ikke varmeveksleren til medier (f.eks. afioniseret vand)/installationer (f.eks. galvaniserede rør), der (kemisk/elektrokemisk) kan påvirke eller påvirkes af pladerne (rustfrit stål) og loddematerialet (kobber).*

Bemærk: *Kobber kan medføre korrosion i installationer med forskellige materialer*

Beskyttelse mod termisk materialetræthed og/eller tryktræthed

Pludselige temperatur- og trykændringer kan medføre metaltræthedsskader på varmeveksleren. Overvej derfor følgende for at sikre dig, at varmevekslere arbejder i et miljø uden varierende tryk/temperaturer.

- Placer temperatursensoren så tæt som muligt på varmevekslerens afgang.
- Vælg ventiler og reguleringsudstyr, der sørger for stabile temperaturer/tryk for varmeveksleren.
- For at undgå trykstød må der ikke benyttes hurtigt lukkende ventiler, f.eks. on/off-ventiler.
- I automatiske installationer skal standsning og start af pumper og aktivering af ventiler programmeres, så den resulterende amplitude og frekvens af trykvariationen er så lille som muligt.

Isolering

Varme- og kuldeisolering er tilgængelig som tilbehør.

Bemærk: *Vær opmærksom på, at temperaturgrænserne kan være forskellige for isoleringen og varmeveksleren.*

Fejlfinding

For at sikre, at varmeveksleren fungerer korrekt, skal du kontrollere, at:

- rørsystemet er tilsluttet til varmeveksleren i overensstemmelse med instruktionerne i denne manual
- varmeveksleren er helt ren og fri for aflejringer.

Bemærk: *Partikler og fibre kan tilstoppe varmeveksleren. En forøgelse i trykfaldet eller et fald i den termiske effektivitet tyder på, at varmeveksleren er snavset.*

- kontrolkredsløbet er forudindstillet korrekt, og der sker ikke frysning.

Rengøring

Udstyret er egnet til rengøring på stedet. For råd vedrørende passende rensningsprocedurer henvises til leverandørens repræsentant, eller besøg leverandørens hjemmeside på internettet. Den person, der er ansvarlig for driften, skal sikre sig, at der benyttes den rigtige metode til rengøring, og skal fastlægge passende rengøringsintervaller.

Bemærk: *Pladepakken er ikke beregnet til at blive åbnet.*

Tilsiktet bruk

De loddede varmevekslerne (BHE) er utformet for å tilfredsstille kravene på en rekke bruksområder slik som kjøling, komfortvarme, industrioppvarming og -kjøling og foredlingsindustrien.

Definisjoner

Advarsel! *Faretype*

ADVARSEL angir en potensielt farlig situasjon som, hvis den ikke unngås, kan sette liv og helse i fare.

Forsiktig! *Faretype*

FORSIKTIG angir en potensielt farlig situasjon som, hvis den ikke unngås, kan føre til mindre eller moderate skader.

Merk:

MERK angir en potensielt farlig situasjon som, hvis den ikke unngås, kan føre til skader på eiendom.

Typeskilt

Det er forskjellige typeskilt alt etter type trykktankgodkjenning.

Merk:

- *Det kan brukes andre typer typeskilt. Ta kontakt med en Alfa Laval-representant for mer informasjon.*
- *Noen spesifikasjoner brukes ikke for alle typer typeskilt*

Typeskiltet viser:

1. Plass til logo.
2. Produsentens navn.
3. Plass til nasjonalt godkjenningsstempel og serienummer.
4. Artikkelnummer.
5. Type.
6. Produksjons- eller serienummer.
7. Produksjonsdato eller -år.
8. Plassering av koblinger for hver væske.
9. Maks. tillatte driftstemperaturer.
10. Maks. tillatte driftstrykk.
11. Testtrykk.
12. Dato for trykktest.
13. Volum i hvert rom.
14. Tillatte driftstemperaturer og -trykk.
15. Driftsområde.
16. Beskrivelse av hvert rom.
17. Væskegruppe.
18. Kundespesifikk informasjon.
19. Mulige plasseringer av koblinger.
20. Strekkodeinformasjon.
21. Plass for godkjenningsmerke. (CE-merkene nedenfor gjelder ikke for typeskilt av type 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co.,Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Original-instruksjon

© COPYRIGHT 2010 Alfa Laval Lund AB. Med enerett

Krav

Advarsel! *Varmeveksleren må installeres og betjenes på en slik måte at verken personell eller utstyr kan utsettes for skade.*

Merk: *Med mindre annet er angitt gjelder produktdataene for vanlige kjølemidler, dvs. HFC og HCFC, til kjøleformål. Før varmeveksleren brukes for brennbare, giftige eller skadelige væsker (f.eks. hydrokarboner), må man ta hensyn til sikkerhetsreglene for håndtering av slike væsker. Se leverandørens webside for ytterligere informasjon.*

Installasjon

Installasjonen skal ha utstyr som beskytter varmeveksleren mot trykk og temperaturer utenfor de godkjente minimums- og maksimumsverdiene som er angitt på typeskiltet.

Forsiktig! *Unngå håndskader fra skarpe kanter ved alltid å bruke beskyttelseshansker når du skal håndtere loddede varmevekslere.*

For best mulig varmeoverføringsytelse bør varmeveksleren kobles til slik at mediet går gjennom varmeveksleren i motsatte retninger (motstrømsflyt).

Merk: *Før du kobler til rør må du påse at alle fremmedlegemer er spylt ut av systemet.*

Forsiktig! *Ta hensyn til brannfaren under installasjonen, dvs. sørg for sikker avstand til brannfarlige stoffer.*

Forsiktig! *Enheten må aldri løftes etter koblingene. Det må brukes stropper ved løfting. Legg stroppene som vist i figur 1.*

Merk: *Når det brukes fordamper og faseendring av mediet, må varmeveksleren installeres vertikalt med rett rør (lengde på minst 150-200 mm) mellom ekspansjonsventilen og kjølemiddelinnløpet.*

Montering

I et fastrørsystem kan små varmevekslere (vekt på 1–6 kg) henges opp direkte i rørsystemet (figur 2A). Større varmevekslere bør festes med støttefester (figur 2D) beregnet for en bestemt varmeveksler (tilbehør) eller sikres med stropper (figur 2C) eller festebolter (figur 2B). For spesialordrer kan festeboltene sveises til fronten eller baksiden. Tiltrekkingsmomentet for M6-bolter er 3,8 Nm, M8-bolter 9,5 Nm og M10-bolter 19,0 Nm.

Merk: *Ved fare for vibrasjoner må det brukes antivibrasjonsfester, som vist i figur 2A.*

Merk: *Varmevekslere med kjølemiddelfordelere bør monteres med fordeleren nederst.*

Merk: *Under installasjonen må ikke tilkoblingsbelastningen overstige verdiene i tabellen "Grenser for tilkoblingsbelastning under installasjon" på innsiden av omslagssiden.*

Merk: *Røropplegget skal være godt forankret og utført slik at ingen belastninger overføres til platevarmeveksleren under drift.*

Tilkoblinger (figur 3)

Gjengede tilkoblinger – Bruk en momentnøkkel når du skal koble røret, og kontroller de angitte grensene. Noen modeller leveres med tilkoblinger av typen Victaulic.

Loddede tilkoblinger – Rengjør ved å gni og fjerne fettet på de ulike flatene. Bruk en loddemetallkvalitet som egner seg for materialene som loddes, og bruk riktig loddetemperatur. Hvis du ønsker mer informasjon, kan du se dokumentet “Lodde rør for loddet varmeveksler” eller kontakte en Alfa Laval-representant.

Sveisede tilkoblinger – TIG- eller MIG-sveising. Slip innsiden og utsiden av røret, og hvis den er skråskåret, også den skrå kanten minst 25 mm fra rørkanten og innover. Dette bør gjøres for å unngå forurensninger av kobber i sveiseområdet, noe som kan føre til sprekker i sveisen.

Merk: *Beskytt varmeveksleren mot overoppheting ved å legge en våt klut rundt koblingen etter loddingen eller sveisingen er utført. For stor varme kan smelte det innvendige loddemetallet i varmeveksleren. Se figur 3.*

⚠ ***Forsiktig!*** *Når du skal koble varmeveksleren fra rørsystemet, må du bruke riktig beskyttelsesutstyr, slik som vernesko, beskyttelseshansker og øyebeskyttelse, avhengig av medietypen i varmeveksleren.*

Fare for frysing

⚠ ***Forsiktig!*** *Vær klar over faren for frysing ved lave temperaturer for å unngå å skade varmeveksleren. Varmevekslere som ikke er i bruk, bør tømmes og tørrblåses når det er fare for frysing.*

Merk: *For å unngå skader grunnet frysing må mediet inneholde frostvæske når enheten brukes under frysepunktet.*

Merk: *Når den brukes som fordamper*

- *Bruk en strømningsbryter og en lavtrykksbryter.*
- *Bruk en frostsikker termostat og strømningsovervåker for å sikre konstand vannstrøm før, under og etter at kompressoren har vært i drift.*
- *Unngå "nedpumping", dvs. å tømme fordamperen ved å kjøre kompressoren etter avstenging før et forhåndsinnstilt kjølemiddeltrykk er nådd. Temperaturen kan da falle under saltvannsfrysepunktet, som kan skade fordamperen.*

Beskyttelse mot tilstopping

Bruk et filter som beskyttelse mot eventuelle fremmedlegemer. Hvis du er i tvil om den maksimale partikkelstørrelsen, kan du konsultere leverandøren eller produktinformasjonen på leverandørens webside.

Kontroll og drift

⚠ ***Forsiktig!*** *Bruk ikke varmeveksleren til medier (f.eks. avionisert vann)/installasjoner (f.eks. galvaniserte rør) som (kjemisk/elektrokjemisk) kan påvirke eller bli påvirket av platene (rustfritt stål) og loddematerialet (kobber).*

Merk: *Kobber kan generere korrosjon i installasjoner med forskjellige materialer*

Beskyttelse mot termisk og/eller trykktretthet
Brå temperatur- og trykkendringer kan gi varmeveksleren tretthetsskader. Følgende må derfor tas i betraktning for å sikre at varmevekslerne fungerer med varierende trykk/temperaturer.

- Plasser temperaturføleren så nær utløpet fra varmeveksleren som mulig.
- Velg ventiler og reguleringsutstyr som gir stabile temperaturer/trykk for varmeveksleren.
- For å unngå vannslag må det ikke brukes hurtigstengende ventiler, f.eks. koblingsventiler.
- I automatiserte installasjoner bør start og stans av pumper og betjening av ventiler programmeres slik at resulterende omfang og hyppighet i trykkvariasjonen holdes så lav som mulig.

Isolasjon
Varme- og kjøleisolasjon fås som tilbehør.

Merk: *Vær klar over at temperaturgrensene for isolasjonen og varmeveksleren kan være ulike.*

Feilsøking
For å sikre riktig ytelse fra varmeveksleren må du kontrollere at:

- rørsystemet er koblet til varmeveksleren iht. instruksjonene i denne håndboken
- varmeveksleren er helt ren og fri for avleiringer.

Merk: *Partikler og fibre kan tette igjen varmeveksleren. En økning i trykkfallet eller en reduksjon i den varmeeffektiviteten indikerer at varmeveksleren er tilsmusset.*

- kontrollkretsen er riktig innstilt og at frysing ikke forekommer.

Rengjøring
Utstyret kan rengjøres på stedet. Hvis du ønsker råd om engede rengjøringsprosesser, kan du kontakte leverandøren eller websiden til leverandøren. Den driftsansvarlige skal sørge for riktige rengjøringsmetoder og -intervaller.

Merk: *Platepakken skal ikke åpnes.*

Ενδεικνυόμενη χρήση
Οι εναλλάκτες θερμότητας με συγκόλληση (BHE) έχουν σχεδιαστεί για τη μετάδοση θερμότητας ώστε να ανταπεξέρχονται στις ανάγκες μιας μεγάλης ποικιλίας εφαρμογών όπως, ψύξη, θέρμανση, βιομηχανική θέρμανση και ψύξη και τις υπόλοιπες βιομηχανικές διαδικασίες.

Ορισμοί

Προειδοποίηση: *Τύπος κινδύνου*
Η ΠΡΟΕΙΔΟΠΟΙΗΣΗ υποδεικνύει μια ενδεχομένως επικίνδυνη κατάσταση η οποία, αν δεν αποφευχθεί, θα μπορούσε να προκαλέσει θάνατο ή σοβαρό τραυματισμό.

Προσοχή: *Τύπος κινδύνου*
Η ΠΡΟΣΟΧΗ υποδεικνύει μια ενδεχομένως επικίνδυνη κατάσταση η οποία, αν δεν αποφευχθεί, θα μπορούσε να προκαλέσει μικρό ή μέτριο τραυματισμό.

Σημείωση:
Η ΣΗΜΕΙΩΣΗ υποδεικνύει μια ενδεχομένως επικίνδυνη κατάσταση, η οποία, αν δεν αποφευχθεί, ενδέχεται να προκαλέσει υλική ζημιά.

Πινακίδες τεχνικών χαρακτηριστικών
Υπάρχουν διάφοροι τύποι πινακίδων τεχνικών χαρακτηριστικών ανάλογα με τον τύπο έγκρισης του δοχείου υπό πίεση.

Σημείωση:
- *Είναι δυνατή η χρήση διαφορετικών τύπων πινακίδων τεχνικών χαρακτηριστικών. Για αναλυτικές πληροφορίες, επικοινωνήστε με κάποιον αντιπρόσωπο της Alfa Laval.*
- *Ορισμένες προδιαγραφές δεν χρησιμοποιούνται σε όλους τους τύπους πινακίδων τεχνικών χαρακτηριστικών*

Στις πινακίδες τεχνικών χαρακτηριστικών εμφανίζεται:
1. Ο χώρος για το λογότυπο.
2. Το όνομα του κατασκευαστή.
3. Ο χώρος για τη σφραγίδα του Εθνικού συμβουλίου και το σειριακό αριθμό.
4. Ο αριθμός προϊόντος.
5. Ο τύπος.
6. Ο αριθμός κατασκευής ή σειράς.
7. Το έτος ή η ημερομηνία κατασκευής.
8. Οι θέσεις σύνδεσης για κάθε υγρό.
9. Οι μέγιστες επιτρεπόμενες θερμοκρασίες λειτουργίας.
10. Οι μέγιστες επιτρεπόμενες τιμές πίεσης λειτουργίας.
11. Η πίεση δοκιμής.
12. Η ημερομηνία της δοκιμαστικής πίεσης.
13. Ο όγκος κάθε χώρου.
14. Οι επιτρεπόμενες τιμές πίεσης και θερμοκρασίας λειτουργίας.
15. Η περιοχή λειτουργίας.
16. Η περιγραφή κάθε χώρου.
17. Η ομάδα υγρού.
18. Οι πληροφορίες που είναι μοναδικές για κάθε πελάτη.
19. Οι πιθανές θέσεις συνδέσεων.
20. Οι πληροφορίες γραμμωτού κώδικα.
21. Ο χώρος για τη σήμανση έγκρισης. (Η σήμανση CE που εμφανίζεται παρακάτω δεν είναι έγκυρη για την πινακίδα τεχνικών χαρακτηριστικών τύπου 3)
    – CE-0409 BHE Manufacturing, Ronneby, Σουηδία
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Ιταλία.

Μετάφραση των πρωτότυπων οδηγιών
© COPYRIGHT 2010 Alfa Laval Lund AB. Με την επιφύλαξη παντός δικαιώματος

Απαιτήσεις

Προειδοποίηση: *Η εγκατάσταση και ο χειρισμός του εναλλάκτη θερμότητας θα πρέπει να γίνεται με τρόπο που δεν θα προκαλέσει κίνδυνο τραυματισμού του προσωπικού ή υλικής ζημιάς.*

Σημείωση: *Αν δεν παρέχονται διαφορετικές οδηγίες, τα δεδομένα προϊόντος για τυπικά ψυκτικά μέσα, π.χ. HFC και HCFC, ισχύουν για τις εφαρμογές ψύξης. Πριν από τη χρήση του εναλλάκτη θερμότητας για εύφλεκτα, τοξικά ή επικίνδυνα υγρά (π.χ. υδρογονάνθρακες) θα πρέπει να εφαρμοστούν οι σχετικοί κανόνες ασφάλειας για το χειρισμό τέτοιου είδους υγρών. Για περαιτέρω πληροφορίες, ανατρέξτε στην τοποθεσία του προμηθευτή στο Internet.*

Εγκατάσταση

Η εγκατάσταση θα πρέπει να παρέχεται μαζί με τον εξοπλισμό που προστατεύει τον εναλλάκτη θερμότητας από τιμές πίεσης και θερμοκρασίας εκτός των εγκεκριμένων ελάχιστων και μέγιστων τιμών που εμφανίζονται στην πινακίδα τεχνικών χαρακτηριστικών.

Προσοχή: *Για την αποφυγή τραυματισμών στα χέρια από τις κοφτερές ακμές, φοράτε πάντοτε προστατευτικά γάντια όταν χειρίζεστε τους εναλλάκτες θερμότητας με συγκόλληση.*

Για τη βέλτιστη απόδοση μετάδοσης θερμότητας, ο εναλλάκτης θερμότητας θα πρέπει να συνδέεται με τρόπο ώστε το μέσα να ρέουν μέσω του εναλλάκτη θερμότητας προς αντίθετες κατευθύνσεις (αντίστροφη ροή).

Σημείωση: *Πριν συνδέσετε τους αγωγούς, βεβαιωθείτε ότι το σύστημα έχει εκπλυθεί καλά ώστε να απομακρυνθούν όλα τα ξένα σώματα.*

Προσοχή: *Λάβετε υπόψη σας τον κίνδυνο πυρκαγιάς κατά την εργασία εγκατάστασης, π.χ. υπολογίστε την απόσταση από τυχόν εύφλεκτες ουσίες.*

Προσοχή: *Μην ανυψώνεται ποτέ τη μονάδα από τις συνδέσεις. Για την ανύψωση της μονάδας πρέπει να χρησιμοποιείτε ιμάντες. Τοποθετήστε τους ιμάντες σύμφωνα με την εικόνα 1.*

Σημείωση: *Σε εφαρμογές εξατμιστών και σε εφαρμογές στις οποίες προκύπτει αλλαγή φάσης των μέσων, ο εναλλάκτης θερμότητας θα πρέπει να εγκατασταθεί κάθετα με σωλήνα σε ευθεία (μήκους τουλάχιστον 150-200 mm) μεταξύ της βαλβίδας επέκτασης και της αναρρόφησης ψυκτικού μέσου.*

Τοποθέτηση

Σε σταθερό σύστημα σωλήνων, είναι δυνατή η ανάρτηση μικρών εναλλακτών θερμότητας (με βάρος 1–6 kg) απευθείας στους αγωγούς (Εικόνα 2A). Οι μεγαλύτεροι εναλλάκτες θερμότητας θα πρέπει να ασφαλίζονται με την τοποθέτηση εξαρτημάτων υποστήριξης (Εικόνα 2D) που ενδείκνυνται για το συγκεκριμένο εναλλάκτη θερμότητας (εξάρτημα) ή να ασφαλίζονται με ιμάντες (Εικόνα 2C) ή με μπουλόνια σταθεροποίησης (Εικόνα 2B). Για ειδικές παραγγελίες, τα μπουλόνια σταθεροποίησης μπορούν να συγκολληθούν στην μπροστινή ή την πίσω πλευρά. Η ροπή σύσφιξης για μπουλόνια M6 είναι 3,8 Nm, για μπουλόνια M8 είναι 9,5 Nm και για μπουλόνια M10 19 Nm.

Σημείωση: *Εάν υπάρχει κίνδυνος δονήσεων, χρησιμοποιήστε εξαρτήματα προστασίας από τις δονήσεις με τον τρόπο που υποδεικνύεται στην εικόνα 2A.*

Σημείωση: *Οι εναλλάκτες θερμότητας με διανομείς ψυκτικού μέσου θα πρέπει να τοποθετούνται με τον διανομέα στο κάτω μέρος.*

Σημείωση: *Κατά την εγκατάσταση, τα φορτία της σύνδεσης δεν πρέπει να υπερβαίνουν τις τιμές που αναφέρονται στον πίνακα "Όρια φορτίων σύνδεσης κατά την εγκατάσταση" στο εσωτερικό του εξωφύλλου.*

Σημείωση: *Ο αγωγός πρέπει να είναι καλά στερεωμένος και τοποθετημένος, ώστε να μην μεταφέρονται φορτία στον πλακοειδή εναλλάκτη θερμότητας κατά τη διάρκεια της λειτουργίας.*

Συνδέσεις (Εικόνα 3)

Σπειροειδείς συνδέσεις – Χρησιμοποιήστε δυναμόκλειδο για τη σύνδεση του σωλήνα και παρατηρήστε τα καθοριζόμενα όρια. Ορισμένα μοντέλα παρέχονται με συνδέσεις τύπου Victaulic.

Συνδέσεις θερμοσυγκόλλησης – Καθαρίστε αφαιρώντας υπολείμματα και γράσα από τις διάφορες επιφάνειες. Χρησιμοποιήστε βαθμό συγκόλλησης μετάλλου που είναι κατάλληλος για τα υλικά που πρόκειται να συγκολλήσετε και την κατάλληλη θερμοκρασία συγκόλλησης. Για αναλυτικές πληροφορίες ανατρέξτε στο έγγραφο “Συγκόλληση αγωγών για εναλλάκτη θερμότητας με συγκόλληση” ή επικοινωνήστε με κάποιον αντιπρόσωπο της Alfa Laval.

Συνδέσεις συγκόλλησης – Συγκόλληση TIG ή MIG. Εφαρμόστε άλεση στο εσωτερικό και το εξωτερικό του σωλήνα και τα άκρα λοξοτομής, εάν υπάρχουν, τουλάχιστον κατά 25 mm από το άκρο του σωλήνα και προς το εσωτερικό. Αυτή η ενέργεια θα πρέπει να εφαρμοστεί ώστε να αποφευχθεί η μεταφορά χαλκού στην περιοχή συγκόλλησης, που θα μπορούσε να προκαλέσει το σπάσιμο της ένωσης συγκόλλησης.

Σημείωση: *Προστατεύστε τον εναλλάκτη θερμότητας από την υπερθέρμανση, τυλίγοντας ένα κομμάτι υγρού πανιού γύρω από τη σύνδεση όταν εκτελείτε εργασίες συγκόλλησης. Η υπερβολική θέρμανση θα μπορούσε να λιώσει το εσωτερικό μέταλλο του εναλλάκτη θερμότητας. Ανατρέξτε στην εικόνα 3.*

⚠ ***Προσοχή:*** *Κατά την αποσύνδεση του εναλλάκτη θερμότητας από το σύστημα σωληνώσεων, χρησιμοποιήστε κατάλληλο προστατευτικό εξοπλισμό, όπως μπότες προστασίας, προστατευτικά γάντια και προστατευτικά για τα μάτια, ανάλογα με τον τύπο των μέσων μεταφοράς θερμότητας που χρησιμοποιούνται στον εναλλάκτη θερμότητας.*

Κίνδυνος ψύξης

⚠ ***Προσοχή:*** *Λάβετε υπόψη σας τον κίνδυνο ψύξης σε χαμηλές θερμοκρασίες, ώστε να αποφευχθεί η ζημιά στον εναλλάκτη θερμότητας. Οι εναλλάκτες θερμότητας που δεν χρησιμοποιούνται θα πρέπει να αδειάζονται και να στεγνώνονται όταν υπάρχει ο κίνδυνος ψύξης.*

Σημείωση: *Για να αποφύγετε τις βλάβες εξαιτίας της ψύξης, το μέσο που χρησιμοποιείτε θα πρέπει να περιλαμβάνει αντιψυκτική ουσία, για συνθήκες χειρισμού κάτω από το αντίστοιχο σημείο ψύξης.*

Σημείωση: *Όταν χρησιμοποιείται ως εξατμιστής*

- *Χρησιμοποιήστε ένα διακόπτη ροής και ένα διακόπτη χαμηλής πίεσης.*
- *Χρησιμοποιήστε αντιψυκτικό θερμοστάτη και μια μονάδα παρακολούθησης ροής για να εξασφαλίσετε τη συνεχή ροή νερού πριν, κατά τη διάρκεια και μετά από την εκτέλεση του συμπιεστή.*
- *Αποφύγετε την "εκκένωση", δηλαδή το άδειασμα του εξατμιστή με χρήση του συμπιεστή μετά τον τερματισμό έως ότου επιτευχθεί η προκαθορισμένη πίεση του ψυκτικού μέσου. Με αυτήν την ενέργεια η θερμοκρασία θα μπορούσε να πέσει κάτω από το σημείο ψύξης της άλμης, καταστρέφοντας τον εξατμιστή.*

Προστασία από έμφραξη

Χρησιμοποιήστε φίλτρα για την προστασία από την ενδεχόμενη παρουσία ξένων σωματιδίων. Εάν έχετε απορίες σχετικά με το μέγιστο μέγεθος σωματιδίων, συμβουλευθείτε τον πιο κοντινό σας αντιπρόσωπο του προμηθευτή ή ανατρέξτε στις πληροφορίες προϊόντος στην τοποθεσία του προμηθευτή στο Internet.

Έλεγχος και λειτουργία

Προσοχή: *Μην χρησιμοποιείτε τον εναλλάκτη θερμότητας για μέσα (π.χ. απιονισμένο νερό)/ εγκαταστάσεις (π.χ. γαλβανισμένους σωλήνες) που θα μπορούσαν να επηρεάσουν (χημικά/ηλεκτροχημικά) ή να επηρεαστούν από τις πλακέτες (ανοξείδωτο ατσάλι) και το υλικό συγκόλλησης (χαλκός).*

Σημείωση: *Ο χαλκός ενδέχεται να διαβρώσει την εγκατάσταση με μεικτά υλικά*

Προστασία από την θερμική καταπόνηση ή/και την καταπόνηση από πίεση

Οι απότομες αλλαγές θερμοκρασίας και πίεσης θα μπορούσαν να προκαλέσουν βλάβες καταπόνησης στον εναλλάκτη θερμότητας. Επομένως, θα πρέπει να λαμβάνετε υπόψη σας τα ακόλουθα για να εξασφαλίσετε ότι οι εναλλάκτες θερμότητας λειτουργούν χωρίς εναλλαγές πίεσης/θερμοκρασίας.

- Τοποθετήστε τον αισθητήρα θερμοκρασίας όσο το δυνατόν πιο κοντά στην έξοδο του εναλλάκτη θερμότητας.
- Επιλέξτε βαλβίδες και ρυθμιστικό εξοπλισμό που θα παρέχει σταθερή θερμοκρασία/πίεση στον εναλλάκτη θερμότητας.
- Για να αποφύγετε το υδραυλικό πλήγμα, μην χρησιμοποιείτε βαλβίδες γρήγορου κλεισίματος, π.χ. βαλβίδες ενεργ./απενεργ.
- Σε αυτοματοποιημένες εγκαταστάσεις, η έναρξη και ο τερματισμός των αντλιών και η ενεργοποίηση των βαλβίδων θα πρέπει να προγραμματίζονται ώστε το εύρος και η συχνότητα των μεταβολών της πίεσης που προκύπτουν να είναι όσο το δυνατόν χαμηλότερες.

Μόνωση

Οι μονώσεις θερμότητας και ψύξης είναι διαθέσιμες ως εξαρτήματα.

Σημείωση: *Λάβετε υπόψη σας ότι τα όρια θερμοκρασίας της μόνωσης και του εναλλάκτη θερμότητας ενδέχεται να διαφέρουν.*

Αντιμετώπιση προβλημάτων

Για να εξασφαλίσετε τη σωστή απόδοση του εναλλάκτη θερμότητας, βεβαιωθείτε ότι:

- το σύστημα σωληνώσεων έχει συνδεθεί στον εναλλάκτη θερμότητας σύμφωνα με τις οδηγίες σε αυτό το εγχειρίδιο
- ο εναλλάκτης θερμότητας είναι απόλυτα καθαρός και απαλλαγμένος από υπολείμματα.

Σημείωση: *Σωματίδια και ίνες θα μπορούσαν να φράξουν τον εναλλάκτη θερμότητας. Τυχόν αύξηση της πτώσης πίεσης ή πτώση της θερμικής απόδοσης αποτελεί ένδειξη ότι υπάρχει βλάβη στον εναλλάκτη θερμότητας.*

- το κύκλωμα ελέγχου είναι σωστά προρυθμισμένο και δεν προκύπτει ψύξη.

Καθαρισμός

Ο εξοπλισμός είναι κατάλληλος για επιτόπιο καθαρισμό. Για συμβουλές σχετικά με τις κατάλληλες διαδικασίες καθαρισμού, συμβουλευθείτε κάποιον αντιπρόσωπο του προμηθευτή ή επισκεφθείτε την τοποθεσία του προμηθευτή στο Internet. Ο υπεύθυνος για το χειρισμό θα πρέπει να εξασφαλίσει ότι χρησιμοποιείται η σωστή μέθοδος καθαρισμού και να αποφασίσει τα κατάλληλα χρονικά διαστήματα καθαρισμού.

Σημείωση: *Το σετ πλακών δεν θα πρέπει να ανοιχθεί.*

Использование по назначению
Паяные теплообменники (BHE) предназначены для выполнения теплопередачи согласно требованиям широкого спектра областей применений, включая охлаждение, комфортный обогрев, промышленный обогрев и охлаждения, а также обрабатывающая промышленность.

Определения

***Предупреждение!** Вид опасности*
ПРЕДУПРЕЖДЕНИЕ указывает на потенциально опасную ситуацию, которая, если ее не избежать, может привести к смерти или серьезной тяжести.

***Осторожно!** Вид опасности*
ВНИМАНИЕ! указывает на потенциально опасную ситуацию, которая, если ее не избежать, может привести к легкой травме или травме средней тяжести.

Примечание.
ПРИМЕЧАНИЕ указывает на потенциально опасную ситуацию, которая, если ее не избежать, может привести к повреждению оборудования.

Приборные щитки
Существуют различные типы приборных щитков в зависимости от типа разрешения на использование резервуара высокого давления.

Примечание.
- *Могут применяться другие типы приборных щитков. Для получения дополнительных сведений обратитесь к представителю Alfa Laval.*
- *Некоторые спецификации не используются для всех типов приборных щитков*

Приборный щиток содержит следующие сведения
1. Место для логотипа.
2. Наименование производителя.
3. Место для штампа национального совета и серийного номера.
4. Номер изделия.
5. Тип.
6. Заводской или серийный номер.
7. Год или дата производства.
8. Расположение подключений для каждой жидкости.
9. Макс. допустимые значения рабочей температуры.
10. Макс. допустимые значения рабочего давления.
11. Испытательное давление.
12. Дата испытания под давлением.
13. Объем каждого пространства.
14. Допустимые значения рабочей температуры и давления.
15. Рабочая зона.
16. Описание каждого пространства.
17. Группа жидкостей.
18. Уникальная информация для заказчика.
19. Возможные расположения подключений.
20. Данные штрих-кода.
21. Место для отметки об утверждении. (Приведенные ниже отметки CE недействительны для приборного щитка типа 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Оригинальная инструкция
© COPYRIGHT 2010 Alfa Laval Lund AB. Все права защищены

Требования

Предупреждение! *Теплообменник должен устанавливаться и эксплуатироваться таким образом, чтобы устранить опасность травмирования персонала и повреждения имущества.*

Примечание. *Если не указано иначе, данные о продукте, касающиеся обычных хладагентов, т. е. HFC и HCFC, применимы к холодильным системам. Прежде, чем использовать теплообменник для легковоспламеняющихся, токсичных и опасных жидкостей (например, углеводородов), необходимо выполнить соответствующие правила безопасности для обращения с такими жидкостями. Для получения дополнительных сведений см. веб-сайт поставщика.*

Установка

При установке должно применяться оборудование, защищающее теплообменник от давления и температуры, выходящих за утвержденные минимальные и максимальные величины, указанные на приборном щитке.

Осторожно! *Для того, чтобы предотвратить травмирование рук об острые края, при обращении с паяными теплообменниками следует всегда надевать защитные перчатки.*

Для достижения оптимальной эффективности теплопередачи теплообменник необходимо подключать таким образом, чтобы поток носителя проходил через теплообменник в противоположных направлениях (противотоком).

Примечание. *Перед подсоединением трубопроводов убедитесь в том, что из системы путем промывания были удалены все посторонние предметы.*

Осторожно! *Во время работ по установке необходимо учитывать опасность возгорания, т. е. следить за расстоянием до легковоспламеняющихся веществ.*

Осторожно! *Никогда не поднимайте агрегат за места соединений. Для подъема следует использовать стропы. Располагайте стропы согласно рисунку 1.*

Примечание. *В установках в качестве испарителя и в установках с фазовым переходом носителя теплообменник следует устанавливать вертикально с прямой трубой (длиной не менее 150—200 мм) между регулирующим вентилем и входом хладагента.*

Монтаж

В жесткой системе трубопроводов небольшие теплообменники (весом 1—6 кг) можно подвешивать непосредственно к трубопроводу (Рис. 2A). Более крупные теплообменники необходимо закреплять при помощи опор (Рис. 2D), предназначенных для конкретного теплообменника (принадлежность), или при помощи строп (Рис. 2C) или монтажных болтов (Рис. 2B). Для специальных заказов монтажные болты можно приваривать к передней или задней части. Момент затяжки болтов M6 составляет 3,8 Нм, болтов M8 — 9,5 Нм, а болтов M10 — 19,0 Нм.

Примечание. *При наличии риска вибрации используйте антивибрационные опоры, как показано на Рисунке 2A.*

Примечание. *Теплообменники с распределителями хладагента необходимо монтировать таким образом, чтобы распределитель находился внизу.*

Примечание: *Во время монтажа нагрузки на соединения не должны превышать значений, указанных в таблице "Ограничения нагрузок на соединения во время монтажа" на обложке.*

Примечание: *Трубопроводы должны быть надежно закреплены и эксплуатироваться таким образом, чтобы во время работы не передавались нагрузки на пластинчатый теплообменник.*

Соединения (Рис. 3)

Резьбовые соединения – Для соединения трубы используйте динамометрический ключ и соблюдайте указанные ограничения. Некоторые модели поставляются с соединениями типа виктолик.

Паяные соединения – Очистите поверхности, зачистив их шкуркой и обезжирив. Используйте твердый припой, подходящий для спаиваемых материалов, и соблюдайте надлежащую температуру пайки. Для получения дополнительных сведений см. документ «Пайка труб для паяного теплообменника» или обратитесь к представителю Alfa Laval.

Сварные соединения – Сварка ВИА или МИА. Отшлифуйте внутреннюю и наружную поверхности трубы и (при необходимости) скошенную кромку на участке не менее 25 мм от края трубы и внутрь. Это необходимо для того, чтобы предотвратить загрязнение меди в зоне сварки, что может привести к возникновению трещин в сварном шве.

Примечание. *Чтобы защитить теплообменник от перегрева, при проведении любых работ по сварке или пайке наматывайте лоскут влажной ткани вокруг соединения. Чрезмерное нагревание может вызвать плавление твердого припоя внутри теплообменника. См. Рис. 3.*

⚠ ***Осторожно!*** *При отсоединении теплообменника от системы трубопроводов используйте соответствующие средства индивидуальной защиты, такие как защитная обувь, защитные перчатки и защитные очки, в зависимости от типа теплоносителя в теплообменнике.*

Опасность замерзания

⚠ ***Осторожно!*** *Чтобы предотвратить повреждения теплообменника, помните об опасности замерзания при низких температурах. Теплообменники, не находящиеся в эксплуатации, необходимо опорожнить и осушить, поскольку существует риск замерзания.*

Примечание. *Во избежание повреждения из-за замораживания используемый носитель должен включать антифриз для условий эксплуатации ниже его точки замерзания.*

Примечание. *При использовании в качестве испарителя*

- *Используйте реле расхода и реле низкого давления.*
- *Для обеспечения постоянного потока воды до, во время и после работы компрессора следует использовать термостат антифриза и расходомер.*
- *Избегайте «откачки», т. е. опорожнения испарителя вследствие работы компрессора после остановки до достижения заданного давления хладагента. Из-за этого температура может упасть ниже точки рассольного замораживания, что приведет к повреждению испарителя.*

Защита от засорения

В качестве защиты от возможного появления посторонних частиц используйте фильтр. При возникновении сомнений относительно максимального размера частиц обратитесь к ближайшему представителю поставщика либо посмотрите раздел

«Информация о продукции» на Интернет-сайте поставщика.

Управление и эксплуатация

> ⚠ ***Осторожно!*** *Не используйте теплообменник с носителями (например, деионизированной водой) или в установках (например, с оцинкованными трубами), которые могут иметь химическое или электрохимическое воздействие на пластины (нержавеющая сталь) и твердый припой (медь) или подвергаться влиянию с их стороны.*

> ***Примечание.*** *Медь может вызывать коррозию в установке, в которой используются различные материалы.*

Защита от усталости вследствие температуры и/или давления

Внезапные изменения температуры и давления могут вызвать усталостное повреждение теплообменника. Поэтому для обеспечения работы теплообменников без колебаний давления и температуры необходимо принимать во внимание следующее.

- Расположите датчик температуры как можно ближе к выпуску теплообменника.
- Выбирайте клапаны и регулировочное оборудование, обеспечивающие в теплообменнике стабильные температуру и давление.
- Во избежание гидравлического удара не допускается использование быстрозакрывающихся клапанов, например двухпозиционных.
- В автоматизированных системах остановка и пуск насосов и приведение в действие клапанов необходимо запрограммировать так, чтобы амплитуда и частота изменений давления в итоге происходили как можно реже.

Изоляция

Тепловая и холодильная изоляция поставляются дополнительно.

> ***Примечание.*** *Учитывайте, что изоляция и теплообменник могут иметь различные ограничения температуры.*

Поиск неисправностей

Для обеспечения правильной работы теплообменника, убедитесь в следующем:

- система трубопроводов была подсоединена к теплообменнику в соответствии с инструкциями, содержащимися в руководстве по эксплуатации теплообменника;
- теплообменник идеально чист и не содержит отложений;

> ***Примечание.*** *Частицы и волокна могут засорять теплообменник. Увеличение снижения давления или снижение теплового коэффициента полезного действия свидетельствуют о засорении теплообменника.*

- контур управления настроен правильно, и не происходит замораживание.

Очистка

Оборудование пригодно для проведения очистки на месте. Для получения рекомендаций о подходящих процессах очистки обратитесь к представителю поставщика или посетите веб-сайт поставщика. Лицо, ответственное за эксплуатацию, должно обеспечивать использование надлежащего способа очистки и принимать решения в отношении подходящих интервалов очистки.

> ***Примечание.*** *Блок пластин не следует открывать.*

Przeznaczenie
Lutowane wymienniki ciepła spełniają wymogi wymiany ciepła w różnorodnych zastosowaniach, takich jak chłodzenie, ciepłownictwo, ciepłownictwo i chłodnictwo przemysłowe oraz przemysł przetwórczy.

Definicje

Zagrożenie: *Typ niebezpieczeństwa*
OSTRZEŻENIE informuje o sytuacji potencjalnie niebezpiecznej której, jeżeli nie da uniknąć, doprowadzi do poważnych obrażeń lub śmierci.

Ostrzeżenie: *Typ niebezpieczeństwa*
OSTRZEŻENIE informuje o sytuacji potencjalnie niebezpiecznej której, jeżeli nie da uniknąć, doprowadzi do drobnych lub umiarkowanych obrażeń ciała.

Uwaga:
UWAGA informuje o potencjalnie niebezpiecznej sytuacji której, jeżeli nie da się uniknąć, doprowadzi do zniszczenia własności.

Tabliczki znamionowe
Zależnie od atestu zbiornika ciśnieniowego stosowane są różne rodzaje tabliczek znamionowych.

Uwaga:
- *W konkretnym przypadku mogą być stosowane inne typy tabliczek znamionowych. Szczegółowe informacje można uzyskać u przedstawiciela Alfa Laval.*
- *Nie wszystkie specyfikacje są stosowane we wszystkich typach tabliczek znamionowych*

Tabliczka znamionowa:
1. Miejsce na logotyp.
2. Nazwa producenta.
3. Miejsce na pieczęć i numer seryjny Rady Krajowej.
4. Numer produktu.
5. Typ.
6. Numer fabryczny lub seryjny.
7. Rok lub data produkcji.
8. Miejsce podłączenia każdego obiegu cieczy.
9. Maks. dopuszczalne temperatury robocze.
10. Maks. dopuszczalne ciśnienia robocze.
11. Próba ciśnieniowa.
12. Data próby ciśnieniowej.
13. Objętość każdego obiegu.
14. Dopuszczalne temperatury i ciśnienia robocze.
15. Obszar roboczy.
16. Opis każdego obiegu.
17. Grupa czynników.
18. Szczególne informacje klienta.
19. Możliwe miejsca podłączeń.
20. Kod paskowy.
21. Miejsce na oznaczenie atestowe. (podane poniżej znaki CE nie są stosowane w tabliczkach znamionowych typu 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Wymagania

Zagrożenie: *Wymiennik ciepła należy zamontować i używać w sposób gwarantujący bezpieczeństwo personelowi i pozwalający na uniknięcie uszkodzenia mienia.*

Uwaga: *Jeśli określono inaczej, dane produktu dotyczące normalnych czynników chłodniczych, np. HFC i HCFC są odpowiednie do aplikacji chłodzenia. W przypadku użycia wymiennika ciepła z łatwopalnymi, toksycznymi lub niebezpiecznymi czynnikami (np. węglowodorami) należy przestrzegać odpowiednich zasad bezpiecznego postępowania z takimi substancjami. Więcej informacji można znaleźć na stronie internetowej dostawcy.*

Montaż

Montaż należy przeprowadzić korzystając z narzędzi, które zabezpieczą wymiennik ciepła na wypadek ciśnień i temperatur przekraczających zatwierdzone minimalne i maksymalne wartości przedstawione na tabliczce znamionowej.

Ostrzeżenie: *W celu uniknięcia ryzyka obrażeń ostrymi krawędziami, przed rozpoczęciem pracy przy lutowanych wymiennikach ciepła należy założyć rękawice ochronne.*

W celu uzyskania najlepszej wydajności wymiany ciepła, wymiennik ciepła należy podłączyć w taki sposób, aby czynniki przepływały przez wymiennik w kierunkach przeciwnych (w przeciwprądzie)..

Uwaga: *Przed podłączeniem instalacji rurowej, należy upewnić się, że z systemu wypłukano wszystkie ciała obce.*

Ostrzeżenie: *Podczas prac montażowych, należy wziąć pod uwagę niebezpieczeństwo związane z pożarem, np. pamiętać o odległościach od substancji łatwopalnych.*

Ostrzeżenie: *W żadnym wypadku nie wolno podnosić urządzenia za przyłącza. Do podnoszenia należy używać taśm. Taśmy należy rozmieścić tak, jak pokazano na ilustracji 1.*

Uwaga: *Do zastosowania wymiennika w charakterze parownika oraz w zastosowaniach, w których występuje zmiana fazy czynnika, wymiennik ciepła należy zamontować pionowo z rurą prostą (co najmniej 150-200 mm długości) między zaworem rozprężnym a wlotem chłodziwa.*

Mocowanie

W układzie sztywnym, małe wymienniki ciepła (o masie 1-6 kg) można podwiesić bezpośrednio w instalacji rurowej (Il. 2A). Większe wymienniki ciepła należy zabezpieczyć wspornikami (Il. 2D) przeznaczonymi dla danego wymiennika ciepła (akcesoria) lub zabezpieczyć taśmami (Il. 2C) albo śrubami montażowymi (Il. 2B). W przypadku zamówień specjalnych śruby montażowe można przyspawać z przodu lub z tyłu. Moment dokręcający dla śrub M6 wynosi 3,8 Nm, dla śrub M8 - 9,5 Nm oraz dla śrub M10 - 19,0 Nm.

Uwaga: *Jeśli istnieje ryzyko drgań, należy użyć wsporników przeciwdrganiowych - patrz ilustracja 2A.*

Uwaga: *Wymienniki ciepła z dystrybutorami czynnika chłodzącego, należy montować tak, by dystrybutor znajdował się u dołu.*

Uwaga: *W trakcie montażu obciążenia działające na połączenia nie mogą wykraczać poza wartości określone w tabeli „Limity obciążeń działających na połączenia podczas montażu”, zamieszczonej po wewnętrznej stronie strony tytułowej.*

Uwaga: *Instalację rurową należy prawidłowo zakotwić i wykonać tak, aby podczas montażu na płytowy wymiennik ciepła nie były przenoszone żadne obciążenia.*

Połączenia (Ilustracja 3)
Połączenia gwintowane – Do podłączenia rury należy użyć klucza dynamometrycznego i przestrzegać podanych limitów. Niektóre modele posiadają połączenia typu rurowego.
Połączenia lutowane – Czyścić poprzez odtłuszczenie i zeszlifowanie różnych powierzchni. Używać klasy lutu dostosowanej do lutowanych materiałów; lutować w odpowiedniej temperaturze. Szczegółowe informacje można znaleźć w dokumencie "Rury lutowane do lutowanego wymiennika ciepła" lub od przedstawiciela firma Alfa Laval.
Połączenia spawane – spawanie TIG lub MIG. Przeszlifować wewnętrzną i zewnętrzną powierzchnię rury, a w przypadku rur fazowanych także co najmniej 25 mm krawędzi rury do środka. Podczas tej czynności należy uważać, aby nie doszło do zanieczyszczenia miedzią spawanej powierzchni, gdyż mogłoby to spowodować pękanie spawu.

Uwaga: *Należy zabezpieczyć wymiennik ciepła przed przegrzaniem, osłaniając mokrą tkaniną połączenie podczas spawania lub lutowania. Nadmierne temperatury mogą spowodować stopienie wewnętrznego lutowania w wymienniku. Patrz il. 3.*

⚠ ***Ostrzeżenie:*** *Podczas odłączania wymiennika z instalacji rurowej należy stosować środki ochrony osobistej, takie jak buty ochronne, rękawice i gogle dostosowane do rodzaju czynnika stosowanego w wymienniku.*

Ryzyko zamarznięcia

⚠ ***Ostrzeżenie:*** *Należy pamiętać, że w niskich temperaturach istnieje ryzyko zamarznięcia wymiennika ciepła. Wymienniki ciepła, które nie są używane należy opróżnić i osuszyć z powodu ryzyka związanego z zamarzaniem.*

Uwaga: *Aby uniknąć uszkodzeń spowodowanych zamarzaniem, używany czynnik musi zawierać środek zabezpieczający przed zamarzaniem w warunkach roboczych poniżej jego temperatury zamarzania.*

Uwaga: *Jeśli wymiennik jest stosowany jako parownik*
- *Użyć przełącznika natężenia przepływu i przełącznika niskociśnieniowego.*
- *Aby zapewnić stały przepływ cieczy przed, podczas i po uruchomieniu sprężarki, należy użyć termostatu zapobiegającego przed zamarzaniem i urządzenia do monitorowania przepływu.*
- *Unikać „przestojów pompy”, np. opróżniania parownika poprzez włączenie sprężarki po wyłączeniu do momentu osiągnięcia ustalonego ciśnienia czynnika chłodniczego. Temperatura może spaść poniżej temperatury krzepnięcia, co może doprowadzić do uszkodzenia parownika.*

Zabezpieczenie na wypadek zablokowania
Jako zabezpieczenia na wypadek pojawienia się ciał obcych należy używać filtra. W razie wątpliwości dotyczących maksymalnej wielkości cząsteczek, należy skontaktować się z najbliższym przedstawicielem dostawcy lub zapoznać się z informacjami na temat produktu na stronie internetowej dostawcy.

Sterowanie i obsługa

Przestroga: *Nie wolno stosować wymiennika ciepła w przypadku czynników (np. woda demineralizowana)/ instalacji (np. rur galwanizowanych), które mogą mieć lub odczuwać wpływ (chemiczny/elektrochemiczny) płyt (ze stali nierdzewnej) oraz lutu (miedź).*

Uwaga: *Miedź może powodować korozję instalacji wykonanej z różnych materiałów*

Zabezpieczenie na wypadek zmęczenia termicznego i/ lub ciśnieniowego

Nagłe zmiany temperatury i ciśnienia mogą doprowadzić do uszkodzenia wymiennika ciepła. Z tego względu, należy sprawdzić, czy wymiennik ciepła pracuje w sposób prawidłowy, bez wahań ciśnienia i temperatury, biorąc pod uwagę poniższe zalecenia.

- Umieścić czujnik temperatury tak blisko jak to możliwe wylotu z wymiennika ciepła.
- Wybrać zawory i sprzęt regulacyjny, który stabilizuje temperatury/ciśnienia wymiennika ciepła.
- Aby uniknąć uderzenia wody, nie należy używać szybko zamykających się zaworów, np. zaworów włączania/wyłączania.
- W zautomatyzowanych instalacjach, zatrzymanie i uruchomienie pompy i uruchomienie zaworów należy zaprogramować tak, aby powstałe amplituda i częstotliwość wahań ciśnienia były jak najmniejsze.

Izolacja

Izolacje grzewcze i chłodzące są dostępne jako akcesoria.

Uwaga: *Należy mieć na uwadze, że izolacja i wymiennik ciepła mogą mieć różne limity temperatur.*

Rozwiązywanie problemów

Aby zapewnić prawidłowe działanie wymiennika, należy sprawdzić, czy:

- instalacja rurowa jest podłączona do wymiennika ciepła zgodnie z instrukcją obsługi
- wymiennik ciepła jest idealnie czysty i wolny od osadów.

Uwaga: *Drobne cząstki i włókna mogą zatkać wymiennik ciepła. Wzrost spadku ciśnienia lub spadek sprawności cieplnej wskazuje na zanieczyszczenie wymiennika.*

- obwód sterowania jest właściwie zaprogramowany i nie zamarza.

Czyszczenie

Urządzenie można czyścić w miejscu instalacji. Informacji na temat właściwych procedur czyszczących udziela przedstawiciel dostawcy, można je także znaleźć na stronie internetowej dostawcy. Za wybór właściwej metody czyszczenia i określenie częstotliwości czyszczenia urządzenia odpowiada jego operator.

Uwaga: *Nie należy otwierać pakietu płyt.*

Kavandatud kasutus
Joodetud soojusvahetid (BHE) on ette nähtud soojusülekandeks vastavalt paljude rakenduste nõuetele, nagu näiteks jahutamine, mugav küte, tööstuslik küte ja jahutus ning keemiatööstus.

Määratlused

Hoiatus! *Ohu tüüp*
HOIATUS tähistab potentsiaalselt ohtlikku olukorda, mille eiramine võib põhjustada tõsise või isegi eluohtliku vigastuse.

Ettevaatust! *Ohu tüüp*
ETTEVAATUST tähistab potentsiaalselt ohtlikku olukorda, mille eiramine võib põhjustada kergema või mõõduka vigastuse.

Tähelepanu!
TÄHELEPANU tähistab potentsiaalselt ohtlikku olukorda, mille eiramine võib põhjustada varalist kahju.

Nimesildid
Toodetel võite leida erinevaid nimesilte olenevalt surveanuma tüübikinnitusest.

Tähelepanu!
- *Kasutusel võivad olla ka muud tüüpi nimesildid. Üksikasjaliku teabe saamiseks võtke ühendust Alfa Lavali esindajaga.*
- *Mõnda spetsifikatsiooni kõigil nimesiltidel ei kasutata.*

Nimesildil on kujutatud järgmist.
1. Koht logotüübi jaoks.
2. Valmistaja nimi.
3. Koht tehnilise järelevalve inspektsiooni templi ja seerianumbri jaoks.
4. Tootetähis.
5. Tüüp.
6. Toote- või seerianumber.
7. Valmistamise aasta või kuupäev.
8. Ühenduskohad iga vedeliku jaoks.
9. Maksimaalne lubatud töötemperatuur.
10. Maksimaalne lubatud töörõhk.
11. Proovirõhk.
12. Surveproovi kuupäev.
13. Iga ruumi maht.
14. Lubatud töötemperatuur ja -rõhk.
15. Kasutuspiirkond.
16. Iga ruumi kirjeldus.
17. Vedeliku rühm.
18. Kliendipõhine teave.
19. Võimalikud ühenduskohad
20. Vöötkooditeave.
21. Vastavusmärgise koht (alltoodud CE-märgised ei kehti nimesildi tüübi 3 puhul).
    – CE-0409 BHE Manufacturing, Ronneby, Rootsi
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Itaalia.

Originaaljuhendi tõlge

Nõuded

Hoiatus! *Soojusvaheti tuleb paigaldada ja kasutusele võtta nii, et sellega ei kaasne töötajate kehavigastuse ega varalise kahju ohtu.*

Tähelepanu! *Kui ei ole määratletud teisiti, kehtivad külmutusrakenduste puhul tavaliste külmutusagensite (s.t HFC ja HCFC) tooteandmed. Enne soojusvaheti kasutamist koos tuleohtlike, mürgiste või ohtlike vedelikega (nt süsivesinikega) tuleb sätestada niisuguste vedelike käitlemiseks ettenähtud ohutuseeskirjad. Lisateavet leiate tarnija veebisaidilt.*

Paigaldamine

Paigaldis tuleb varustada seadmetega, mis kaitsevad soojusvahetit nimesildil toodud miinimum- ja maksimumväärtust ületava rõhu ja temperatuuri eest.

Ettevaatust! *Teravatest servadest põhjustatud käevigastuste vältimiseks kandke joodetud soojusvaheti käsitsemisel alati kaitsekindaid.*

Parima võimaliku jõudluse tagamiseks tuleb soojusvaheti ühendada nii, et keskkonnad voolaksid läbi soojusvaheti vastupidises suunas (vastuvoolu).

Tähelepanu! *Enne torude ühendamist veenduge, et kõik võõrkehad on süsteemist välja loputatud.*

Ettevaatust! *Võtke paigaldustöödel arvesse tuleohtu, s.t hoidke tuleohtlikud ained piisaval kaugusel.*

Ettevaatust! *Ärge mingil juhul tõstke seadet ühendustest kinni võttes. Kasutage tõstmiseks tõsterihmu. Paigutage rihmad vastavalt joonisele 1.*

Tähelepanu! *Aurustites ja keskkonna faasimuutusega rakendustes tuleb soojusvaheti paigaldada vertikaalselt, nii et sirgtoru (vähemalt 150–200 mm pikkune) paikneb paisumisklapi ja külmutusagensi sisselaske vahel.*

Paigaldamine

Jäigas torusüsteemis võib väikese soojusvaheti (kaaluga 1–6 kg) riputada vahetult torustiku külge (joonis 2A). Suuremad soojusvahetid tuleb kinnitada konkreetse soojusvaheti (lisaseadme) jaoks ettenähtud tugiarmatuuri abil (joonis 2D), rihmadega (joonis 2C) või paigalduspoltidega (joonis 2B). Eritellimusel võib paigalduspoldid keevitada seadme esi- või tagaossa. Pingutusmoment on poltidel M6 3,8 Nm, poltidel M8 9,5 Nm ja poltidel M10 19,0 Nm.

Märkus. *Vibratsiooniohu korral kasutage vibratsioonikindlat armatuuri, nagu näha joonisel 2A.*

Märkus. *Külmutusagensi jaoturiga varustatud soojusvaheti tuleb paigaldada nii, et jaotur jääb allossa.*

Märkus. *Paigaldamise ajal ei tohi ühenduskoormused ületada tiitellehe siseküljel asuvas tabelis „Ühenduskoormuste piirnormid paigaldamise ajal" esitatud väärtuseid.*

Märkus. *Torustik peab olema hästi kinnitatud ja teostatud, et käitamise ajal ei kanduks mingisugune koormus üle plaatsoojusvahetile.*

Ühendused (joonis 3)

Keermesühendused – kasutage toru ühendamisel momendimõõtevõtit ning jälgige ettenähtud piire. Mõni mudel on varustatud Victaulic-tüüpi ühendustega.

Jooteühendused – puhastage hoolikalt, siludes ja rasvatustades ühenduspindu. Kasutage joodetavate materjalide jaoks sobivat joodisemarki ja õiget jootetemperatuuri. Üksikasjalikumat teavet leiate dokumendist „Torude jootmine joodetud soojusvaheti jaoks" või võtke ühendust Alfa Lavali esindajaga.

Keevisühendused – TIG-keevitus (sulamatu elektroodiga kaarkeevitus inertgaasis) või MIG-keevitus (sulavelektroodiga kaarkeevitus inertgaasis). Lihvige toru seest- ja väljastpoolt; kaldserva puhul ka kaldserva vähemalt 25 mm toru otsast sissepoole. See on vajalik vasesaaste vältimiseks keevise piirkonnas, mis võib põhjustada keevisliite pragunemise.

Tähelepanu! *Kaitske soojusvahetit ülekuumenemise eest, mähkides joote- või keevitustööde tegemisel ühenduskoha ümber märja riidetüki. Liigkuumus võib sulatada sisemise joodise soojusvaheti sisemusse. Lisateavet leiate jooniselt 3.*

⚠ ***Ettevaatust!*** *Soojusvaheti lahutamisel torusüsteemist kasutage sobivat kaitsevarustust olenevalt soojusvaheti keskkonna tüübist – näiteks kaitsejalatseid, kaitsekindaid ja kaitseprille.*

Külmumisoht

⚠ ***Ettevaatust!*** *Soojusvaheti kahjustuste vältimiseks arvestage külmumisohuga madalal temperatuuril. Külmumisohu korral tühjendage parajasti mittekasutatavad soojusvahetid ja kuivatage läbipuhumise abil.*

Tähelepanu! *Kui töökoha temperatuur langeb alla kasutatava keskkonna külmumistemperatuuri, tuleb külmakahjustuste vältimiseks keskkonnale lisada antifriisi.*

Tähelepanu! *Aurustina kasutamine*

- *Kasutage voolülitit ja madalrõhulülitit.*
- *Kasutage külmumistermostaati ja voolukulu seireseadet püsiva veevoolu tagamiseks enne kompressori käivitamist, kompressori töö ajal ja pärast väljalülitamist.*
- *Vältige „tühjakspumpamist", s.t aurusti tühjendamist kompressori käitamisega pärast väljalülitamist kuni külmutusagensi rõhu eelsätte saavutamiseni. Selle tagajärjel võib temperatuur langeda alla soolalahuse külmumistemperatuuri ja aurustit kahjustada.*

Kaitse ummistuste vastu

Kasutage filtrit, mis kaitseb kõrvaliste osakeste võimaliku juurdepääsu eest. Kui teil on kahtlusi osakeste maksimaalse suuruse suhtes, pidage nõu tarnija lähima esindajaga või uurige tooteteavet tarnija veebisaidil.

Kasutamine ja järelevalve

⚠ ***Ettevaatust!*** *Ärge kasutage soojusvahetit keskkonna (nt deioniseeritud vesi) või paigaldiste (nt tsingitud torud) puhul, mis võivad keemiliselt või elektrokeemiliselt mõjutada plaate (roostevaba teras) ja jootematerjali (vask) või nendega mitte ühilduda.*

Tähelepanu! *Vask võib tekitada segamaterjalist valmistatud paigaldises korrosiooni.*

Kaitse termilise ja/või rõhust tingitud väsimuse eest

Temperatuuri ja rõhu äkilised muudatused võivad põhjustada soojusvahetis väsimuskahjustusi. Seetõttu tuleb kindlustada soojusvaheti töö rõhu ja temperatuuri oluliste kõikumisteta, võttes arvesse järgmist:

- paigutage temperatuuriandur soojusvaheti väljalaskele võimalikult lähedale;
- valige klapid ja regulaatorid, mis tagavad soojusvahetis stabiilse temperatuuri ja rõhu;
- hoiduge hüdrauliliste löökide vältimiseks kiirsulgeklappide, näiteks sulgearmatuuri kasutamisest;
- automaatsüsteemi paigaldamisel tuleb pumpade seiskamine ja käivitamine ning klappide juhtimine programmeerida nii, et tulemuseks olevate rõhumuutuste amplituud ja sagedus jääksid võimalikult väikseks.

Isoleerimine

Soojus- ja jahutusisolatsioon on saadaval lisavarustusena.

Tähelepanu! *Võtke arvesse, et isolatsiooni ja soojusvaheti temperatuuripiirid võivad olla erinevad.*

Rikkeotsing

Soojusvaheti õige jõudluse tagamiseks kontrollige järgmist:

- torusüsteem on soojusvahetiga ühendatud käesoleva kasutusjuhendi kohaselt;
- soojusvaheti on täiesti puhas ja settevaba;

Tähelepanu! *Osakesed ja kiud võivad soojusvaheti ummistada. Rõhulangu kasv või soojusliku kasuteguri langus näitavad, et soojusvaheti ei ole töökorras.*

- juhtimisahel on õigesti häälestatud ja külmumist ei esine.

Puhastamine

Seadet saab puhastada kohapeal. Lisateabe saamiseks sobivate puhastustoimingute kohta võtke ühendust tarnija esindajaga või külastage tarnija veebisaiti. Soojusvaheti kasutamise eest vastutav isik peab tagama õige puhastusmeetodi rakendamise ja määrama sobiva puhastusvälba.

Tähelepanu! *Plaadipakett ei ole mõeldud avamiseks.*

Paskirtis

Lituotieji šilumokaičiai (LŠM) yra skirti šilumai perduoti ir naudojami įvairiems poreikiams tenkinti, pvz., šaldymo, patalpų šildymo, pramoninio šildymo ir aušinimo bei perdirbimo pramonės poreikiams.

Apibrėžtys

Įspėjimas: *Pavojaus tipas*

ĮSPĖJIMAS žymi potencialiai pavojingą situaciją, kuri gali sukelti mirtį ar sunkią traumą.

Perspėjimas: *Pavojaus tipas*

PERSPĖJIMAS žymi potencialiai pavojingą situaciją, kuri gali sukelti nesunkią arba vidutinio sunkumo traumą.

Pastaba:

PASTABA žymi potencialiai pavojingą situaciją, kuri gali padaryti žalos turtui.

Gamyklinė lentelė

Priklausomai nuo slėginio indo tipo patvirtinimo, naudojamos skirtingos gamyklinės lentelės.

Pastaba:

- *Gali būti naudojamos kitų tipų gamyklinės lentelės. Dėl išsamios informacijos kreipkitės į „Alfa Laval“ atstovą.*
- *Kai kurie techniniai duomenys nurodomi ne visų tipų gamyklinėse lentelėse.*

Gamyklinėje lentelėje būna nurodyta:

1. Vieta logotipui.
2. Gamintojo pavadinimas.
3. Vieta nacionalinės tarybos spaudui ir serijos numeriui.
4. Gaminio numeris.
5. Tipas.
6. Gamybinis arba serijos numeris.
7. Pagaminimo metai arba data.
8. Kiekvieno skysčio jungčių išdėstymas.
9. Didžiausiosios leidžiamosios darbinės temperatūros vertės.
10. Didžiausiojo leidžiamojo darbinio slėgio vertės.
11. Bandymo slėgis.
12. Slėginio bandymo data.
13. Kiekvienos ertmės tūris.
14. Leidžiamosios darbinės temperatūros ir slėgio vertės.
15. Įrangos zona.
16. Kiekvienos ertmės aprašas.
17. Skysčių grupė.
18. Paties užsakovo informacija.
19. Galimas jungčių išdėstymas.
20. Brūkšninio kodo informacija.
21. Vieta patvirtinimo ženklui. (Toliau pateikti CE ženklai negalioja 3 tipo gamyklinei lentelei)
    – CE-0409 „BHE Manufacturing“, Ronneby, Švedija

Pradinės instrukcijos vertimas

© AUTORIŲ TEISĖ 2010 „Alfa Laval Lund AB“. Visos teisės saugomos

Reikalavimai

> ⚠ ***Įspėjimas:*** *šilumokaitis turi būti įrengtas ir eksploatuojamas taip, kad nekeltų darbuotojų traumos ir žalos turtui pavojaus.*

> ***Pastaba:*** *jei nenurodyta kitaip, naudojant prietaisą šaldymui taikomi įprastų šaldalų, t. y. HFC ir HCFC, duomenys. Prieš naudojant šilumokaitį degiesiems, nuodingiesiems ar pavojingiesiems skysčiams (pvz., angliavandeniams), būtina atsižvelgti į tokių skysčių tvarkymui taikomas saugos taisykles. Išsamesnės informacijos prašome ieškoti tiekėjo interneto svetainėje.*

Įrengimas

Įrengiant šilumokaitį, būtina sumontuoti įrangą, kuri apsaugotų jį nuo slėgio ir temperatūros, neatitinkančių gamyklinėje lentelėje nurodytų patvirtintų mažiausiųjų ir didžiausiųjų verčių.

> ⚠ ***Perspėjimas:*** *dirbdami su lituotaisiais šilumokaičiais, visada mūvėkite apsaugines pirštines, kad nesusižeistumėte rankų į aštrias briaunas.*

Kiek galima geresnio šilumos perdavimo sumetimais šilumokaitį visada reikia prijungti taip, kad terpės tekėtų per šilumokaitį priešingomis kryptimis (priešpriešiniu srautu).

> ***Pastaba:*** *prieš prijungdami bet kokius vamzdžius, sistemą būtinai praplaukite ir pašalinkite visus teršalus.*

> ⚠ ***Perspėjimas:*** *įrengdami šilumokaitį, atsižvelkite į gaisro pavojų, t. y. turėkite omenyje atstumą iki degiųjų medžiagų.*

> ⚠ ***Perspėjimas:*** *niekada nekelkite šilumokaičio paėmę už jungčių. Keliant reikia naudoti diržus. Šilumokaitį apjuoskite diržais taip, kaip pavaizduota 1 paveiksle.*

> ***Pastaba:*** *naudojant šilumokaitį garintuve ir kitais atvejais, kai keičiasi terpių būvis, šilumokaitį reikia montuoti vertikaliai, o tarp plėtimosi vožtuvo ir šaldalo įvado turi būti sumontuotas tiesus vamzdis (ne trumpesnis kaip 150–200 mm).*

Tvirtinimas

Standžiojoje vamzdžių sistemoje nedideli šilumokaičiai (sveriantys 1–6 kg) gali būti tvirtinami tiesiogiai prie vamzdyno (2A pav.). Didesnius šilumokaičius reikia pritvirtinti atraminiais laikikliais (2D pav.), skirtais konkrečiam šilumokaičiui (priedais), diržais (2C pav.) arba tvirtinimo varžtais (2B pav.). Pagal specialų užsakymą tvirtinimo varžtai gali būti privirinti prie priekinės arba užpakalinės pusės. M6 varžtų užveržimo sūkio momentas yra 3,8 Nm, M8 varžtų – 9,5 Nm, o M10 varžtų – 19,0 Nm.

> ***Pastaba:*** *jei egzistuoja vibracijos pavojus, naudokite antivibracinius laikiklius, kaip pavaizduota 2A paveiksle.*

> ***Pastaba:*** *šilumokaičius su šaldalo skirstytuvais reikia montuoti taip, kad skirstytuvas būtų apačioje.*

> ***Pastaba:*** *montavimo metu jungties apkrovos negali viršyti verčių, nurodytų jungčių apkrovų montavimo metu ribinių verčių lentelėje, pateiktoje vidinėje viršelio pusėje.*

> ***Pastaba:*** *vamzdžiai turi būti gerai pritvirtinti ir sujungiami taip, kad naudojimo metu šilumokaičio plokštė nebūtų veikiama apkrovos.*

Jungtys (3 pav.)

Srieginės jungtys – vamzdžiui prijungti naudokite dinamometrinį raktą ir laikykitės nustatytų apribojimų. Kai kurie modeliai tiekiami su „Victaulic“ tipo jungtimis.

Lituotosios jungtys – įvairius paviršius nuvalykite nušveisdami ir pašalindami riebalus. Naudokite tokios rūšies lydmetalį, kuris tinka lituojamoms medžiagoms, ir lituokite tinkamoje temperatūroje. Išsamios informacijos ieškokite dokumente „Lituotajam šilumokaičiui skirtų vamzdžių litavimas“ arba kreipkitės į „Alfa Laval“ atstovą.

Suvirintosios jungtys – suvirinimas volframo (TIG) arba lydžiuoju (MIG) elektrodu inertinėse dujose. Nušlifuokite vamzdžio vidų ir išorę, o jei vamzdis yra su nuosklemba, nušlifuokite ir nusklembtąjį kraštą ne mažiau kaip 25 mm nuo vamzdžio krašto į vidaus pusę. Tai būtina norint išvengti vario užteršimo suvirintoje srityje, dėl kurio suvirinimo siūlė gali įtrūkti.

Pastaba: *atlikdami litavimo ar suvirinimo darbus, šilumokaitį apsaugokite nuo perkaitimo apvyniodami aplink jungtį šlapią skudurą. Per didelis karštis gali išlydyti šilumokaičio viduje esantį lydmetalį. Žr. 3 paveikslą.*

Perspėjimas: *atjungdami šilumokaitį nuo vamzdyno sistemos naudokite tinkamas apsaugos priemones, pvz., apsauginius batus, apsaugines pirštines ir akių apsaugos priemonę, priklausomai nuo to, kokios rūšies terpės naudojamos šilumokaityje.*

Užšalimo pavojus

Perspėjimas: *siekdami išvengti šilumokaičio sugadinimo, turėkite omenyje užšalimo pavojų esant žemai temperatūrai. Visais atvejais, kai egzistuoja užšalimo pavojus, iš nenaudojamų šilumokaičių reikia išleisti skystį ir prapučiant išdžiovinti.*

Pastaba: *siekiant išvengti sugadinimo dėl užšalimo, į naudojamą terpę reikia įpilti antifrizo, jei įrenginys eksploatuojamas esant temperatūrai, žemesnei už terpės užšalimo temperatūrą.*

Pastaba: *kai įrenginys naudojamas kaip garintuvas*

- *Naudokite srauto jungiklį ir mažo slėgio jungiklį.*
- *Naudokite antifrizo temperatūros relę ir srauto kontrolės prietaisą, kad užtikrintumėte nepertraukiamą vandens srautą prieš įjungiant kompresorių, jam veikiant ir jį išjungus.*
- *Stenkitės „neišpumpuoti“, t. y. neištuštinti garintuvo palikdami kompresorių įjungtą po šilumokaičio išjungimo, kol bus pasiektas iš anksto nustatytas šaldalo slėgis. Tokiu atveju temperatūra gali nukristi žemiau sūrymo užšalimo temperatūros ir dėl to garintuvas gali sugesti.*

Apsauga nuo užsikimšimo

Kaip apsaugos nuo galimų pašalinių dalelių priemonę naudokite filtrą. Jei tiksliai nežinote didžiausiojo dalelių skersmens, kreipkitės į artimiausią tiekėjo atstovą arba paieškokite informacijos tiekėjo interneto svetainės skyriuje „Informacija apie gaminius“.

Valdymas ir eksploatavimas

Perspėjimas: *nenaudokite šio šilumokaičio su terpėmis (pvz., dejonizuotu vandeniu) ir įrenginiais (pvz., cinkuotojo plieno vamzdžiais), kurie (chemiškai ir (arba) elektrochemiškai) gali paveikti arba kuriuos gali paveikti plokštelės (iš nerūdijančiojo plieno) ir lydmetalis (varis).*

Pastaba: *įrenginyje, kuriame naudojamos mišrios medžiagos, varis gali sukelti koroziją.*

Apsauga nuo šiluminio ir (arba) slėginio nuovargio
Staigūs temperatūros ir slėgio pokyčiai gali sukelti šilumokaičio gedimą dėl nuovargio. Dėl šios priežasties būtina atsižvelgti į toliau pateiktus nurodymus, siekiant, kad eksploatuojami šilumokaičiai nepatirtų slėgio ir temperatūros svyravimų poveikio.

- Temperatūros jutiklį įtaisykite kiek galima arčiau šilumokaičio išleidimo angos.
- Parinkite vožtuvus ir reguliavimo prietaisus, kurie užtikrintų šilumokaičio eksploatavimą pastovios temperatūros ir slėgio sąlygomis.
- Siekiant išvengti hidraulinių smūgių, negalima naudoti greitaveikių uždarymo vožtuvų, pvz., įjungimo ir išjungimo vožtuvų.
- Automatinių įrenginių siurblių išjungimą ir įjungimą bei vožtuvų įjungimą reikia užprogramuoti taip, kad susidaranti slėgio svyravimo amplitudė ir dažnis būtų kiek galima žemesni.

Izoliacija
Šildymo izoliacija ir aušinimo izoliacija tiekiamos kaip priedai.

Pastaba: *turėkite omenyje, kad izoliacijos ir šilumokaičio temperatūros ribinės vertės gali būti skirtingos.*

Gedimų paieška ir šalinimas
Siekdami užtikrinti nepriekaištingą šilumokaičio veikimą, patikrinkite, ar:

- vamzdyno sistema yra prijungta prie šilumokaičio pagal šiame vadove pateiktus nurodymus;
- šilumokaitis yra idealiai švarus ir jame nėra nuosėdų;

Pastaba: *dalelės ir plaušeliai gali užkimšti šilumokaitį. Per didelis slėgio kritimas arba šiluminio efektyvumo sumažėjimas yra šilumokaičio užsikimšimo požymiai.*

- valdymo grandinė yra tinkamai nustatyta ir įrenginys neužšąla.

Valymas
Šią įrangą galima valyti eksploatavimo vietoje. Dėl tinkamų valymo procedūrų pasitarkite su tiekėjo atstovu arba apsilankykite tiekėjo interneto svetainėje. Už eksploatavimą atsakingas asmuo turi užtikrinti, kad būtų taikomas tinkamas valymo būdas, ir nustatyti tinkamus valymo intervalus.

Pastaba: *plokštelių paketo negalima ardyti.*

Paredzētais lietojums

Lodētie siltummaiņi (BHE) ir izstrādāti, lai veiktu siltuma pārnesi atbilstoši plaša lietojuma prasībām, piemēram, saldēšanai, komforta apsildei, industriālai apsildei un atdzesēšanai, kā arī apstrādes rūpniecībā.

Formulējumi

Brīdinājums! *Bīstamības veids*

BRĪDINĀJUMS norāda potenciāli bīstamu situāciju, kas var izraisīt nāvi vai smagus ievainojumus, ja šī situācija netiek novērsta.

Uzmanību! *Bīstamības veids*

UZMANĪBU norāda potenciāli bīstamu situāciju, kas var izraisīt nelielus vai vidēji smagus ievainojumus.

Piezīme.

PIEZĪME norāda potenciāli bīstamu situāciju, kas var izraisīt īpašuma bojājumus, ja šī situācija netiek novērsta.

Nosaukuma plāksnes

Atkarībā no apstiprinātā spiediena rezervuāra ir dažādi nosaukuma plākšņu tipi.

Piezīme.

- *Var tikt izmantoti citi nosaukuma plākšņu tipi. Lai iegūtu detalizētu informāciju, sazinieties ar Alfa Laval pārstāvi.*
- *Dažas specifikācijas netiek izmantotas visiem nosaukuma plākšņu tipiem*

Nosaukuma plāksnē ir šāda informācija:

1. Vieta logotipam.
2. Ražotāja nosaukums.
3. Vieta Nacionālās padomes zīmogam un sērijas numuram.
4. Artikula numurs.
5. Tips.
6. Ražošanas vai sērijas numurs.
7. Ražošanas gads vai datums.
8. Savienojuma vietas katram šķidrumam.
9. Maks. pieļaujamās darba temperatūras.
10. Maks. pieļaujamais darba spiediens.
11. Spiediena pārbaude.
12. Spiediena pārbaudes datums.
13. Katras vietas apjoms.
14. Pieļaujamās darba temperatūras un spiedieni.
15. Darbības zona.
16. Katras vietas apraksts.
17. Šķidruma grupa.
18. Unikāla informācija klientam.
19. Iespējamās pieslēgvietas.
20. Svītrkoda informācija.
21. Vieta, kas paredzēta apstiprināšanas marķējumam. (Tālāk norādītais CE marķējums nav derīgs nosaukuma plāksnes 3. tipam.)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Oriģinālā rokasgrāmata

© COPYRIGHT 2010 Alfa Laval Lund AB. Visas tiesības paturētas

Prasības

Brīdinājums! *Siltummainis jāuzstāda un jādarbina tā, lai nerastos ievainojumu risks personālam un īpašuma bojājumu risks.*

Piezīme. *Parasto aukstumaģentu, piem., HFC un HCFC, produktu dati attiecas uz lietojumu saldēšanā, ja vien nav norādīts citādi. Pirms siltummainis tiek izmantots ar viegli uzliesmojošiem, toksiskiem vai bīstamiem šķidrumiem (piemēram, ogļūdeņradi), jāievēro atbilstošie drošības noteikumi darbībai ar šādiem šķidrumiem. Papildinformāciju, lūdzu, skatiet piegādātāja interneta vietnē.*

Uzstādīšana

Uzstādīšana jāveic ar aprīkojumu, kas aizsargā siltummaini pret spiedienu un temperatūrām ārpus nosaukuma plāksnē norādītajām apstiprinātajām minimālajām un maksimālajām vērtībām.

Uzmanību! *Lai izvairītos no asu stūru radītiem roku ievainojumiem, vienmēr jāvalkā aizsargcimdi, kad strādājat ar lodētiem siltummaiņiem.*

Lai iegūtu labāko iespējamo siltuma pārnesi, siltummainis jāpievieno tā, lai šķidrums plūstu caur siltummaini pretējos virzienos (pretplūsmā).

Piezīme. *Pirms cauruļu savienošanas pārliecinieties, ka visi svešķermeņi ir izskaloti no sistēmas.*

Uzmanību! *Ņemiet vērā, ka uzstādīšanas laikā pastāv ugunsgrēka risks, proti — ievērojiet attālumu līdz uzliesmojošām vielām.*

Uzmanību! *Nekad neceliet aiz savienojumiem. Siksnas jāizmanto tad, kad paredzēts pacelt. Uzlieciet siksnas atbilstoši 1. attēlam.*

Piezīme. *Iztvaikotājos un iekārtās, kur notiek šķidruma fāzes maiņa, siltummainis jāuzstāda vertikāli ar taisnu cauruli (vismaz 150-200 mm garumā) starp izplešanās vārstu un aukstumaģenta ieplūdi.*

Montāža

Stingru cauruļu sistēmā nelielus siltummaiņus (svars 1–6 kg) var nostiprināt tieši uz caurulēm (2A attēls). Lielākus siltummaiņus jānostiprina ar atbalsta stiprinājumiem (2D attēls), kas paredzēti konkrētajam siltummainim (piederums), vai jānostiprina ar siksnām (2C attēls) vai montāžas skrūvēm (2B attēls).
Pēc īpaša pasūtījuma montāžas skrūves var tikt piemetinātas priekšpusē vai aizmugurē. Pievilkšanas moments M6 skrūvēm ir 3,8 Nm, M8 skrūvēm — 9,5 Nm, bet M10 skrūvēm — 19,0 Nm.

Piezīme. *Ja pastāv vibrācijas risks, izmantojiet pretvibrācijas stiprinājumus, kā norādīts 2A attēlā.*

Piezīme. *Siltummaiņus ar aukstumaģenta sadalītāju jāmontē tā, lai sadalītājs atrastos apakšā.*

Piezīme. *Uzstādīšanas laikā savienojumu noslodze nedrīkst pārsniegt vērtības, kas norādītas tabulā vāka iekšpusē "Savienojumu noslodzes robežvērtības uzstādīšanas laikā".*

Piezīme. *Cauruļvadu sistēmai jābūt labi nostiprinātai un ierīkotai tā, lai ekspluatācijas laikā plākšņu siltummainis netiktu noslogots.*

Savienojumi (3. attēls)
Vītņsavienojumi — izmantojiet uzgriežņu atslēgu, kad pievienojat cauruli, un ievērojiet norādītos ierobežojumus. Daži modeļi tiek piegādāti ar Victaulic tipa savienojumiem.
Lodēti savienojumi — veiciet tīrīšanu, noberžot dažādās virsmas un notīrot no tām smērvielas. Izmantojiet lodējamajiem materiāliem atbilstošos lodēšanas metālus un pareizo lodēšanas temperatūru. Lai iegūtu detalizētu informāciju, skatiet dokumentu "Cauruļu lodēšana lodētajam siltummainim" vai sazinieties ar Alfa Laval pārstāvi.
Metināti savienojumi — TIG vai MIG metināšana. Režģis caurules iekšpusē un ārpusē, kā arī, ja pastāv slīpums, slīpā mala vismaz 25 mm no caurules malas un uz iekšpusi. Šie stiprinājumi jāpiemetina, lai novērstu vara piesārņojumu metināšanas zonā, jo tas var izraisīt metinājuma lūzumu.

Piezīme. *Aizsargājiet siltummaini pret pārkaršanu, aptinot mitru drānu ap savienojuma vietu, kad tiek veikti lodēšanas vai metināšanas darbi. Pārāk liels karstums var izkausēt iekšējo lodēšanas metālu siltummaiņa iekšpusē. Skatiet 3. attēlu.*

⚠ ***Uzmanību!*** *Atvienojot siltummaini no cauruļu sistēmas, izmantojiet piemērotu aizsargaprīkojumu, piemēram, aizsargzābakus, aizsargcimdus un acu aizsargu, atkarībā no siltummainī esošā šķidruma veida.*

Sasalšanas risks

⚠ ***Uzmanību!*** *Ievērojiet, ka pie zemām temperatūrām pastāv sasalšanas risks, lai novērstu siltummaiņa bojājumus. Siltummaiņus, kas netiek izmantoti, ir jāiztukšo un jāizžāvē, kad pastāv sasalšanas risks.*

Piezīme. *Lai novērstu sasalšanas radītus bojājumus, izmantotajam šķidrumam jāsatur antifrīzs, kad darba apstākļi ir zem šķidruma sasalšanas punkta.*

Piezīme. *Kad tiek izmantots kā iztvaikotājs*
- *Izmantojiet plūsmas slēdzi un zema spiediena slēdzi.*
- *Izmantojiet antifrīza termostatu un plūsmas kontrolierīci, lai nodrošinātu nemainīgu ūdens plūsmu pirms un pēc kompresora palaišanas, kā arī tā darbības laikā.*
- *Izvairieties no "izsūknēšanas", t.i., no iztvaikotāja iztukšošanas, darbinot kompresoru pēc izslēgšanas, līdz ir sasniegts iepriekšnoteikts aukstumaģenta spiediens. Temperatūra var samazināties zem sālsūdens sasalšanas punkta, kas var izraisīt iztvaikotāja bojājumus.*

Aizsardzība pret aizsprostošanos
Izmantojiet filtru kā aizsardzību pret iespējamu svešķermeņu daļiņu iekļūšanu. Ja radušās šaubas saistībā ar maksimālo daļiņu lielumu, sazinieties ar tuvāko piegādātāja pārstāvi vai skatiet sadaļu par produkta informāciju piegādātāja interneta vietnē.

Kontrole un darbība

⚠ ***Uzmanību!*** *Neizmantojiet siltummaini ar šķidrumiem (piemēram, dejonizētu ūdeni) vai instalācijās (piemēram, galvanizētās caurulēs), kas (ķīmiski/elektroķīmiski) var ietekmēt vai ko var ietekmēt plāksnes (nerūsējošais tērauds) un lodēšanas materiāls (varš).*

Piezīme. *Varš var izraisīt koroziju instalācijai ar sajauktiem materiāliem*

Aizsardzība pret termisku vai/un spiediena izraisītu nogurumu

Pēkšņas temperatūras un spiediena izmaiņas var izraisīt noguruma radītus siltummaiņa bojājumus. Tādēļ, lai nodrošinātu, ka siltummaiņi darbojas bez straujām spiediena/temperatūras izmaiņām, jāņem vērā šādi nosacījumi.

- Novietojiet temperatūras sensoru maksimāli tuvu siltummaiņa izplūdei.
- Izvēlieties vārstus un regulēšanas aprīkojumu, kas siltummainim nodrošina stabilu temperatūru/ spiedienu.
- Lai izvairītos no hidrauliskā trieciena, nedrīkst izmantot ātri noslēdzamos vārstus, piem., divpozīciju vārstus.
- Automatizētās instalācijās sūkņu ieslēgšanai un izslēgšanai un vārstu aktivizēšanai jābūt programmētai tā, lai spiediena amplitūda un frekvence būtu iespējami zema.

Izolācija

Siltumizolācija un aukstumizolācija ir pieejama kā piederums.

Piezīme. *Ņemiet vērā, ka izolācijas un siltummaiņa temperatūras ierobežojumi var atšķirties.*

Problēmu novēršana

Lai nodrošinātu siltummaiņa pareizu darbību, pārbaudiet, vai:

- cauruļu sistēma ir savienota ar siltummaini atbilstoši šajā rokasgrāmatā minētajām instrukcijām;
- siltummainis ir pilnībā tīrs un tajā nav nosēdumu;

Piezīme. *Daļiņas un šķiedras var aizsprostot siltummaini. Straujš spiediena kritums vai termiskās efektivitātes kritums norāda, ka siltummainis ir bojāts.*

- kontroles kontūrs ir pareizi iestatīts un nepastāv sasalšanas risks.

Tīrīšana

Šis aprīkojums ir piemērots tīrīšanai lietojuma vietā. Lai iegūtu ieteikumus par piemērotām tīrīšanas procedūrām, sazinieties ar piegādātāja pārstāvi vai apmeklējiet piegādātāja interneta vietni. Personai, kas atbildīga par darbību, jānodrošina, lai tiktu izmantota pareizā tīrīšanas metode, un jāievieš piemēroti tīrīšanas intervāli.

Piezīme. *Plākšņu iepakojums nav paredzēts atvēršanai.*

Namenjena uporaba
Lamelasti toplotni izmenjevalniki (BHE) so zasnovani za prenos toplote, ki bo ustrezala zahtevam širše uporabe, kot so zamrzovanje, ogrevanje bivalnih prostorov, ogrevanje in hlajenje industrijskih prostorov in v obdelovalni industriji.

Definicija pojmov

Opozorilo: *Vrsta nevarnosti*

OPOZORILO opozarja na možno nevarnost, ki lahko, če je ne odpravite, povzroči smrt ali resno telesno poškodbo.

Svarilo: *Vrsta nevarnosti*

SVARILO opozarja na možno nevarnost, ki lahko, če je ne odpravite, povzroči majhno ali zmerno telesno poškodbo.

Upoštevaj:
UPOŠTEVAJ opozarja na možno nevarnost, ki lahko, če je ne odpravite, poškoduje lastnino.

Plošče z oznakami
Obstajajo različni tipi plošč z oznakami, odvisno od vrste dovoljenja za tlačno posodo.

Upoštevaj:
- *Uporabljajo se lahko drugi tipi plošč z oznakami. Za podrobne informacije se obrnite na predstavnika podjetja Alfa Laval.*
- *Nekateri tehnični podatki niso namenjeni za vse tipe plošč z oznakami*

Plošča z oznakami vsebuje:
1. Logotip.
2. Ime proizvajalca.
3. Oznaka nacionalne uprave in serijska številka.
4. Številka člena.
5. Tip prenosnika.
6. Proizvodna ali serijska številka.
7. Leto ali datum proizvodnje.
8. Mesta priključkov glede na vrsto tekočine.
9. Maksimalne dovoljene obratovalne temperature.
10. Maksimalni dovoljeni obratovalni tlaki.
11. Preizkusni tlak.
12. Datum tlačnega preizkusa.
13. Prostornina vsakega prostora.
14. Dovoljene obratovalne temperature in tlaki.
15. Delovno območje.
16. Opis vsakega prostora.
17. Skupina tekočine.
18. Informacije o kupcu.
19. Možna mesta priključkov.
20. Črtna koda.
21. Znak odobritvenega organa. (spodnje oznake CE ne veljajo za ploščo z oznakami tip 3)
    – CE-0409 BHE Manufacturing, Ronneby, Švedska
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italija.

Originalna navodila
© AVTORSKE PRAVICE 2010 Alfa Laval Lund AB. Vse pravice zadržane

Zahteve

Opozorilo: *Toplotni izmenjevalnik mora obratovati in biti nameščen tako, da preprečuje tveganja telesnih poškodb ali poškodbe lastnine.*

Upoštevajte: *Če ni drugače navedeno, za hlajenje veljajo podatki o izdelku za običajne hladilne tekočine, npr. HFC in HCFC. Pred uporabo toplotnega izmenjevalnika z vnetljivimi, strupenimi ali nevarnimi tekočinami (npr. ogljikovodiki) morate upoštevati ustrezne varnostne predpise za ravnanje s takšnimi tekočinami. Za več informacij obiščite spletno mesto dobavitelja.*

Montaža

Montaža mora biti opravljena z opremo, ki ščiti toplotni izmenjevalnik pred tlaki in temperaturi, ki niso v skladu z odobrenimi minimalnimi in maksimalnimi vrednostmi navedenimi na plošči z oznakami.

Svarilo: *Da si na ostrih robovih ne poškodujete rok, morate pri rokovanju lamelastega toplotnega izmenjevalnika vedno uporabljati zaščitne rokavice.*

Za najboljšo prevajanje toplote mora biti toplotni izmenjevalnik priključen tako, da bo omogočal pretok medija skozi toplotni izmenjevalnik v nasprotni smeri (proti toku).

Upoštevaj: *Pred nameščanjem cevi se prepričajte, da v prenosniku ni tujkov.*

Svarilo: *Med montažo upoštevajte nevarnost požara, tj. pazite na razdaljo do vnetljivih snovi.*

Svarilo: *Nikoli ne dvigujte za priključke. Za dviganje uporabljajte jermena. Jermene namestite kot prikazuje shema 1.*

Upoštevajte: *Pri izparevanju in pri uporabi, kjer se pojavi fazna sprememba medija, morate toplotni izmenjevalnik namestiti navpično z ravno cevjo (z dolžino vsaj 150-200 mm) med razširitvenim ventilom in vhodno odprtino za hladilno tekočino.*

Vgradnja

V togem sistemu cevi lahko majhne toplotne izmenjevalnike (s težo od 1 do 6 kg) obesite neposredno na cevi (Shema 2A). Večje toplotne izmenjevalnike morate zavarovati s podporniki (Shema 2D), namenjenimi za določen toplotni izmenjevalnik (dodatek), z jermeni (Shema 2C) ali s pritrditvenimi vijaki (Shema 2B). Pri posebnih naročilih so pritrditveni vijaki lahko privarjeni na sprednjo ali zadnjo stran. Moment privijanja za vijake M6 znaša 3,8 Nm, vijake M8 znaša 9,5 Nm in za vijake M10 znaša 19,0 Nm.

Upoštevaj: *V primeru vibracij uporabite proti vibracijske nosilce, kot to prikazuje shema 2A.*

Upoštevaj: *Toplotne izmenjevalnike, ki imajo distribucijski sistem za hladilno tekočino, morate namestiti tako, da bo sistem na dnu.*

Upoštevaj: *Med vgrajevanjem obremenitve priključkov ne smejo presegati vrednosti iz preglednice „Omejitve obremenitev priključkov med vgrajevanjem“ na notranji strani platnice.*

Upoštevaj: *Cevna napeljava mora biti dobro pritrjena in izvedena tako, da se med delovanjem z nje na ploščni izmenjevalnik toplote ne prenašajo nikakršne obremenitve.*

Priključki (Shema 3)
Priključi z navoji – Uporabite momentni ključ za pritrditev cevi in pazite na določene mejne vrednosti. Nekaterim modelom so priloženi priključki tipa Victaulic.
Spajkalni priključki – Očistite z drgnjenjem in razmaščevanjem različnih površin. Uporabite kovino za spajkanje, ki je primerna za materiale, ki jih spajkate, ter pri tem pazite na ustrezno temperaturo za spajkanje. Za več informacij glejte dokument "Spajkanje cevi za lamelasti toplotni izmenjevalnik" ali se obrnite na predstavnika Alfa Laval.
Varjeni priključki – Varjeni deli TIG ali MIG. Zbrusite notranji in zunanji del cevi in, če je prirezana, prirezan konec vsaj 25 mm stran od roba cevi proti notranjosti. S tem boste preprečili kontaminacijo z bakrom na zvarjenem mestu, ki lahko povzroči, da le-to poči.

Upoštevajte: *V primeru spajkanja in varjenja lahko toplotni izmenjevalnik zaščitite pred prekomernim segrevanjem, če okoli priključka ovijete mokro krpo. Prekomerno segrevanje lahko stopi notranji spajkani material znotraj toplotnega izmenjevalnika. Glejte shemo 3.*

⚠ ***Svarilo:*** *Ko odklapljate toplotni izmenjevalnik s cevi, uporabite ustrezno zaščitno opremo, kot so zaščitni škornji, zaščitne rokavice in zaščito za oči, odvisno od medija v toplotnem izmenjevalniku.*

Nevarnost zamrzovanja

⚠ ***Svarilo:*** *Upoštevajte nevarnost zamrzovanja pri nizkih temperaturah, da s tem preprečite okvaro toplotnega izmenjevalnika. Toplotne izmenjevalnike, ki ne obratujejo, morate sprazniti in osušiti, če je prisotna nevarnost zamrzovanja.*

Upoštevajte: *Če želite preprečiti škodo zaradi zamrzovanja, morate uporabljenemu mediju primešati sredstvo proti zamrzovanju pri delovnih pogojih pod njegovim lediščem.*

Upoštevajte: *Če ga uporabljate ko izparilnik*
- *Uporabite tokovno stikalo ali nizko tlačno stikalo.*
- *Uporabite termostat proti zamrzovanju in tokovni upravljalnik, da s tem zagotovite konstantni pretok vode pred, med in po delovanju kompresorja.*
- *Izogibajte se tako imenovanem "pump-down" delovanju, tj. praznjenje izparilnika z zagonom kompresorja po izklopu vse dokler ni dosežen prednastavljen tlak hladilnega sredstva. Temperatura lahko pri tem pade pod ledišče slanice, kar lahko poškoduje izparilnik.*

Zaščita pred zamašitvijo
Za zaščito pred možno prisotnostjo tujkov uporabite filter. Če ste negotovi glede največje velikosti delcev, se posvetujte z dobaviteljem ali poiščite informacije o izdelku na spletnem mestu dobavitelja.

Krmiljenje in obratovanje

⚠ ***Svarilo:*** *Toplotnega izmenjevalnika ne uporabljajte za medije (npr. deionizirana voda)/instalacij (npr. pocinkane cevi), ki bi lahko (kemično/elektrokemično) vplivale na plošče (nerjavno jeklo) in material za varjenje (baker).*

Upoštevaj: *Baker lahko povzroči korozijo v instalacijah iz različnih materialov*

Zaščita pred toplotno in/ali tlačno utrujenostjo
Nenadne spremembe v temperaturi in tlaku lahko povzročijo poškodbo toplotnega izmenjevalnika zaradi utrujenosti materiala. Zaradi tega morate upoštevati naslednje, da s tem zagotovite obratovanje toplotnega izmenjevalnika brez nihanja vrednosti tlaka/ temperature.

- Namestite temperaturni senzor čim bližje izhodni odprtini toplotnega izmenjevalnika.
- Izberite ventile in opremo za reguliranje, ki omogočajo stabilno temperaturo/tlak v toplotnem izmenjevalniku.
- Preprečite vodni kamen z uporabo ventilov za hitro zapiranje, npr. zapiralni ventili.
- Pri avtomatiziranih instalacijah je potrebno vklop in izklop črpalk ter delovanje ventilov programirati tako, da sta amplituda in frekvenca tlačnih sprememb čim manjši.

Izolacija
Toplotni in hladilni izolaciji sta na voljo posebej.

Upoštevaj: *Upoštevajte, da se lahko mejne temperaturne vrednosti izolacije in toplotnega izmenjevalnika razlikujejo.*

Odpravljanje težav
Za pravilno delovanje toplotnega izmenjevalnika preverite ali:

- so cevi priključene na toplotni izmenjevalnik v skladu z navodili v tem priročniku.
- je toplotni izmenjevalnik povsem čist in brez usedlin.

Upoštevaj: *Delci in tkanine lahko zamašijo toplotni izmenjevalnik. Visok padec tlaka ali znižan toplotni izkoristek pomeni, da je toplotni izmenjevalnik umazan.*

- krmilno vezje je pravilno prednastavljeno in ni zamrzovanja.

Čiščenje
Oprema omogoča čiščenje na mestu. Za nasvet o primernem procesu čiščenja, se posvetujte z dobaviteljem ali obiščite spletno mesto dobavitelja. Oseba, ki je odgovorna za obratovanje, mora zagotoviti, da se uporablja pravilna metoda čiščenja in hkrati mora določiti ustrezne intervale čiščenja.

Upoštevaj: *Embalažo plošče ne smete odpreti.*

Javasolt felhasználás
A keményforrasztott hőcserélők (BHE) kialakítása széles körű felhasználást tesz lehetővé, a hőcserélő készülékek alkalmazhatók fagyasztó és központi fűtési berendezésekben, ipari fűtési és hűtési, illetve feldolgozóipari rendszereknél.

Meghatározások

Figyelmeztetés: *A veszély típusa*
FIGYELMEZTETÉS: olyan potenciálisan veszélyes helyzetet jelez, amely, ha bekövetkezik, halált vagy súlyos sérülést okozhat.

Vigyázat: *A veszély típusa*
VIGYÁZAT: olyan potenciálisan veszélyes helyzetet jelez, amely, ha bekövetkezik, enyhe vagy közepes sérülést okozhat.

Megjegyzés:
MEGJEGYZÉS: olyan potenciálisan veszélyes helyzetet jelez, amely, ha bekövetkezik, anyagi kárt okozhat.

Adattáblák
Az adattáblák különböző típusúak lehetnek a nyomástartó edény jóváhagyásának típusától függően.

Megjegyzés:
- *Előfordulhat, hogy más típusú adattáblákat használnak. Bővebb tájékoztatásért forduljon az Alfa Laval képviselőjéhez.*
- *Néhány műszaki adat nem alkalmazható minden adattáblatípus esetén.*

Az adattáblán látható:
1. Az embléma számára fenntartott hely.
2. A gyártó neve.
3. A nemzeti hatóság bélyegzője számára fenntartott hely és a gyártási szám.
4. Cikkszám.
5. Típus.
6. Gyári szám vagy sorozatszám.
7. A gyártás éve vagy dátuma.
8. Az egyes folyadékok csatlakozásának helyei.
9. Megengedett legnagyobb üzemi hőmérsékletek.
10. Megengedett legnagyobb üzemi nyomások.
11. Próbanyomás.
12. A próbanyomás dátuma.
13. Az egyes terek térfogata.
14. Megengedett üzemi hőmérsékletek és nyomások.
15. Üzemi terület.
16. Az egyes terek leírása.
17. Folyadékcsoport.
18. Az ügyfél számára fontos információk.
19. A csatlakozások lehetséges helyei.
20. Vonalkód-információ.
21. A jóváhagyási jel számára fenntartott hely. (Az alábbi CE jelölések a 3-as típusú adattáblára nem érvényesek.)
    – CE-0409 BHE Manufacturing, Ronneby, Svédország
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, Kína
    – CE-0948 Alfa Laval S.p.A. Alonte, Olaszország.

Eredeti utasítások

Követelmények

Figyelmeztetés: *A hőcserélő beszerelése és működtetése során ki kell küszöbölni a személyi sérülés és az anyagi kár lehetőségét.*

Megjegyzés: *Amennyiben nincs más rendelkezés, a szokványos hűtőközegek, például a HFC és a HCFC termékadatai alkalmazhatók a hűtési alkalmazásokra. A hőcserélő gyúlékony, mérgező vagy veszélyes folyadékokkal (pl. szénhidrogénekkel) történő használata előtt kötelező az ezen folyadékok kezelésére vonatkozó biztonsági szabályok betartása. További információért keresse fel a szállító honlapját.*

Beszerelés

A beszerelést olyan felszereléssel kell biztosítani, amely megvédi a hőcserélőt az adattáblán található minimális és maximális hőmérsékleti és nyomási értékeken kívüli hatásoktól.

Vigyázat: *Az éles szélek okozta kézsérülések elkerülése érdekében mindig védőkesztyűt kell viselni a keményforrasztott hőcserélők kezelésekor.*

A lehető legjobb hőcserélő teljesítmény érdekében úgy kell csatlakoztatni a hőcserélőt, hogy a folyadék ellenáramban haladjon rajta keresztül..

Megjegyzés: *Az összes csővezeték csatlakoztatása előtt ellenőrizze, hogy minden idegen tárgy ki lett-e öblítve a rendszerből.*

Vigyázat: *A beszerelés során vegye számításba a tűzveszélyt, például ügyeljen a környezetében található gyúlékony anyagokra.*

Vigyázat: *Soha ne a csatlakozásoknál végezze az emelést. Emeléskor hevedereket kell használni. A hevedereket az 1. ábrának megfelelően kell elhelyezni.*

Megjegyzés: *Párologtató berendezéseknél és olyan eszközök esetében, amelyeknél a folyadék fázisának megváltozásával kell számolni, a hőcserélőt függőlegesen kell beszerelni, és egy egyenes (legalább 150-200 mm hosszúságú) csövet kell elhelyezni a tágulási szelep és a hűtőközeg bemenete között.*

Felszerelés

Merev csőrendszer esetén a kis (1–6 kg tömegű) hőcserélőket közvetlenül a csőhálózatba lehet függeszteni (2A ábra). A nagyobb hőcserélőket támasztó szerelékekkel kell ellátni (2D ábra), amely az adott hőcserélőhöz tartozik (tartozékként), vagy hevedereket (2C ábra), illetve rögzítőcsavarokat kell használni (2B ábra). Speciális megrendelés esetén a rögzítőcsavarok a készülék elejére vagy hátuljára hegeszthetők. Az M6 csavarok meghúzási nyomatéka 3,8 Nm, az M8 csavaroké 9,5 Nm, az M10 csavaroké pedig 19,0 Nm.

Megjegyzés: *Ha fennáll a vibráció kockázata, használjon vibrációcsökkentő rögzítőberendezéseket, amint az a 2A ábrán látható.*

Megjegyzés: *A hűtőközeg-elosztóval rendelkező hőcserélőket úgy kell felszerelni, hogy az elosztó legyen alul.*

Megjegyzés: *A telepítés során a csatlakozási terhelések nem haladhatják meg a borító belső oldalán felüntetett "Csatlakozási terhelés határai telepítés során" c. táblázat értékeit.*

Megjegyzés: *A csővezetékeknek megfelelően horgonyzottnak és kivitelezettnek kell lenniük, úgy, hogy semmilyen terhelés ne kerüljön át a lap hőcserélőjére működés közben.*

Csatlakozások (3. ábra)
Menetes csatlakozások – Használjon nyomatékkulcsot a cső csatlakoztatásakor, és vegye figyelembe a megadott határértékeket. Egyes modellek Victaulic típusú csatlakozással rendelkeznek.
Forrasztott csatlakozások – Dörzsöléssel és zsírmentesítéssel tisztítsa meg a különböző felületeket. Használja a forrasztandó anyagoknak megfelelő forraszanyagot és a megfelelő forrasztási hőmérsékletet. Bővebb tájékoztatásért tanulmányozza a „Brazing tubes for brazed heat exchanger” (Keményforrasztott hőcserélők csöveinek forrasztása) című dokumentumot vagy forduljon az Alfa Laval képviselőjéhez.
Hegesztett csatlakozások – TIG vagy MIG hegesztés. Csiszolja le a cső belsejét és külsejét – leélezett csővég esetén a csővéget is – a cső szélétől legalább 25 mm hosszúságú részen befelé. Ezzel megakadályozható, hogy a hegesztési terület rézzel szennyeződjön, ami a hegesztés törését okozhatná.

Megjegyzés: *Óvja a hőcserélőt a túlmelegedéstől, és tekerjen egy darab nedves ruhát a csatlakozás köré a forrasztás vagy hegesztés környékén. Az erős hőhatás megolvaszthatja a hőcserélő belsejében a forraszanyagot. Lásd a 3. ábrát.*

⚠ ***Vigyázat:*** *A hőcserélő csővezetékről történő leválasztásakor a hőcserélőben található folyadéktól függően használjon megfelelő védőfelszerelést, például védőcipőt, védőkesztyűt és védőszemüveget.*

Fagyásveszély

⚠ ***Vigyázat:*** *A hőcserélő károsodásának elkerülése érdekében tartsa szem előtt az alacsony hőmérsékleten fellépő fagyásveszélyt. Ha fennáll a fagyásveszély, az üzemen kívül helyezett hőcserélőket ki kell üríteni és levegőbefúvással ki kell szárítani.*

Megjegyzés: *A fagyáskárok elkerülése érdekében a fagyáspontja alatt alkalmazott folyadéknak tartalmazni kell fagyálló összetevőt.*

Megjegyzés: *Párologtatóként történő alkalmazás esetén*
- *Alkalmazzon áramláskapcsolót és alacsonynyomás-kapcsolót.*
- *Használjon fagyvédelmi termosztátot és áramlásmérőt, hogy a kompresszor működése előtt, alatt és után biztosított legyen a folyamatos vízáramlás.*
- *Kerülje el a „kiszivattyúzást”, vagyis ne ürítse ki a párologtatót úgy, hogy a leállás után a kompresszort a hűtőközeg előre beállított nyomásának eléréséig működteti. A hőmérséklet így a sós víz fagypontja alá eshet, ami károsíthatja a párologtatót.*

Dugulás elleni védelem
Az esetlegesen előforduló idegen anyagok ellen használjon szűrőt. Ha bármilyen kétsége merül fel a maximális szemcseméretttel kapcsolatban, forduljon a szállító legközelebbi képviseletéhez vagy tájékozódjon a szállító honlapjának Termékinformáció részében.

Vezérlés és üzemeltetés

⚠ ***Vigyázat:*** *Ne használja a hőcserélőt olyan közeg (pl. ionmentesített víz)/szerelvények (pl. galvanizált csövek) esetén, amelyek (kémiai vagy elektrokémiai módon) reakcióba léphetnek a lemezekkel (rozsdamentes acél) vagy a forraszanyaggal (réz).*

Megjegyzés: *A réz korróziót idézhet elő a különböző anyagokkal történő alkalmazás esetén*

Védelem a hő és/vagy nyomás következtében fellépő anyagfáradás ellen
A hirtelen hőmérséklet- vagy nyomásváltozások a hőcserélő anyagfáradásból következő károsodását okozhatják. Ezért az alábbiakat kell figyelembe venni annak érdekében, hogy a hőcserélők hő/nyomásingadozás nélkül működjenek.

- A hőérzékelőt a lehető legközelebb helyezze a hőcserélő kimenetéhez.
- Válasszon olyan szelepeket és szabályozó berendezéseket, amelyek stabil hőmérsékletet/nyomást biztosítanak a hőcserélő számára.
- A vízlökés elkerülése érdekében ne használjon gyorsan záró, például be/ki szelepeket.
- Automatizált telepítés esetén a szivattyúk elindulását és leállását, illetve a szelepek működését úgy kell programozni, hogy a nyomásváltozás amplitúdója és frekvenciája a lehető legkisebb legyen.

Szigetelés
A fűtő és hűtő szigetelések tartozékként érhetők el.

Megjegyzés: *Ne feledje, hogy a szigetelés és a hőcserélő hőmérsékleti korlátai eltérőek lehetnek.*

Hibaelhárítás
A hőcserélő megfelelő teljesítményének elérése érdekében ellenőrizze a következőket:

- a csővezeték az ebben a kézikönyvben leírt utasításoknak megfelelően csatlakozik a hőcserélőhöz
- a hőcserélő tökéletesen tiszta, és nincs benne lerakódás.

Megjegyzés: *A részecskék és szálak eltömíthetik a hőcserélőt. A nyomás fokozatos csökkenése, illetve a hőhatásfok csökkenése a hőcserélő dugulását jelzi.*

- a vezérlőkör előzetes beállítása megfelelő, és nem jelentkezik fagyás.

Tisztítás
A berendezés helyben tisztítható. A megfelelő tisztítási eljárásról érdeklődjön a szállító képviselőjénél, vagy tájékozódjon a szállító honlapján. Az üzemeltetésért felelős személy feladata biztosítani a helyes tisztítási eljárás alkalmazását, illetve neki kell megállapítania a tisztítási időközöket.

Megjegyzés: *A lemezcsomagot nem szabad kinyitni.*

Určené použití

Pájené výměníky tepla (Brazed Heat Exchangers – BHE) jsou určeny k zajištění potřebného přenosu tepla v celé řadě aplikací, jako je zchlazování, komfortní vytápění, průmyslové vytápění a chlazení a zpracovatelské odvětví.

Definice

Výstraha: *Typ nebezpečí*

⚠ *VÝSTRAHA označuje potenciálně nebezpečnou situaci, která, není-li jejímu vzniku zabráněno, může mít za následek usmrcení nebo vážné zranění.*

Varování: *Typ nebezpečí*

⚠ *VAROVÁNÍ označuje potenciálně nebezpečnou situaci, která, není-li jejímu vzniku zabráněno, může mít za následek lehké nebo střední zranění.*

Upozornění:
UPOZORNĚNÍ označuje potenciálně nebezpečnou situaci, která, není-li jejímu vzniku zabráněno, může mít za následek škodu na majetku.

Typové štítky

Existují různé varianty typového štítku v závislosti na druhu atestu tlakové nádoby.

Poznámka:
- *Mohou být použity i jiné varianty typového štítku. Podrobné informace vám sdělí zástupce společnosti Alfa Laval.*
- *Některé specifikace nejsou používány pro všechny varianty typového štítku.*

Typový štítek obsahuje:

1. Místo pro logo
2. Název výrobce
3. Místo pro razítko státního orgánu a sériové číslo
4. Číslo výrobku
5. Typ
6. Výrobní nebo sériové číslo
7. Rok nebo datum výroby
8. Umístění přípojek pro jednotlivé kapaliny
9. Maximální dovolené provozní teploty
10. Maximální dovolené provozní tlaky
11. Zkušební tlak
12. Datum tlakové zkoušky
13. Objem každého prostoru
14. Dovolené provozní teploty a tlaky
15. Pracovní oblast
16. Popis každého prostoru
17. Skupina kapalin
18. Informace týkající se výhradně zákazníka
19. Možné umístění přípojek
20. Čárový kód
21. Prostor pro schvalovací značku (Dále uvedené značky CE nejsou platné pro typový štítek 3.)
    – CE-0409 BHE Manufacturing, Ronneby, Švédsko
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, Čína
    – CE-0948 Alfa Laval S.p.A. Alonte, Itálie

Originální návod

Požadavky

> ⚠ ***Výstraha:*** *Výměník tepla musí být instalován a obsluhován takovým způsobem, aby nehrozilo žádné riziko zranění osob nebo škody na majetku.*

> ***Poznámka:*** *Není-li stanoveno jinak, výrobkové specifikace pro běžná chladiva, tj. HFC a HCFC, lze použít pro aplikace zchlazování. Před použitím výměníku tepla pro hořlavé, jedovaté nebo nebezpečné kapaliny (např. uhlovodíky) musí být dodrženy příslušné bezpečnostní předpisy pro zacházení s těmito kapalinami. Další informace najdete na internetových stránkách dodavatele.*

Instalace

Zařízení musí být vybaveno prostředky, které chrání výměník tepla před tlaky a teplotami mimo schválené minimální a maximální hodnoty uvedené na typovém štítku.

> ⚠ ***Varování:*** *Aby nedošlo k poranění rukou ostrými hranami, při práci s pájenými výměníky tepla vždy používejte ochranné rukavice.*

Aby přenos tepla byl co nejlepší, musí být výměník tepla připojen tak, aby jím média proudila v opačném směru (protiproud).

> ***Poznámka:****Před připojením jakéhokoliv potrubí se ujistěte, že ze systému byly odstraněny veškeré cizí předměty.*

> ⚠ ***Varování:*** *Během montážních prací počítejte s rizikem vzniku požáru, tj. udržujte dostatečnou vzdálenost od hořlavin.*

> ⚠ ***Varování:*** *Zařízení nikdy nezvedejte za přípojky. Při zvedání použijte popruhy. Popruhy umístěte podle obr. 1.*

> ***Poznámka:*** *V případě aplikací s odpařováním a se změnou skupenství média musí být výměník tepla instalován ve svislé poloze s rovnou délkou trubky (min. 150–200mm) mezi expanzním ventilem a vstupem chladiva.*

Montáž

V pevném potrubním rozvodu mohou být malé výměníky tepla (hmotnost 1–6kg) zavěšeny přímo v potrubí (obr. 2A). Větší výměníky tepla musí být zabezpečeny montážními podpěrami (obr. 2D), které jsou určeny pro specifický výměník (příslušenství), třmeny (obr. 2C) nebo montážními šrouby (obr. 2B). Ve zvláštních případech mohou být montážní šrouby přivařeny vpředu, nebo vzadu. Utahovací moment je 3,8Nm pro šrouby M6, 9,5Nm pro šrouby M8 a 19,0Nm pro šrouby M10.

> ***Poznámka:*** *Jestliže existuje nebezpečí vibrací, použijte antivibrační uchycení podle obr. 2A.*

> ***Poznámka:*** *Výměníky tepla s distributorem chladiva musí být namontovány s distributorem v dolní poloze.*

> ***Poznámka:*** *Během instalace nesmí namáhání spojů překročit hodnoty podle tabulky „Limity pro namáhání spojů během instalace“ na vnitřní straně obálky.*

> ***Poznámka:*** *Potrubní systém by měl být řádně zakotven a proveden tak, aby se během provozu nepřenášely žádné zátěže na deskový výměník tepla.*

Přípojky (obr. 3)
Závitové přípojky – Během připojování trubky použijte momentový klíč a dodržte stanovené mezní hodnoty. Některé modely jsou dodávány s přípojkami typu Victaulic.
Pájené přípojky – Různé povrchy očistěte obroušením a odmaštěním. Použijte jakost tvrdé pájky, která je vhodná pro pájené materiály, a použijte správnou pájecí teplotu. Podrobné informace najdete v dokumentu „Pájení trubek pro pájené výměníky tepla“ nebo se obrat’te na zástupce společnosti Alfa Laval.
Svařované přípojky – Svařování metodami TIG nebo MIG. Obruste vnitřní a vnější povrch trubky, a je-li trubka zkosená, obruste rovněž zkosenou hranu do vzdálenosti alespoň 25mm od hrany a uvnitř. Tím se zamezí znečištění oblasti svaru mědí, která by mohla způsobit svarové trhliny.

Poznámka: *Chraňte výměník tepla před přehřátím tím, že během pájení nebo svařování obalíte přípojku kusem mokré látky. Nadměrné zahřátí by mohlo roztavit tvrdou pájku uvnitř výměníku. Viz obrázek 3.*

⚠ ***Varování:*** *Během odpojování výměníku tepla od potrubí používejte v závislosti na druhu média ve výměníku vhodné ochranné prostředky jako ochrannou obuv, ochranné rukavice a ochranu zraku.*

Nebezpečí zamrznutí

⚠ ***Varování:*** *Pamatujte na nebezpečí zamrznutí při nízkých teplotách, aby nedošlo k poškození výměníku tepla. Jestliže existuje nebezpečí zamrznutí, výměníky tepla mimo provoz musí být vyprázdněny a vysušeny proudem vzduchu.*

Poznámka: *Aby nedošlo k poškození v důsledku zamrznutí, musí použité médium při provozních podmínkách pod jeho bodem tuhnutí obsahovat nemrznoucí prostředek.*

Poznámka: *Je-li výměník použit jako výparník*
- *Použijte průtokový spínač a nízkotlaký spínač.*
- *Použijte termostat proti zamrznutí a hlídač průtoku k zajištění konstantního průtoku vody před, během a po uvedení kompresoru do provozu.*
- *Vyvarujte se „vyčerpání“, tj. vyprázdnění výparníku v důsledku spuštění kompresoru po přerušení provozu bez dosažení předem nastaveného tlaku chladiva. Mohlo by dojít k poklesu teploty pod teplotu tuhnutí solanky a k následnému poškození výparníku.*

Ochrana proti ucpání
Jako ochranu před možným výskytem cizích částic použijte filtr. Máte-li pochybnosti týkající se maximální velikosti částic, poraďte se s nejbližším zástupcem dodavatele nebo údaje vyhledejte na internetových stránkách dodavatele v sekci informací o výrobcích.

Řízení a provoz

⚠ ***Varování:*** *Výměník tepla nepoužívejte pro média (např. deionizovanou vodu) a instalace (např. pozinkované trubky), které by mohly (chemicky nebo elektrochemicky) ovlivňovat nebo být ovlivněny deskami (nerezová ocel) a tvrdou pájkou (měď).*

Poznámka: *Měď může vyvolat korozi v zařízeních složených z různých materiálů.*

Ochrana proti tepelné a/nebo tlakové únavě
Náhlé změny teploty a tlaku mohou být příčinou únavového poškození výměníku tepla. Proto je nutné provést následující opatření, která zajistí provoz výměníku bez teplotních a tlakových změn.

- Umístěte snímač teploty co nejblíže k výstupu z výměníku tepla.
- Volte ventily a regulační zařízení, která pro výměník tepla zajistí stabilní tlaky a teploty.
- Pro vyloučení vodního rázu nesmějí být použity rychlouzavírací ventily, např. ventily otevřeno/zavřeno.
- Vautomatizovaných instalacích je třeba naprogramovat spouštění a zastavování čerpadel a pohony ventilů tak, aby byly výsledné amplitudy a frekvence změn tlaku co nejnižší.

Izolace
Tepelná a chladová izolace je dodávána jako příslušenství.

Poznámka: *Nezapomeňte, že mezní teploty izolace a výměníku tepla se mohou lišit.*

Odstraňování problémů
Chcete-li zajistit správnou funkci výměníku tepla:

- Zkontrolujte, zda je potrubní systém připojený k výměníku tepla v souladu s pokyny uvedenými v tomto návodu.
- Zkontrolujte, zda je výměník tepla dokonale čistý a bez usazenin.

Poznámka: *Částice a vlákna mohou výměník tepla ucpat. Zvýšení tlakové ztráty nebo snížení tepelné účinnosti signalizuje, že výměník tepla je zanesený.*

- Zkontrolujte, zda je regulační okruh správně přednastavený a nedochází k zamrznutí.

Čištění
Zařízení je vhodné pro metodu čištění na místě.
Použití vhodných metod čištění konzultujte se zástupcem dodavatele nebo navštivte jeho internetové stránky.
Osoba odpovědná za provoz musí zajistit, aby byla použita správná metoda čištění, a musí stanovit vhodné intervaly čištění.

Poznámka: *Otevření svazku desek se neuvažuje.*

Účel použitia
Spájkované výmenníky tepla (BHE) sú navrhnuté tak, aby uskutočňovali výmenu tepla a spĺňali požiadavky pri mnohých aplikáciách, napríklad chladení, pohodlnom vykurovaní, priemyselnom vykurovaní a chladení a v spracovateľskom priemysle.

Definície

Varovanie: *typ nebezpečenstva*

Slovo VAROVANIE signalizuje potenciálne nebezpečnú situáciu, ktorá, ak jej nezabránite, môže spôsobiť usmrtenie alebo vážne poranenie.

Upozornenie: *typ nebezpečenstva*

Slovo UPOZORNENIE signalizuje potenciálne nebezpečnú situáciu, ktorá, ak jej nezabránite, môže spôsobiť mierne alebo stredne ťažké poranenie.

Poznámka:
Slovo POZNÁMKA signalizuje potenciálne nebezpečnú situáciu, ktorá, ak jej nezabránite, môže spôsobiť poškodenie majetku.

Typové štítky
Existujú rôzne typy typových štítkov v závislosti od typu schválenia tlakovej nádoby.

Poznámka:
- *Môžu byť použité iné typy typových štítkov. Podrobnejšie informácie vám poskytne zástupca spoločnosti Alfa Laval.*
- *Niektoré špecifikácie sa nepoužívajú na všetkých typoch typových štítkov*

Na typovom štítku sa nachádza:
1. Priestor pre logo.
2. Názov výrobcu.
3. Priestor pre pečiatku výboru National Board a sériové číslo.
4. Číslo výrobku.
5. Typ:
6. Výrobné alebo sériové číslo.
7. Rok alebo dátum výroby.
8. Umiestnenie spojov pre jednotlivé kvapaliny.
9. Maximálna dovolená prevádzková teplota.
10. Maximálny dovolený prevádzkový tlak.
11. Skúšobný tlak.
12. Dátum tlakového testu.
13. Objem každého priestoru.
14. Dovolená prevádzková teplota a tlak.
15. Prevádzková oblasť.
16. Popis každého priestoru.
17. Skupina kvapalín.
18. Jedinečné informácie pre zákazníka.
19. Možné umiestnenie spojov.
20. Informácie o čiarovom kóde.
21. Priestor pre značku schválenia. (značky CE nižšie nie sú platné pre typový štítok typu 3)
    – CE-0409 BHE Manufacturing, Ronneby, Švédsko
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, Čína
    – CE-0948 Alfa Laval S.p.A. Alonte, Taliansko.

Pôvodné pokyny
© COPYRIGHT 2010 Alfa Laval Lund AB. Všetky práva vyhradené

Požiadavky

> ***Varovanie:*** *Výmenník tepla musí byť nainštalovaný a obsluhovaný spôsobom, ktorý nebude mať za následok riziko poranenia pracovníkov a poškodenia majetku.*

> ***Poznámka:*** *Ak nie je uvedené inak, produktové údaje pre bežné chladiace zmesi, napr. HFC a HCFC, platia pre aplikácie chladenia. Pred použitím výmenníka tepla s horľavými, toxickými alebo nebezpečnými kvapalinami (napr. uhľovodíkmi) sa musia uplatniť príslušné bezpečnostné opatrenia pre manipuláciu s týmito kvapalinami. Ďalšie informácie nájdete na internetovej lokalite dodávateľa.*

Inštalácia

Inštalácia sa musí uskutočniť so zariadením, ktoré bude výmenník tepla chrániť pred tlakom a teplotou mimo schválených minimálnych a maximálnych hodnôt uvedených na typovom štítku.

> ***Upozornenie:*** *Aby nedošlo kporaneniu rúk ostrými hranami, pri práci sospájkovanými výmenníkmi tepla vždy používajte ochranné rukavice.*

Na dosiahnutie maximálneho možného výkonu pri výmene tepla by mal byť výmenník tepla pripojený tak, aby médiá pretekali výmenníkom tepla opačnými smermi (v protiprúde).

> ***Poznámka:*** *Pred pripojením akéhokoľvek potrubia sa uistite, že boli zo systému odstránené všetky cudzie predmety.*

> ***Upozornenie:*** *Počas inštalačných prác berte do úvahy riziko požiaru, t.j. vzdialenosť horľavých látok.*

> ***Upozornenie:*** *Nikdy nedvíhajte výmenník za spoje. Pri zdvíhaní použite popruhy. Popruhy umiestnite podľa obrázka 1.*

> ***Poznámka:*** *V aplikáciách vyparovania a v aplikáciách, v ktorých dochádza k zmene fázy médií, musí byť výmenník tepla nainštalovaný zvisle s priamym potrubím (s dĺžkou minimálne 150-200 mm) medzi expanzným ventilom a vstupom chladiacej zmesi.*

Montáž

V pevnom systéme potrubia sa môžu malé výmenníky tepla (s hmotnosťou 1–6 kg) uložiť priamo v potrubí (obrázok 2A). Väčšie výmenníky tepla by mali byť zabezpečené prostredníctvom podpornej armatúry (obrázok 2D) určenej pre konkrétny výmenník tepla (príslušenstvo) alebo prostredníctvom popruhov (obrázok 2C) alebo montážnych skrutiek (obrázok 2B). Pri špeciálnych objednávkach môžu byť montážne skrutky privarené k prednej alebo zadnej časti. Uťahovací moment pre skrutky M6 je 3,8 Nm, pre skrutky M8 9,5 Nm a pre skrutky M10 19,0 Nm.

> ***Poznámka:*** *Ak existuje riziko vibrácií, použite tlmiacu podložku tak, ako je znázornené na obrázku 2A.*

> ***Poznámka:*** *Výmenníky tepla s rozvádzačom chladiacej zmesi by sa mali montovať tak, aby sa rozvádzač nachádzal v spodnej časti.*

> ***Poznámka:*** *Počas inštalácie nesmie namáhanie spojov prekročiť hodnoty podľa tabuľky „Limity pre namáhanie spojov počas inštalácie“ na vnútornej strane obálky.*

> ***Poznámka:*** *Potrubný systém by mal byť riadne zakotvený a vyhotovený tak, aby sa počas prevádzky neprenášali žiadne zát'aže na doskový výmenník tepla.*

Pripojenia (obrázok 3)
Pripojenia so závitom – pri pripojení potrubia použite momentový kľúč a dodržujte uvedené limity. Niektoré modely sa dodávajú s pripojeniami typu Victaulic.
Spájkované pripojenia – obrúsením a odmastením vyčistite jednotlivé povrchy. Pri spájkovaní použite triedu kovu vhodnú pre spájkované materiály a správnu teplotu spájkovania. Podrobnejšie informácie nájdete v dokumente „Spájkovanie potrubia pre spájkovaný výmenník tepla“ alebo kontaktujte zástupcu spoločnosti Alfa Laval.
Zvárané pripojenia – zváranie TIG alebo MIG. Obrúste vnútornú a vonkajšiu stranu potrubia. Ak je potrubie naklonené, obrúste tiež fazetu v dĺžke aspoň 25 mm od okraja potrubia smerom dovnútra. Tým sa zabráni kontaminácii medi v zváranej oblasti, čo by mohlo spôsobiť prasknutie zvaru.

Poznámka: *Pri každom spájkovaní alebo zváraní chráňte výmenník tepla pred prehriatím tak, že okolo pripojenia omotáte kus mokrej látky. Nadmerné teplo môže roztopiť vnútorný spájkovací kov vo výmenníku tepla. Pozrite si obrázok 3.*

⚠ ***Upozornenie:*** *Pri odpájaní výmenníka tepla od systému potrubia použite vhodné ochranné pomôcky, napríklad bezpečnostnú obuv, bezpečnostné rukavice a prostriedky na ochranu zraku, v závislosti od typu média vo výmenníku tepla.*

Riziko zamrznutia

⚠ ***Upozornenie:*** *Berte do úvahy riziko zamrznutia pri nízkych teplotách, aby sa zabránilo poškodeniu výmenníka tepla. Výmenníky tepla, ktoré sú mimo prevádzky, by mali byť vyprázdnené a vysušené vždy, keď existuje riziko zamrznutia.*

Poznámka: *Ak chcete zabrániť poškodeniu z dôvodu zamrznutia, použité médium musí pri prevádzkových podmienkach pod bodom mrazu obsahovať nemrznúce činidlo.*

Poznámka: *Pri použití výparníka*
- *Použite prietokový a nízkotlakový spínač.*
- *Použite termostat, ktorý zabráni zamrznutiu, a monitor prietoku, aby sa zabezpečil rovnaký prietok vody pred, počas a po skončení prevádzky kompresora.*
- *Zabráňte „vyčerpaniu“, t.j. vyprázdneniu výparníka prevádzkou kompresora po vypnutí, kým sa nedosiahne stanovený tlak chladiacej zmesi. Teplota by mohla klesnúť pod bod mrazu kvapaliny, čo by mohlo poškodiť výparník.*

Ochrana pred upchaním
Použite ochranný filter, ktorý zabráni možnému výskytu cudzích častíc. Ak máte akékoľvek pochybnosti týkajúce sa maximálnej veľkosti častíc, požiadajte o radu miestneho zástupcu dodávateľa alebo si prečítajte časť Informácie o produkte na internetovej lokalite dodávateľa.

Ovládanie a prevádzka

⚠ ***Upozornenie:*** *Nepoužívajte výmenník tepla s médiami (napr. deionizovanou vodou)/inštaláciami (napr. pozinkovaným potrubím), ktoré môžu (chemicky/elektrochemicky) ovplyvniť alebo byť ovplyvnené doskami (nehrdzavejúca oceľ) a spájkovacím materiálom (meď).*

Poznámka: *V inštalácii so zmiešanými materiálmi môže meď spôsobiť koróziu*

Ochrana pred tepelnou alebo tlakovou únavou materiálu

Náhle zmeny teploty a tlaku môžu spôsobiť únavové poškodenie výmenníka tepla. Preto je nutné vziať do úvahy nasledujúce opatrenia, aby sa zabezpečila prevádzka výmenníkov tepla bez kolísania tlaku/teploty.

- Umiestnite teplotný snímač čo najbližšie k výstupu z výmenníka tepla.
- Použite ventily a regulačné zariadenia, ktoré zabezpečujú nemennú teplotu/tlak vo výmenníku tepla.
- Ak chcete zabrániť vodnému rázu, nesmú sa rýchlo uzatvárať ventily, napr. otváracie/uzatváracie ventily.
- Vautomatizovaných inštaláciách je potrebné naprogramovať spustenie a zastavovanie čerpadiel a pohony ventilov tak, aby boli výsledné amplitúdy a frekvencie zmien tlaku čo najnižšie.

Izolácia

Tepelná izolácia a izolácia chladenia je k dispozícii ako príslušenstvo.

Poznámka: *Teplotný rozsah izolácie a výmenníka tepla sa môže líšiť.*

Riešenie problémov

Ak chcete zabezpečiť správnu prevádzku výmenníka tepla, uistite sa, že:

- systém potrubia je pripojený k výmenníku tepla podľa pokynov v tomto návode
- výmenník tepla je úplne čistý a neobsahuje usadeniny.

Poznámka: *Častice a vlákna môžu výmenník tepla upchať. Vyšší pokles tlaku alebo pokles tepelnej účinnosti indikuje, že výmenník tepla je znečistený.*

- regulačný obvod je nastavený správne a nedochádza k mrznutiu.

Čistenie

Zariadenie je vhodné na čistenie na mieste. Ak potrebujete informácie o vhodných čistiacich postupoch, požiadajte o radu zástupcu dodávateľa alebo navštívte internetovú lokalitu dodávateľa. Osoba zodpovedná za prevádzku by mala zabezpečit', aby sa použil správny čistiaci postup, a určiť vhodný interval čistenia.

Poznámka: *Súprava dosiek nie je určená na otváranie.*

Tujuan penggunaan
Penukar haba terpateri (BHE) telah direka untuk menjalankan pemindahan haba untuk memenuhi keperluan rangkaian aplikasi yang luas seperti penyejukan, pemanasan selesa, pemanasan dan penyejukan industri serta industri proses.

Definisi

Amaran: *Jenis bahaya*
AMARAN menunjukkan situasi yang berpotensi berbahaya yang, jika tidak dielakkan, boleh menyebabkan kematian atau kecederaan serius.

Awas: *Jenis bahaya*
AWAS menunjukkan situasi yang berpotensi berbahaya yang, jika tidak dielakkan, boleh menyebabkan kecederaan kecil atau sederhana.

Nota:
NOTA menunjukkan situasi yang berpotensi berbahaya yang, jika tidak dielakkan, boleh menyebabkan kerosakan harta-benda.

Plat nama
Terdapat jenis plat nama yang berbeza bergantung kepada jenis kelulusan bekas tekanan.

Nota:
- *Jenis plat nama lain mungkin digunakan. Untuk maklumat terperinci hubungi wakil Alfa Laval.*
- *Beberapa spesifikasi tidak digunakan untuk semua jenis plat nama*

Plat nama menunjukkan:
1. Ruang untuk jenis logo.
2. Nama pengeluar.
3. Ruang untuk cap Lembaga Kebangsaan dan nombor siri.
4. Nombor artikel.
5. Jenis.
6. Nombor pengeluaran atau siri.
7. Tahun atau tarikh dikeluarkan.
8. Lokasi sambungan untuk setiap bendalir.
9. Suhu pengendalian dibenarkan maks.
10. Tekanan pengendalian dibenarkan maks.
11. Tekanan ujian.
12. Tarikh tekanan ujian.
13. Isipadu bagi setiap ruang.
14. Suhu dan tekanan pengendalian dibenarkan.
15. Kawasan pengendalian.
16. Penerangan bagi setiap ruang.
17. Kumpulan bendalir.
18. Maklumat unik kepada pelanggan.
19. Kemungkinan lokasi bagi sambungan.
20. Maklumat kod bar.
21. Ruang untuk tanda kelulusan. (Tanda CE di bawah tidak sah untuk plat nama jenis 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Arahan asal

Keperluan

> ***Amaran:*** *Penukar haba mesti dipasang dan dikendalikan dengan cara supaya tiada risiko kecederaan kepada kakitangan dan kerosakan kepada harta-benda akan berlaku.*

> ***Nota:*** *Kecuali dinyatakan sebaliknya, data produk untuk bahan penyejuk biasa, iaitu HFC dan HCFC adalah berkaitan kepada aplikasi penyejukan. Sebelum penukar haba digunakan untuk cecair mudah bakar, toksik atau merbahaya (cth. hidrokarbon) peraturan keselamatan yang relevan untuk mengendalikan cecair seumpamanya mesti digunakan. Untuk maklumat lanjut, sila rujuk laman Internet pembekal.*

Pemasangan

Pemasangan mesti disediakan bersama peralatan yang melindungi penukar haba terhadap tekanan dan suhu di luar nilai minimum dan maksimum yang diluluskan yang ditunjukkan pada plat nama.

> ***Awas:*** *Untuk mengelakkan kecederaan tangan akibat terkena bahagian tepi yang tajam, sarung tangan pelindung perlu sentiasa dipakai semasa mengendalikan penukar haba terpateri.*

Untuk prestasi pemindahan haba yang terbaik, penukar haba perlu disambungkan supaya aliran media melalui penukar haba adalah dalam arah bertentangan (dalam aliran lawan).

> ***Nota:*** *Sebelum menyambungkan sebarang perpaipan, pastikan semua objek asing telah dikeluarkan daripada sistem.*

> ***Awas:*** *Ambil kira risiko kebakaran semasa kerja pemasangan, iaitu berhati-hati mengenai jarak ke bahan mudah bakar.*

> ***Awas:*** *Jangan sekali-kali mengangkat pada sambungan. Tali pengikat perlu digunakan semasa mengangkat. Letakkan tali pengikat mengikut rajah 1.*

> ***Nota:*** *Di dalam aplikasi penyejat dan di dalam aplikasi di mana perubahan fasa media berlaku, penukar haba mesti dipasang secara menegak menggunakan paip lurus (sekurang-kurangnya 150-200 mm panjang) di antara injap pengembangan dan salur masuk bahan penyejuk.*

Cagakan

Dalam sistem paip yang tegar, penukar haba kecil (berat 1–6 kg) boleh diampai terus di dalam kerja paip (Rajah 2A). Penukar haba yang lebih besar perlu diperkemaskan menggunakan cagakan sokongan (Rajah 2D) yang disediakan untuk penukar haba khusus (aksesori), atau diperkemaskan menggunakan tali pengikat (Rajah 2C) atau dengan menggunakan bolt cagakan (Rajah 2B). Untuk pesanan khas, bolt cagakan boleh dikimpal ke depan atau belakang. Kilas pengikat untuk bolt M6 adalah 3.8 Nm, bolt M8 adalah 9,5Nm dan untuk bolt M10 19.0 Nm.

> ***Nota:*** *Jika terdapat risiko getaran, gunakan cagakan anti getaran seperti ditunjukkan dalam Rajah 2A.*

> ***Nota:*** *Penukar haba yang mempunyai pengagih bahan penyejuk perlu dicagak supaya pengagih berada di bawah.*

> ***Nota:*** *Semasa pemasangan beban sambungan mesti tidak melebihi nilai yang dinyatakan menurut jadual "Had bagi Beban Sambungan semasa Pemasangan" pada bahagian dalam halaman depan.*

> ***Nota:*** *Kerja paip perlu terpasang kukuh dan sempurna supaya tiada beban dipindahkan ke penukar haba plat semasa operasi.*

Sambungan (Rajah 3)

Sambungan terulir – Gunakan sepana kilas semasa menyambungkan paip dan patuhi had yang dinyatakan. Beberapa model dibekalkan bersama jenis sambungan Victaulic.

Sambungan terpateri – Bersihkan dengan menggosok dan menyahgris kesemua permukaan yang berbeza. Gunakan gred logam pateri yang sesuai untuk bahan yang dipateri, dan gunakan suhu pematerian yang betul. Untuk maklumat terperinci rujuk dokumen "Tiub pematerian untuk penukar haba terpateri" atau hubungi wakil Alfa Laval.

Sambungan terkimpal – Kimpalan TIG atau MIG. Kisar di dalam dan di luar paip dan, jika serong, hujung serong sekurang-kurangnya 25 mm daripada hujung paip dan ke arah dalam. Ini perlu dilakukan untuk mengelakkan pencemaran tembaga di dalam kawasan yang dikimpal, yang boleh menyebabkan kimpalan retak.

Nota: *Lindungi penukar haba daripada pemanasan berlebihan dengan membalutkan sehelai kain basah di keliling sambungan setiap kali sebarang pematerian atau kimpalan dilakukan. Pemanasan berlebihan boleh mencairkan logam pematerian dalaman di dalam penukar haba. Rujuk rajah 3.*

⚠ ***Awas:*** *Semasa menanggalkan penukar haba daripada sistem perpaipan gunakan peralatan perlindungan yang sesuai, seperti kasut keselamatan, sarung tangan keselamatan dan perlindungan mata, bergantung pada jenis media di dalam penukar haba.*

Risiko penyejukbekuan

⚠ ***Awas:*** *Berhati-hati mengenai risiko penyejukbekuan pada suhu rendah untuk mengelakkan kerosakan kepada penukar Haba. Penukar haba yang tidak digunakan perlu dikosongkan dan disembur kering setiap kali terdapat risiko penyejukbekuan.*

Nota: *Untuk mengelakkan kerosakan akibat penyejukbekuan, medium yang digunakan mesti termasuk ejen anti beku pada keadaan pengendalian di bawah takat penyejukbekuannya.*

Nota: *Apabila digunakan sebagai penyejat*

- *Gunakan suis aliran dan suis tekanan rendah.*
- *Gunakan termostat anti beku dan pemantau aliran untuk memastikan aliran air yang malar sebelum, semasa dan selepas pemampat telah berjalan.*
- *Elakkan "pam turun", iaitu mengosongkan penyejat dengan menjalankan pemampat selepas penutupan sehingga tekanan bahan penyejuk yang dipraset dicapai. Suhu kemudiannya boleh jatuh di bawah titik penyejukbekuan garam, yang boleh merosakkan penyejat.*

Perlindungan daripada tersumbat

Gunakan penapis sebagai perlindungan daripada kemungkinan berlakunya partikel asing. Jika anda mempunyai sebarang keraguan mengenai saiz partikel maksimum, rujuk wakil pembekal terdekat anda atau cari di bawah maklumat Produk di laman Internet pembekal.

Kawalan dan operasi

⚠ ***Awas:*** *Jangan gunakan penukar haba untuk media (cth. air ternyahion)/pemasangan (cth. paip tergalvani) yang (secara kimia/elektrokimia) boleh memberi kesan atau menerima kesan oleh plat (Keluli tahan karat) dan bahan pematerian (Tembaga).*

Nota: *Tembaga boleh menghasilkan pengakisan di dalam pemasangan yang mempunyai bahan bercampur*

Perlindungan terhadap lesu terma atau/dan tekanan

Perubahan suhu dan tekanan yang tiba-tiba boleh menyebabkan kerosakan lesu kepada penukar haba. Oleh itu, yang berikut perlu diambil kira untuk memastikan penukar haba beroperasi tanpa tekanan/ suhu yang tidak menentu.

- Letakkan penderia suhu seberapa hampir yang boleh dengan salur keluar daripada penukar haba.
- Pilih injap dan peralatan pengatur yang memberikan suhu/tekanan yang stabil untuk penukar haba.
- Untuk mengelakkan tukul air, injap yang ditutup cepat tidak boleh digunakan, cth. injap buka/tutup.
- Di dalam pemasangan automatik, pemberhentian dan permulaan pam dan penggerakan injap perlu diprogramkan supaya amplitud yang dihasilkan dan kekerapan variasi tekanan akan seberapa rendah yang boleh.

Penebatan

Penebatan pemanasan dan penyejukan tersedia sebagai aksesori.

Nota: *Sila ketahui bahawa had suhu bagi penebatan dan penukar haba boleh berbeza.*

Menyelesaikan masalah.

Untuk memastikan prestasi penukar haba yang betul, pastikan bahawa:

- sistem perpaipan telah disambungkan ke penukar haba menurut arahan di dalam manual ini
- penukar haba bersih sepenuhnya dan bebas daripada endapan.

Nota: *Partikel dan fiber boleh menyumbat penukar haba. Peningkatan dalam jatuhan tekanan atau jatuhan dalam kecekapan terma menunjukkan bahawa penukar haba rosak.*

- litar kawalan dipraset dengan betul dan tiada penyejukbekuan berlaku.

Pembersihan

Peralatan ini sesuai untuk dibersihkan di tempatnya. Untuk mendapatkan nasihat mengenai proses pembersihan, rujuk wakil pembekal atau lawati laman Internet pembekal. Orang yang bertanggungjawab untuk operasi perlu memastikan bahawa kaedah pembersihan yang betul digunakan dan perlu memutuskan mengenai selang pembersihan yang sesuai.

Nota: *Pakej plat bukan untuk dibuka.*

Utilizarea conform destinaţiei
Schimbătoarele de căldură brazate (BHE) au fost destinate transferului de căldură pentru a întruni cerinţele unei game vaste de aplicaţii precum refrigerare, încălzire confortabilă, încălzire şi răcire industrială şi industria prelucrătoare.

Definiţii

Avertisment: *Tipul de pericol*
AVERTISMENTUL indică o situaţie potenţial periculoasă care, dacă nu este evitată, poate cauza moartea sau rănirea gravă.

Atenţie: *Tipul de pericol*
ATENŢIE indică o situaţie potenţial periculoasă care, dacă nu este evitată, poate cauza rănire minoră sau gravă.

Notă:
NOTĂ indică o situaţie potenţial periculoasă care, dacă nu este evitată poate cauza daune materiale.

Plăcuţe de fabricaţie
Există diferite tipuri de plăcuţe de fabricaţie în funcţie de autorizaţia vasului sub presiune.

Notă:
- *Pot fi utilizate alte tipuri de plăcuţe de fabricaţie. Pentru informaţii detaliate contactaţi reprezentantul Alfa Laval.*
- *Unele specificaţii nu sunt utilizate pentru toate tipurile de plăcuţe de fabricaţie*

Plăcuţa de fabricaţie indică:
1. Spaţiu pentru tipul logoului.
2. Numele producătorului.
3. Spaţiu pentru ştampila Consiliului Naţional şi numărul de serie.
4. Numărul articolului.
5. Tipul.
6. Numărul de fabricaţie sau de serie.
7. Anul sau data de fabricaţie.
8. Locaţiile racordurilor pentru fiecare lichid.
9. Temperaturi de funcţionare max. admise.
10. Presiuni de funcţionare max. admise.
11. Presiunea de probă.
12. Data presiunii de probă.
13. Capacitatea pentru fiecare spaţiu.
14. Temperaturi şi presiuni de funcţionare admise.
15. Zona de operare.
16. Descrierea fiecărui spaţiu.
17. Grupul de lichide.
18. Informaţii unice pentru client.
19. Posibile locaţii ale racordurilor.
20. Informaţii cod de bară.
21. Spaţiu pentru marcajul autorizaţiei. (Marcajele CE de mai jos nu sunt valabile pentru plăcuţa de fabricaţie tip 3)
    – CE-0409 BHE Manufacturing, Ronneby, Suedia
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italia.

Instrucţiuni originale
© COPYRIGHT 2010 Alfa Laval Lund AB. Toate drepturile rezervate

Cerinţe

Avertisment: *Schimbătorul de căldură trebuie montat şi utilizat astfel încât să nu apară riscul de vătămări de persoane sau de daune materiale.*

Notă: *Dacă nu s-a specificat altceva, datele de produs pentru agenţi frigorifici normali, de ex. HFC şi HCFC, sunt destinate aplicaţiilor de refrigerare. Înainte ca schimbătorul de căldură să fie utilizat pentru lichide inflamabile, toxice sau periculoase (de ex. hidrocarburi), trebuie utilizate regulile relevante de siguranţă pentru manevrarea unor astfel de lichide. Pentru informaţii suplimentare, vă rugăm să consultaţi pagina de internet a furnizorului.*

Instalarea

Instalarea trebuie asigurată cu echipament care protejează schimbătorul de căldură împotriva presiunilor şi temperaturilor din afara valorilor minime şi maxime aprobate indicate pe plăcuţa de fabricaţie.

Atenţie: *Pentru a evita vătămarea mâinilor din cauza muchiilor ascuţite, se vor purta întotdeauna mănuşi de protecţie în timpul manipulării schimbătoarelor de căldură brazate.*

Pentru cea mai bună performanţă posibilă de transfer al căldurii, schimbătorul de căldură trebuie conectat astfel încât mediile să curgă prin schimbătorul de căldură în direcţii opuse (în contra-flux).

Notă: *Înainte de conectarea tubulaturii, asiguraţi-vă că toate obiectele străine au fost evacuate din sistem.*

Atenţie: *Luaţi în considerare riscul de incendiu în timpul lucrării de instalare, de ex. aveţi în vedere distanţa faţă de substanţele inflamabile.*

Atenţie: *Nu ridicaţi niciodată de racorduri. Pentru ridicare, trebuie folosite chingi. Aşezaţi chingile conform figurii 1.*

Notă: *În aplicaţiile de evaporator şi în aplicaţiile în care apare o modificare de fază a mediilor, schimbătorul de căldură trebuie instalat vertical cu o ţeavă dreaptă (cel puţin 150-200 mm în lungime) între supapa de expansiune şi admisia agentului frigorific.*

Montarea

Într-un sistem de ţevi rigide, schimbătoarele de căldură mici (cu o greutate de 1-6 kg) pot fi suspendate direct în conductele îngropate (figura 2A). Schimbătoarele de căldură mai mari trebuie asigurate cu cadre de susţinere (figura 2D) destinate pentru un schimbător de căldură specific (accesoriu) sau trebuie asigurate cu chingi (figura 2C) sau cu ajutorul bolţurilor de montare (figura 2B). Pentru comenzi speciale, bolţurile de montare pot fi sudate la partea din faţă sau din spate. Cuplul de strângere pentru bolţurile M6 este de 3,8 Nm, bolţurile M8 este de 9,5 Nm şi pentru bolţurile M10 este de 19,0 Nm.

Notă: *Dacă există risc de vibraţii, utilizaţi suporturi anti-vibraţii, aşa cum este indicat în figura 2A.*

Notă: *Schimbătoarele de căldură cu distribuitoare de agent frigorific trebuie montate cu distribuitorul la partea inferioară.*

Notă: *În timpul instalării, sarcinile de racordare nu trebuie să depăşească valorile specificate în tabelul din interiorul paginii de copertă "Valorile limită pentru sarcinile de racordare în timpul instalării".*

Notă: *Conducta trebuie să fie bine ancorată şi bine îmbinată astfel încât, în timpul operaţiunii, să nu existe transferuri de sarcină către schimbătorul de căldură cu plăci.*

Racorduri (figura 3)
Racordurile filetate - Utilizaţi o cheie dinamometrică atunci când conectaţi ţeava şi respectaţi limitele specificate. Unele modele sunt echipate cu racorduri tip Victaulic.
Racorduri brazate – Curăţaţi prin frecarea şi degresarea diferitelor suprafeţe. Utilizaţi un tip de metal brazat care este adecvat pentru materialele care sunt brazate şi utilizaţi temperatura corectă de brazare. Pentru informaţii detaliate consultaţi documentul "Tuburi de brazare pentru schimbător de căldură brazat" sau contactaţi reprezentantul Alfa Laval.
Racorduri sudate – Sudură TIG sau MIG. Şlefuiţi interiorul şi exteriorul ţevii şi, dacă este oblic, şlefuiţi şi marginea oblică la cel puţin 25 mm faţă de muchia ţevii şi faţă de interior. Acest lucru trebuie realizat pentru a evita contaminarea cuprului din zona sudată, care poate cauza fisurarea sudurii.

Notă: *Protejaţi schimbătorul de căldură împotriva supraîncălzirii, înfăşurând o bucată de lavetă umedă în jurul racordului, de fiecare dată când se execută o brazare sau o sudare. Încălzirea excesivă poate topi metalul interior de brazare din interiorul schimbătorului de căldură. Consultaţi figura 3.*

⚠ ***Atenţie:*** *Atunci când deconectaţi schimbătorul de căldură de la sistemul de ţevi, utilizaţi echipament adecvat de protecţie, precum încălţăminte de protecţie, mănuşi de siguranţă şi protecţie a ochilor, în funcţie de tipul mediilor din schimbătorul de căldură.*

Risc de îngheţ

⚠ ***Atenţie:*** *Aveţi în vedere riscul îngheţului la temperaturi joase pentru a evita deteriorarea schimbătorului de căldură. Schimbătoarele de căldură care nu se află în funcţiune trebuie golite şi uscate prin purjare, de fiecare dată când există risc de îngheţare.*

Notă: *Pentru a evita daunele cauzate de îngheţ, mediile utilizate trebuie să includă agent anti-îngheţ în condiţii de funcţionare sub punctul de îngheţ.*

Notă: *Atunci când este utilizat ca evaporator*
- *Utilizaţi un comutator de flux şi un comutator de joasă presiune.*
- *Utilizaţi un termostat anti-îngheţ şi un dispozitiv de monitorizare a fluxului pentru a asigura un flux de apă constant, în timpul funcţionării şi după ce compresorul a funcţionat.*
- *Evitaţi "pomparea în jos", de ex. golind evaporatorul prin funcţionarea compresorului după oprire, până când se obţine o presiune presetată a agentului frigorific. Temperatura poate scădea sub punctul de îngheţare al saramurii, care poate deteriora evaporatorul.*

Protecţia împotriva colmatării
Utilizaţi un filtru ca protecţie împotriva posibilei apariţii a particulelor străine. Dacă aveţi dubii referitoare la dimensiunea maximă a particulelor, consultaţi reprezentantul dvs. al furnizorului sau Informaţiile despre produs de pe pagina de internet a furnizorului.

Control şi operare

⚠ ***Atenţie:*** *Nu utilizaţi schimbătorul de căldură pentru medii (de ex. apă de-ionizată)/instalaţii (de ex. ţevi galvanizate) care pot afecta sau pot fi afectate (chimic/electrochimic) de plăci (oţel inoxidabil) şi material de brazare (cupru).*

Notă: *Cuprul poate cauza coroziunea în instalaţiile cu materiale mixte*

Protecţie împotriva oboselii termice şi/sau cauzate de presiune.
Temperatura bruscă sau modificările de temperatură pot duce la deteriorarea schimbătorului de căldură cauzată de oboseală. Prin urmare, trebuie luate în considerare următoarele pentru a asigura că schimbătoarele de căldură funcţionează fără presiuni/ temperaturi de oscilare.

- Localizaţi senzorul de temperatură cât de aproape posibil faţă de evacuarea schimbătorului de căldură.
- Alegeţi supape şi echipament de reglare care oferă temperaturi/presiuni stabile pentru schimbătorul de căldură.
- Pentru a evita lovitura de berbec, nu trebuie utilizate supape cu închidere rapidă, de ex. supape deschis/închis.
- În instalaţiile automate, oprirea şi pornirea pompelor şi acţionarea supapelor trebuie programate, astfel încât amplitudinea rezultată şi frecvenţa variaţiei de presiune vor fi cât de joase posibil.

Izolarea
Izolările de încălzire şi de răcire sunt disponibile ca accesorii.

Notă: *Aveţi în vedere că limitele de temperatură ale izolării şi schimbătorului de căldură pot fi diferite.*

Disfuncţionalităţi
Pentru a asigura o performanţă corectă a schimbătorului de căldură, verificaţi dacă:

- sistemul de ţevi a fost conectat la schimbătorul de căldură conform instrucţiunilor din acest manual
- schimbătorul de căldură este perfect curat şi nu prezintă depuneri.

Notă: *Particulele şi fibrele pot colmata schimbătorul de căldură. O creştere în scăderea presiunii sau o scădere a eficienţei termice indică faptul că schimbătorul de căldură este înfundat.*

- circuitul de control este presetat corect şi nu apare îngheţarea.

Curăţarea
Echipamentul este adecvat pentru curăţarea pe loc. Pentru sfaturi privind procesele adecvate de curăţare, consultaţi reprezentatul furnizorului sau vizitaţi pagina de internet a acestuia. Persoana responsabilă cu operarea trebuie să se asigure că este utilizată metoda corectă de curăţare şi trebuie să se decidă referitor la intervalele adecvate de curăţare.

Notă: *Ambalajul plăcuţei nu trebuie desfăcut.*

Предназначение
Запоените пластинчати топлообменници са предназначени за извършване на топлообмен и отговарят на изискванията в широка гама от приложения като хладилна техника, домашно отопление, промишлено отопление и охлаждане, както и на преработващата промишленост.

Определения

Предупреждение: *Тип на опасността ПРЕДУПРЕЖДЕНИЕТО означава потенциално опасна ситуация, която, ако не бъде избегната, може да доведе до смърт или сериозно нараняване.*

Внимание: *Тип на опасността ВНИМАНИЕТО означава потенциално опасна ситуация, която, ако не бъде избегната, може да доведе до леко или средно нараняване.*

Забележка:
ЗАБЕЛЕЖКАТА означава потенциално опасна ситуация, която ако не бъде избегната, може до доведе до имуществени щети.

Фирмени табелки
Съществуват различни видове фирмени табелки в зависимост от вида на одобрението на съда под налягане.

Забележка:
- *Може да се използват и други видове фирмени табелки. Свържете се с представител на Alfa Laval за по-подробна информация.*
- *Някои спецификации не се използват при всички видове фирмени табелки*

Фирмената табелка показва:
1. Място за логотип.
2. Име на производителя.
3. Място за печат на Националния борд и сериен номер.
4. Номер на артикул.
5. Тип.
6. Производствен или сериен номер.
7. Година или дата на производство.
8. Местоположение на връзките за всеки флуид.
9. Максимално допустима работна температура.
10. Максимално допустимо работно налягане.
11. Пробно налягане.
12. Дата на пробно налягане.
13. Обем на всяко пространство.
14. Допустими работни температури и налягане.
15. Работна област.
16. Описание на всяко пространство.
17. Група флуид.
18. Информация, специфична за клиента.
19. Възможни местоположения на връзките.
20. Информация за бар кода.
21. Място за марка за одобрение. (CE марките по-долу не са валидни за фирмена табелка тип 3)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

Оригинални инструкции
© COPYRIGHT 2010 Alfa Laval Lund AB. Всички права запазени

Изисквания

Предупреждение: *Топлообменникът трябва да е инсталиран и работещ по начин, който не създава риск от нараняване на персонала или вреда на имуществото.*

Забележка: *Продуктовите данни за нормалните охладители, т.е. хидро-флуоро-въглеродни и хидро-флуоро-хлоро-въглеродни агенти, са приложими при охладителните системи, освен ако не е упоменато друго. Преди да използвате топлообменника за запалими, токсични или опасни течности (напр. въглеводород) трябва да вземете необходимите мерки за безопасност при работа с такива течности. Моля, погледнете интернет сайта на доставчика за повече информация.*

Монтаж

Монтажът трябва да бъде извършен с оборудване, което защитава топлообменника от налягане и температура извън одобрените минимални и максимални стойности, показани на фирмената табелка.

Внимание: *За да избегнете нараняването на ръцете от остри ръбове, винаги носете предпазни ръкавици, когато работите със запоените пластинчати топлообменници.*

За да осигурите най-добрия топлообмен, топлообменникът трябва да бъде свързан така, че флуидите да протичат през топлообменника в противоположни посоки (в противоток).

Забележка: *Преди да свържете каквито и да е тръби към топлообменника, се уверете, че всички чужди тела са били изхвърлени от системата.*

Внимание: *Вземете под внимание риска от пожар по време на монтаж, т.е. спазвайте необходимото разстояние до запалимите вещества.*

Внимание: *Никога не повдигайте топлообменника за връзките. При повдигане на топлообменника трябва да се използват примки от метално въже. Поставете примките в съответствие с фигура 1.*

Забележка: *В изпарителните системи и в приложенията, при които настъпва фазово превръщане на флуида, топлообменниците трябва да бъдат монтирани вертикално с права тръба (с дължина поне 150-200 мм) между разширителния шибър и входа на охлаждащото вещество.*

Монтиране

В системите с твърди тръби малките топлообменници (с тегло 1-6 кг) могат да бъдат окачени директно в системата от тръбопроводи (Фигура 2A): По-големите топлообменници трябва да бъдат закрепени здраво с крепежни елементи (Фигура 2D), предназначени за определени топлообменници (допълнителни принадлежности) или да бъдат закрепени с примки от метално въже (Фигура 2C) или чрез монтажни болтове (Фигура 2B). При специални поръчки монтажните болтове може да бъдат заварени към предната или задната част. Въртящият момент на затягането за M6 болтове е 3,8 Nm, за M8 болтове е 9,5 Nm, а за M10 болтове е 19,0 Nm.

Забележка: *Ако съществува риск от вибрации използвайте противовибрационни стойки за закрепване, както е показано на Фигура 2A.*

Забележка: *Топлообменниците с разпределители на охладителните вещества трябва да бъдат монтирани с разпределителя в долната част.*

Забележка: *По време на монтажа включеното натоварване не трябва да надвишава стойностите според таблицата „Ограничения за включено натоварване по време на монтаж“ от вътрешната страна на корицата.*

Забележка: *Тръбопроводната система трябва да е добре закрепена и изпълнена така, че натоварванията да се прехвърлят към топлообменника по време на работа.*

Връзки (Фигура 3)
Резбови съединения – Използвайте динамометричен гаечен ключ при свързване на тръбата и спазвайте определените ограничения. Някои модели са снабдени с виктоличен тип съединение.
Споени съединения – Почистете чрез търкане и обезмасляване на различните повърхности. Използвайте степен на запояване на метала, която е подходяща за материалите, които се запояват. Използвайте и правилната температура на спояване. За подробности вижте документа "Спояване на тръби за споени топлообменници" или се свържете с представител на Alfa Laval.
Заваръчни съединения – заваряване по метода ВИГ или МИГ. Шлифовайте вътрешната и външната страна на тръбата, а ако е скосена - и скосения край, на поне 25 мм от края на тръбата и навътре. Това трябва да бъде извършено с цел да се избегне заразяването на медта в областта на заваряване, което може да предизвика пропукване на заварката.

Забележка: *Защитете топлообменника от пренагряване чрез обвиване на парче влажна кърпа около връзката при всеки случай на спояване или заваряване. Прекомерното нагряване може да разтопи метала за спояване във вътрешността на топлообменника. Вижте фигура 3.*

⚠ ***Внимание:*** *При изключване на топлообменника от тръбопроводната система използвайте подходяща защитна екипировка, като например ботуши, предпазни ръкавици и очила в зависимост от вида на флуида в топлообменника.*

Риск от замръзване

⚠ ***Внимание:*** *Вземете под внимание риска от замръзване при ниски температури, за да избегнете повредата на топлообменника. Топлообменниците, които не се използват, трябва да бъдат изпразнени и изсушени, когато има риск от замръзване.*

Забележка: *За да избегнете повредата вследствие на замръзване, използваният флуид трябва да включва добавка, предпазваща от замръзване, при работни условия под неговата точка на замръзване.*

Забележка: *Когато се използва като изпарител*
- *Използвайте реле за поток и превключвател за ниско налягане.*
- *Използвайте термостат, защитаващ от замръзване и монитор за поток, за да осигурите постоянно снабдяване с вода преди, по време на и след работа на компресора.*
- *Избягвайте "евакуацията", т.е. изпразването на изпарителя чрез работа на компресора след изключване, до достигане на предварително зададеното налягане на охладителя. При това положение температурата може да спадне под точката на замръзване на соления разтвор, което може да повреди изпарителя.*

Защита от запушване
Използвайте филтър като защита срещу евентуално попадане на чужди частици. Ако имате съмнения относно максималния размер на частиците, консултирайте се с най-близкия представител на доставчика или погледнете в раздел Информация за продукта на уеб страницата на доставчика.
Контрол и работа

⚠ ***Внимание:*** *Не използвайте топлообменника за флуиди (напр. дейонизирана вода)/монтаж (напр. галванизирани тръби), които могат (по химичен или по електро-химичен път) да засегнат или да бъдат засегнати от пластините (неръждаема стомана) и материала за спояване (мед).*

Забележка: *Медта може да генерира корозия в монтаж със смесени материали*

Защита от топлинна умора или/и умора от налягане
Внезапните промени в температурата и налягането може да предизвикат повреда вследствие на умора на топлообменника. По тази причина трябва да вземете под внимание следното, за да осигурите работата на топлообменниците без промяна на налягането/ температурата.

- Поставете температурния датчик възможно най-близо до изхода от топлообменника.
- Подберете клапани и регулиращо оборудване, което осигурява стабилна температура/налягане за топлообменника.
- За да избегнете хидравлически удар не трябва да използвате бързо-затварящи се клапани, като например двупозиционни клапани.
- При автоматизираните инсталации спирането и пускането на помпите и задействането на клапаните трябва да бъде програмирано така, че получената амплитуда и честота на вариациите в налягането да бъдат възможно най-ниски.

Изолация
Отоплителните и охладителни изолации са налични като допълнителни принадлежности.

Забележка: *Вземете под внимание, че температурните ограничения на изолацията и топлообменника може да са различни.*

Отстраняване на неизправности
За да осигурите правилната работа на топлообменника, проверете дали:

- тръбопроводната система е свързана към топлообменника според инструкциите в това ръководство
- топлообменникът е напълно чист и освободен от отлагания.

Забележка: *Частиците и влакната може да запушат топлообменника. Увеличението на спада на налягането или спадът в топлинната ефективност указват, че топлообменникът е замърсен.*

- контролната верига е с правилни предварително зададени настройки и не се получава замръзване.

Почистване
Оборудването може да бъде почистено на място. Свържете се с представителя на доставчика или посетете интернет страницата на доставчика за съвет относно подходящи процедури за почистване. Човекът, отговорен за работата на топлообменника, трябва да осигури използването на подходящия метод на почистване и да установи подходящи интервали на почистване.

Забележка: *Пакетът пластини не трябва да бъде отварян.*

使用目的

本ブレージング熱交換器 (BHE) は、冷凍、空調、業務用冷却 / 加熱、プロセス産業といった多様な用途の要件に対応する熱交換用に設計されています。

定義

警告： *危険の種類*

警告は、放置すると死亡または重傷事故が発生する可能性がある、潜在的に危険な状況を示します。

注意： *危険の種類*

注意は、放置すると軽傷事故が発生する可能性がある、潜在的に危険な状況を示します。

注意：

注意は、放置すると物的損害が発生する可能性がある潜在的に危険な状況を示します。

ネームプレート

圧力容器承認の種類に応じて、様々な種類のネームプレートがあります。

注意：

- *他の種類のネームプレートが使用される場合もあります。詳しくは、アルファ・ラバルの担当者にお問い合わせください。*
- *一部の仕様は、すべてのネームプレートでは使用できません*

ネームプレートには以下の情報が表示されています：

1. ロゴタイプ用のスペース。
2. メーカー名。
3. 委員会のスタンプおよびシリアル番号用の余白。
4. 品番。
5. 型式。
6. 製造番号またはシリアル番号。
7. 製造年または日付。
8. 流体別の接続場所。
9. 最大許容使用温度。
10. 最大許容使用圧力。
11. テスト圧力。
12. テスト圧力の日付。
13. 各スペースの容積。
14. 許容使用温度および圧力。
15. 使用エリア。
16. 各スペースの説明。
17. 流体グループ。
18. お客様固有の情報。
19. 可能な接続場所。
20. バーコード情報。
21. 承認マーク用の余白。(下の CE マークは、ネームプレートタイプ 3 には無効です)
    – CE-0409 BHE Manufacturing, Ronneby, Sweden
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, Jiangyin City, PRC
    – CE-0948 Alfa Laval S.p.A. Alonte, Italy.

オリジナル取扱説明書

© COPYRIGHT 2010 Alfa Laval Lund AB.All rights reserved

要件

警告： *熱交換器の設置および操作は、負傷や物的損害が発生しないように行ってください。*

注意： *他に指示のない限り、通常の冷却材 (HFC および HCFC) の製品データは冷却用途に適用されます。熱交換器で可燃性液体、有毒液体または危険な液体 (炭化水素など) を扱う前に、当該の液体に関する安全規則に従ってください。詳しくは、サプライヤのウェブサイトを参照してください。*

設置

設置は、ネームプレートに記載されている承認済みの最小値 / 最大値を逸脱する圧力や温度から熱交換器を保護する機器を使用して行ってください。

注意： *鋭利なエッジによる手の負傷を防ぐために、ブレージング熱交換器を取り扱う際は必ず保護グローブを着用してください。*

熱交換器のパフォーマンスを最大限に高めるためには、熱交換器内で流体の流れが対向するように熱交換器を接続してください。

注意： *配管を行う前に、システム内のすべての異物を流して除去してください。*

注意： *設置作業中は引火リスクに配慮してください。つまり、引火性物質と十分な距離をとってください。*

注意： *接続部で吊り上げないでください。吊り上げにはストラップを使用する必要があります。ストラップは図 1 に従って配置します。*

注意： *蒸発器の用途や、媒体の相変化が発生する用途では、拡張バルブと冷媒入り口の間にストレートパイプ (長さ 150 ～ 200 mm 以上) を使用して熱交換器を垂直に設置する必要があります。*

取り付け

硬質管システムでは、小型の熱交換器 (重量が 1 ～ 6 kg) は配管に直接吊り下げることができます (図 2A)。大型の熱交換器は、特定の熱交換器 (付属品) 専用の支持取付部 (図 2D) を使用して固定するか、ストラップ (図 2C) を使用して固定するか、取付ボルト (図 2B) を使用します。特注の場合、取付ボルトを全部または後部に溶接できます。M6 ボルトの締め付けトルクは 3.8 Nm、M8 ボルトの締め付けトルクは 9.5 Nm、M10 ボルトの締め付けトルクは 19.0 Nm です。

注意： *振動リスクがある場合、図 2A を参照して防振取付部を使用してください。*

注意： *冷媒の分散装置が搭載されている熱交換器は、分散装置を底部に配置して取り付ける必要があります。*

注記： *設置中には、負荷接続か表紙の内側に記載されている「設置中の負荷接続の限界」表に従って、限界値を超えないようにしなければなりません。*

注記： *設置中には、負荷接続か表紙の内側に記載されている「設置中の負荷接続の限界」表に従って、限界値を超えないようにしなければなりません。*

接続 (図 3)

ネジ接続 - パイプの接続時にはトルクレンチを使用して、規定の上限を超えないよう注意してください。一部のモデルは接続タイプがビクトリック形です。

ろう付け接続 - 様々な表面をこすり、グリースを除去してクリーニングします。ろう付け対象物に適したろう付け金属グレードを使用し、正しいろう付け温度を使用してください。詳しくは『ブレージング熱交換器用ブレージングチューブ (Brazing tubes for brazed heat exchanger)』マニュアルを参照するか、アルファ・ラバルの担当者にお問い合わせください。

溶接接続 - TIG または MIG 溶接。パイプの内側と外側を研磨します。傾斜している場合は、パイプの端から少なくとも 25 mm、内側に向かって斜端も研磨してください。研磨の際は、溶接部に銅が混入しないようにしてください。混入すると、溶接がひび割れる可能性があります。

***注意**: ろう付けまたは溶接を行うときは、濡れた布切れを接続部に巻くことにより、熱交換器の過熱を防いでください。過熱により、熱交換器内部のろう付け金属が溶解する場合があります。図 3 を参照してください。*

⚠ ***注意**: 配管システムから熱交換器を外すときは、熱交換器内の流体のタイプに応じて、安全ブーツ、安全グローブ、眼球保護装置など適切な保護用具を使用してください。*

凍結リスク

⚠ ***注意**: 低温時は凍結リスクに注意し、熱交換器が破損しないようにしてください。熱交換器を使用しない場合、凍結リスクがあるときは、熱交換器を空にして吹き付け乾燥してください。*

***注意**: 凍結による破損を防ぐために、凍結温度を下回る運転状況では、使用する流体に不凍液を加える必要があります。*

***注意**: 蒸発器として使用する場合*

- *フロースイッチと低圧スイッチを使用してください。*
- *圧縮室の使用前、使用中、使用後に水の流量を一定に保つために、不凍サーモスタットと流量モニターを使用してください。*
- *「ポンプダウン」を回避してください。シャットダウン後、規定の冷媒圧力に達するまで圧縮室を稼働することにより、蒸発器を空にします。塩水の凍結温度を下回り、蒸発器が破損する可能性があります。*

詰まり保護

異物の混入を防ぐためにフィルターを使用してください。粒子の最大サイズについて疑問がある場合、お近くのサプライヤ代理店にご相談いただくか、サプライヤのウェブサイトで製品情報を参照してください。

制御と操作

⚠ ***注意**: プレート (ステンレス鋼) とろう付け材料 (銅) に化学的 / 電気化学的な影響を与える (または受ける) 可能性がある流体 (イオン除去水など)/ 設置 (めっきパイプなど) に熱交換器を使用しないでください。*

***注意**: 銅は、混合材料の設置で腐食を発生させる可能性があります*

熱や圧力による披露からの保護
温度や圧力が急激に変化すると、熱交換器が疲労損傷を受ける可能性があります。そのため、圧力 / 温度の変動なく熱交換器を運転するためには、次の事項に従う必要があります。

- 温度センサーは、熱交換器の出口にできるだけ近い位置に設置してください。
- 熱交換器に安定した温度 / 圧力を提供できるバルブと制御装置を選択してください。
- ウォーターハンマーを防止するために、急速閉止バルブ (オン / オフバルブなど) は使用しないでください。
- 自動設置では、圧力変動の振れ幅と頻度が可能なかぎり低くなるようにポンプの開始 / 停止とバルブの作動をプログラムする必要があります。

絶縁材
冷却および加熱の断熱材は付属品として提供されています。

注意: *温度の限度は、断熱材と熱交換器で異なる可能性があります。*

トラブルシューティング
熱交換器のパフォーマンスを最適化するためには、以下を確認してください :

- 本書の指示に従って配管システムを熱交換器に接続している
- 熱交換器が完全にクリーンで、沈殿物がない。

注意: *粒子や繊維で熱交換器が詰まる可能性があります。圧力低下の増加または熱効率の低下は、熱交換器で障害が発生している可能性を示唆しています。*

- 制御回路が正しくプリセットされており、凍結が発生していない。

洗浄
本機は、設置したままでの洗浄に最適です。適切な洗浄プロセスについて詳しくは、サプライヤの担当者にお問い合わせいただくか、サプライヤのウェブサイトを参照してください。操作担当者は、正しい洗浄方法を使用していることを確認し、適切な洗浄間隔を決める必要があります。

注意: *プレートパッケージは開封には適していません。*

预期用途

本钎焊换热器（BHE）设计用于热传递，以满足诸如冷藏、供暖、工业加热与冷却以及加工行业等广泛应用领域的要求。

定义

警告： *危险类型*

“警告”表示有潜在危险的情况，如果未加以避免，可能导致死亡或重伤。

小心： *危险类型*

“小心”表示有潜在危险的情况，如果未加以避免，可能导致轻微或中等程度的伤害。

注意：

“注意”表示有潜在危险的情况，如果未加以避免，可能导致财产损坏。

铭牌

铭牌的类型因压力容器许可类型的不同而异。

注意：

？有可能使用其他类型的铭牌。有关详细信息，请联系阿法拉伐代表。

？某些规格并不用于所有类型的铭牌

铭牌上包含：

1. 商标。
2. 制造商名称。
3. 国家委员会戳记和序列号。
4. 项目编号。
5. 类型。
6. 制造编号或序列号。
7. 制造年份或日期。
8. 每种液体的接头位置。
9. 允许的最高操作温度。
10. 允许的最大操作压力。
11. 测试压力。
12. 测试压力的日期。
13. 各空间的容量。
14. 允许的操作温度和压力。
15. 操作区域。
16. 各空间的描述。
17. 液体组。
18. 客户独有的信息。
19. 可能的接头位置。
20. 条形码信息。
21. 认证标记的位置。（下面的 CE 标记对于铭牌类型 3 无效）
    - CE-0409 BHE Manufacturing, Ronneby, Sweden
    - CE-0036 阿法拉伐（江阴）设备制造有限公司，中华人民共和国江阴市
    - CE-0948 Alfa Laval S.p.A. Alonte, Italy.

原厂说明

© 版权所有 2010 Alfa Laval Lund AB. 保留所有权利

要求

警告： *安装和操作本换热器时不得造成任何人身伤害或财产损坏的风险。*

注意： *除非另有说明，否则针对普通制冷剂（即 HFC 和 HCFC）的产品数据适用于制冷应用领域。在将换热器用于易燃、有毒或危险液体（例如碳氢化合物）之前，必须按照处理此类液体的相关安全规则操作。有关更多信息，请参阅供应商的网站。*

安装

进行安装时必须使用相应的保护设备，避免换热器承受超出铭牌标注的最低和最高认可值的压力和温度。

小心： *为避免尖锐边缘割伤手部，搬动钎焊换热器时应始终佩戴防护手套。*

为了达到可能的最佳热传递性能，连接换热器时应能够使介质经过换热器流向相反方向（逆向流动）。

注意： *在连接任何管路之前，应确保系统中的所有异物均已排净。*

小心： *安装施工期间要注意防火，牢记远离易燃物品。*

小心： *切勿拉住接头提升装置。提升时应使用皮带。请将皮带置于图 1 所示的位置。*

注意： *在蒸发器应用领域和发生介质相变的应用领域中，换热器必须垂直安装，并在膨胀阀与制冷剂注入口之间安装直管（长度至少 150-200 毫米）。*

固定

在刚性管道系统中，小型换热器（重量在 1 - 6 千克）可以直接悬吊在管道中（图 2A）。较大型的换热器应使用适用于特定换热器的支撑固定架（配件）进行固定（图 2D），或使用皮带（图 2C）或固定螺栓（图 2B）进行固定。对于专门定制产品，可以将固定螺栓焊接在前部或后部。M6 螺栓的拧紧扭矩为 3.8 Nm，M8 螺栓的拧紧扭矩为 9.5 Nm，M10 螺栓的拧紧扭矩为 19.0 Nm。

注意： *如果存在振动风险，请使用图 2A 中所示的防振动固定架。*

注意： *固定带有制冷剂分配器的换热器时，应将分配器置于底部。*

注意： *安装期间，连接负载不得超过封面内页上表“安装期间连接负载的限值”中的规定值。*

注意： *管道应固定可靠，其设置应保证在运转过程中负载不会传导到板式换热器上。*

接头 （图 3）

螺纹接头 – 连接管路时使用扭矩扳手并遵守规定的限度。某些型号提供维克托利克型接头。

钎焊接头 – 打磨各表面并去除油污，以清洁接头。采用适合要钎焊之材料的钎焊金属级品位，并采用正确的钎焊温度。有关详细信息，请参阅 “ 为钎焊换热器钎焊管道 ” 文档，或联系阿法拉伐代表。

焊接接头 – TIG 或 MIG 焊接方法。打磨管道内部和外部，如果有斜坡口，在管道边沿向内至少 25 毫米处打磨斜坡边缘。应采取这种做法，以避免焊接区域出现铜沾污，如果出现沾污，可能导致开焊。

注意： *钎焊或焊接完成时，应在接头处包裹湿布，保护换热器不会过热。过度加热可能导致换热器内部的钎焊金属融化。请参阅图 3。*

⚠ ***小心：*** *在断开换热器与管道系统的连接时，请穿戴适当的保护设备 （如安全靴、安全手套和护目用具），具体取决于换热器内的介质。*

结冰风险

⚠ ***小心：*** *切记低温条件下存在结冰风险，避免换热器因结冰而损坏。当存在结冰风险时，不工作的换热器应排空并进行风干。*

注意： *为避免结冰造成设备损坏，所用介质必须加入防冻剂，在其冰点以下的操作条件下使用。*

注意： *当用作蒸发器时*

- *使用流量开关和低压开关。*
- *使用防冻恒温器和流量监视器，确保压缩机运行之前、期间及之后保持恒定水流。*
- *避免 “ 抽气 ”，即通过关机后运行压缩机，直至达到预设的制冷压力，而使蒸发器排空。一旦如此，温度可能跌落至盐水冰点以下，从而可能损坏蒸发器。*

阻塞防护措施

使用过滤器作为防护措施，防止可能出现的异物颗粒。如果对最大颗粒尺寸有任何疑问，请就近咨询供应商代表或查询供应商网站上的产品信息。

控制和操作

⚠ ***小心：*** *请勿将换热器用于可能对板片 （不锈钢）和钎焊材料 （铜）造成化学／电化学影响或受这两者影响 （化学／电化学）的介质 （例如去离子水）／安装 （例如镀锌管）。*

注意： *铜在使用混合材料安装时可能产生腐蚀。*

热疲劳和 / 或压力疲劳的防护措施
温度和压力的骤然变化可能对换热器造成疲劳损坏。因此，必须注意以下事项，确保换热器在运转时不会出现压力 / 温度摆动。

? 将温度传感器尽可能靠近换热器的出口。
? 选择可以为换热器提供稳定温度 / 压力的阀门和调节设备。
? 为避免水锤现象，不要使用快关阀，例如开关阀。
? 在自动安装时，应对泵的停止和启动以及阀门的启动进行编程，以便使得到的压力变化的振幅和频率尽可能地低。

保温
加热和冷却保温装置作为配件提供。

注意：*保温装置和换热器的温度限制可能各有不同。*

故障排除
为了确保换热器发挥应有的性能，请检查：

? 管道系统已经按照本手册的说明连接到换热器
? 换热器经过彻底清洁并且无积淀物。

注意：*颗粒和纤维可能会阻塞换热器。压降升高或热效率下降表明换热器发生堵塞。*

? 控制回路已经过正确预设，并且未发生结冰现象。

清洗
本设备适合原位清洗。有关合适的清洗过程的建议，请咨询供应商的代表或访问供应商的网站。负责操作设备的人员应当确保采用正确的清洗方法，并确定合适的清洗间隔。

注意：*不应打开板片组。*

Pravilna uporaba

Lemljeni izmjenjivači topline (BHE) projektirani su tako da se ispune zahtjevi za izmjenu topline u širokom području primjene kao što je hlađenje, grijanje stambenog prostora, industrijsko grijanje i hlađenje te izmjena topline u procesnoj industriji.

Definicija

Upozorenje: *Vrsta opasnosti*

UPOZORENJE označava potencijalno opasnu situaciju koja bi, ako se ne izbjegne, mogla imati za posljedicu smrtni slučaj ili ozbiljnu ozljedu.

Oprez: *Vrsta opasnosti*

OPREZ označava potencijalno opasnu situaciju koja, ako se ne izbjegne, može imati za posljedicu manje ili umjerene povrede.

Napomena:

NAPOMENA označava potencijalno opasnu situaciju koja, ako se ne izbjegne, može imati za posljedicu oštećenje imovine.

Označna pločica

Postoje različite vrste pločica ovisno o vrsti odobrenja tlačnog spremnika.

Napomena:

- *U uporabi mogu biti različite nazivne pločice. Za više informacija kontaktirajte s predstavnikom tvrtke Olympus.*
- *Neke specifikacije nisu navedene na svim vrstama pločica.*

Na natpisnoj pločici nalazi se sljedeće:

1. Mjesto za logotip.
2. Naziv proizvođača.
3. Mjesto za oznaku Državnog odbora i serijski broj.
4. Kataloški broj.
5. Tip.
6. Proizvodni ili serijski broj.
7. Godina ili datum proizvodnje.
8. Mjesto priključaka za pojedini fluid.
9. Maks. dopuštene radne temperature.
10. Maks. dopušteni radni tlakovi.
11. Ispitni tlak.
12. Datum ispitivanja tlaka.
13. Volumen pojedinog prostora.
14. Dopuštene radne temperature i tlakovi.
15. Raspon primjene.
16. Opis pojedinog prostora.
17. Grupa fluida.
18. Informacije prema traženju kupca.
19. Mogući položaji priključaka.
20. Bar kod informacije Crtični kod.
21. Mjesto za oznaku certifikata. (Dolje navedene CE-oznake ne vrijede za natpisnu pločicu tipa 3)
    - CE-0409 BHE Proizvodnja, Ronneby, Švedska
    - CE-0036 Alfa Laval (Jiangyin) Manufacturing Co, Ltd, Jiangyin City, NR Kina
    - CE-0948 Alfa Laval S.p.A. Alonte, Italija.

Prijevod originalnih uputa

©Autorska prava 2010 Alfa Laval Lund AB. Sva prava pridržana.

Zahtjevi

Upozorenje: *Izmjenjivač topline mora biti instaliran i njime treba rukovati na način da se izbjegnu opasnosti od ozljede osoblja i oštećenja imovine.*

Napomena: *Ako nije drugačije navedeno, u rashladnim primjenama upotrebljavaju se proizvodni podaci za standardne rashladne tvari, kao što su kloro-fluoro-ugljikovodici. Prije nego što se izmjenjivač topline počne koristi za zapaljive, otrovne ili opasne kapljevine (npr. ugljikovodici), moraju se primijeniti odgovarajuća sigurnosna pravila za rukovanje takvim kapljevinama. Sve dodatne informacije potražite na internetskim stranicama dobavljača.*

Instalacija

Postrojenje mora imati opremu koja ga štiti od tlaka i temperature izvan odobrenih minimalnih i maksimalnih vrijednosti navedenih na nazivnoj pločici.

Oprez: *Pri rukovanju lemljenim izmjenjivačem topline uvijek trebate nositi zaštitne rukavice kako biste izbjegli ozljede ruku na oštrim bridovima.*

Za najbolji mogući učinak prijenosa topline izmjenjivač treba biti spojen tako da mediji kroz izmjenjivač teku u suprotnom smjeru (protustrujno).

Napomena: *Prije spajanja cjevovoda, pobrinite se da svi strani predmeti budu isprani iz sustava.*

Oprez: *Uzmite u obzir opasnost od požara tijekom ugradnje, odnosno imajte na umu udaljenost od zapaljivih tvari.*

Oprez: *Nikada ne podižite izmjenjivač hvatajući za priključke. Prilikom podizanja koristite trake. Postavite trake kao na slici 1.*

Napomena: *U primjenama za isparavanje i onima u kojima dolazi do promjene agregatnog stanja fluida izmjenjivač topline mora biti ugrađen okomito. Ulazni priključak s ravnom cijevi (uz minimalnu duljinu od 150 do 200 mm) između ulaza i ekspanzijskog ventila rashladnog sredstva.*

Ugradnja

U sustavu s krutim cijevima manji izmjenjivači topline (težine od 1 do 6 kg) mogu se montirati izravno u cjevovod (slika 2A). Veći izmjenjivači topline trebaju se dodatno pričvrstiti (slika 2D) nosačima namijenjenima za pojedini izmjenjivač topline (pribor), trakom (slika 2C) ili pričvrsnim vijcima (slika 2B). Za posebne narudžbe pričvrsni vijci mogu se zavariti s prednje i stražnje strane. Moment zatezanja vijka M6 je 3,8 Nm, za M8 je 9,5 Nm, a za M10 je 19,0 Nm.

Napomena: *Ako postoji opasnost od vibracija, upotrijebite protuvibracijske nosače, kao što je prikazano na slici 2A.*

Napomena: *Izmjenjivači topline s razdjelnikom rashladnog sredstva trebaju biti ugrađeni s razdjelnikom pri dnu.*

Napomena: *Tijekom instalacije opterećenje priključaka ne smije prijeći vrijednosti navedene u tablici "Granice za opterećenje priključaka tijekom instalacije" na unutarnjoj naslovnoj stranici.*

Napomena: *Cjevovod treba biti dobro pričvršćen i montiran na način da tijekom rada ne opterećuje pločasti izmjenjivač topline.*

Priključci (slika 3)
Navojni priključci – Prilikom spajanja cijevi upotrijebite momenti ključ i poštujte zadane granice. Neki su modeli opremljeni priključcima tipa Victaulic.
Lemljeni priključci – Dobro očistite i odmastite sve površine. Koristite gradaciju materijala za lemljenje koja je pogodna za materijal koji se lemi i lemite pri ispravnoj temperaturi lemljenja. Detaljne informacije možete pronaći u dokumentu "Lemljenje cijevi za lemljene izmjenjivače topline" ili se obratite predstavniku tvrtke Alfa Laval.
Zavareni priključci – TIG i MIG zavarivanje. Izbrusite cijev iznutra i izvana i, ako je ukošena, učinite isto s nakošenim rubom najmanje 25 mm od ruba cijevi i prema unutra. Ovo je potrebno kako bi se izbjegla kontaminacija bakrom u zavarenom području, što bi moglo dovesti do loma zavara.

Napomena: *Zaštitite izmjenjivač topline od pregrijavanja omatanjem komada mokre tkanine oko mjesta lemljenja ili zavara. Pretjerano zagrijavanje može rastopiti lemljeni metal unutar izmjenjivača topline. Pogledajte na slici 3.*

⚠ ***Oprez:*** *Kad odvajate izmjenjivač topline iz sustava cjevovoda, upotrijebite odgovarajuću zaštitnu opremu kao što su sigurnosne čizme, zaštitne rukavice i zaštitne naočale (ovisno o vrsti medija koji se nalazi u izmjenjivaču topline).*

Opasnost od zaleđivanja

⚠ ***Oprez:*** *Imajte na umu da na niskim temperaturama postoji opasnost od zaleđivanja i izbjegnite oštećenje izmjenjivača topline. Izmjenjivače topline koji nisu u funkciji treba isprazniti i osušiti kad god postoji opasnost od smrzavanja.*

Napomena: *U radnim uvjetima ispod ledišta sredstvo koje se koristi mora sadržavati dodatak protiv zaleđivanja kako biste izbjegli oštećenja uslijed zaleđivanja.*

Napomena: *Korištenje u svojstvu isparivača*
- *Koristite sklopku protoka i niskotlačnu sklopku.*
- *Koristite termostat za zaštitu od zaleđivanja i protokomjer kako biste osigurali stalan protok vode prije, tijekom i nakon rada kompresora.*
- *Izbjegavajte ispumpavanje, primjerice, pražnjenje isparivača pokretanjem kompresora nakon isključivanja dok se ne postigne predviđeni tlak hladnjaka. U takvom bi slučaju temperatura mogla opasti ispod ledišta otopine, što može oštetiti isparivač.*

Zaštita od začepljenja
Koristite filtar kao zaštitu od nakupljanja stranih čestica. Ako imate bilo kakve dvojbe u vezi s maksimalnom veličinom čestica, obratite se najbližem predstavniku dobavljača filtera ili pogledajte odjeljak Informacije o proizvodu na internetskim stranicama dobavljača.

Upravljanje i rad

⚠ ***Oprez:*** *Nemojte koristiti izmjenjivač topline s medijima (primjerice, deionizirana vodu) ili s opremom (primjerice, pocinčane cijevi) koja bi mogla kemijski ili elektrokemijski reagirati s pločama (nehrđajući čelik) ili lemljenim materijalima (bakar).*

Napomena: *Bakar može izazvati koroziju ako je ugrađen u instalaciju s miješanim materijalima.*

Zaštita od toplinskog i tlačnog zamora materijala
Nagle promjene temperature i tlaka mogu uzrokovati oštećenja na izmjenjivaču topline uslijed zamora materijala. Kako biste osigurali da izmjenjivači topline rade bez promjena tlaka ili temperature, postupite prema sljedećim uputama.

- Postavite temperaturni senzor što je moguće bliže izlazu izmjenjivača topline.
- Odaberite ventile i opremu za reguliranje koja osigurava stabilnu temperaturu i tlak u izmjenjivaču topline.
- Kako biste izbjegli vodni udar, ne upotrebljavajte ventile s brzim zatvaranjem (primjerice, ventile za otvoren/zatvoren funkcijom).
- Kod automatiziranih postrojenja, zaustavljanje i pokretanje pumpi i aktiviranje ventila treba biti programirano tako da nastala amplituda i frekvencija promjene tlaka budu što manji.

Izolacija
Izolacije od visoke i niske temperature dostupne su kao dodatna oprema.

Napomena: *Imajte na umu da temperaturna ograničenja izolacije i izmjenjivača topline mogu biti različiti.*

Otklanjanje poteškoća
Kako biste osigurali ispravan rad izmjenjivača topline, provjerite sljedeće:

- je li cjevovod spojen na izmjenjivač topline prema uputama ovog priručnika
- je li izmjenjivač topline potpuno čist i bez naslaga.

Napomena: *Čestice i vlakna mogu začepiti izmjenjivač topline. Povećanje pada tlaka ili smanjenje toplinskog učina ukazuje na to da je izmjenjivač neispravan.*

- je li upravljački sklop postavljen i dolazi li do zaleđivanja.

Pranje
Proizvod se može čistiti na mjestu ugradnje. Za savjet o odgovarajućim postupcima čišćenja obratite se predstavniku dobavljača ili posjetite internetske stranice dobavljača. Osoba odgovorna za rad treba osigurati da se primjenjuje ispravna metoda čišćenja i treba odlučiti o odgovarajućim intervalima čišćenja.

Napomena: *Paket ploča nije predviđen za otvaranje.*

용도

브레이징 열교환기 (BHE) 는 냉장 , 난방 , 산업용 가열 및 냉각 , 가공 산업 등과 같은 다양한 용도에 대한 요구 사항을 충족하는 열전달을 수행하도록 설계되었습니다.

정의

경고 : *위험 유형*

경고는 방지하지 않을 경우 사망이나 심각한 부상을 초래할 수 있는 잠재적으로 위험한 상황을 나타냅니다 .

주의 : *위험 유형*

주의는 방지하지 않을 경우 경미하거나 심하지 않은 부상을 초래할 수 있는 잠재적으로 위험한 상황을 나타냅니다 .

참고 :

참고는 방지하지 않을 경우 재산상의 손해를 초래할 수 있는 잠재적으로 위험한 상황을 나타냅니다 .

명판

압력 용기 인증 유형에 따라 명판 유형이 다릅니다 .

참고 :

- *다른 유형의 명판을 사용할 수 있습니다 . 자세한 내용은 Alfa Laval 담당자에게 문의하십시오 .*
- *명판 유형에 따라서는 일부 사양이 사용되지 않습니다 .*

명판에 표시되는 사항 :

1. 로고가 들어가는 자리
2. 제조업체 이름
3. 국가위원회 소인 및 일련번호가 들어가는 자리
4. 물품 번호
5. 유형
6. 제조 또는 일련번호
7. 제조 연도 또는 날짜
8. 각 유체의 연결 위치
9. 허용 가능한 최대 운전 온도
10. 허용 가능한 최대 운전 압력
11. 테스트 압력
12. 테스트 압력 날짜
13. 각 공간의 부피
14. 허용 가능한 작동 온도 및 압력
15. 작동 영역
16. 각 공간에 대한 설명
17. 유체 그룹
18. 고객 고유의 정보
19. 가능한 연결 위치
20. 바코드 정보
21. 인증 마크가 들어가는 자리 (아래 CE 마크는 명판 유형 3 에 사용할 수 없음)
    – CE-0409 BHE Manufacturing, 론네뷔 , 스웨덴
    – CE-0036 Alfa Laval (Jiangyin) Manufacturing Co., Ltd, 장인시 , 중국
    – CE-0948 Alfa Laval S.p.A. 알롱테 , 이탈리아

요구 사항

경고 : *열교환기는 인적 피해 및 재산 손실이 발생할 위험이 없는 방식으로 설치 및 작동해야 합니다 .*

참고: *달리 명시하지 않은 경우 일반 냉매(예: HFC 및 HCFC)에 대한 제품 데이터는 냉장 용도에 적용 가능합니다 . 열교환기를 가연성 또는 유독성의 위험 액체 (예 : 탄화수소) 에 사용하려면 먼저 이러한 액체 취급과 관련된 안전 규칙을 따라야 합니다 . 자세한 내용은 공급업체의 인터넷 사이트를 참조하십시오 .*

설치

설치할 때는 압력 및 온도가 명판에 표시된 승인된 최소 및 최댓값을 벗어나는 경우에 열교환기를 보호하는 장비를 함께 제공해야 합니다 .

주의 : *날카로운 모서리에 손을 다치지 않도록 브레이징 열교환기를 취급할 때는 항상 보호용 장갑을 착용하십시오 .*

최상의 열전달 성능을 얻으려면 열교환기를 통과하는 유체가 서로 반대 방향 (대향류) 으로 흐르도록 열교환기를 연결해야 합니다 .

참고 : *파이프를 연결하기 전에 시스템에서 이물질을 모두 씻어냈는지 확인하십시오 .*

주의 : *설치 작업 중 화재 위험을 고려하십시오 . 즉 , 가연성 물질과의 거리에 유념하십시오 .*

주의 : *배관 연결부를 잡고 들어 올리지 마십시오 . 들어 올릴 때는 끈을 사용해야 합니다 . 그림 1 에 따라 끈을 배치하십시오 .*

참고 : *증발기 용도에서와 유체의 상변화가 발생하는 용도에서는 , 팽창 밸브와 냉매 유입부 사이를 연결하는 직선 파이프 (길이 150-200mm 이상) 를 사용하여 열교환기를 수직으로 설치해야 합니다 .*

설치

견고한 파이프 시스템에서는 소형 열교환기 (무게 1–6kg)를 파이프에 직접 매달 수 있습니다(그림 2A). 대형 열교환기는 특정 열교환기용 지지 받침대(부속품)(그림 2D) 를 사용하여 고정하거나 끈 (그림 2C) 또는 장착용 볼트 (그림 2B) 를 사용하여 고정해야 합니다 . 특별 주문하면 장착용 볼트를 전면 또는 후면에 용접할 수 있습니다. M6 볼트용 체결 토크는 3.8Nm, M8 볼트용은 9.5Nm, M10 볼트용은 19.0Nm 입니다 .

참고 : *진동이 발생할 위험이 있는 경우 그림 2A 에 나온 진동 방지 받침대를 사용하십시오 .*

참고: *냉매 분배기가 있는 열교환기의 경우 분배기가 맨 아래에 오도록 하여 장착해야 합니다 .*

참고: *설치 중 연결부 부하가 표지 안쪽에 있는 " 설치 중 연결부 부하에 대한 제한 " 표에 나온 값을 초과하면 안 됩니다 .*

참고: *파이프를 제대로 고정해 작동 중 부하가 판형 열교환기로 전달되지 않도록 해야 합니다 .*

연결부 (그림 3)

나사 연결부 – 파이프를 연결할 때 토크 렌치를 사용하고 지정된 제한을 준수하십시오 . 일부 모델에는 빅톨릭 (Victualic) 유형의 연결부가 제공됩니다 .

브레이징 연결부 – 다양한 표면을 반질반질하게 문지르거나 기름기를 제거하여 깨끗하게 하십시오 . 소재에 적합한 브레이징 금속 등급을 사용하고 올바른 브레이징 온도를 사용하십시오 . 자세한 내용은 " 브레이징 열교환기용 튜브 브레이징 " 문서를 참조하거나 Alfa Laval 담당자에게 문의하십시오 .

용접 연결부 – TIG 또는 MIG 용접 . 파이프의 내부와 외부 및 (비스듬한 경우) 경사진 모서리를 파이프 모서리에서 25mm 이상 안쪽으로 연마하십시오. 이렇게 해야만 용접 부위의 구리 오염으로 인해 용접에 균열이 생기는 문제를 방지할 수 있습니다 .

참고 : *브레이징이나 용접을 수행하는 중에는 항상 젖은 천 조각으로 연결부를 둘러싸서 열교환기가 과열되지 않게 하십시오 . 지나치게 가열되면 열교환기 안쪽의 내부 브레이징 금속이 녹을 수 있습니다 . 그림 3 을 참조하십시오 .*

주의 : *열교환기와 파이프 시스템을 분리할 때는 열교환기의 유체 유형에 따라 안전화 , 안전 장갑 , 보호 안경 등과 같은 적절한 보호 장비를 사용하십시오 .*

동결 위험

주의 : *저온에서 열교환기 손상을 피하기 위해서는 동결 위험에 유념하십시오 . 동결 위험이 있을 때마다 작동 중이지 않은 열교환기를 비우고 헤어 드라이기로 말려야 합니다 .*

참고 : *동결로 인한 손상을 방지하려면 빙점 이하의 운전 조건에는 부동액을 유체에 넣어야 합니다 .*

참고 : *증발기로 사용하는 경우*

- *흐름 스위치와 저압 스위치를 사용하십시오 .*
- *동결방지 서모스탯과 흐름 모니터를 사용하여 컴프레서 가동 중과 전후에 일정한 수류를 유지하십시오 .*
- *" 펌프다운 " 을 방지하십시오 . 즉 , 가동 중단 후 미리 설정된 냉매 압력에 도달할 때까지 컴프레서를 가동하여 증발기를 비우십시오 . 온도가 브라인의 빙점 아래로 떨어지면 증발기가 손상될 수 있습니다 .*

막힘 방지

필터를 사용하여 발생 가능한 외부 입자를 방지하십시오. 최대 입자 크기에 관해 궁금한 사항이 있는 경우 가까운 공급업체 담당자에게 문의하거나 공급업체 인터넷 사이트에서 제품 정보를 알아보십시오 .

제어 및 작동

주의: *플레이트(스테인리스강) 및 브레이징 소재(구리)와 전기 / 화학적으로 영향을 주고받을 수 있는 유체 (예 : 탈이온수) / 설치 (예 : 아연도금 파이프) 에는 열교환기를 사용하지 마십시오 .*

참고 : *구리는 혼합 소재가 사용된 설치에 부식을 일으킬 수 있습니다 .*

열 및 / 또는 압력 피로 방지
갑작스러운 온도 및 압력 변화로 인해 열교환기에 피로 손상이 발생할 수 있습니다 . 따라서 열교환기가 급격한 압력 / 온도 변화 없이 작동하도록 다음 사항을 고려해야 합니다 .

- 온도 센서를 열교환기 배출부에 최대한 가깝게 배치하십시오 .
- 열교환기에 안정적인 온도 / 압력을 제공하는 밸브 및 조정 장비를 선택하십시오 .
- 수격을 방지하려면 온 / 오프 밸브와 같이 급속 폐쇄 밸브를 사용하면 안 됩니다 .
- 자동 설치에서는 펌프의 정지와 시작 및 밸브 작동을 프로그래밍하여 이런 작동에 따른 압력 변화의 진폭과 빈도를 최대한 낮춰야 합니다 .

보온
가열 및 냉각 보온재는 부속품으로 제공됩니다 .

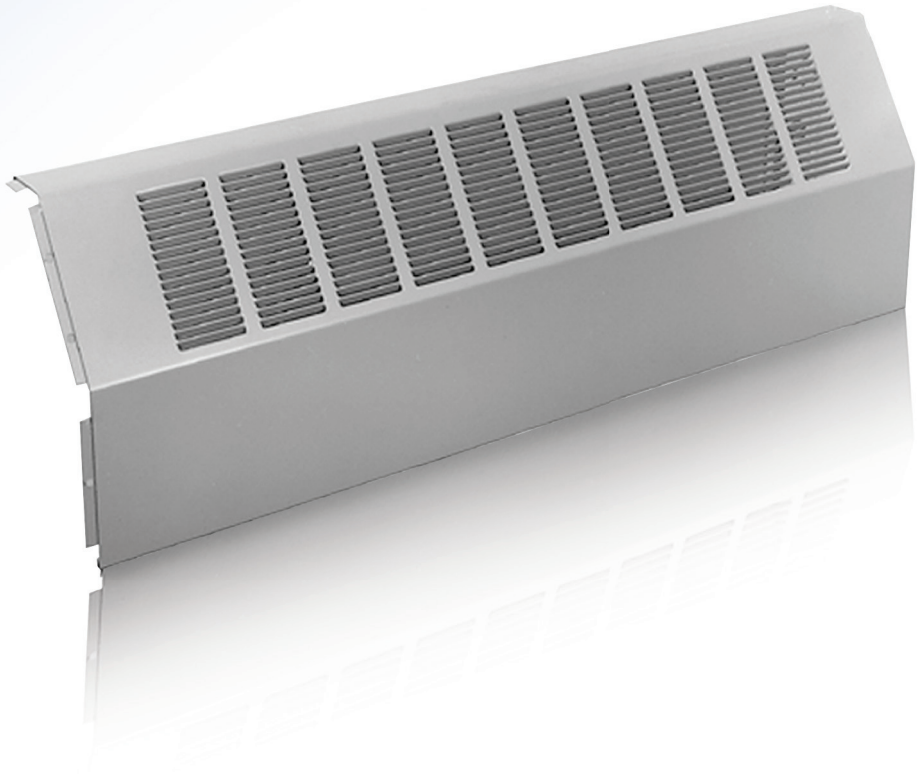
참고 : *보온재와 열교환기의 온도 한계는 다를 수 있습니다 .*

보수
열교환기의 올바른 성능을 보장하려면 다음을 확인하십시오 .

- 이 설명서의 지침에 따라 파이프 시스템을 열교환기에 연결했습니다 .
- 열교환기가 완전히 깨끗하고 축적물이 없습니다 .

참고: *입자와 섬유로 열교환기가 막힐 수 있습니다. 압력 손실이 증가하거나 열 효율이 감소하면 열교환기가 오염되어졌음을 나타냅니다 .*

- 제어 회로가 올바르게 미리 설정되어 있고 동결이 발생하지 않습니다 .



세정
이 장비는 제자리 세정 (Cleaning In Place) 에 적합합니다 . 적합한 세정 프로세스에 대한 조언을 얻으려면 공급업체 담당자에게 문의하거나 공급업체 인터넷 사이트를 참조하십시오 . 작동 담당자는 올바른 세정 방법을 사용하도록 확인하고 적합한 세정 간격을 결정해야 합니다 .

참고 : *플레이트 패키지는 열지 마십시오 .*

BREEZE™ AccuSpec

The Modine Breeze® AccuSpec is the fastest way to generate performance data based on actual job conditions. The Breeze® AccuSpec program is a web-based sizing and selection program. The program provides a series of step-by-step questions that allow for the easy configuration of Modine products. After a model has been configured, the program can generate Submittal Schedules, Submittal Data (including performance and dimensional drawings), and Specifications.

DESIGN FEATURES - SYSTEM COMPONENTS/ACCESSORIES

Figure 4.1 - Typical System Components

1. Hanger strip provides an easy and sturdy method to properly align all components. Enclosure rests in the top V-bend of the hanger strip and positions the enclosure 1/16" from the wall and 3/16" above the top of the hanger strip so it is not visible, creating a clean, one piece appearance (see Figure 4.2). Standard hanger strip is 20 gauge aluminized steel in 4 and 8 foot lengths. Also available with full back panel.
2. Enclosure/element support brackets with heating element cradle are suspended from the bottom V-bend of the hanger strip (see Figure 4.2). Infinite side to side location of brackets allows installation at strongest support points, such as wall studs. The hanger strip bears most of the weight, so only one wall fastener is required for each bracket. Holes are provided near the top of the bracket for installation of return pipe hanger (not available if using a damper in Note 7).
3. All element cradles rest on a full bearing nylon washer. There is no metal to metal contact and no noise from element expansion. Cradle and washer are fastened to bracket with a nylon rivet (see Figure 4.3).
4. The double V-bend of the enclosure rests in the bottom V-bend of the enclosure support bracket (see Figure 4.4). A quarter turn latch (shown in locked position) allows insertion of the enclosure and securely holds it to the bracket. Latch is rotated by using a socket wrench on the Hex head bolt underneath.
5. Copper tube/aluminum fin heating element is available in 3 tube diameters, 2 fin sizes, and 3 fin spacings.
6. Enclosure sections are joined together utilizing a slip joint connection. Viewed from the interior of the enclosure, the slip joint is comprised of left and right hand spot welded clips (see Figure 4.5). Slip joint connections produce a barely noticeable joint on the exterior of the enclosure. Certain accessory parts, such as end caps, are also assembled with slip joint connections.
7. Optional dampers are available with either exposed knob type damper operator or tamper-proof operator to prevent unauthorized damper operation or adjustment (see Figure 5.1). Damper blades are painted to match the enclosure. The damper blades are adjustable to any position between open and closed using a screw type operator. The damper blade assembly is factory installed and permanently attached to the enclosure. The damper operator mechanism is field installed.

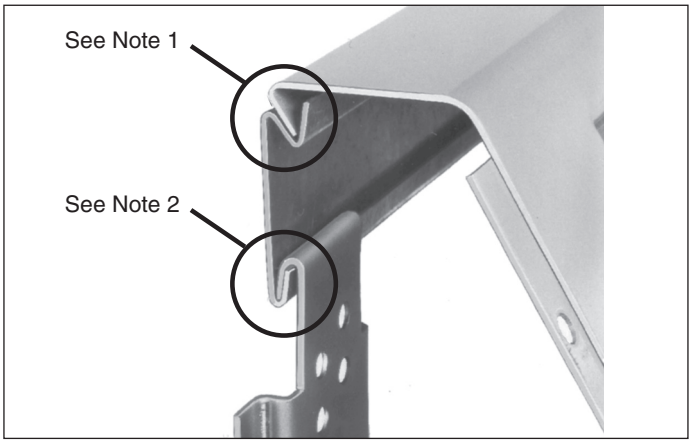

Figure 4.3 - Element/Enclosure Support Assemblies

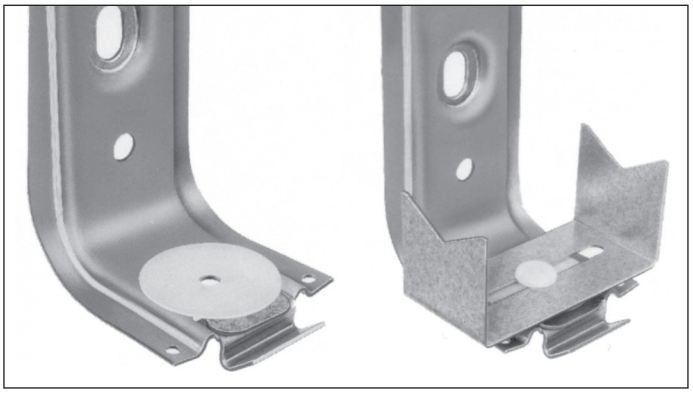

Figure 4.4 - Bottom Enclosure Support

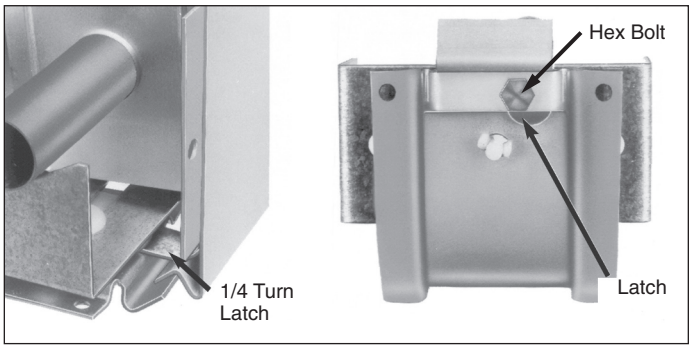

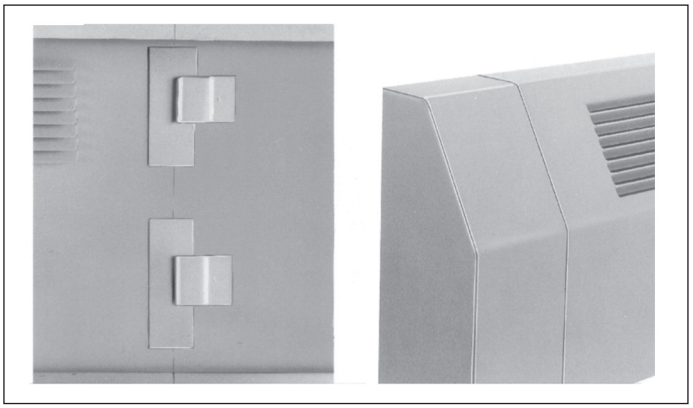

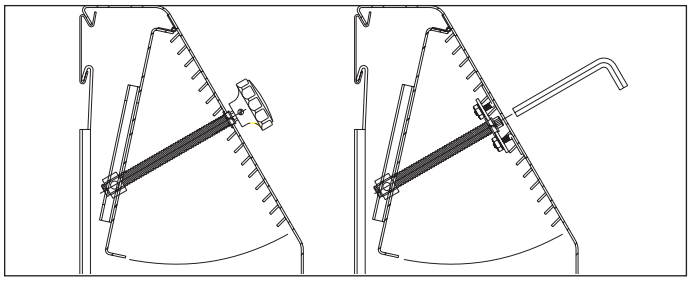

Figure 4.5 - Enclosure Slip Fit Connections

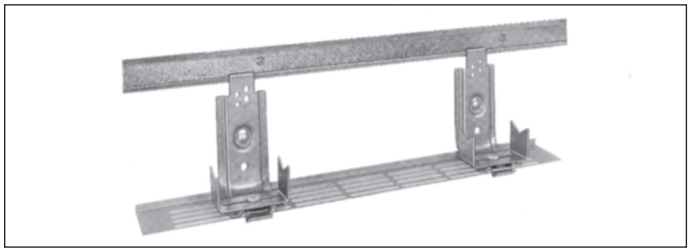

DESIGN FEATURES - SYSTEM COMPONENTS/ACCESSORIES

Figure 5.1 - Damper Operators

8. The bottom inlet panel is available to provide security cover to the open inlet at the bottom of the enclosure. It is fastened to the enclosure support brackets with a plastic expansion dart. See Figure 5.2

Figure 5.2 - Bottom Inlet Panel

9. A wall support is used to support overlapping enclosure extensions at a wall. A 5" wide enclosure extension completes the gap between the enclosure and the wall. Fold over tabs at the bottom hold the extension firmly in place. Some accessory items, 12" wide extensions, 12" wide end enclosures are available with access doors. See Figure 5.3.

Figure 5.3 - Enclosure Accessories

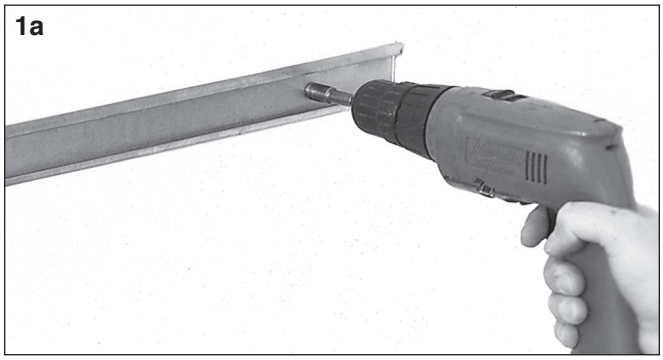
4	90° Inside Corner	(O)
5	90° Outside Corner	(O)
6	12" Wide End Enclosure	(S) (R or L)
6	12" Wide End Enclosure with Access Door	(S) (R or L)
7	End Cap	(S) (R or L)
8	135° Inside Corner	(O)
9	135° Outside Corner	(O)

① Accessories constructed of 20 gauge CRS
② See Page 39 for Pedestal support and accessories
③ (O)=Overlapping, (S)=Slip, (R or L)=Right or Left Hand Configurations



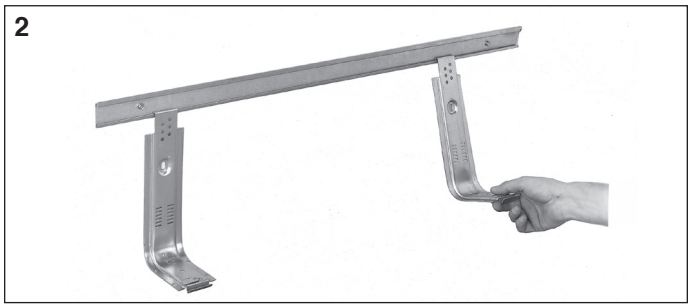
INSTALLATION

1. Create a level line at the required mounting height (recommended 4" clearance below element support bracket). Fasten the hanger strip or hanger strip with full back panel at the desired height.

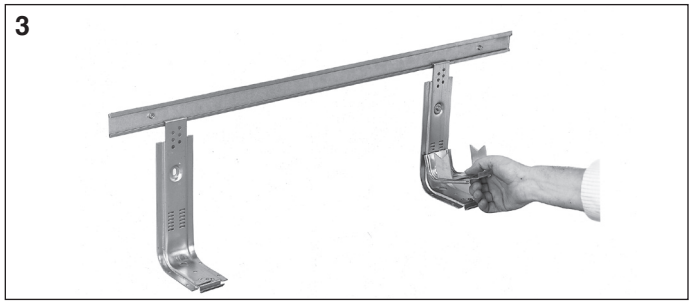
   For styles SF or RF, a second line may be set on the floor to locate the floor angle location.

   For style P, attach pedestal base to floor. Insert pedestal assembly and adjust height.

1a

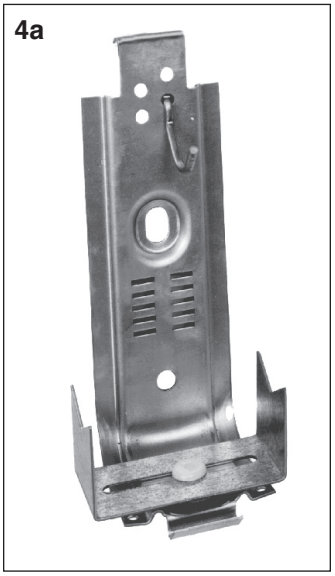


1b



2. Place the Enclosure Wall Support (EWS) on the hanger strip. Position the EWS to assure location directly over wall supports. Fasten each EWS with one fastener to a wall support. EWS placement is recommended every 3 feet. All EWS are equipped with a concealed enclosure lock. If the EWS has been ordered with integral element cradles, skip step 3.

2

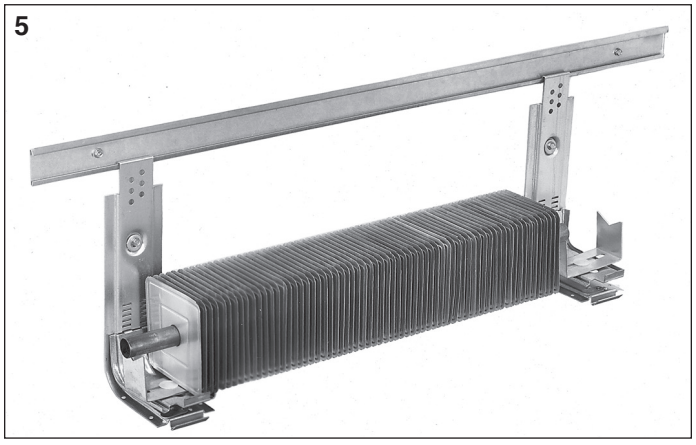


3. When element pitch or other adjustment is required, a separate Element Support Assembly (ESA) is used. The ESA hooks into slots on the EWS. For 12" high style S enclosure, the ESA must be located in the lowest slot to avoid element contact with the enclosure.

3

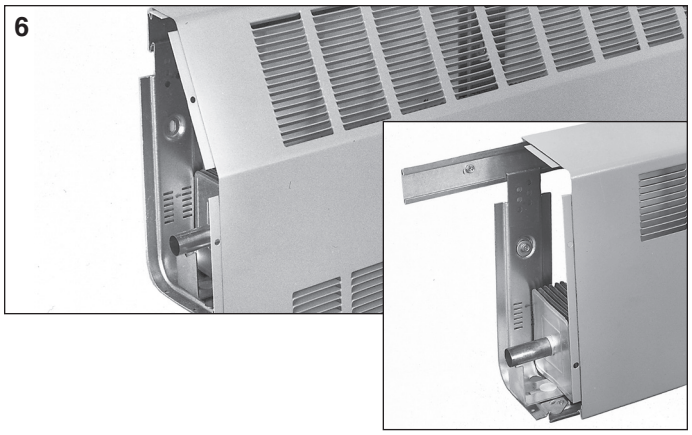
4. Return Pipe hangers (RPH) are attached into holes on the upper portion of the EWS to accommodate return piping. RPH is not to be used in combination with a damper for styles S or SF enclosures.

4a



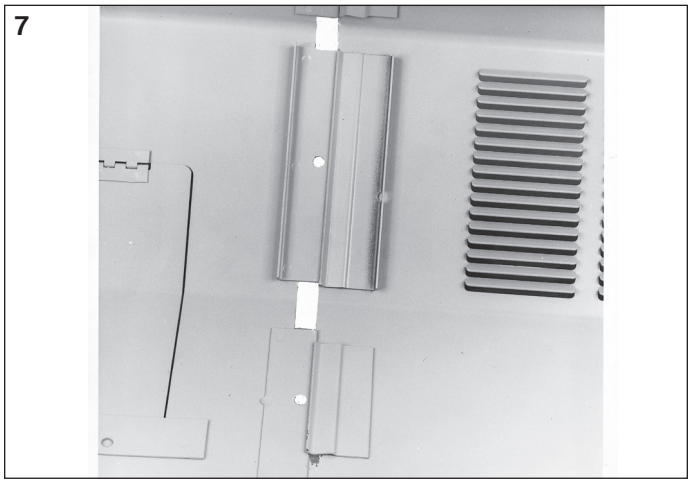
4b

If dampers are included, the operator must be pre-assembled prior to enclosure installation.



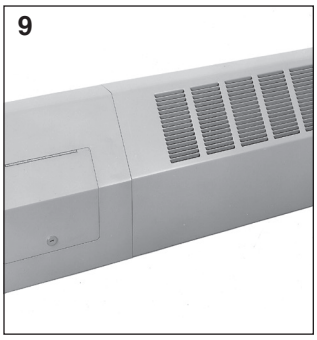
5. In the fin-tube element placement, position the cradle on the EWS to allow for expansion of the element.

5

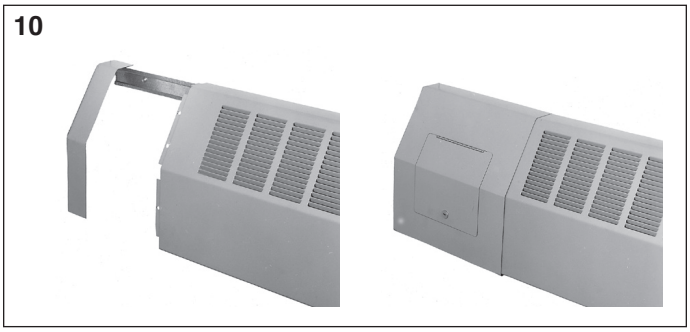


INSTALLATION

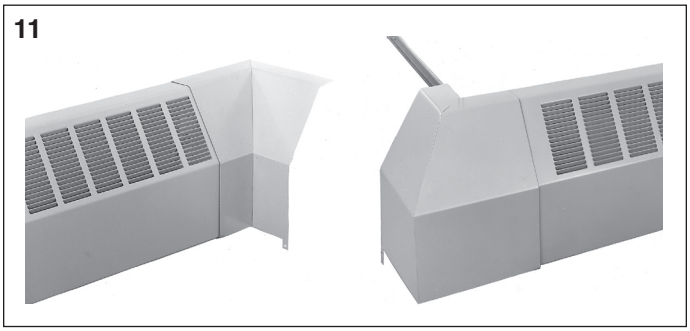
6. The first enclosure section should be set in place as noted by the Room Schedule (style S is shown at right). Engage the enclosure into the hanger strip, then into the bottom bend of the Enclosure Wall Support (EWS). Once in place, secure the enclosure to the bracket with a quarter turn of the hex headed enclosure latch.



7. Adjoining sections of enclosure can be added to the first by means of interlocking slip-joints. The male strip always faces to the left, the concealed female clip always right. Start enclosure slip-joints from the top before engaging the hanger strip and EWS. Enclosures may be tapped together to protect the edge of the adjoining enclosure. As with the first enclosure, all other enclosures should be secured to the EWS by a quarter-turn of the built-in enclosure latch.



8. Enclosure End Caps terminate enclosure when not running wall-to-wall and join to enclosures with concealed slip-joints. Each end cap adds to the overall length of fin-tube enclosures. End Caps with access door are also available. For fin-tube covers, EM and FT end caps overlap.



9. Valve Compartments have concealed interlocking slip-joints to mate up with enclosures to provide valve access within an enclosure run. Locate as directed on Room Schedule.

10. Enclosure extensions overlap enclosures and make up length differences when running to a wall. Place extension over enclosure, then bend tabs to secure the extension to the bottom of the enclosure.

11. Inside or Outside corners allow an enclosure run to continue around a corner. Corners overlap enclosures to make up length difference between walls. Corners have fold-over tabs. Place corner over enclosure, then bend tabs to secure the corner to the bottom of the enclosure.

SAMPLE SIZING CALCULATIONS

Example 1 - Hot Water At Decreased Flow

Determine fin tube length required:

Conditions:

Standard air temperature = 65°F
Average water temperature = 200°F
Water velocity = 1.0 ft/sec
Calculated heat loss of room = 20,000 Btu/hr.

Water Velocity Correction:

A water velocity correction factor must be used if the water velocity is other than the 3.0 ft/sec.

$$\frac{\text{Heat Loss}}{\text{Correction Factor}} = \text{Btu/hr if the water velocity is 3.0 ft/sec}$$

Water velocity correction factor for 1.0 ft/sec = .957 (Refer to Table 9.2 on page 9)

$$\frac{20{,}000 \text{ Btu/hr}}{0.957} = \text{20,899 Btu/hr if the water velocity is 3.0 ft/sec}$$

Selection of Unit:

A model 'S' Slope Top with an enclosure height of 12" and one row of 3/4" copper tube with aluminum fin size of 4-1/4" X 4-1/4" is desired.

Determine hot water ratings for desired tube and fin size (Refer to Table 15.1 on page 15):

34 fins/ft = 1160 Btu/hr/ft $\frac{20{,}899 \text{ Btu/hr}}{1160 \text{ Btu/hr/ft}}$ = 18.0 linear ft.

42 fins/ft = 1380 Btu/hr/ft $\frac{20{,}899 \text{ Btu/hr}}{1380 \text{ Btu/hr/ft}}$ = 15.1 linear ft.

50 fins/ft = 1390 Btu/hr/ft $\frac{20{,}899 \text{ Btu/hr}}{1390 \text{ Btu/hr/ft}}$ = 15.0 linear ft.

Example 2 - Hot Water, Air And Water Temperature Other Than Standard

Determine fin tube length required:

Conditions:

Air temperature = 55°F
Average water temperature = 210°F
Water velocity = 3.0 ft/sec (standard)
Calculated heat loss of room = 20,000 Btu/hr.

Air And Water Temperature Correction:

A correction factor must be used if the air and/or water temperatures other than standard conditions

$$\frac{\text{Heat Loss}}{\text{Correction Factor}} = \text{Btu/hr if the air and/or water temperature are not standard}$$

Air and water correction factor = 1.05 (Refer to Table 10.2 on page 10)

$$\frac{20{,}000 \text{ Btu/hr}}{1.05} = \text{19,048 Btu/hr if standard conditions}$$

Selection of Unit:

A model 'S' Slope Top with an enclosure height of 18" and two rows of 3/4" copper tube with aluminum fin size of 4-1/4" X 4-1/4" is desired.

Determine hot water ratings for desired tube and fin size (Refer to Table 15.1 on page 15):

34 fins/ft = 2130 Btu/hr/ft $\frac{19{,}048 \text{ Btu/hr}}{2130 \text{ Btu/hr/ft}}$ = 8.9 linear ft., two rows

42 fins/ft = 2340 Btu/hr/ft $\frac{19{,}048 \text{ Btu/hr}}{2340 \text{ Btu/hr/ft}}$ = 8.1 linear ft., two rows

50 fins/ft = 2560 Btu/hr/ft $\frac{19{,}048 \text{ Btu/hr}}{2560 \text{ Btu/hr/ft}}$ = 7.4 linear ft., two rows

SAMPLE SIZING CALCULATIONS

Example 3 - Steam Systems At Non-Standard Air Temperature And Steam Pressure

Determine fin tube length required:

Conditions:

Air temperature = 55°F
Steam pressure = 25 psi
Calculated heat loss of room = 25,000 Btu/hr.

Air Temperature And Steam Pressure Correction:

A model 'S' Slope Top with an enclosure height of 24" and three rows of 3/4" copper tube with aluminum fin size of 4-1/4" X 4-1/4" is desired.

A correction factor must be used for steam systems.

Standard Output X Correction Factor = Output at Conditions

34 fins/ft: 2630 Btu/hr/ft X 1.59 = 4182 Btu/hr/ft

42 fins/ft: 2910 Btu/hr/ft X 1.59 = 4627 Btu/hr/ft

50 fins/ft: 3160 Btu/hr/ft X 1.59 = 5024 Btu/hr/ft

Refer to Table 15.1 on page 15 for ratings
Refer to Table 10.3 on page 10 for correction factors

Selection of Unit:

Determine fin tube length required:

34 fins/ft = 4182 Btu/hr/ft $\frac{25{,}000 \text{ Btu/hr}}{4182 \text{ Btu/hr/ft}}$ = 6.0 linear ft., three rows

42 fins/ft = 4627 Btu/hr/ft $\frac{25{,}000 \text{ Btu/hr}}{4627 \text{ Btu/hr/ft}}$ = 5.4 linear ft., three rows

50 fins/ft = 5024 Btu/hr/ft $\frac{25{,}000 \text{ Btu/hr}}{5024 \text{ Btu/hr/ft}}$ = 5.0 linear ft., three rows

Example 4 - Ethylene Glycol Solution Correction

Determine fin tube length required:

Conditions:

Standard air temperature = 65°F
Average solution temperature = 150°F
Percent Ethylene Glycol = 50%
Calculated heat loss of room = 20,000 Btu/hr.

Ethylene Glycol Correction:

A model 'S' Slope Top with an enclosure height of 24" and one row of 3/4" copper tube with aluminum fin size of 4-1/4" X 4-1/4" is desired.

A correction factor must be used if an ethylene glycol solution is used.

Standard Output X Correction Factor = Output with 50% Glycol

34 fins/ft: 790 Btu/hr/ft X 0.90 = 711 Btu/hr/ft

42 fins/ft: 860 Btu/hr/ft X 0.90 = 774 Btu/hr/ft

50 fins/ft: 940 Btu/hr/ft X 0.90 = 846 Btu/hr/ft

Refer to Table 15.1 on page 15 for ratings
Refer to Table 10.1 on page 10 for correction factors

Selection of Unit:

Determine fin tube length required:

34 fins/ft = 711 Btu/hr/ft $\frac{20{,}000 \text{ Btu/hr}}{711 \text{ Btu/hr/ft}}$ = 28.1 linear ft.

42 fins/ft = 774 Btu/hr/ft $\frac{20{,}000 \text{ Btu/hr}}{774 \text{ Btu/hr/ft}}$ = 25.8 linear ft.

50 fins/ft = 846 Btu/hr/ft $\frac{20{,}000 \text{ Btu/hr}}{846 \text{ Btu/hr/ft}}$ = 23.6 linear ft.

0.25	0.4	0.7	1.1	0.905

① The factors in this table may be used only when the water flow rate through the finned tube unit is known and where the flow rate is less than three feet per second. To determine the output at less than three feet per second, multiply the AHRI Water Rating by the factor in this table which applies to the known flow rate.

Table 11.3 - Factor for Enclosure Mounted Lower Than Recommended 4" Inlet Height ①

R, F, FT, EM	1.15	1.14	1.13	1.12	1.11	1.10	1.09	1.08	1.07	1.06	1.05	1.04	1.03	1.02	1.01	1.00

① When enclosures are mounted more than 4" above floor, use the following formula to determine BTU at actual mounting height.

If the unit is to be installed at a different height than recommended, the AHRI Rating shall be adjusted as follows:

$$\frac{\text{Actual Mounting Height Factor}}{\text{Recommended Mounting Height Factor}} = \text{CORRECTION FACTOR}$$

EXAMPLE - S12

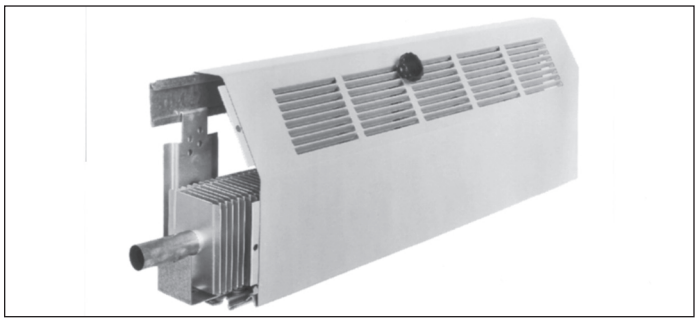
12 inch enclosure height + 4 inch inlet height = 16 inch recommended Mounting Height.
Change to 12 inch enclosure height + 12 inch inlet height = 24 inch actual Mounting Height.

Factors from Table 11.4:
At 16 inches, factor = 1.10 At 24 inches, factor = 1.06
Apply to formula: $\frac{1.06}{1.10}$ = CORRECTION FACTOR

Correction Factor X Catalog Rating (BTU) = BTU at Actual Mounting Height.

MODEL SP SLOPE TOP TRIMFIN™ FEATURES

- Enclosure ② engages with concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS ④ supports Heating Element ①, second and third row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- EWS ④ supports have integral enclosure lock.



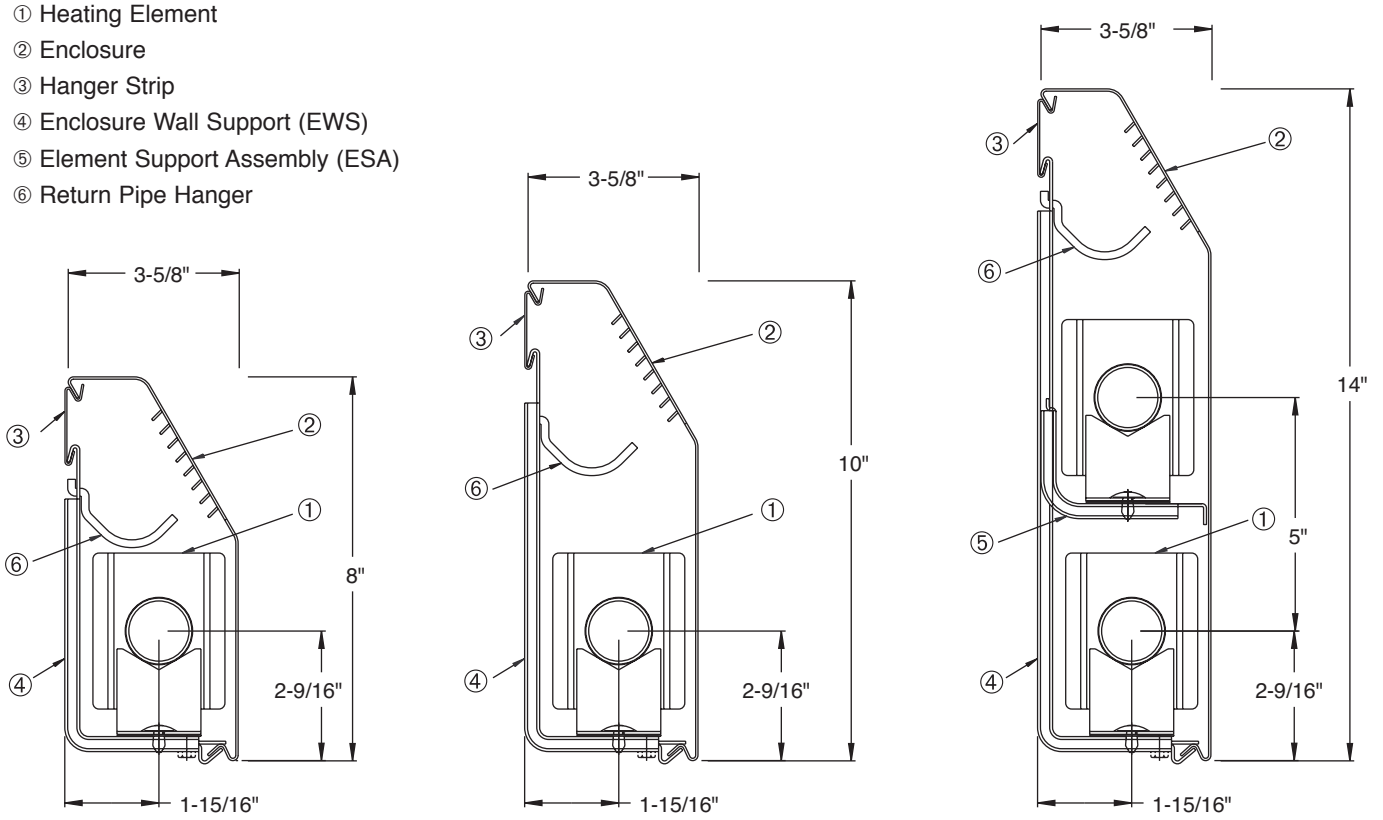


Figure 12.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 8, 10, and 14 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 18 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Bottom inlet grille conceals open air inlet for installations above eye level.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.

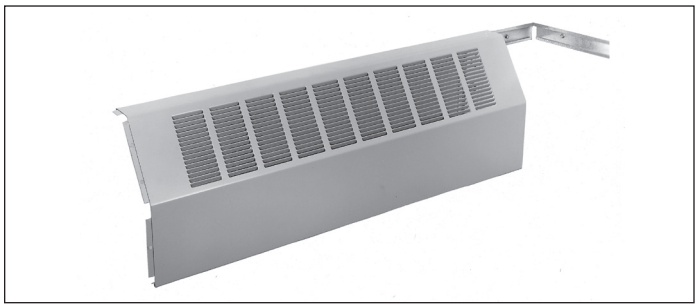
- Bottom of enclosure mounted 2 inches above floor. Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED® ◀

MODEL S SLOPE TOP FEATURES

- Enclosure ② engages concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS ④ supports Heating Element ①, second and third row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- EWS ④ supports have integral enclosure lock.



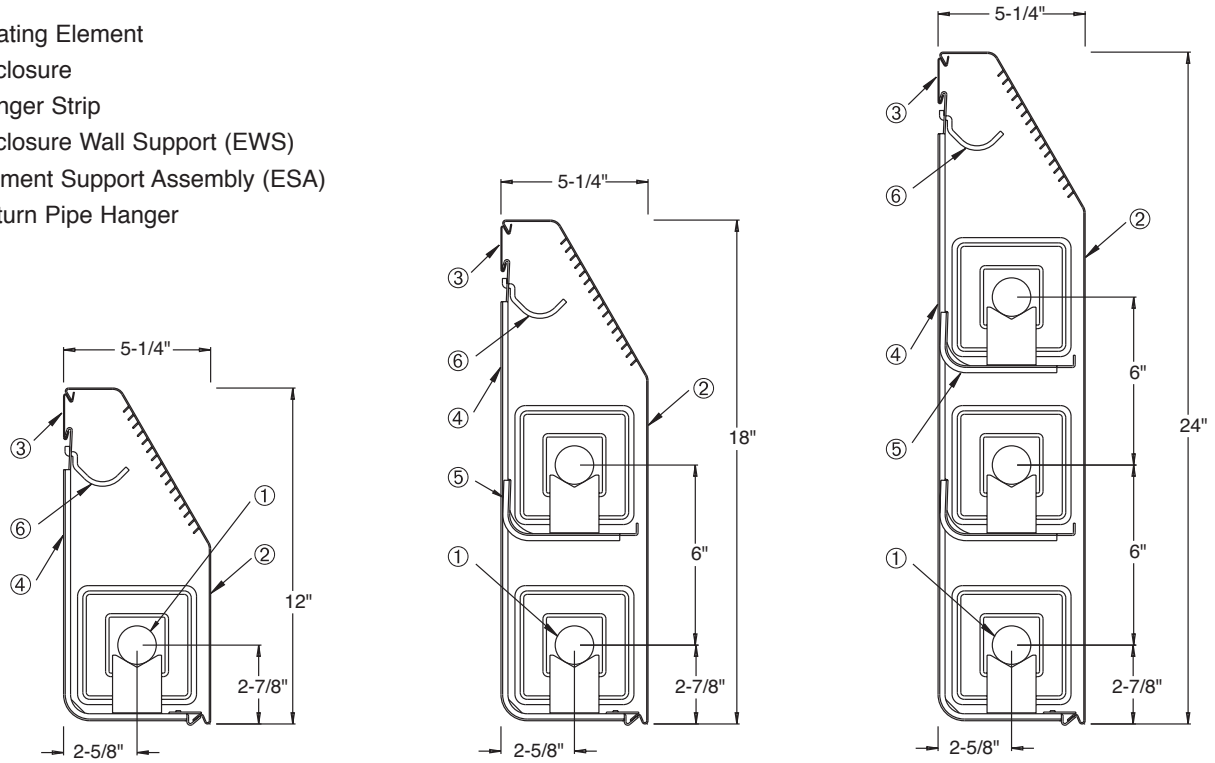


Figure 14.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 12, 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Bottom inlet grille conceals open air inlet for installations above eye level.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

• Bottom of enclosure mounted 2 inches above floor. Refer to page 11 for correction factors for other mounting heights.
• Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
• Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

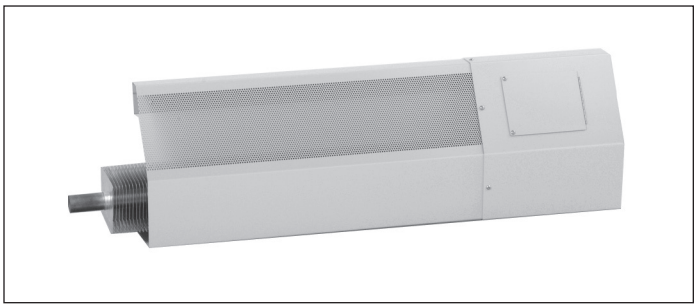
PS SECURITY SLOPE TOP FEATURES

- Enclosure ② engages concealed Hanger Strip ③.
- Heating Elements are supported by Inverted Element Bracket (IEB) ④.



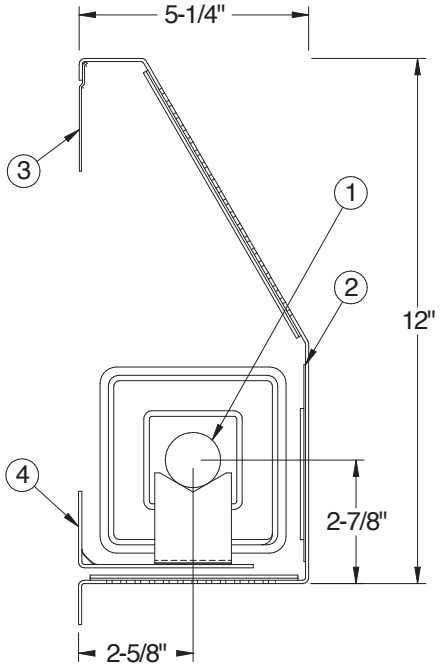


Figure 17.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Inverted Element Support Bracket (IEB)

PS 012

Standard Features

- Hanger strip - 16 gauge aluminized steel.
- Enclosure, 14 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Height of 12 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 14 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.

Options

- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Hanger strip with full back panel.
- Tamperproof (key) damper.
- Column enclosure conceals piping around columns.

⑥ Return Pipe Hanger

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 12, 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Bottom inlet grille conceals open air inlet for installations above eye level.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

• Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
• Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
• Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

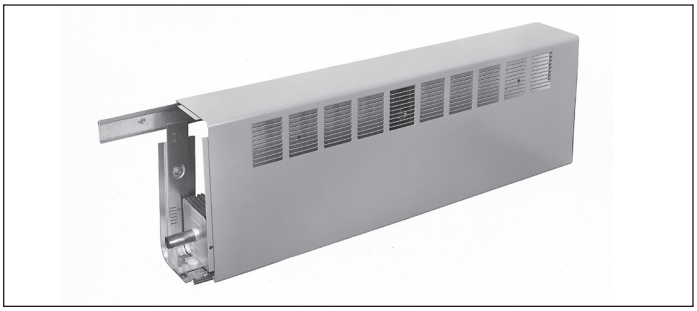
- Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

MODEL F FRONT OUTLET FEATURES

- Enclosure ② engages concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS ④ supports Heating Element ①, second and third row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- EWS ④ supports have integral enclosure lock.



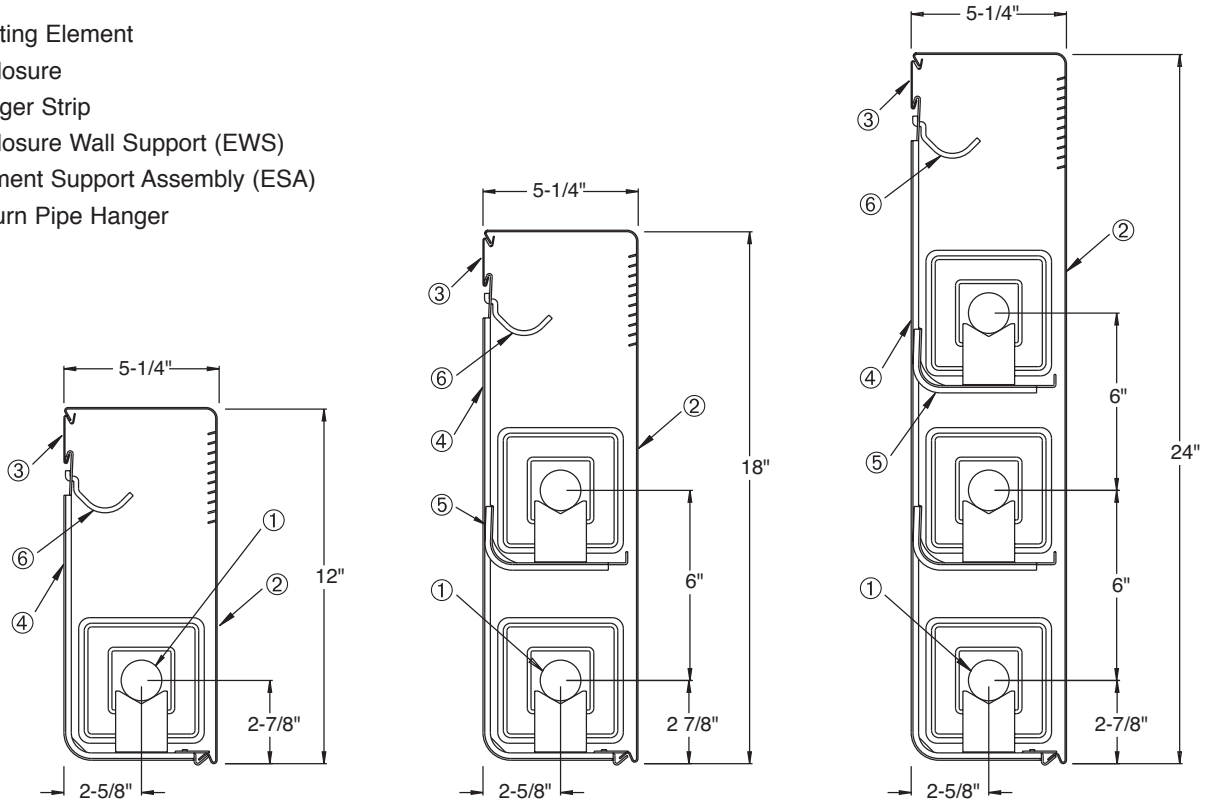


Figure 22.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 12, 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Bottom inlet grille conceals open air inlet for installations above eye level.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

- Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

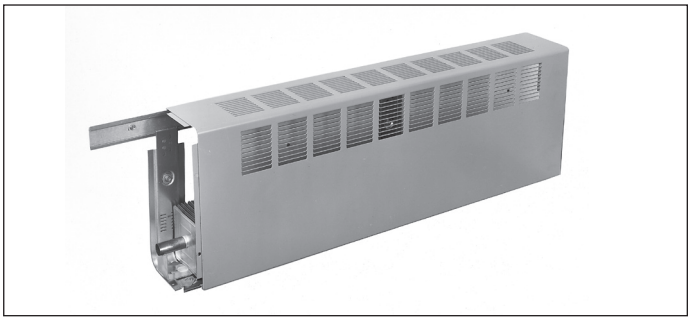
- Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

MODEL R FRONT AND TOP OUTLET FEATURES

- Enclosure (2) engages concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS (4) supports Heating Element ①, second and third row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- EWS ④ supports have integral enclosure lock.



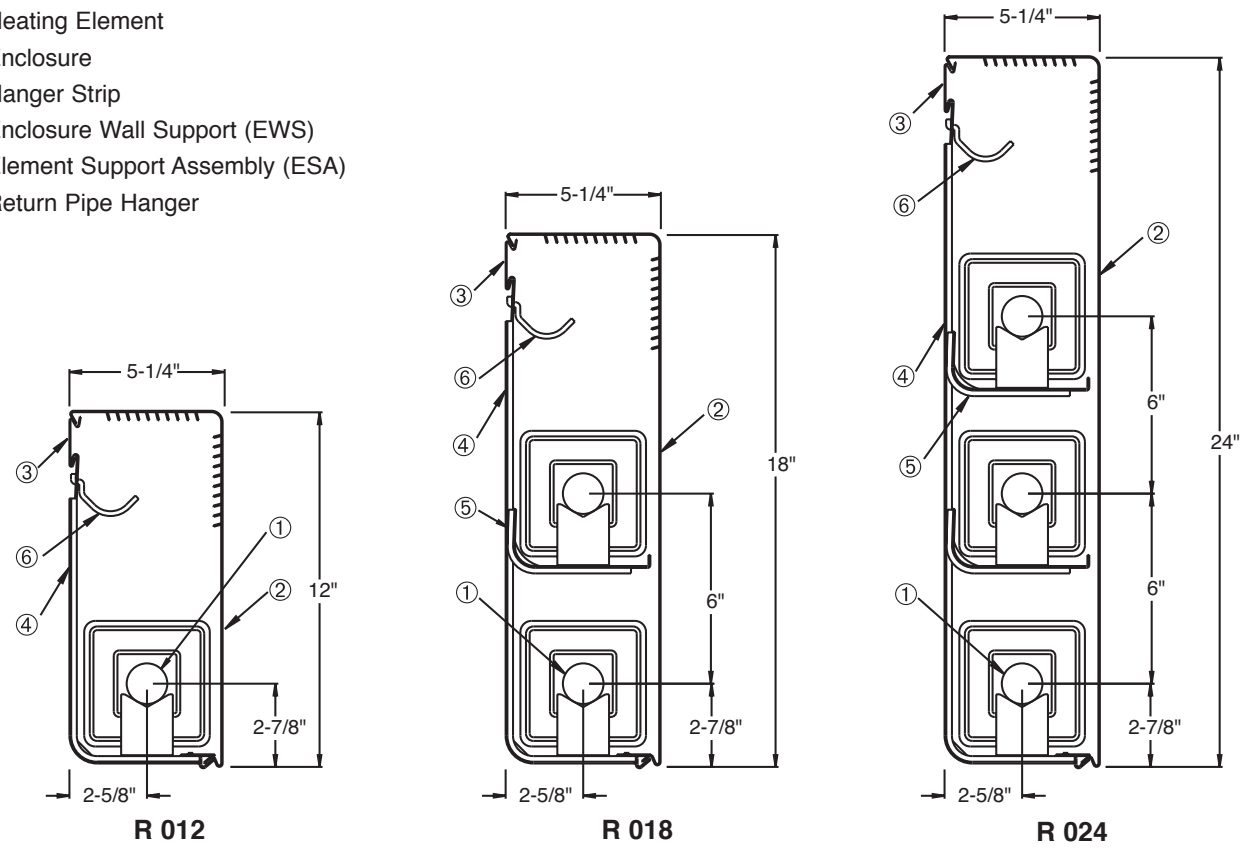


Figure 25.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 12, 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Bottom inlet grille conceals open air inlet for installations above eye level.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

• Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
• Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
• Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

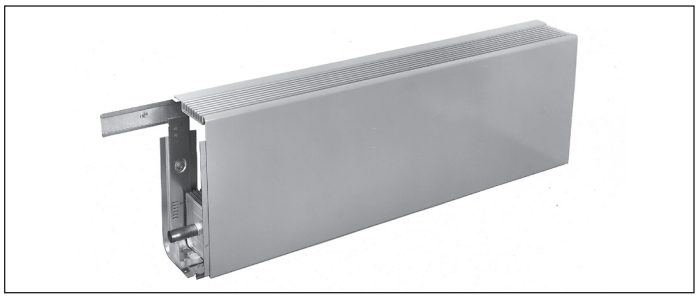
- Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI
- Finned length is the specified element length - 6" (3" plain end each side).

MODEL TA ARCHITECTURAL TOP OUTLET FEATURES

- Enclosure ② engages concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS ④ supports Heating Element ①, second and third row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- EWS ④ supports have integral enclosure lock.



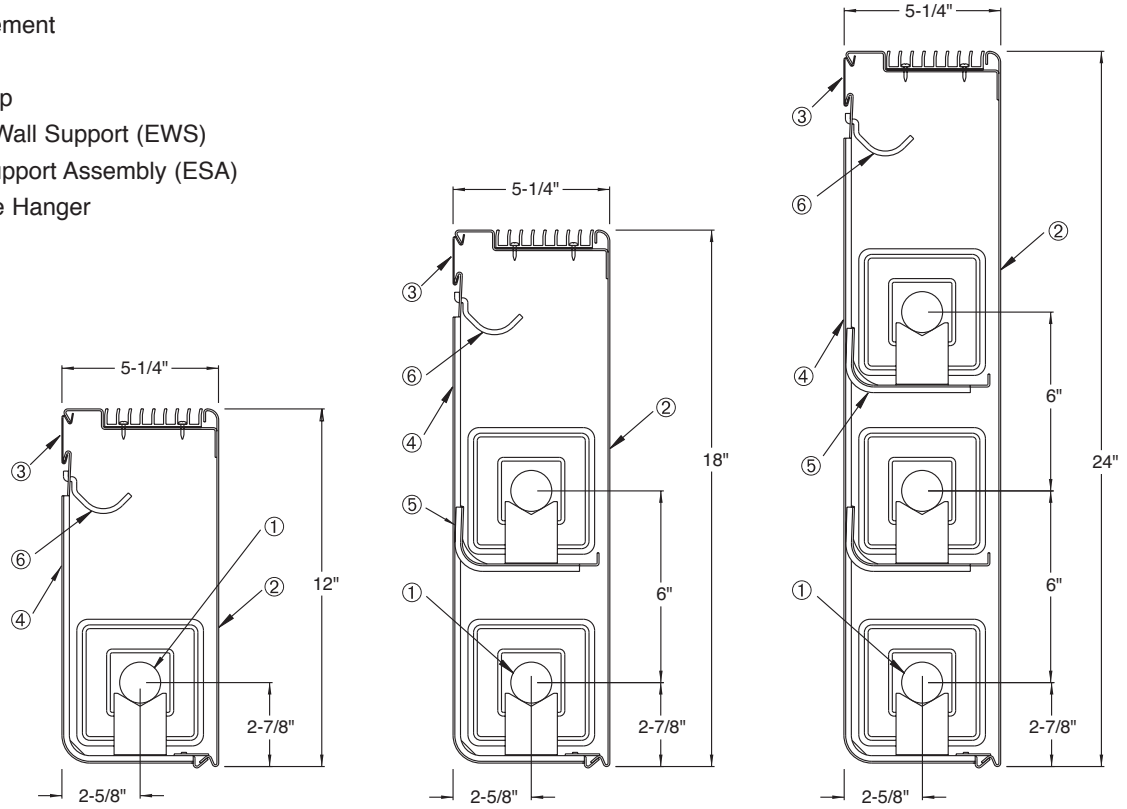


Figure 28.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 16 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 12, 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Aluminum bar grille at top outlet.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Bottom inlet grille conceals open air inlet for installations above eye level.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

• Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
• Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
• Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

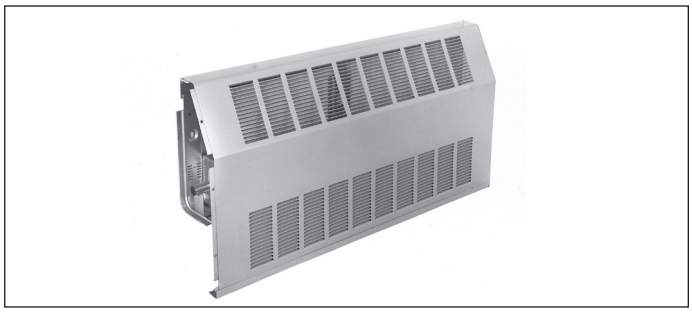
- Bottom of enclosure mounted 4 inches above floor. Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI
- Finned length is the specified element length - 6" (3" plain end each side).

MODEL SF SLOPE TOP, FLOOR MOUNTED FEATURES

- Enclosure ② engages concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS ④ supports Heating Element ①, first and/or second row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- Single or double Floor Angle ⑦ anchors enclosure to floor.



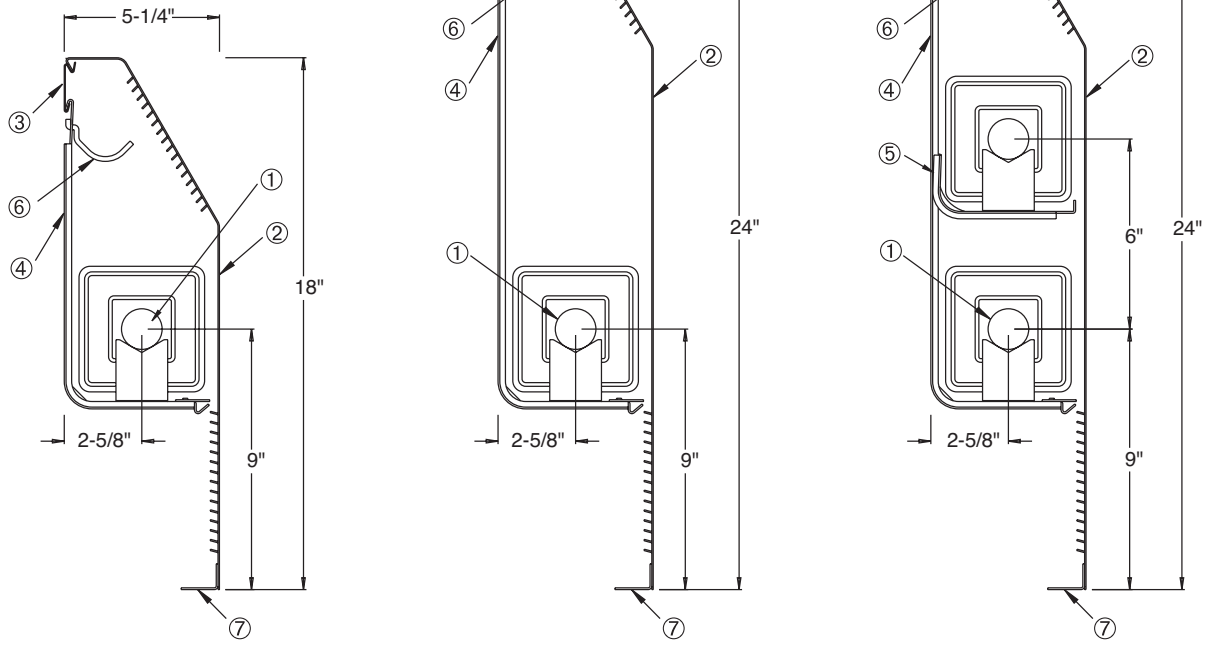


Figure 31.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger
⑦ Single or Double Floor Angle

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Single floor angle using screws or double floor angle without screws to anchor enclosure to floor.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

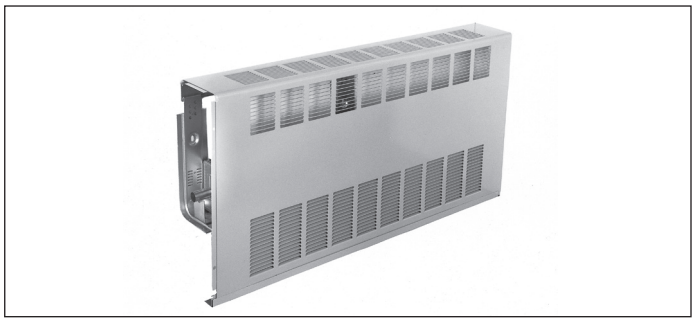
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

MODEL RF FRONT/TOP OUTLET, FLOOR MOUNTED FEATURES

- Enclosure ② engages concealed Hanger Strip ③.
- Enclosure Wall Support (EWS) ④ hangs from Hanger Strip at any location and attaches to wall with one fastener.
- EWS ④ supports Heating Element ①, first and/or second row Element Support Assembly (ESA) ⑤ and Return Pipe Hanger ⑥ without fasteners.
- Single or double Floor Angle ⑦ anchors enclosure to floor.



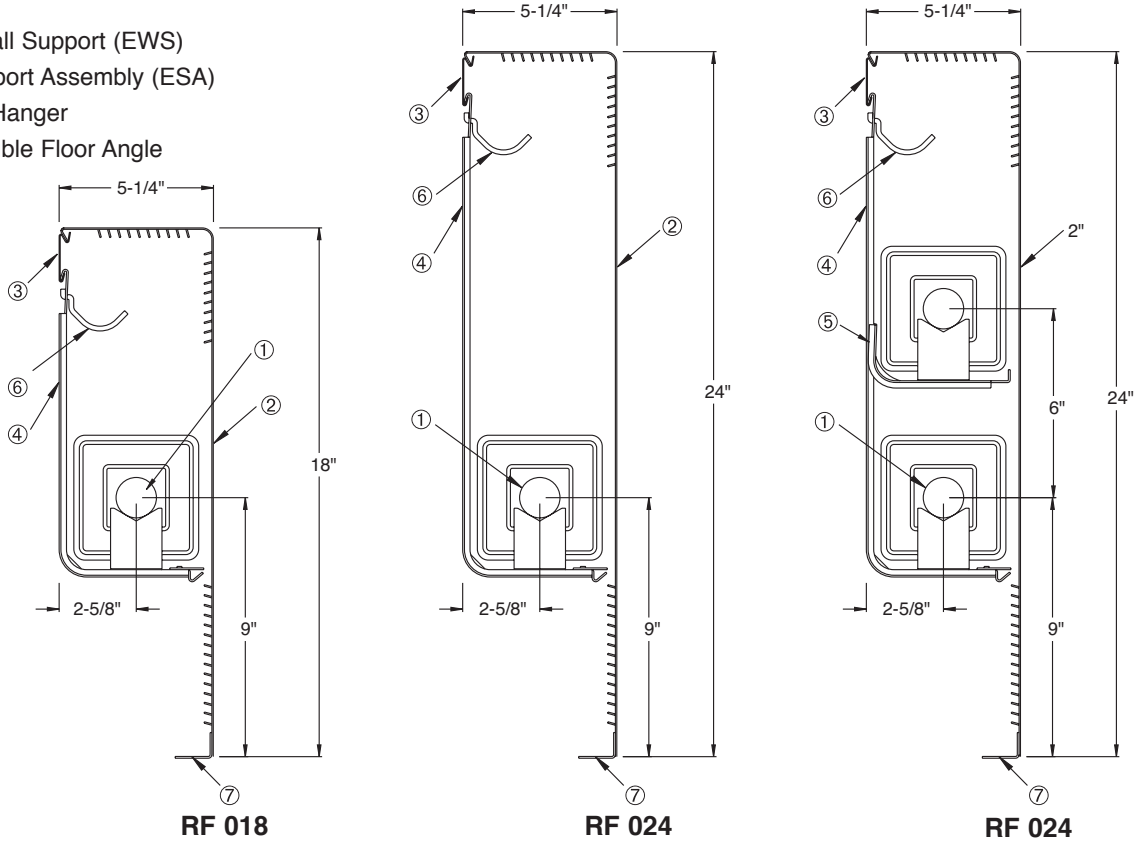


Figure 33.1 - System Components

① Heating Element
② Enclosure
③ Hanger Strip
④ Enclosure Wall Support (EWS)
⑤ Element Support Assembly (ESA)
⑥ Return Pipe Hanger
⑦ Single or Double Floor Angle

Standard Features

- Hanger strip - 20 gauge aluminized steel.
- Enclosure, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Heights of 18 and 24 inches.
- Enclosure sections are joined using concealed slip joints.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps, end enclosures and valve compartments use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.
- Return pipe hanger. Note: return pipe hanger cannot be used with damper option.

Options

- Enclosures available in 14 or 16 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Single floor angle using screws or double floor angle without screws to anchor enclosure to floor.
- Hanger strip with full back panel.
- Knob operated or tamperproof (key) damper.
- Column enclosure conceals piping around columns.

- Accessories, 20 gauge, include all items for a complete installation.
- End caps and end enclosures use slip joints to attach to enclosure.
- Inside, outside corners and enclosure extensions overlap enclosure sections.

Options

- Enclosures available in 14 gauge steel.
- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).
- Column enclosure conceals piping around columns.

- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity. These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

MODEL P AND PA ACCESSORIES

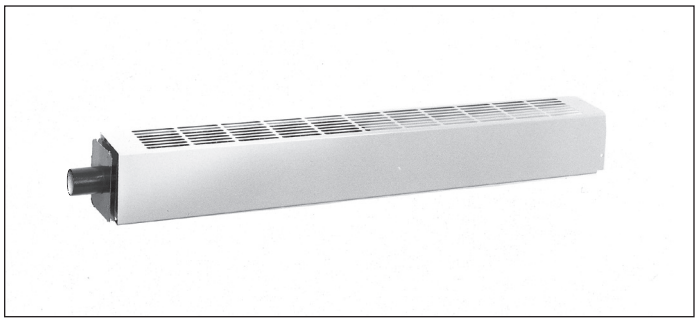
Figure 39.1 - Model P and PA Enclosure Accessories

Ref. No.	Accessory Description ① ②	Fit Type ③
1	Wall Support	(R or L)
2	5" or 12" Wide Enclosure Extension	(O)
3	12" Wide Enclosure Extension with Access Door	(O)
4	90° Inside/Outside Corner	(O)
5	135° Inside/Outside Corner	(O)
6	12" Wide End Enclosure	(S) (R or L)
7	12" Wide End Enclosure with Access Door	(S) (R or L)
8	End Cap	(S) (R or L)

① At least two pedestals are required for each enclosure section. Allow a pedestal every 3'.
② Accessories constructed of 20 gauge CRS
③ (O)=Overlapping, (S)=Slip, (R or L)=Right or Left Hand Configurations

MODEL FT FLAT TOP ELEMENT COVER FEATURES

- Cover ② attaches directly to Heating Element ① fins.
- Heating Element ① and Cover ② can be installed in one, two or three rows.
- Heating Elements are supported by Fixed Brackets (FB) ④ or Expansion Brackets (EB) ③.
- Cover has overlapping joints.
- Enclosure Strap ⑤ provides a means to secure Cover to Heating Elements in multiple row installations.



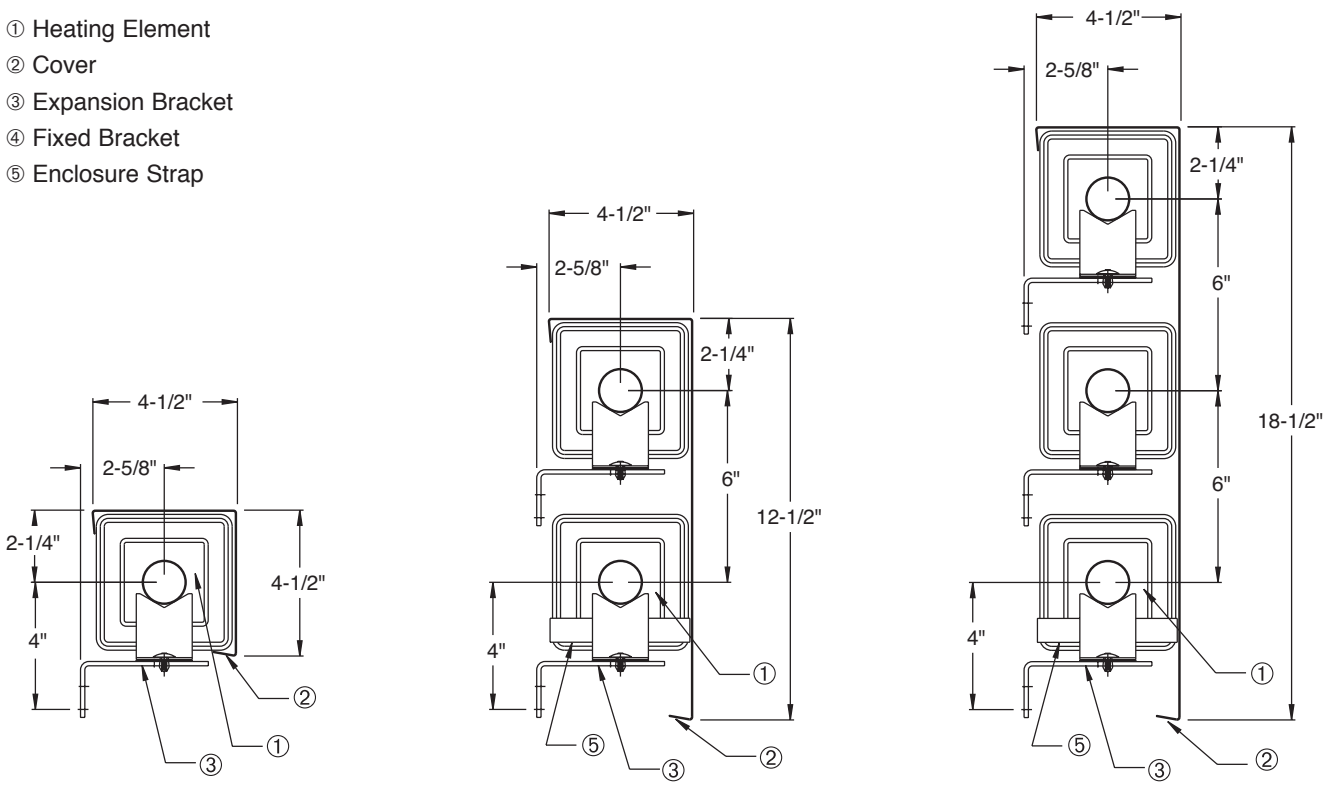


Figure 40.1 - System Components

FT 004 **FT 012** **FT 018**

Standard Features

- Cover, 18 gauge in lengths of 2 feet through 8 feet in 6 inch increments.
- Cover heights of 4.5, 12.5 and 18.5 inches.
- Cover sections are joined using overlapping joints secured with screws.
- Baked on polyester powdercoat paint finish, tan color.

Accessories

- Accessories, 20 gauge, include all items for a complete installation.
- End caps and end enclosures overlap cover and attach with screws.
- Inside, outside corners and enclosure extensions overlap cover sections and attach with screws.

Options

- Baked on polyester powdercoat paint finish available in colors selected from color guide (75-403).

- Refer to page 11 for correction factors for other mounting heights.
- Ratings are based on finned length with 65°F entering air, 1 PSI steam or average water temperature (215°F) at 3 ft/sec. water velocity These water ratings, applicable to water flow rates of three or more feet per second, have been determined by applying the factors listed on page 11 to the AHRI Steam Ratings, which have been approved by AHRI.
- Finned length is the specified element length - 6" (3" plain end each side).

▶ Bold, italicized units are AHRI CERTIFIED ◀

SPECIFICATIONS

Heating Elements

Copper tube/Aluminum fin elements are available in 3/4, 1, and 1-1/4 inch outer diameter seamless copper tubing. Fins are either 2-3/4 x 3-1/4, 2-3/4 x 4-1/4, or 4-1/4 x 4-1/4 inches with 34, 42, or 50 fins/ft., and are unpainted and bonded to the tube by mechanical expansion of the tube. Maximum element length is 8 feet for 3/4 and 1 inch diameter tubes and 12 feet for 1-1/4 inch diameter tubes. Maximum working pressure at 300° F is 250 psi for 3/4 inch tubes, 185 psi for 1 inch tube and 190 psi for 1-1/4 inch tubes.

Hangers and Supports

Enclosure wall supports attach to the 20 gauge aluminized steel hanger strip. Enclosure wall supports may be placed at any location along the hanger strip allowing installation directly over wall supports.

One fastener is required for each enclosure wall support in order to properly secure it.

Enclosure wall supports have a V-bend at the bottom which fully engages the enclosure and supports its weight.

Element support assembly and return pipe hangers hook into the wall support “pegboard style”.

Enclosure and element supports are die-formed in 16 gauge galvanized steel with integral stiffening ribs. All return pipe hangers are wire formed for ease of adjustment. No fasteners or sub-assembly are required for any element or return pipe support.

Element support cradles give two-point support to the element and allow over 2-1/2 inches of lateral movement. Cradles slide on full bearing polymeric discs and are held in place with a polymeric rivet.

Fin Tube Enclosures

All standard Commercial enclosures are manufactured in 18 gauge (14 gauge for model PS) cold-rolled steel. Enclosure lengths range from 2 feet to 8 feet in 6 inch increments.

Air discharge louver banks are 3 inches on center and have a “pencil proof” design.

All standard enclosures have a tan color, baked-on polyester powdercoat paint finish, which may be used as a final coat or repainted.

All enclosure styles include interlocking slip-joints for smooth hairline joints, with no fasteners required. All friction clips and back-up strips include stiffening angles for added reinforcement at all enclosure joints.

Fin Tube Element Covers

Types FT and EM element covers overlap and clip over the fin area of the element. No hanger strip is required. The element must be supported by either a fixed bracket (FB) or expansion bracket (EB).

All covers are made of 18 gauge steel and are finished in tan baked on polyester powdercoat paint finish. Type EM covers butt together. Type FT covers overlap one another. Cover straps are available for use with multiple rows of element, to secure the cover to the lower row of element.

Accessories

Accessories are manufactured in either 14, 18, or 20 gauge cold-rolled steel, depending on the piece. Accessories are cleaned, phosphatized, and finished with a baked on polyester powdercoat paint finish to match enclosures. Valve compartments, end caps, and end enclosures have slip joints to attach to the end of the enclosure. Corners and extensions are telescoping and overlap adjacent corners. They incorporate fold-over tabs to secure the accessory to the enclosure without fasteners, except for model PS accessories which attach to the enclosure with tamperproof fasteners.

AIREDALE

Products from Modine are designed to provide indoor air-comfort and ventilation solutions for residential, commercial, institutional and industrial applications. Whatever your heating, ventilating and air conditioning requirements, Modine has the product to satisfy your needs, including:

HVAC

- Unit Heaters:
  - Gas
  - Hydronic
  - Electric
  - Oil
- Ceiling Cassettes
- Duct Furnaces
- Hydronic Cabinet Unit Heaters, Fin Tube, Convectors
- Infrared Heaters
- Make-up Air Systems
- Unit Ventilators

Ventilation

- Packaged Rooftop Ventilation

School Products

- Vertical Packaged Classroom HVAC:
  - DX Cooling/Heat Pump
  - Water/Ground Source Heat Pump
  - Horizontal/Vertical Unit Ventilators

Geothermal

- Water-to-Water
- Water-to-Air
- Combination

Specific catalogs are available for each product. Catalogs 75-136 and 75-137 provide details on all Modine HVAC equipment.

3rd Floor Fin Tube

Radiator Installation Instructions

Horizontal Radiators

1. Radiators are boxed together in as few crates as possible. A box of brackets is included as a separate piece, and it is marked to denote brackets. Inside the crates, each panel is wrapped in foam sheeting. Saving this foam to re-wrap the panel once it is wall mounted will protect it from construction site damage.
2. Each radiator is tagged with a label that indicates the project name, model type, color, connection code, bracket type & quantity and tag number. The tag number will usually designate a floor level and room number for easier placement on the job. Locate each radiator as required.
3. Carefully place each radiator face down on a smooth level surface (e.g. floor or table). Distribute the K12 wall brackets for each radiator. The tag on the radiator indicates the quantity of brackets. Mount the brackets securely on wall studs, spacing them as evenly as possible at 2 to 4 feet apart, with a bracket at least 12 inches from each end of the panel. Allow a minimum of 3 inches below each panel radiator to facilitate cleaning and to assure proper output. For baseboard models, 2 inches or even 1 inch above the floor is permissible with little loss of heat output.

4A. **RADIATORS WITH FINS (BACK SIDE OF PANEL)**
With the radiator face down, attach each K12 clip to the fins at the stud location. With the radiator still face down, thread the K45 offset bolts (5/16” carriage bolts) into the bottom threaded positions with a crescent wrench. Once the bolts have cleared the paint away, they should turn easily by hand. Attach the K12 bracket to the wall stud with 2 lag bolts. Hang the panel onto the brackets to determine if the K45 offset bolts are properly adjusted. Check that the panel is level.

4B. **RADIATORS (NO FINS ON BACK SIDE OF PANEL)**
With the radiator face down, attach each K12 clip to the radiator’s perforated steel mounting channel at the K12 stud locations. With the radiator still face down, thread the K45 offset bolts (5/16” carriage bolts) into the bottom threaded positions with a crescent wrench. Once the bolts have cleared the paint away, they should turn easily by hand. Hang the panel onto the brackets to determine if the K45 offset bolts are properly adjusted. Check that the panel is level.

5. Remove the radiator from the wall, and thread the supply and return fittings into the connections on the panel. The sealing tape or pipe dope used is the installer’s choice – make sure the connections are leak tight. One quarter of a turn past hand tight is usually sufficient. Use the foam wrap as a pad for the face of the panel while tightening up the fittings. Each radiator needs to be fitted with a 1/8” air vent prior to startup.
6. **FLOOR POST & PEDESTAL MOUNTED RADIATORS**
When using floor posts, each post must line up with a corresponding K45 offset bolt attached to the back side of the radiator. Using this spacing as a guide, securely fasten each floor post to the floor, using appropriate fasteners. The K12 wall bracket is attached to the floor post, and the K12 clip to the radiator, as described in step #4. The nut and bolt used to attach the K12 bracket to the floor post is to be supplied by others.
For pedestal mounting, the pedestals should be arranged so that the end pedestals sit within 12 inches of each end of the radiator, with the remainder spaced evenly along the radiator’s length. Each pedestal should be securely fastened to the floor using appropriate fasteners.
Radiators sit on the pedestals, with the “fingers” of the pedestals sticking up between the fins to provide stability.
7. . Radiators expand a maximum of 0.016 inch per linear foot of length if heated to 215°F. Piping attached to the radiator must provide the necessary expansion compensation.
8. Once the radiators are installed, the system can be tested to 50 psi. **DO NOT OVER-PRESSURIZE THE RADIATORS** as permanent damage may be done.

Standard Pressure Panels
Maximum 56 psi

Medium Pressure Panels
Maximum 85 psi

High Pressure Panels
Maximum 128 psi

When the system has been shown to hold 50 psi maximum air, the piping and radiators can be filled with water. As water fills the system and radiators, air is forced to the vent fittings. Vent as much air as possible before turning on the circulating pump(s).

9. When the system is filled, operate the circulator(s) to force the remaining air to the high points of the system. With the system pressurized, turn off the circulator(s) to vent the panels. Each radiator should be individually bled of air. Once cold venting has been completed, heat the system to design temperature and repeat the venting procedure as many times as necessary to remove all air from the system.

Hazard Identification Information

⚠ DANGER

The use of unauthorized components, accessories or devices may adversely affect the operation of the condensing unit and may also endanger life and property.

The manufacturer disclaims any responsibility for such loss or injury and the manufacturer's warranty does not cover any damage or defect to the air conditioner caused by the attachment or use of any components, accessories or devices (other than those authorized by the manufacturer) into, onto or in conjunction with the condensing unit.

⚠ DANGER

Dangers indicate a hazardous situation which will result in death or serious injury if not avoided.

⚠ WARNING

Warnings indicate potentially hazardous situations, which canresult in property damage, severe personal injury, or death ifnot avoided.

⚠ CAUTION

Cautions indicate potentially hazardous situations, which can result in personal injury or equipment damage if not avoided.

This manual contains the installation and operating instructions for your split condensing unit. There are a few precautions that should be taken to derive maximum satisfaction from it. Improper installation can result in unsatisfactory operation or dangerous conditions.

Read this manual and any instructions packaged with separate equipment required to make up the system prior to installation. Give this manual to the owner and explain its provisions. The owner should retain this manual for future reference.

Checking Product Received

Upon receiving the unit, inspect it for any damage from shipment. Claims for damage, either shipping or concealed, should be filed immediately with the shipping company. Check the unit model number, electrical characteristics, and accessories to determine if they are correct.

Nomenclature

R C S – 06 – F – 078 – C

Rooftop Condensing System

Nominal capacity (tons)
06 = 6.5
07 = 7.5
10 = 10 (single compressor)
11 = 10 (tandem compressors)
12 = 12
15 = 15
20 = 20

Refrigerant
F = R-410A

Voltage
C = 208/230 - 3 - 60
D = 460 - 3 - 60
Y = 575 - 3 - 60

Compressor
078 = 6.5 ton, single
090 = 7.5 ton, single
120 = 10 ton, single
125 = 10 ton, tandem
150 = 12.5 ton, tandem
180 = 15 ton, tandem
240 = 20 ton, tandem

NOTE: For larger size units (greater than 20 ton), refer to Catalog 222.

Standard Unit Features

Cabinet — Galvanized steel with a durable powder paint finish. Stamped louvered panels offer 100% protection for the condenser coil.

Compressor — Hermetically sealed scroll compressors. Compressors are mounted on rubber-in-shear pads to reduce vibration and noise.

Condenser Coil — Constructed with copper tubes and aluminum fins mechanically bonded to the tubes for maximum heat transfer capabilities. All coil assemblies are leak tested at 450 psig internal pressure.

Refrigerant Connections — Field piping connections are made through a fixed panel. This allows complete access or removal of access panels after piping connections have been made.

Crankcase Heater — Standard, all models.

Low Ambient Control — A pressure sensitive fan cycling control to allow unit operation to 0°F is standard.

Service Valves — Standard on liquid lines and vapor lines.

Service Access — The control box, as well as the compressor and other refrigerant controls, is accessible through access panels. It may be opened without affecting the normal operation of the unit. Condenser fan motors are accessible by removing wire grilles.

Filter Drier — Field supplied.

Sight Glass — Optional, field supplied.

Transformer — Step down type, line to 24 volts.

Contactor — The contactor is an electrical switch which operates the compressor and condenser fans.

High Pressure Control — Opens the contactor circuit on high refrigerant pressure; manual reset.

Low Pressure Control — Stops compressor operation in the event of loss of refrigerant.

Condenser Fan Motor (Direct Drive) — Ball bearing 1075 RPM motors are mounted to minimize vibration and noise problems.These are permanent split capacitor types and require the same capacitance for both run and start.
Testing — All units are run tested at the factory prior to shipment. Units are shipped with a holding pressure of nitrogen.

Figure 7: Control Box Example – RCS 10F Through 20F

Order Parts

When reporting shortages or damaged parts, or when ordering repair parts, give the complete unit model and serial numbers which are stamped on the unit rating plate.

Standard Items

The condensing unit consists of a completely assembled package which includes a compressor pack, condenser coils, fans, fan motors, outdoor control box, factory wiring, factory tubing and fittings.

Crankcase Heaters

These units are equipped with a crankcase heater that is factory wired to operate whenever the main power supply to the unit is “ON” and compressors are “OFF.” Before starting the equipment after prolonged shutdown or at the time of initial spring startup, be sure that the circuits to the condensing units are closed for at least 24 hours.

Corrosive Environment

The metal parts of this unit may be subject to rust or deterioration if exposed to a corrosive environment. This oxidation could shorten the equipment’s useful life. Corrosive elements include salt spray, fog or mist in seacoast areas, sulphur or chlorine from lawn watering systems, and various chemical contaminants from industries such as paper mills and petroleum refineries.

If the unit is to be installed in an area where contaminants are likely to be a problem, special attention should be given to the equipment location and exposure.

- Avoid having lawn sprinkler heads spray directly on the unit cabinet
- In coastal areas, locate the unit on the side of the building away from the waterfront.
- Shielding provided by a protection, based on clearances

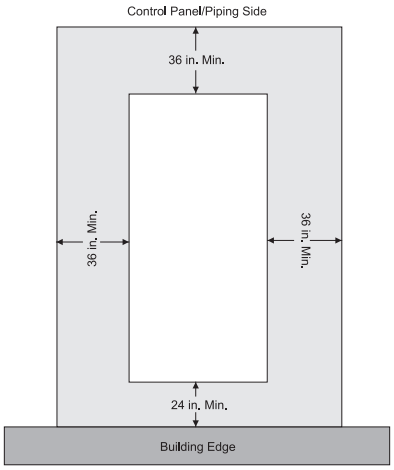
⚠ DANGER

Disconnect all power to unit before starting maintenance. Failure to do so can cause electrical shock resulting in severe personal injury or death.

Regular maintenance will reduce the buildup of contaminants and help to protect the unit’s finish.

- Frequent washing of the cabinet, fan blade and coil with fresh water will remove most of the salt or other contaminants that build up on the unit.
- Regular cleaning and waxing of the cabinet with a good automobile polish will provide some protection.
- A good liquid cleaner may be used several times a year to remove matter that will not wash off with water.

Several different types of protective coatings are offered in some areas. These coatings may provide some benefit, but the effectiveness of such coating materials cannot be verified by the equipment manufacturer.



Installation General

The condensing unit should be installed outdoors. It should be located as near as possible to the evaporator section to keep connecting refrigerant tubing lengths to a minimum. The unit must be installed to allow a free air flow to the condenser coils

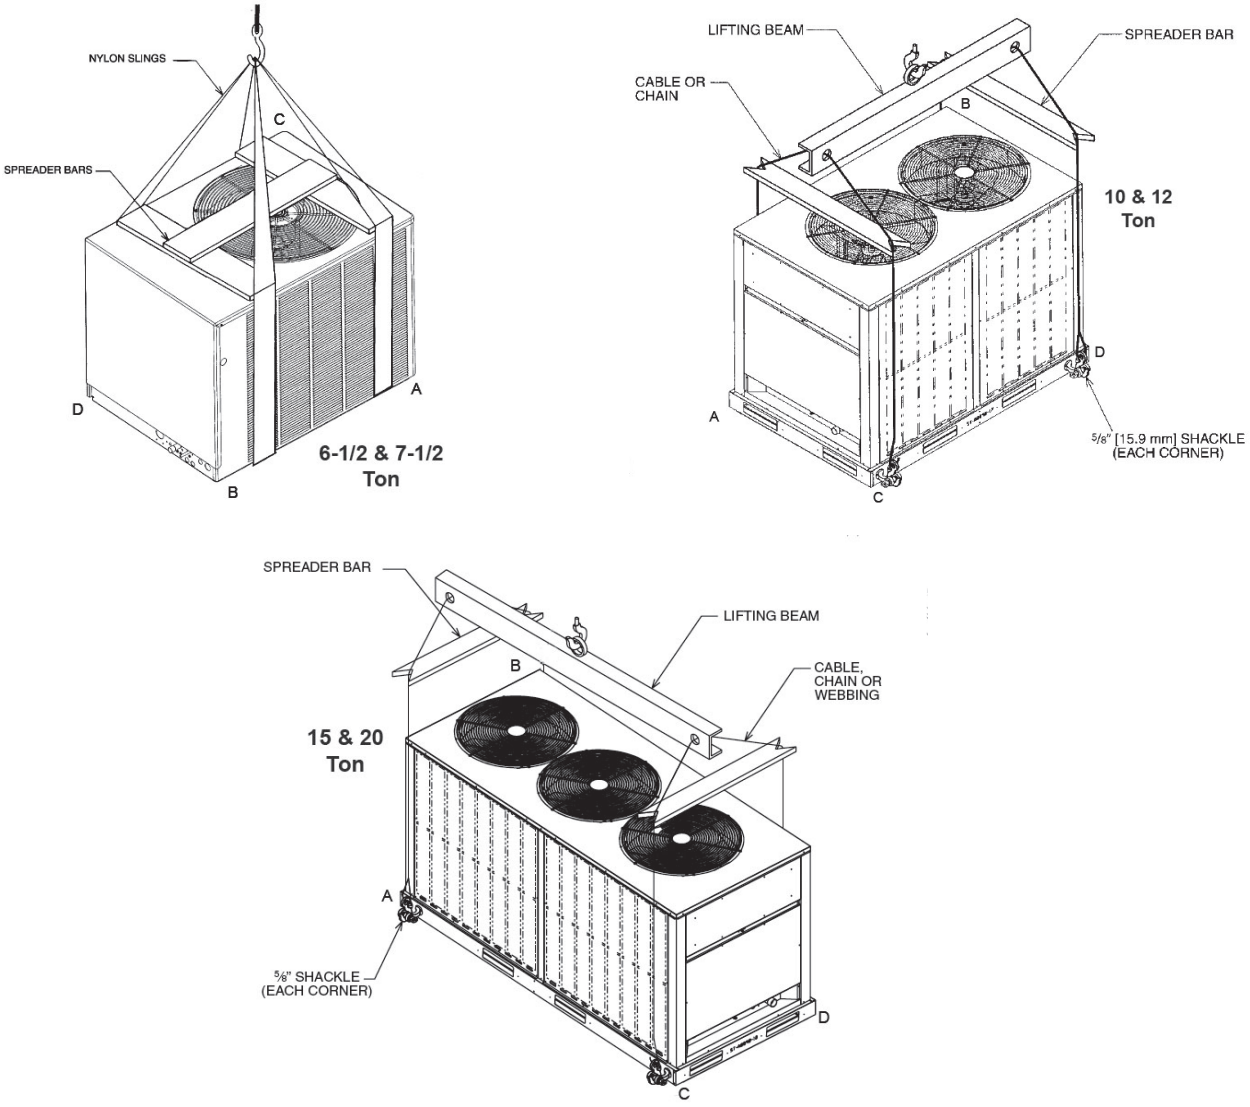
If several units are installed adjacent to each other, take care to avoid recirculation of air from one condenser to another. In all installations, adequate space must be provided for installation and servicing.

The unit must not be connected to any duct work. Do not locate unit under a roof drip; if necessary, install gutters, etc., to prevent water runoff onto the unit. To prevent air recirculation, it is recommended that the unit not be installed under an overhang. However, if this is necessary, allow a minimum of 60" above the unit for air discharge

Figure 8: Clearances RCS 06F – 20F Service Clearances

Rooftop Installation

If rooftop installation is required, make certain that the building construction is adequate for the weight of the unit. (Table 5) Before placing the unit on the roof, make certain that the nylon rigging slings are of sufficient length to maintain equilibrium of the unit when lifting. Under no circumstances should the unit be lifted by only one corner for rooftop installation.



Slab Installation

Condensing units should be set on a solid level foundation. When installed at ground level, the unit should be placed on a 6" cement slab. If the pad is formed at the installation site, do not pour the pad tight against the structure, otherwise vibration will be transmitted from the unit through the pad.

Table 7: RCS 06F and 07F Operating Weights

RCS model	Total weight lbs. [kg]	Corner weight lbs. [kg]			
		A	B	C	D
06F	291 [132]	50 [22.7]	73 [33.1]	69 [31.3]	99 [44.9]

Figure 9: Rigging

Installation of Piping

⚠ WARNING

Do not use oxygen to purge lines or pressure system for leak test. Oxygen reacts violently with oil, which can cause an explosion resulting in severe personal injury or death.

NOTE: The condensing unit is shipped with a holding charge of dry nitrogen which must be purged from the unit before evacuation.

Once located, the condensing unit is ready to be interconnected with the evaporator using ONLY refrigeration grade dehydrated tubing.The following should be considered when connecting the tubing.

1. Pitch vapor line toward the compressor approximately 1/2" every 10 feet to facilitate oil return.
2. It is recommended that the sight glass, filter drier and liquid line solenoid valve be installed in the liquid line just prior to the evaporator.
3. Silver solder (such as silfos, Easy Flow, etc.) should be used for all refrigerant joints.
4. Thoroughly clean all joints before fluxing. DO NOT USE ACID FLUX.
5. When fluxing, limit the application of paste to the minimum and always apply flux to the male portion of the connection.
6. Vapor lines should be insulated to prevent condensate drip. Use insulation of at least 3/8" wall thickness. The insulation should be installed on the tubing prior to making the sweat connections.
7. Insulate the liquid line whenever the heat pickup or transfer can affect the subcooling.
8. Care should be taken to avoid transmission of noise or vibration to building structure.

Table 8: Refrigerant Piping Data

Equivalent Length, ft. [m] of Straight Type "L" Tubing for Nonferrous Valves/Fittings (Brazed)						
Tube Size, O.D.	**Solenoid Valve**	**Angle Valve**	**Short Radius Ell**	**Long Radius Ell**	**Tee Line Flow**	**Tee Branch Flow**

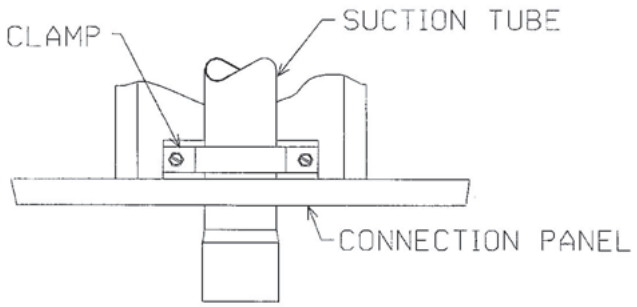
5/8	72 [21.9]	10.4 [3.2]	1.9 [0.6]	1.2 [0.4]	1.2 [0.4]	3.6 [1.1]
3/4	75 [22.9]	12.5 [3.8]	2.1 [0.7]	1.4 [0.4]	1.4 [0.4]	4.2 [1.3]
7/8	78 [23.8]	14.6 [4.4]	2.4 [0.7]	1.6 [0.5]	1.6 [0.5]	4.8 [1.5]
1-1/8	—	18.8 [5.7]	3.0 [0.9]	2.0 [0.6]	2.0 [0.6]	6.0 [1.8]
1-3/8	—	22.9 [7.0]	3.6 [1.1]	2.4 [0.7]	2.4 [0.7]	7.2 [2.2]
1-5/8	—	27.1 [8.3]	4.2 [1.3]	2.8 [0.8]	2.8 [0.8]	8.4 [2.6]
2-1/8	—	35.4 [10.8]	5.3 [1.6]	3.5 [1.1]	10.7 [3.3]	10.7 [3.3]

Typical Piping Recommendations

The following will be of help in accomplishing a successful

1. Size liquid line for no more than 10°F loss which corresponds to approximately 3 psig pressure drop.
2. Size vapor lines for no more than 2°F loss which corresponds to approximately 3 psig pressure drop.
3. Install sight glass, filter drier and solenoid valve in liquid line adjacent to evaporator. Filter drier should be between the condensing unit and sight glass.
4. Pitch all horizontal vapor lines downward in the direction of flow (1/2" to 10 ft. run).
5. When making up refrigerant piping, take every precaution to prevent dirt and moisture from entering the piping.
6. Locate the condensing unit and evaporator(s) as close together as possible to minimize piping runs.
7. Liquid or vapor lifts not to exceed 60 ft.
8. To prevent suction line breakage due to vibration and to prevent tubing noise transmission into the conditioned space, the suction clamp must be installed after tubing is brazed as illustrated in Figure 10.

Figure 10: Suction Clamp



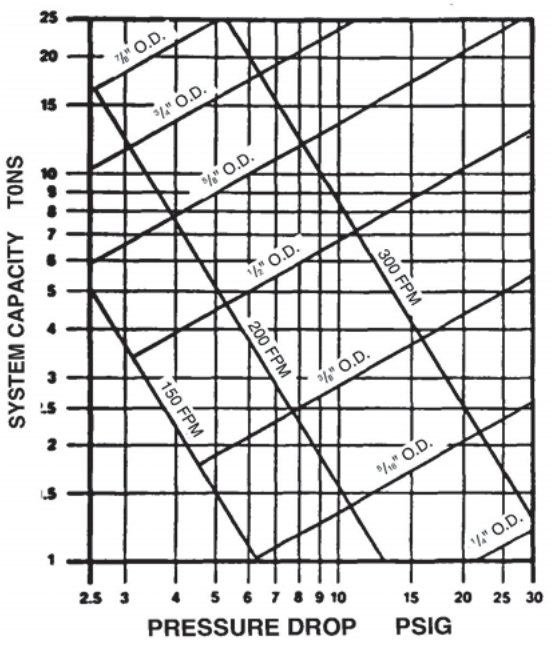


Table 9: Recommended Vapor and Liquid Line Sizes for Various Lengths of Run

Recommended Vapor and Liquid Line Sizes for Various Lengths of Run														
Equivalent Length to Evaporator (ft)	Cooling Model													
	Liquid Line O.D. Sizes (in)							Vapor Line O.D. Sizes (in)						
	6	7	10	11	12	15	20	6	7	10	11	12	15	20
0 to 15	1/2	1/2	5/8	5/8	5/8	5/8	7/8	1-1/8	1-1/8	1-3/8	1-3/8	1-3/8	1-5/8	1-5/8
16 to 50	1/2	1/2	5/8	5/8	5/8	5/8	7/8	1-1/8	1-1/8	1-3/8	1-3/8	1-5/8	1-5/8	1-5/8
51 to 100	1/2	1/2	5/8	5/8	5/8	3/4	7/8	1-1/8	1-3/8	1-3/8	1-3/8	1-5/8	1-5/8	2-1/8
101 to 150	1/2	1/2	5/8	5/8	5/8	3/4	7/8	1-3/8	1-3/8	1-5/8	1-5/8	2-1/8	2-1/8	2-1/8

NOTE: Line length between condenser and evaporator (suction and liquid) not to exceed 150' equivalent length.

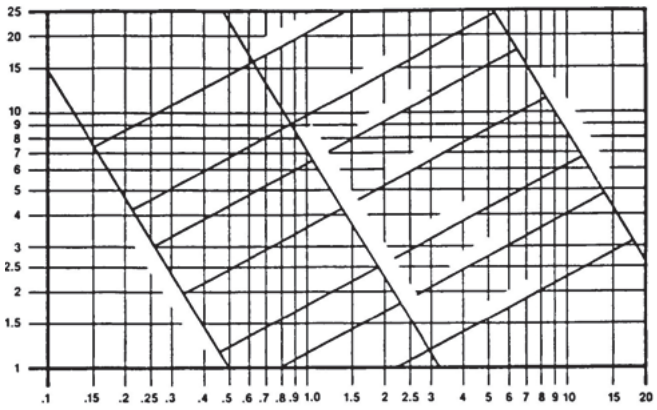

Figure 11: Liquid Line Pressure Drop Per 100 Feet Equivalent Length (Type L Copper Tubing)

Note:

1. When evaporator coil is above condenser, the pressure drop due to vertical lift (0.5 PSIG per foot of lift) must be added to the pressure drop derived from this curve.
2. Size liquid line for no more than 10°F loss (approximately 30 PSIG total pressure drop).
3. Do not oversize liquid line. Oversized liquid lines add significantly to the amount of refrigerant required to charge the system.
4. The maximum recommended velocity with solenoid valves or other quick closing devices in the liquid line is 300 FPM.

Figure 12: Suction Line System Capacity Loss In Percent Per 100 Feet Equivalent Length (Type L Copper Tubing)

Note:

1. The minimum velocity line (700 fpm) is recommended for cooling only units with vertical or horizontal run refrigerant lines.
2. For suction pressure drop (PSIG), multiply percent (%) loss by 1.18.

Figure 13: Typical Drain Piping

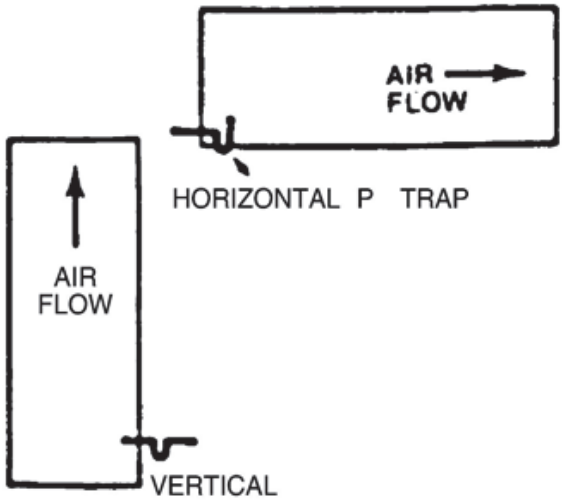

Figure 14: Coil Above Condensing Unit

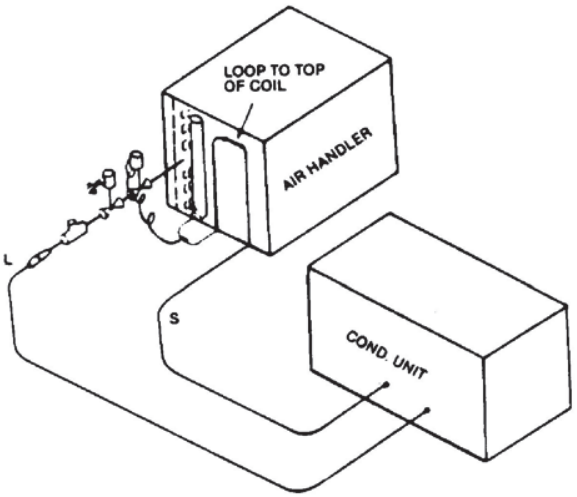

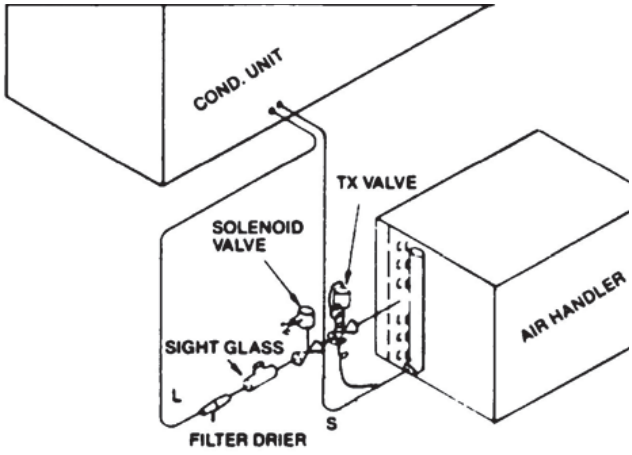

Figure 15: Coil Below Condensing Unit

NOTE: PIPING ACCESSORIES SHOWN SHOULD BE MOUNTED AS CLOSE TO AIR HANDLER AS POSSIBLE.

Electrical Wiring

NOTE: Field wiring must comply with the National Electric Code (CEC in Canada) and any local ordinance that may apply.

Electrical Power

It is important that proper electrical power is available at the unit. Voltage must not vary more than 10% from that stamped on the rating plate. (See Table 6 on page 9 for minimum and maximum voltage.) Interphase voltage variation on three-phase units must not be more than 3%. Contact local power company for correction of improper voltage or phase unbalance.

Important: Models equipped with scroll compressors must be phased correctly for proper compressor rotation. If the compressor is noisy or if suction and discharge pressures do not appear normal, reverse any two power leads to the unit. Extended run time in reverse rotation will damage the compressor and lead to premature failure.

Power Wiring

Power wiring should be run in grounded rain-tight conduit. See Table 6 for wire ampacity and proper wire size.

Wire Routing

POWER WIRING MUST BE RUN IN CONDUIT. Conduit must be run through the connector panel below the service cover and attached to the bottom of the control box.

If low (extra-low in Canada) voltage control wire is run in conduit with power supply, Class I insulation is required. If run separate, Class II is required. Low voltage wiring may be run through the insulated bushing provided in the 7/8" hole in the connector panel, then route to the control box.

⚠ WARNING

After completing wiring, check all electrical connections, including factory wiring within the unit. Make sure all connections are tight. eplace and secure all electrical box covers and access doors before leaving the unit or turning on power to the unit. Failure to do so can cause a fire or electrical shock resulting in property damage, personal injury or death.

Table 10: Field Wire Size for 24 Volt Thermostat

Thermostat Load Amps	Solid Copper Wire –AWG				
3.0	16	12	10	10	10
2.5	16	12	12	10	10
2.0	18	14	12	12	10
Length of Run, ft(1)	50	150	200	250	300

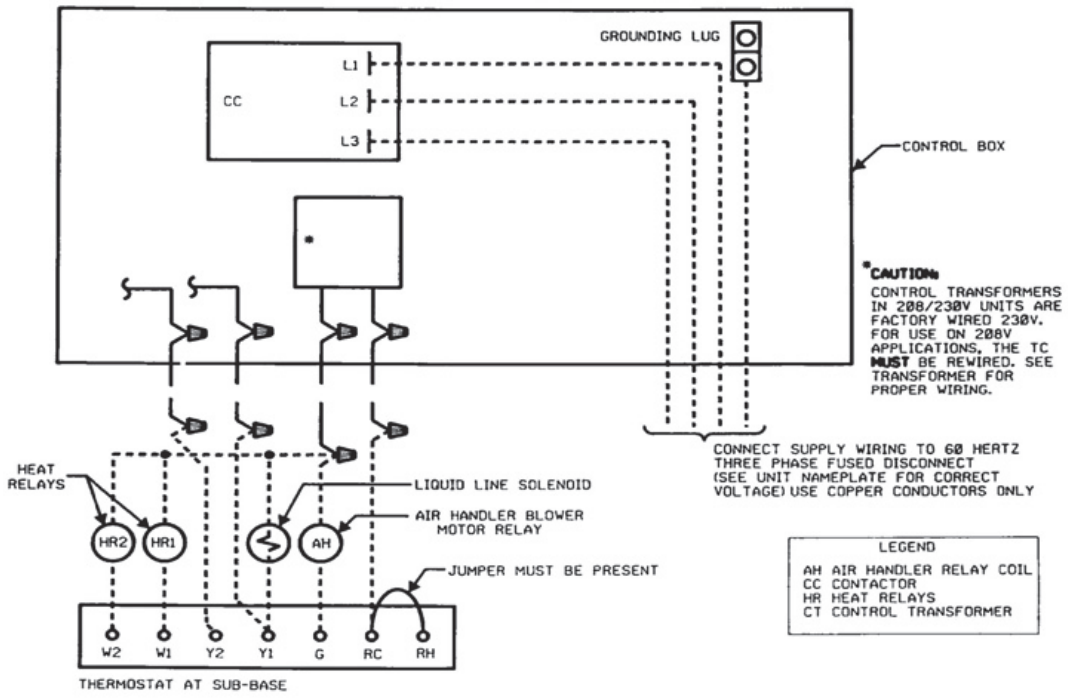
(1) Wire length equals twice the run distance.

Grounding

A grounding lug is provided in control box for a ground wire. Grounding also may be accomplished by grounding the power line conduit to the unit.

⚠ WARNING

This unit must be permanently grounded. A ground lug is provided near the contactor for a ground wire. Failure to do so can cause a fire or electrical shock resulting in property damage, severe personal injury or death.



Thermostat

An appropriate thermostat should be mounted on an inside wall in a location where it will not be affected by the sun or drafts, from open doors or other sources. Install, level, and after installation check the thermostat calibration and recalibrate if necessary. Refer to thermostat manufacturer's information for additional installation, checkout and operation instructions.

Table 11: Copper Wire Size (1% Voltage Drop)

Circuit Ampacity	Copper Wire Gauge (75°C Insulation)

Figure 16: Typical Field Wiring Connections

Refrigerant Charge

Leak Testing

Pressurize line set and coil through service fittings with dry nitrogen to 150 psig maximum. Leak test all joints using liquid detergent. If a leak is found, recover pressure and repair.

⚠ WARNING

Do not use oxygen to purge lines or pressure system for leak test. Oxygen reacts violently with oil, which can cause an explosion resulting in severe personal injury or death.

Tools Required for Installing and Servicing R410A Models

Manifold Sets:

- Up to 800 PSIG High side
- Up to 250 PSIG Low Side
- 550 PSIG Low Side Retard

Manifold Hoses:

- Service Pressure Rating of 800 PSIG

Recovery Cylinders:

- 400 PSIG Pressure Rating
- Dept. of Transportation 4BA400 or BW400

⚠ CAUTION

R410A systems operate at higher pressures than R22 systems. Do not use R22 service equipment or components on R410A equipment

Specification of R410A

Application: R410A is not a drop-in replacement for R22; equipment designs must accommodate its higher pressures. It cannot be retrofitted into R22 condensing units.

Physical Properties: R410A has an atmospheric boiling point of 62.9°F and its saturation pressure at 77°F is 224.5 psig.

Composition: R410A is an azeotropic mixture of 50% by weight difluoromethane (HFC32) and 50% by weight pentafluoroethane (HFC125).

Pressure: The pressure of R410A is approximately 60% (1.6 times) greater than R22. Recovery and recycle equipment, pumps, hoses and the like need to have design pressure ratings appropriate for R410A. Manifold sets need to range up to 800 psig high-side and 250 psig low-side with a 550 psig low-side retard. Hoses need to have a service pressure rating of 800 psig. Recovery cylinders need to have a 400 psig service pressure rating. DOT 4BA400 or BW400.

Combustibility: At pressures above 1 atmosphere, mixture of R410A and air can become combustible. R410A and air should never be mixed in tanks or supply lines, or be allowed to accumulate in storage tanks. Leak checking should never be done with a mixture of R410A and air. Leak checking can be performed safely with nitrogen or a mixture of FR410A and nitrogen.

Quick Reference Guide for R410A

- R410A refrigerant operates at approximately 60% higher pressure (1.6 times) than R22. Ensure that servicing equipment is designed to operate with R410A.
- R410A refrigerant cycles are pink in color.
- R410A, as with other HFC's is only compatible with POE oils.
- Vacuum pumps will not remove moisture from oil.
- R410A systems are to be charged with liquid refrigerants. Prior to March 1999, R410A refrigerant cylinders had a dip tube. These cylinders should be kept upright for equipment charging. Post March 1999 cylinders do not have a dip tube and should be inverted to ensure liquid charging of the equipment.
- Do not install a suction line filter drier in the liquid line.
- A liquid line filter drier is standard on every unit. Only manufacturer approved liquid line filter driers can be used. These filter driers are rated for minimum working pressure of 600 psig.
- Desiccant (drying agent) must be compatible for POE oils and R410A.

Replacement Units

To prevent failure of a new condensing unit, the existing evaporator tubing system must be correctly sized and cleaned or replaced. Care must be exercised that the expansion device is not plugged. For new and replacement units, a liquid line filter drier should be installed and refrigerant tubing should be properly sized. Test the oil for acid. If positive, a suction line filter drier is mandatory.

Important: When replacing an R22 unit with an R410A unit, either replace the line set or ensure that the existing line set is thoroughly cleaned of any old oil or debris.

Evaporator Coil

Refer to evaporator coil manufacturer's installation instructions.

Important: The manufacturer is not responsible for the performance and operation of a mismatched system, or for a match listed with another manufacturer's coil.

⚠ CAUTION

Only use evaporators approved for use on R410A systems. Use of existing R22 evaporators can introduce mineral oil to the R410A refrigerant forming two different liquids and decreasing oil return to the compressor. This can result in compressor failure.

Evacuation and Charging

The evacuation of any system component that has been exposed to atmosphere or lost its charge is essential before charging. Never attempt to operate a system while it is under a vacuum.

NOTE: The condensing unit is shipped with a holding charge of dry nitrogen which must be purged from the unit before evacuation.

1. Since the condensing unit itself must be evacuated, open the vapor, discharge and liquid shut-off valves.
2. Use a refrigeration type vacuum pump capable of evacuation in the 500 micron range.
3. Connect the vacuum pump to the service manifold assembly with a pressure gauge that will read 30 inches vacuum. Connect the service manifold to the vapor line service port. ("Low" shown on label.)
4. With an accurate scale, 1/2 oz., set refrigerant tank up so its weight can be measured while in a position to charge liquid. (Unit must be OFF.) Energize liquid line solenoid valve by wiring valve to 24V power supply (or open by manual stem if applicable).
5. Connect to the liquid line service port. ("High" shown on label.) Shut off tank and evacuate the system. The pressure gauge should read at least 29.5" of vacuum.
6. Triple evacuate the system.
7. The refrigerant system will now be free of noncondensables.
8. Remove vacuum pump from 3-way valve.
9. Install refrigerant tank (liquid charging) to liquid line service valve.
10. Before tightening, purge tank and service valve hose.
11. Note weight of refrigerant tank.
12. De-energize liquid line solenoid valve. Open refrigerant tank valve. Allow pressure in tank and unit to equalize.
13. Close off service valve to liquid line service port and note weight of refrigerant tank.
14. Position tank for gas charging.
15. Rewire liquid line solenoid to thermostat control. Close main disconnect switch and turn thermostat to lowest setting.
16. Charge unit per Table 12 and Table 13.

17. Adjust refrigerant charge to obtain pressures indicated in the temperature/pressure Charging Charts starting on page 21.
18. Note weight of refrigerant tank.
19. When system has stabilized, check superheat at the suction line service valve. The actual line temperature should be 8° to 20°F higher than the saturation temperature corresponding to the vapor pressure. If superheat is measured at evaporator, the actual line temperature should be 6° to 10° higher than the saturation temperature corresponding to the vapor pressure.
20. Close service ports on vapor and liquid valves. Remove service gauges.
21. Replace service port caps and valve stem caps. These caps must be replaced to prevent leaks.
22. Record total charge quantity on rating plate.

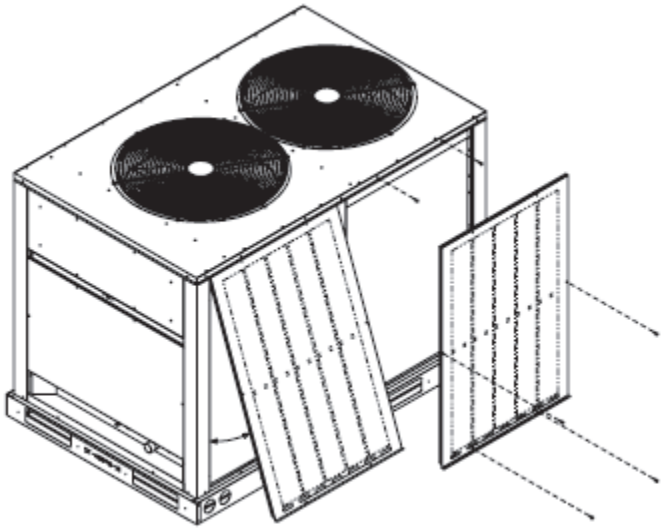
Final Leak Testing

After the unit has been properly evacuated and charged, a halogen leak detector should be used to detect leaks in the system. All piping within the condensing unit, evaporator, and interconnecting tubing should be checked for leaks. If a leak is detected, the refrigerant should be recovered before repairing a the leak. The Clean Air Act prohibits releasing refrigerant into the atmosphere.

Table 14: Charging Hints

Symptom	Possible Cause	Remedy
High head pressure	Air flow to/from condenser restricted or dirty condenser	Remove obstruction, relocate condensing unit, if necessary clean condenser
	Faulty condenser fan or motor	Replace
	Overcharge of refrigerant	Reduce charge
	Air in system	Evacuate and recharge
Low head pressure	Short of refrigerant	Check for leak, add charge
	Low evaporator air flow	Increase blower speed, check filters
Low vapor & hot compressor	Short of refrigerant	Check for leak—add refrigerant
Excessive sweating	Low indoor airflow	Increase speed of air handler blower or reduce restriction, replace air filter
	Excess refrigerant	Slowly reduce charge

Table 15: Pre-Start Check



1	Is the condensing unit properly located and level?	☐ Yes	☐ No
2	Is there free air movement to and from the condensing unit?	☐ Yes	☐ No
3	Is the wiring connected according to the unit wiring diagram?	☐ Yes	☐ No
4	Are the wiring connections tight (including those in the unit and compressor electrical box)?	☐ Yes	☐ No
5	Is the unit properly grounded?	☐ Yes	☐ No
6	Is the circulating air blower correctly wired?	☐ Yes	☐ No
7	Is the condensing unit properly fused?	☐ Yes	☐ No
8	Is the thermostat level, correctly wired and in a good location?	☐ Yes	☐ No
9	Is the ductwork correctly sized, run, taped and insulated?	☐ Yes	☐ No
10	Is the refrigerant tubing neatly run and the vapor line thoroughly insulated?	☐ Yes	☐ No
11	Is the condensate drain properly sized, run, trapped and pitched?	☐ Yes	☐ No
12	Are the refrigerant connections tight and leak tested?	☐ Yes	☐ No
13	Are the filters clean and in place?	☐ Yes	☐ No
14	Does the condenser fan turn freely without rubbing?	☐ Yes	☐ No
15	Is the fan blade tight on the fan shaft?	☐ Yes	☐ No
16	Areall covers and access panels in place to prevent air loss?	☐ Yes	☐ No

Accessory Installation

Louvered Panels

1. Remove two screws from top panel where louver will install.
2. Slide top of louver panel under lip of the top panel and slide into place.
3. Attach with four screws provided.

Figure 17: Louver Removal

Optional Service Valve

1. Remove clamp securing suction line ext. tube (if applicable).
2. Remove connector panel “A”.
3. Remove suction line ext. tube by sweating at reducer/ suction line “B” (reducer required on some models and remains on suction line). Remove excess braze material from surface.
4. Slide service valve “C” onto reducer/suction line “B” (DO NOT braze at this time).
5. Install connector panel “A”.
6. Install bracket “D”.
7. Braze valve.

⚠ IMPORTANT

Refrigerant Piping: A qualified Architect or Systems HVAC Design Engineer familiar with refrigerant piping design, as well as local codes and regulations, must provide refrigerant piping design. The following manufacturer recommendations serve as a general guide and should not replace a qualified professional's refrigerant piping system design.

⚠ IMPORTANT

Chilled Water Piping: A qualified Architect or Systems HVAC Design Engineer familiar with piping design, local codes and regulations, must provide piping design. The following manufacturer recommendations serve as a general guide and should not replace a qualified professional's piping system design.

- All access panels must be in place when unit is in operation.
- For maximum efficiency, the condenser coil must be kept clean. Periodic inspections, depending on local conditions are recommended. If it is necessary to clean the condenser coil, use a common garden hose.
- Never operate the unit without filters installed in the air handler.

Crankcase Heaters

All units are equipped with crankcase heaters that are factory wired to operate whenever the main power supply to the unit is "ON" and compressors are "OFF". Before starting the equipment after prolonged shutdown or at the time of initial start-up, be sure that the circuits to the condensing units are closed for at least 24 hours.

Contactor

The contactor is an electrical switch which operates the compressor and condenser fans. Relay activates contactor when safety circuit is made.

High Pressure Switch (HPC)

Opens the contactor circuit on high refrigerant pressure - Manual Reset - check for cause of tripping before putting unit back in service.

⚠ WARNING

Do not wire around the high pressure switch. 15 ton unit compressors are not provided with internal pressure relief means. Failure to follow this warning can cause an explosion resulting in personal injury or death.

Low Pressure Switch (LPC)

Acts as safety against loss of refrigerant.

Relay (R)

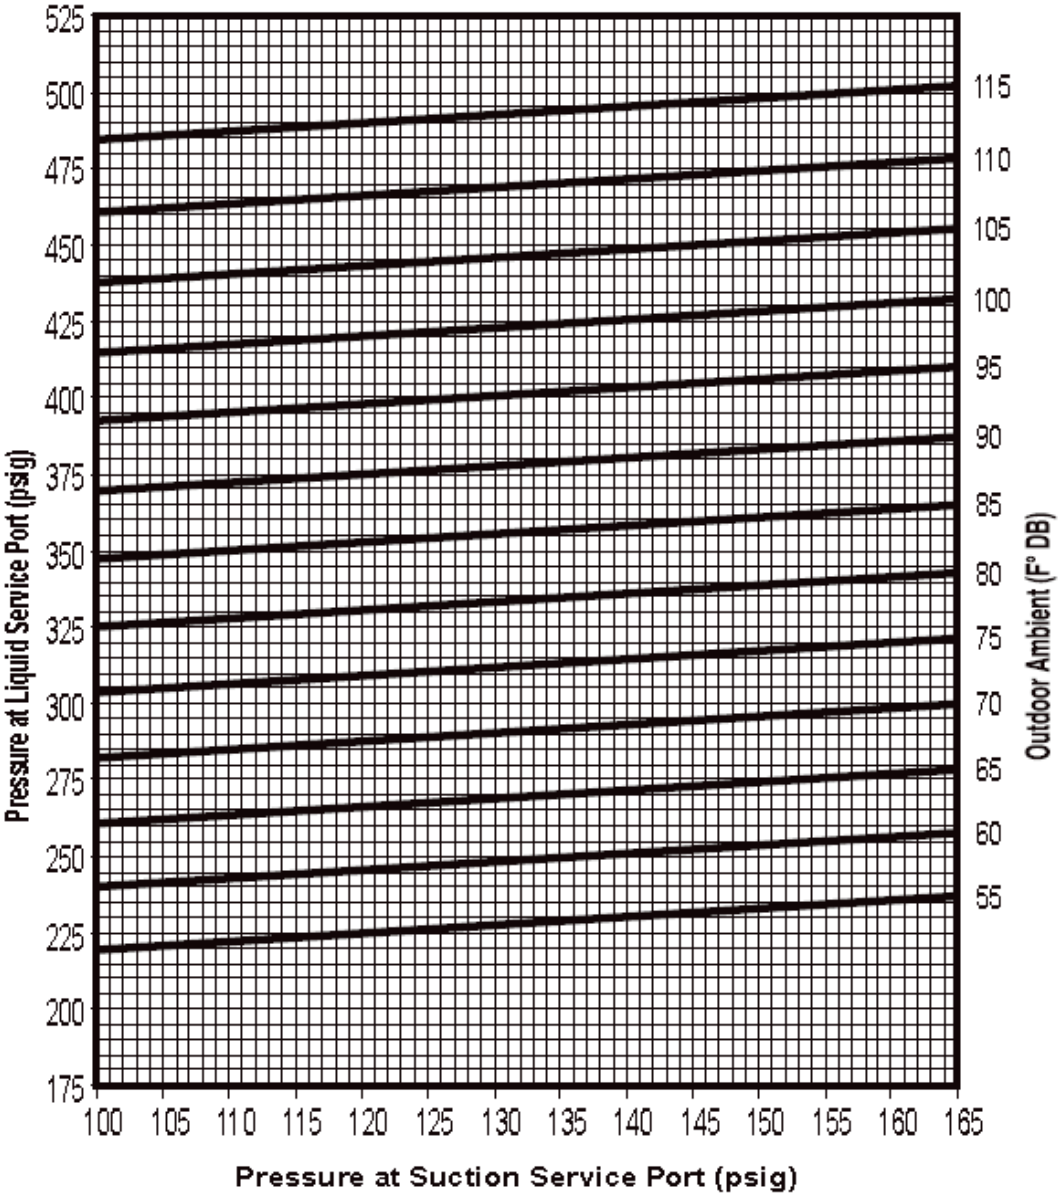
Energizes the compressor contactor when safety circuit is made.

Replacement Parts

To find your local Daikin McQuay Certified Parts Distributor, go to www.DaikinMcQuay.com and select Parts Locator.

Charge Information

Refer to the appropriate Charging Charts starting on page 21.



Wiring Diagrams

Refer to the appropriate Wiring Diagrams starting on page 27.

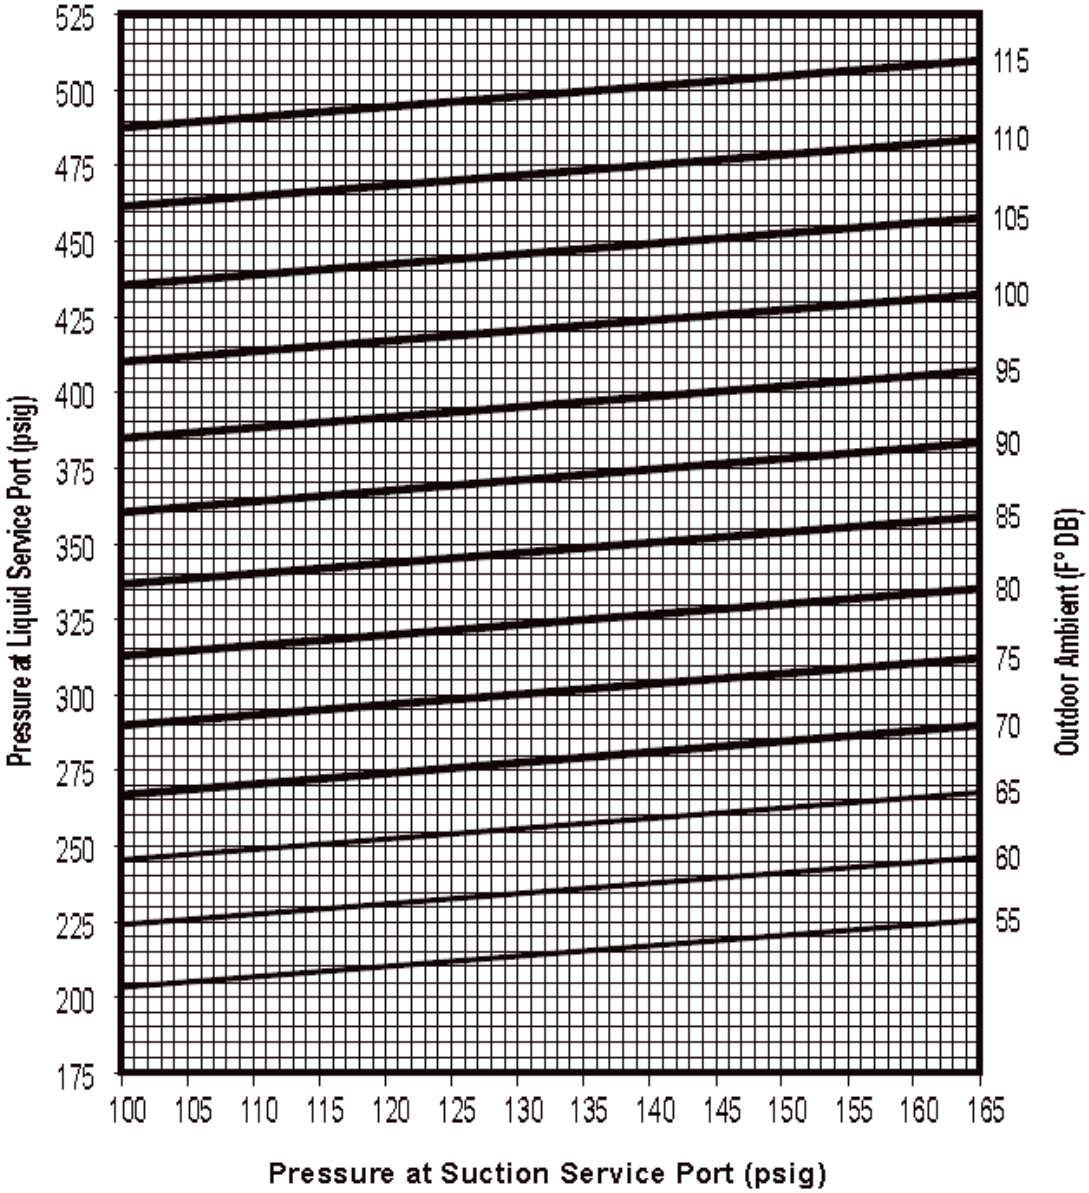
Troubleshooting

Refer to the troubleshooting chart Table 15 on page 18.

Figure 18: 6-1/2 Ton Charging Charts

REQUIRED OUNCES R-410A CHARGE PER FOOT OF TUBING		
TUBE SIZE O.D. IN.	LIQUID LINE	VAPOR LINE
1/2	1.06	
5/8	1.65	
1-1/8		.22
1-3/8		.34

REFRIGERANT REQUIRED: 178 OZ. WITH 0 FT. OF SUCTION AND LIQUID LINE.



CAUTION: BEFORE FINAL REFRIGERANT CHECK, INDOOR AIR TEMPERATURE SHOULD BE AT COMFORT CONDITIONS FOR MOST ACCURATE RESULTS.

INSTRUCTIONS:

1. CONNECT PRESSURE GUAGES TO SUCTION AND LIQUID PORTS ON UNIT.
2. MEASURE AIR TEMPERATURE TO OUTDOOR COIL.
3. PLACE AN "X" ON THE APPROPRIATE CHART WHERE THE SUCTION AND LIQUID PRESSURES CROSS.
4. IF "X" IS BELOW AMBIENT TEMPERATURE LINE, ADD CHARGE AND REPEAT STEP 3.
5. IF "X" IS ABOVE AMBIENT TEMPERATURE LINE, RECOVER EXCESS CHARGE AND REPEAT STEP 3.
6. IF CONDENSER FANS ARE NOT RUNNING, THE HEAD PRESSURE CONTROL MAY REQUIRE JUMPERING.

Charging Charts

Figure 19: 7-1/2 Ton Charging Chart

REQUIRED OUNCES R-410A CHARGE PER FOOT OF TUBING

Replacement Parts

When contacting Daikin McQuay for service or replacement parts, provide the model number, serial number, and unit part number of the unit as stamped on the serial plate attached to the unit. For questions regarding wiring diagrams, provide the number on the specific diagram. If replacement parts are required, include the date of unit installation, the date of failure, an explanation of the malfunction, and a description of the replacement parts required.

Scroll Compressor

All Daikin McQuay Rooftop products include a first-year parts only warranty. The warranty period extends 12 months from startup or 18 months from date of shipment, whichever comes first. Labor to install these parts is not included with this warranty. Compressors are considered a part and are included in this standard warranty.

All Compressors

Replacement compressors for Daikin McQuay Rooftop Units can be obtained from the Daikin McQuay Service Parts department.

1. Contact the Daikin McQuay Parts Department for compressor availability.
2. Send a completed parts order form to the Daikin McQuay Parts Department.
3. The Parts Department processes the order and the compressors are shipped from our Dayton, OH warehouse via ground transportation. If next-day air is required, indicate this on the parts order form and a freight charge will be billed to your account. Air freight costs are not covered under the Daikin McQuay warranty.
4. After the failed compressor is replaced, return it to Daikin McQuay with a Return Goods Tag attached, which you will receive in the mail. It must be attached to the compressor. The Return Goods Tag has instructions on where to send the compressor. If the compressor is not returned, you will be billed for the replacement compressor.
5. Consideration may be given at this time to a compressor teardown analysis, depending on the history of failures.

In-Warranty Return Material Procedure

Material other than compressors may not be returned except by permission of authorized factory service personnel of Daikin McQuay at Minneapolis, Minnesota.

A “return goods” tag will be sent to be included with the returned material. Enter the information as called for on the tag in order to expedite handling at out factories and issuance of credits. All parts shall be returned to the factory designated on the return goods tag, transportation charges prepaid.

The return of the part does not constitute an order for replacement. A purchase order for the replacement part must be entered through your nearest Daikin McQuay representative. The order should include the component’s part number and description and the model and serial numbers of the unit involved.

If it is determined that the failure of the returned part is due to faulty material or workmanship within the standard warranty period, credit will be issued on the customer’s purchase order.

Warranty Registration Form

DAIKIN McQUAY®

To comply with the terms of Daikin McQuay Warranty, complete and return this Equipment Warranty Registration Form within 10 days to Daikin McQuay, Warranty Department.

2. How would you rate the overall appearance of the product; i.e., paint, fin damage, etc.?

   Excellent Good Fair Poor

3. Did all sections of the unit fit together properly? . . . . . Yes No N/A
4. Did the cabinet have any air leakage? . . . . . Yes No N/A

   Location on unit _____

5. Were there any refrigerant leaks? . . . . . Yes No N/A

   From where did it occur? . . . . . Shipping Workmanship Design

6. Does the refrigerant piping have excessive vibration? . . . . . Yes No N/A

   Location on unit _____

7. Did all of the electrical controls function at start-up? . . . . . Yes No N/A

   Comments _____

8. Did the labeling and schematics provide adequate information? . . . . . Yes No N/A
9. How would you rate the serviceability of the product?

   Excellent Good Fair Poor

10. How would you rate the overall quality of the product?

    Excellent Good Fair Poor

11. How does the quality of McQuay products rank in relation to competitive products?

    Excellent Good Fair Poor

    Comments _____

Please list any additional comments which could affect the operation of this unit; i.e., shipping damage, failed components, adverse installation applications, etc. If additional comment space is needed, write the comment(s) on a separate sheet, attach the sheet to this completed Quality Assurance Survey Report, and return it to the Warranty Department with the completed preceding “Equipment Warranty Registration Form”.

Daikin McQuay Training and Development

Now that you have made an investment in modern, efficient Daikin McQuay equipment, its care should be a high priority. For training information on all Daikin McQuay HVAC products, please visit us at www.DaikinMcQuay.com and click on training, or call 540-248-9646 and ask for the Training Department.

Warranty

All Daikin McQuay equipment is sold pursuant to its standard terms and conditions of sale, including Limited Product Warranty. Consult your local Daikin McQuay Representative for warranty details. Refer to Form 933-430285Y. To find your local Daikin McQuay Representative, go to www.DaikinMcQuay.com.

Aftermarket Services

To find your local parts office, visit www.DaikinMcQuay.com or call 800-37PARTS (800-377-2787). To find your local service office, visit www.DaikinMcQuay.com or call 800-432-1342.

This document contains the most current product information as of this printing. For the most up-to-date product information, please go to www.DaikinMcQuay.com.

Products manufactured in an ISO Certified Facility.

General Information

These are general guidelines for the installation, operation and maintenance of McQuay water heating and high capacity booster coils. They may have to be tailored to meet the specific requirements of any one job. An experienced installation company or fully trained personnel should perform the installation and maintenance of any coil.

Hazard Identification Information

⚠ DANGER

Dangers indicate a hazardous situation which will result in death or serious injury if not avoided.

⚠ WARNING

Warnings indicate potentially hazardous situations, which can result in property damage, severe personal injury, or death if not avoided.

⚠ CAUTION

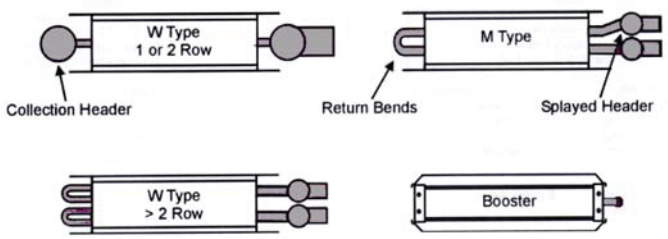
Cautions indicate potentially hazardous situations, which can result in personal injury or equipment damage if not avoided.

Receiving Instructions

1. All McQuay fluid coils are factory tested at 315 psig minimum air pressure while submersed in water, inspected, and carefully packaged.
2. Damage to the coils can occur after they have left the factory. Therefore, the coils should be inspected for shipping damage upon receipt. The freight bill should also be checked against items received for complete delivery.
3. Damaged and/or missing items should be noted on the carrier's freight bill and signed by the driver.
4. For additional assistance, contact your local McQuay sales representative.

Coil Types

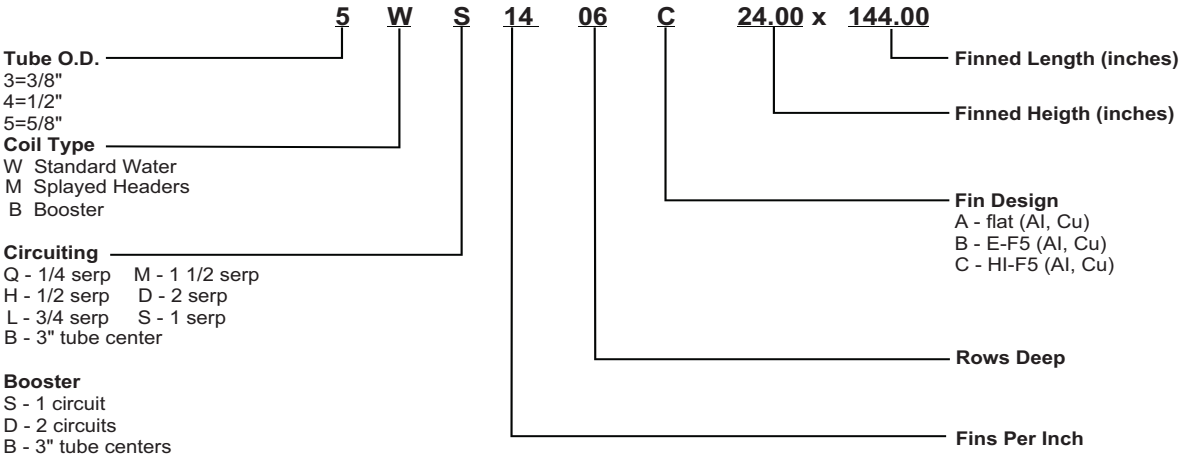
Standard Fluid Coils



McQuay fluid coils are specifically designed for your particular application. Flexibility is built into our manufacturing processes, offering variations in fin type, fin density, circuitry arrangement, coil casing, and materials of construction.

Standard fluid type "W" coils utilize a collection header for one and two row applications and return bends for applications that require three or more rows.

Type "M" coils are used for one and two row applications that require same end connections. For type "M" coils, the supply and return headers are offset or "splayed." This orientation allows for the supply and return headers to be placed side by side.

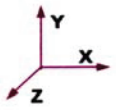


Booster coils, type "B," are also available for one and two row applications.

Figure 1: Coil Types

Introduction

Nomenclature



Mounting

All McQuay water and glycol coils are designed to be fully drainable when properly mounted. Vertical air-flow is not recommended for dehumidifying coils.

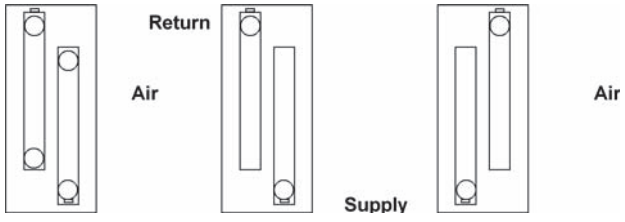
Figure 2: Coil Mounts

	Horizontal Air Flow Horizontal Tubes	Level with the y-axis and x-axis.
	Vertical Air Flow[2] Horizontal Tubes	Level with the z-axis and x-axis.
	Horizontal Air Flow Vertical Tubes	Level with the y-axis and x-axis.

Installation

⚠ CAUTION

Sharp edges on sheet metal and fasteners can cause personal injury. This equipment must be installed, operated, and serviced only by an experienced installation company and fully trained personnel.
Protective equipment such as safety glasses, steel toe boots and gloves are recommended during the installation and routine maintenance of the coil.



⚠ CAUTION

Failure to properly install the coil can result in irreparable damage to the coil as well as other components in the system.

If you are unsure about any portion of the installation, contact your local steam specialist for assistance.

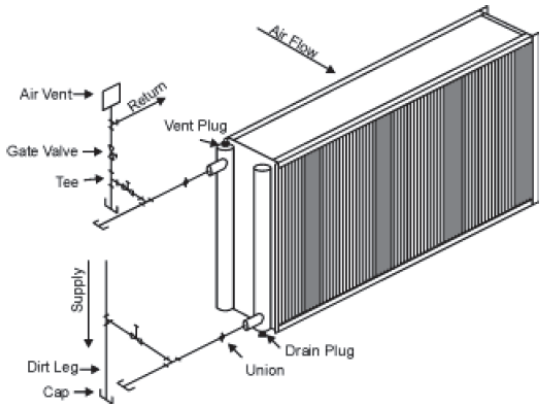
1. Carefully remove the coil from the shipping package to avoid damage to the finned surface area. Damaged fins can be straightened using an appropriate fin comb.
2. McQuay recommends cleaning the coil with a commercially available coil cleaner prior to installation. Refer to "Maintenance" on page 5 for cleaning recommendations.
3. Check the coil hand designation to insure that it matches the system. Water and glycol coils are generally plumbed with the supply connection located on the bottom of the leaving air-side of the coil and the return connection at the top of the entering air-side of the coil. This arrangement (Figure 2) provides counter flow heat exchange and positive coil drainage. If a universal coil is supplied, cap off the two unused connections.

Figure 3: Supply and Return Locations

4. Standard coils must be mounted level to insure proper drainage. Refer to "Mounting" on page 4 for leveling requirements.
5. Proper clearance should be maintained between the coil and other structures such as the fan, filter racks, transition areas, etc.
6. Once installed, the coil should be pressurized to 100 psig with dry nitrogen or other suitable gas. The coil should be left pressurized for a minimum of 10 minutes. If the coil holds the pressure, the hook-up can be considered leak free. If the pressure drops by 5 psig or less, re-pressurize the coil and wait another 10 minutes. If the pressure drops again, there is more than likely one or more small leaks which should be located and repaired. Pressure losses greater than 5 psig would indicate a larger leak that should be isolated and repaired. If the coil itself is found to be leaking, contact your local McQuay sales representative.

   Note: Unauthorized repair to the coil may void the coil's warranty (see McQuay's warranty policy on back cover).
7. All field brazing and welding should be performed using high quality materials and an inert gas purge (like nitrogen) to reduce oxidation of the internal surface of the coil.
8. All field piping must be self-supporting. System piping should be flexible enough to allow for thermal expansion and contraction of the coil. Typical piping diagrams are represented in Figure 4 and Figure 5.

Figure 4: Horizontal Air Flow



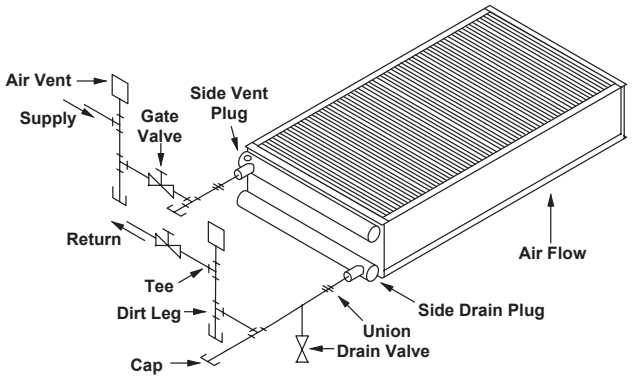


Figure 5: Vertical Air Flow

Operation

Initial Start-Up

1. Open all air vents to eliminate air in the coil circuitry and headers.
2. Verify that all vents and drains are unobstructed and can discharge a stream of water.
3. Fill the coil with water an then close all vents.
4. Perform an initial hydrostatic leak test of all brazed, threaded or flanged joints, valves, and interconnecting piping. Recheck the coil level and correct if necessary. When the setup is found to be leak free, discharge and discard initial water charge. It is important that all grease, oil, flux and sealing compounds found present during installation be removed.

General

1. Proper air distribution is vital to coil performance. Airflow anywhere on the coil face should not vary by more than 20%.
2. The drain pan and associated piping (drain line and trap) should be installed so that there is no standing water in the drain pan and that no blow-through occurs.
3. Working pressure rating is 250 psig @ 300°F (standard)
4. Fluid and air velocities should be maintained within McQuay's recommended values and for ARI certification.

Table 1: Fluid Velocities

Fluid Velocity	
Water	1 to 8 fps
Glycol	1 to 6 fps

Maintenance

⚠ DANGER

Follow the manufacturer's guidelines for lockout/tagout and disconnect all power to the unit before performing maintenance. Contact with high voltage power will cause electrical shock, resulting in severe personal injury or death.

⚠ WARNING

Moving parts, high pressure, and/or high temperature fluids can cause serious personal injury.

General

1. Filters should be inspected on a regular basis and changed as needed. Maintaining clean filters is a cost effective way to help maintain maximum coil performance and service life.
2. Periodic inspection of the coil for signs of corrosion and/or leaks is recommended. Repair and replacement of the coil and the connecting piping, valves, etc., should be performed as needed by a qualified individual.
3. Should the coil surface need cleaning, caution should be exercised in selecting the cleaning solution as well as the cleaning equipment. Improper selection can result in damage to the coil and/or health hazards.
4. Suggested cleaning instructions:
   - **a** When handling strong chemicals, be sure to wear chemical impervious gloves, apron and splash goggles.
   - **b** Acti-Brite (AB-1) is the recommended cleaning solution. For more information, contact your local McQuay Parts Distributor.
   - **c** Determine required dilution for the specific application. It is recommended to start with a dilution ratio of 10:1 and increase concentration until the desired results are achieved.
   - **d** As with mixing all acids, place the desired amount of water into the tank and then add the chemicals.
   - **e** Turn off fans and allow hot coils to cool before applying.
   - **f** Using plain water, wet both the coil as well as the area surrounding the equipment. Wetting the coil with water aids in product penetration and performance.

⚠ CAUTION

Carefully read and follow the manufacturer's recommendations before using any cleaning fluid.

   - **g** Apply properly diluted product to coil surface. Whenever possible, apply solution from the outlet side of the coil. Allow solution to remain on surface, normally 5-10 minutes. Do not allow solution to dry on the coil.

   Note: In extreme cases, application may have to be repeated to achieve desired results.

   - **h** If foaming does not occur, check for extreme grease buildup which will slow the cleaning process. Foaming may not occur if coil is coated or painted.
   - **i** Rinse coils, tools, and surrounding area thoroughly after the coil cleaning.
5. Clean the coil from the leaving airside so that foreign material will be washed out of the coil rather than pushed further in.
6. Maintain the circulated fluid free of sediment, corrosive products, and biological contaminants. Periodic testing of the fluid followed by any necessary corrective measures, along with maintaining adequate fluid velocities and proper filtering of the fluid, will help to satisfy this goal.
7. If automatic air vents are not utilized, periodic venting of the coil is recommended to remove accumulated air.

Blowing-Out Coils

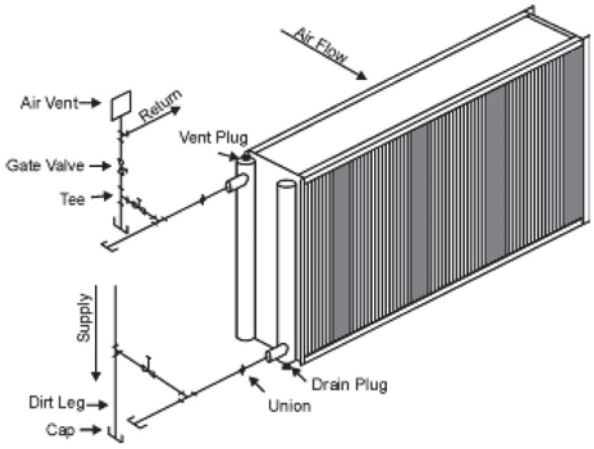
1. Isolate the coil from the rest of the system by closing the valves on both the supply and return lines (see gate valves in Figure 5 and Figure 6).
2. Drain the coil by opening all drain valves and/or the drain plug. Remove the vent plug to aid the draining process.
3. Once the coil has been fully drained, the blower compressed air can be hooked-up. Caps installed in the piping on straight runs going to the supply and return connections are ideal points to hook-up the blower. The air vent and drain plug are not suitable locations for hooking up the blower.

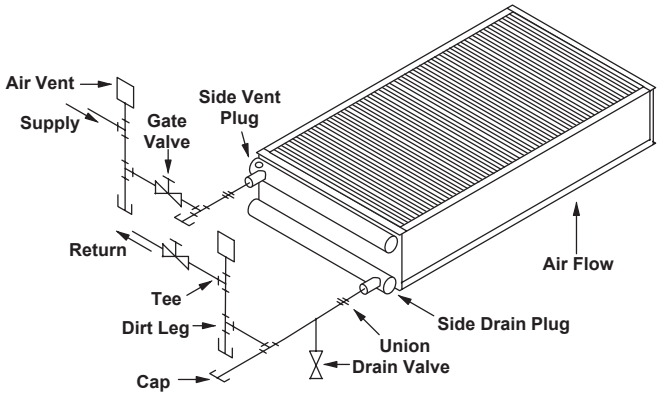
⚠ DANGER

The blower operator must take precautions to insure that water does not come into contact with any of the electrical components of the blower. Failure to do so will result in damage to the equipment and serious injury.

4. Close the vent or drain plug on the header that the blower is connected and open the drain valve or cap on the other header.
5. Operate the blower for 45 minutes and then check the coil to see if it is dry. A mirror placed in the discharge will become fogged if moisture is present. Repeat this procedure until the coil is dry.
6. Let the coil stand for several minutes then blow it out again. If water comes out, repeat the blowout operation.
7. Leave all plugs out and drains open until the threat of freezing has passed.

Figure 6: Horizontal Air Flow





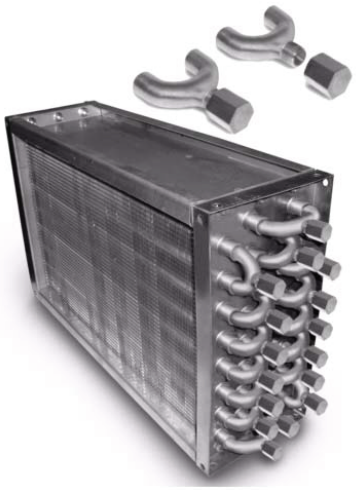


Figure 7: Vertical Air Flow

Freeze Protection Fittings

During the winter, chilled water coils need to be protected against freezing. Factory installed and tested freeze protection fittings are brazed onto water and steam coil headers, return bends and tube stubs (as necessary) as part of the factory assembly process. Freeze relief caps are then screwed onto each fitting. All coils are leak tested at 315 psi air pressure before shipping. The relief caps are designed to burst at 650 psig, relieving pressure before coil damage occurs. When freeze damage occurs, simply unscrew the ruptured relief caps and screw in replacement caps.

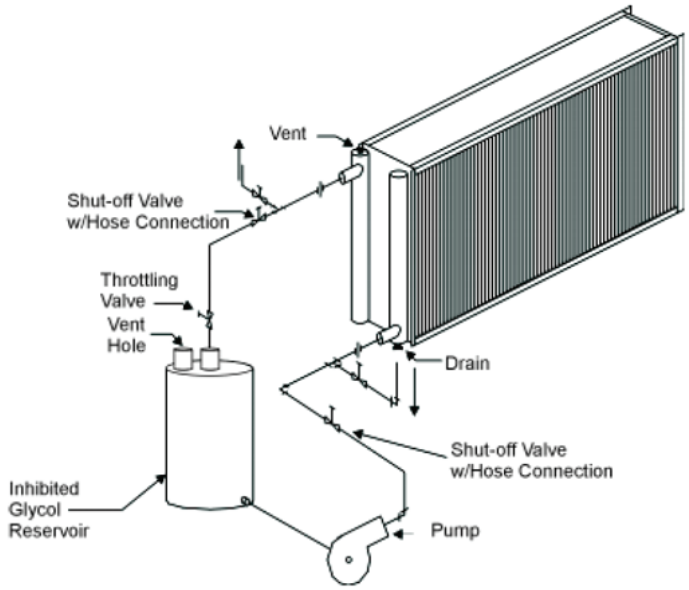

Figure 8: Freeze Protection Fittings

Flushing Coils

1. McQuay recommends the use of inhibited glycol designed for HVAC applications for corrosion protection. The use of uninhibited glycol has produced formicary corrosion in copper tubing. The complete filling of water coils with an inhibited glycol solution for freeze protection can be expensive. In some instances, it is more cost effective to flush the coils with an appropriate concentration of inhibited glycol solution. Residual fluid can be left in the coil without the threat of freeze damage provided the correct concentration of inhibited glycol was used. The recovered fluid can then be used to flush other coils. Select an inhibited glycol solution that will protect the coil from the lowest possible temperatures that can occur at the particular coil's locality.
2. Estimate the volume of the coil in gallons. For 5/8" tubes (1.5" face tube spacing) (finned height in inches) x (finned length in inches) x (# of rows) x 0.0011 = gallons.
3. Isolate the coil from the rest of the system by closing the valves on both the supply and return lines (gate valves in Figure 5 and Figure 6).
4. Drain the coil by opening all drain valves and/or the drain plug. Remove the vent plug to aid the draining process.

Figure 9: Flushing System

5. Close the drain valve(s) and drain plug.
6. Connect the flushing system to the coil. A typical system is shown in Figure 9.
7. With the throttling valve closed, start the pump and operate until the air is vented from the coil. After venting, close the air vent.
8. Open the throttling valve about halfway and circulate the fluid through the coil for 15 minutes. Check the strength of the fluid. A hydrometer or test kit from the fluid manufacturer is suitable for this application.
9. Adjust the solution strength as needed and circulate the fluid for another 15 minutes.
10. Repeat steps 8 and 9 until the desired concentration is reached.
11. Shut the pump down and drain the inhibited glycol from the coil.
12. The recaptured fluid can be used to flush other coils.

Note: Follow the manufactures' recommendations before utilizing any glycol based antifreeze solution. Additional fluid will be required for the pump, connected piping, and fluid reservoir. Formulae are for estimation purposes only.

McQuay Training and Development

Now that you have made an investment in modern, efficient McQuay equipment, its care should be a high priority. For training information on all McQuay HVAC products, please visit us at www.mcquay.com and click on training, or call 540-248-9646 and ask for the Training Department.

Warranty

All McQuay equipment is sold pursuant to its standard terms and conditions of sale, including Limited Product Warranty. Consult your local McQuay Representative for warranty details. Refer to Form 933-43285Y. To find your local McQuay Representative, go to www.mcquay.com.

This document contains the most current product information as of this printing. For the most up-to-date product information, please go to www.mcquay.com.

Daikin Thinline Horizontal Fan Coils are intended for use in single zone applications. They are available in sizes from 200 to 1200 cfm. Figure 2 describes the main features of these units and can be referred to for component placement. These units are available in two-pipe configurations with one hydronic coil, with or without electric heat.

They are also available in four-pipe configurations with a primary coil and a secondary reheat or preheat coil. A variety of factory-built piping packages are available, either factory or field-installed. Units are available with a variety of thermostat and fan speed control options, including the MicroTech® III controller board.

Figure 1: Nomenclature (see Table 3 page 49 through page 53 for complete model number description)

FC H C – 2 02 A

Unit Type
FC = Fan Coil
FH = Cabinet Unit Heater

Unit Configuration
H= Horizontal

Cabinet Type
C = Cabinet
R = Recessed
H = Hideaway

Voltage
A = 115/60/1
E = 208-230/60/1
J = 277-265/60/1

Unit Size
02 = 200 CFM
03 = 300 CFM
04 = 400 CFM
06 = 600 CFM
08 = 800 CFM
10 = 1000 CFM
12 = 1200 CFM

Design Series

Figure 2: Model FCHH with Return Plenum

Safety

Follow all safety codes. Wear safety glasses and work gloves. Use a quenching cloth for brazing operations. Have a fire extinguisher available. Follow all warnings and cautions in these instructions and attached to the unit. Consult applicable local building codes and National Electrical Codes (NEC) for special requirements.

Recognize safety information. When you see a safety symbol on the unit or in these instructions, be alert to the potential for personal injury. Understand the meanings of the words DANGER, WARNING, and CAUTION.

- **DANGER** identifies the most serious hazards that will result in death or severe personal injury;
- **WARNING** means the hazards can result in death or severe personal injury;
- **CAUTION** identifies unsafe practices that can result in personal injury or product and property damage.

Improper installation, adjustment, service, maintenance, or use can cause explosion, fire, electrical shock, or other conditions which may result in personal injury or property damage.

This product must be installed only by personnel with the training, experience, skills, and applicable licensing that makes him/her “a qualified professional HVACR installer.”

Operating Limits

This equipment is designed for indoor installation only. Sheltered locations such as attics, garages, etc., generally will not provide sufficient protection against extremes in temperature and/or humidity, and equipment performance, reliability, and service life may be adversely affected.

⚠ DANGER

Disconnect all electrical power before servicing unit. Electrical shock will cause severe injury or death.

⚠ WARNING

Hazardous Voltage!

Use copper conductors only. Unit terminals are not designed to accept other types of conductors. Failure to do so may cause damage to the equipment.

⚠ WARNING

Personal injury hazard. Wear protective gloves to avoid possible cuts and abrasions from exposed edges. Avoid contact with sharp edges

⚠ CAUTION

Cleaning agents may cause serious damage to internal components, such as aluminum coils and electronic controls, etc. Do not operate fan coil while building maintenance cleaning agents are in use.

⚠ CAUTION

Sharp edges and coil surfaces are injury hazards. Avoid contact with them.

⚠ CAUTION

Moving machinery and electrical power hazards may cause severe personal injury or death. Disconnect and lock off power before servicing equipment.

⚠ NOTICE

Installation and maintenance are to be performed only by qualified personnel who are familiar with and in compliance with state, local and national codes and regulations, and experienced with this type of equipment.

Receiving and Storage

Upon receipt of the equipment, check carton for visible damage. Make a notation on the shipper's delivery ticket before signing. If there is any evidence of rough handling, immediately open the cartons to check for concealed damage. If any damage is found, notify the carrier within 48 hours to establish your claim and request their inspection and a report. The Warranty Claims Department should then be contacted.

Do not stand or transport the machines on end. For storing, each carton is marked with "up" arrows.

Temporary storage at the job site must be indoors, completely sheltered from rain, snow, etc. High or low temperatures naturally associated with weather patterns will not harm the units. Excessively high temperatures, 140°F (60°C) and higher, may deteriorate certain plastic materials and cause permanent damage.

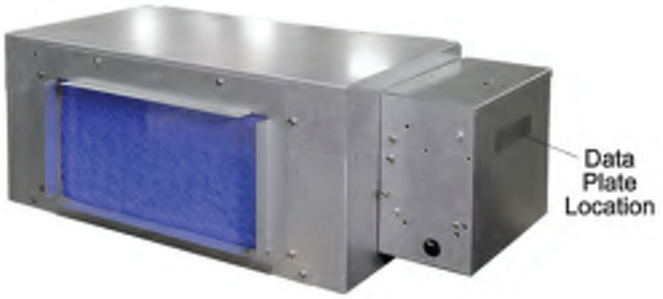
⚠ IMPORTANT

This product was carefully packed and thoroughly inspected before leaving the factory. Responsibility for its safe delivery was assumed by the carrier upon acceptance of the shipment. Claims for loss or damage sustained in transit must therefore be made upon the carrier as follows:

VISIBLE LOSS OR DAMAGE
Any external evidence of loss or damage must be noted on the freight bill or carrier's receipt, and signed by the carrier's agent. Failure to adequately describe such external evidence of loss or damage may result in the carrier's refusal to honor a damage claim. The form required to file such a claim will be supplied by the carrier.

CONCEALED LOSS OR DAMAGE
Concealed loss or damage means loss or damage which does not become apparent until the product has been unpacked. The contents may be damaged in transit due to rough handling even though the carton may not show external damages. When the damage is discovered upon unpacking, make a written request for inspection by the carrier's agent within fifteen (15) days of the delivery date and file a claim with the carrier

Pre-Installation Notes



Installation and maintenance are to be performed only by qualified personnel who are familiar with and in compliance with state, local and national codes and regulations, and experienced with this type of equipment. Before beginning installation, please read this publication in its entirety. Directions given in this bulletin for right and left sides or coil hand assume a position facing the front (discharge) of the unit.

1. To prevent damage, do not operate this equipment for supplementary heating and cooling during the construction period. Doing so will void the warranty.
2. Inspect the carton for any specific tagging numbers indicated by the factory per a request from the installing contractor. At this time the voltage, phase and capacity should be checked against the plans.
3. Check the packing list and unit identification/tagging numbers against the plans to verify that the unit is being installed in the correct location. The unit data plate is attached to the front of the control box (see Figure 3). Remove the bottom panel on cabinet units to access it. The panel contains specific information on standard components as listed in Figure 1 on page 3 and starting in Table 3 on page 49.
4. Before installation, check the available dimensions of the space where the unit is to be installed against the dimensions of the unit.
5. Note the location and routing of water piping, condensate drain piping, and electrical wiring. The locations of these items should be clearly marked on submittal drawings.
6. An installing contractor may find it beneficial to confer with piping, sheet metal, and electrical foremen before installing any unit.

NOTE: Check the unit data plate for correct voltage with the plans before installing the equipment. Also, make sure all electrical ground connections are made in accordance with local code.

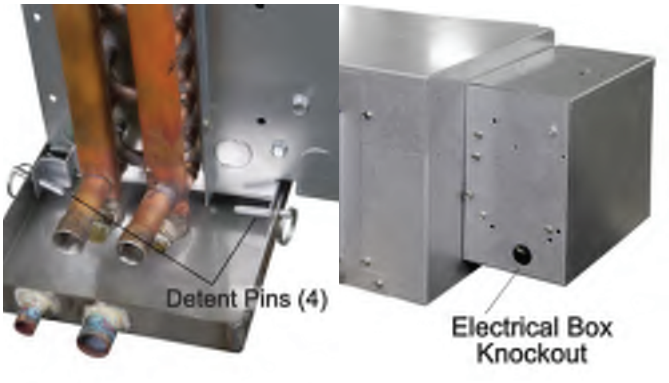
7. After installation, cover the unit with the shipping carton or other appropriate material for protection during finishing of the building. This is critical while spraying fireproofing material on ceiling beams, bar joists, sandblasting, spray painting and plastering. Damage to the unit due to a failure to protect it during finishing of the building is not covered by the warranty.
8. Maximum entering water temperature is 200°F (93°C).

Figure 3: Data Plate Location

9. Air ducts, when used with hideaway units, should be installed in accordance with local and national codes, including National Fire Protection Association standards for the Installation of Air Conditioning and Ventilating Systems and the National Fire Protection Association standards for the Installation of Air Conditioning and Ventilation Systems other than Residence Type.
10. Completed installation of hideaway units without return plenum must comply with the requirements of NFPA90B with regard to the use of concealed ceiling spaces as return air plenums.
11. When a return air duct is not provided, applicable codes may limit installation to single story buildings.
12. A one-inch duct collar is provided on units with a ducted return and/or discharge to attach ductwork. Daikin recommends using galvanized sheet metal ductwork. Slide the sheetmetal duct over the duct collar flange of the unit, seal the joint and fasten with sheetmetal screws.
13. Vibration isolators are generally not needed, if required by local codes, they must be provided by the installing contractor.
14. Valve and Piping Packages supplied with the unit should be supported during the installation process. It is advisable to keep the support in place after the unit has been installed and started.

Uncrating and Inspecting the Unit

⚠ WARNING



Plastic packaging is a suffocation hazard, dispose of properly. Keep away from children.

1. Carefully remove the packaging, remaining alert to any signs of shipping damage. Be careful not to discard components that may be included with the packaging.
2. If the unit is damaged, file a claim with the carrier. Notify the local Daikin representative immediately.
3. You may want to retain some or all of the packaging to provide jobsite unit location information and temporary protection for the fan coil after installation. Be sure to dispose of plastic packaging and protective cardboard properly, in accordance with local recycling rules and guidelines.
4. Touch up painted panels if necessary. If panels need paint, sanding is not necessary. However, clean the surface of any oil, grease, or dirt residue so the paint will adhere. Purchase factory approved touch up paint from your Daikin representative or Daikin Service.

Installation

1. Consult job blueprints for unit location.
2. Clean area where unit is to be installed, removing all construction dirt and debris.
3. Remove the unit from the shipping carton and plastic covering. Save the carton and plastic to use as a protective cover after the installation is complete.
4. Rotate fan wheels by hand to make sure the wheels rotate freely.
5. Unit is ready for installation. See Duct Connections for more detail.
6. Secure unit in proper position. The top of the unit must be level. If hanger rods are used, “back-up” nuts should be put on the rods to prevent the mounting nuts from loosening. The drain pan is designed to have a little gradient to ensure proper drainage and operation. Do not level Drain Pan.
7. Water and drain connections can now be made to the unit. Piping must be installed in accordance with local codes and regulations. See Piping Connection Recommendations for more detail.
8. Vent the coils.
9. All water and drain lines should be well insulated to prevent sweating and heat loss. See External Insulating Requirements for more detail Electrical connections can now be made to the electrical panel or chase, in case the panel is not provided. Unless it is a special-order unit, all electrical connections are made in the main electrical control panel located on the opposite side of the primary panel connections. Electrical power wiring goes through the chase located between the drain pan and coil section. If needed the power connections may be done through knockouts located on both sides of the unit. See Figure 4.

Figure 4: Electrical Knockouts (Typical)

10. The installer shall provide wiring to the unit. Branch circuit overcurrent protection and disconnect should conform to the applicable electrical codes. The motor provided is “thermally protected.” See Electrical Connections on page 13.
11. All panels and doors should be in place and closed before starting up the unit.
12. During summer construction, there is an unusually high amount of moisture in the air; therefore, the initial pulldown should be very gradual (high speed for maximum airflow with reduced GPM and elevated chilled water temperature for reduced capacity). This procedure will reduce the possibility of the unit sweating.

Recommended Maintenance Clearance

Cabinet units have removable bottom and side panels for easy access to components for service and maintenance. The fan assembly and main drain pan are easily removable from the bottom for cleaning. See Accessing/Removing the Main Fan Deck and Motor Assembly on page 20 for more information.

Figure 5 shows recommended maintenance clearances for hideaway units. For exposed units use: 24 inches [61 cm] on either side (A and B) and 18 inches [46 cm] (C) below for bottom panel removal. Units are referred to as either right-hand or left-hand depending upon the piping connection. Hand is designated by facing the front of the unit (airflow discharges from the front or bottom).

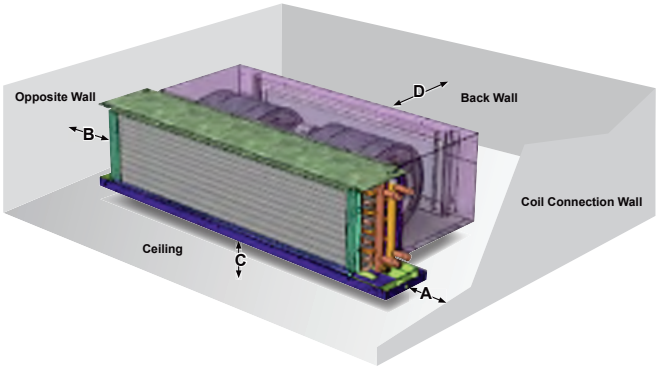
Duct Connections

Air ducts, when used with hideaway units, should be installed in accordance with local and national codes, including National Fire Protection Association standards for the Installation of Air Conditioning and Ventilating Systems and the National Fire Protection Association standards for the Installation of Air Conditioning and Ventilation Systems other than Residence Type.

A one-inch duct collar is provided on units with a ducted return and/or discharge to attach ductwork. Daikin recommends using galvanized sheet metal ductwork. Slide the sheetmetal duct over the duct collar flange of the unit, seal the joint and fasten with sheetmetal screws.

Ductwork Recommendations

Follow the general recommendations listed below when installing the ductwork for the unit.



1. Air ducts should be made of galvanized steel and connected to the flange of the unit with a canvas connector. Insert the duct into the flange and fix with screws. Duct connections must be installed in accordance with national and local codes.
2. Discharge ductwork should run in a straight line, unchanged in size or direction, for a minimum distance of three fan diameters from the unit (approximately 20 inches).
3. Avoid making sharp turns when making duct turns and transitions. Use proportional splits, turning vanes, and air scoops when necessary.
4. When possible, construct and orient supply ductwork turns in the same direction as the fan rotation.

External Insulating Requirements

Insulate and vapor-seal surfaces that are colder than the surrounding air dew point to prevent unplanned condensation. Daikin recommends field-insulation in the following areas to prevent potential condensate problems:

- Supply and return water piping connections
- Condensate drain lines and connections
- Fresh air intake duct connections
- Discharge duct connections
- Wall boxes

Figure 5: Concealed Hideaway Unit Clearance

A = 8" (same side connection) or 24" (opposite side)
B = 24"
C = 3"
D = 18" for Hideaway units without plenum

Piping Connection Recommendations

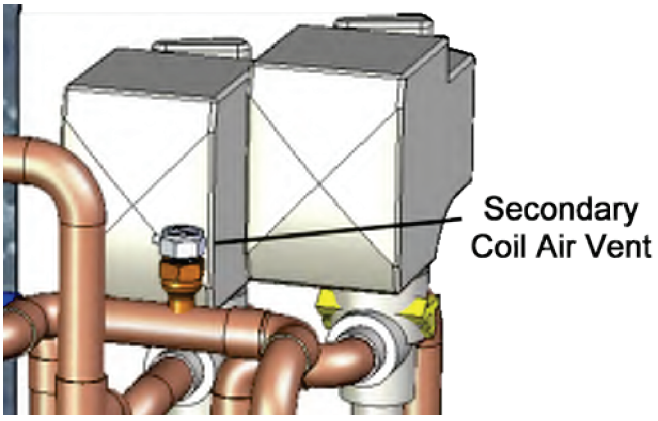
General Guidelines

IMPORTANT

Venting is required on the return piping for secondary preheat or reheat coils. It is included on factory-built piping packages, but must be added by the installing contractor for field-installed piping. See Figure 7

WARNING

Avoid overheating when soldering field connections to the coil to prevent leakage, overheating of the copper tubes, and melting of valves, factory-soldered joints or component gasketing. A quenching cloth is recommended. See Figure 6.



- Piping can be steel, copper or PVC, but must comply with local codes.
- Proper ventilation is required for soldering. When soldering, use a quenching cloth to protect fan coil components from overheating damage—melting insulation, also damage to valves, wiring, electronics, sensors, etc. See Figure 6. When Daikin provides valve packages with unions, o-rings are included. When soldering near unions, remove the o-rings before heating.

Figure 6: Protect Components from Overheating

- If sealant compound is not provided for flexible hose fittings, apply Teflon tape to the connections to help prevent leaks.
- Ensure proper insulation of supply and return piping. Proper insulation prevents loss of fan coil capacity, overheating of end compartments, and/or moisture dripping.
- The piping to and from the unit must be protected from outside air and freeze conditions. It must be suitably insulated for condensation and for heat loss or gain. Penetrations entering the unit end compartments must be fitted/sealed for unit integrity.
- Exterior condensate may be an issue if field piping does not have a control valve. Review the supply and return header locations in the dimensions drawings. If using a field-assembled piping package, allow sufficient room to install the secondary drain pan. Uninsulated piping for chilled water should not extend over the edges of the secondary condensate drain pan.
- Supply and return shutoff valves are recommended at each unit. The return valve is used for balancing and should have a “memory stop” so that it can always be closed off, but can only be re-opened to the proper position for the flow required.
- Primary coils are factory-equipped with vents for venting the system, but secondary coils (preheat or reheat) are not. If the unit is not equipped with factory-built piping packages which includes a secondary coil air vent, then vents must be added. See Figure 7.
- Be sure to install control valves on the correct fan coil. Indiscriminate mixing of valves in the field can result in valves improperly sized for the desired flow rate, which can result in poor operation and coil freezes.
- Install control valves so there is at least 2" (51mm) minimum clearance to remove the actuator from the valve body.

Figure 7: Secondary Coil Air Vent

- Do not connect a unit to the supply and return piping until the water system has been cleaned and flushed completely. After this is done, the initial connection should have all valves wide open in preparation for water system flushing.
- Automatic flow control devices must not be installed prior to system cleaning and flushing.
- Check local code for any requirement for electrical fittings.

Drain Piping

- Condensate piping can be steel, copper, or PVC. A means of disconnection must be furnished to facilitate fan deck removal.
- No point of the drain system may be above the drain pan of any unit.
- Pipe insulation is recommended to avoid condensation.
- Suggested slope of the drain pipe is at least 1/8" per foot to facilitate adequate condensate drainage but local code requirement should prevail.
- Slide the pipe over the drain pan nipple and tighten the collar on the pipe with a hose clamp (supplied by installer).
- The drain line should be supported to prevent undue stress on the secondary drain pan. Make sure the drain line is free of kinks.
- Trap drain line according to local codes.
  NOTE: Traps for exposed units may be located outside the cabinet as there is insufficient space inside the unit.
- Cap overflow drain connection or connect it with clear piping to the point where it can be used as an indicator for a clogged main drain connection.

Chilled Water Pipe Connections

No Valve Package

- Connect chilled water pipes to the unit. The water supply is on the bottom and water return is on top of the coil header.

Connecting to a Factory-Installed Valve & Piping Package

To view connection locations for factory-installed valve & piping packages, see Valve and Piping Packages on page 39.
Before installing supply and return lines to a factory piping package, review the following items.

- All piping connections are 5/8" O.D.S. (1/2" nominal) female copper connections.
- Supply and return piping should not interfere with the secondary drain pan or condensate line. The installer must provide adequate piping system filtration and water treatment. Daikin Deluxe and Enhanced piping packages include a strainer which prevents debris from entering the coil. Clean the strainer regularly.
- The fan coil ships with brackets and special shipping packaging to adequately support the piping package during shipment. Remove the packaging before connecting to the water piping but leave the support brackets in place during and after the installation.
- Set ALL valves to the fully open position to prevent damage to the valve seat during brazing. Use a quenching cloth as protection.
- Remove the secondary drain pan, if in place, to prevent exposure to dripping solder or excessive temperatures.
- Solder water piping connections to supply and return end connections. Avoid overheating factory soldered joints to prevent the possibility of leakage.
- Insulate fan coil piping to secondary drain pan connections and any piping that is not above the secondary drain pan.

Field-Installed Valve & Piping

Review General Guidelines on page 9 before beginning. Then carry out the following steps to install valves and piping.

- For units equipped with a secondary coil make sure that an air vent is included in the return line piping. Primary coils are factory-equipped with vents, secondary coils are not. See Figure 7. Valve Package support brackets are included with the secondary coil kits.
- Remove the secondary drain pan, if in place, to prevent exposure to dripping solder or excessive temperatures.

NOTE: Field-installed valve and piping packages provided by Daikin include the secondary drain pan. If valve packages by the field, secondary drain pans should be provided by others.

- Slide ½" copper tubing or connection couplings (provided by installer) onto the coil connections. Solder the joint using a good-quality, lead-free solder to provide a watertight connection.
- After connections are complete, insulate all piping to the coil connections as necessary to prevent condensate from dripping outside of the secondary drain pan.
- Install the optional secondary drain pan.

Shutoff/Balancing Valve

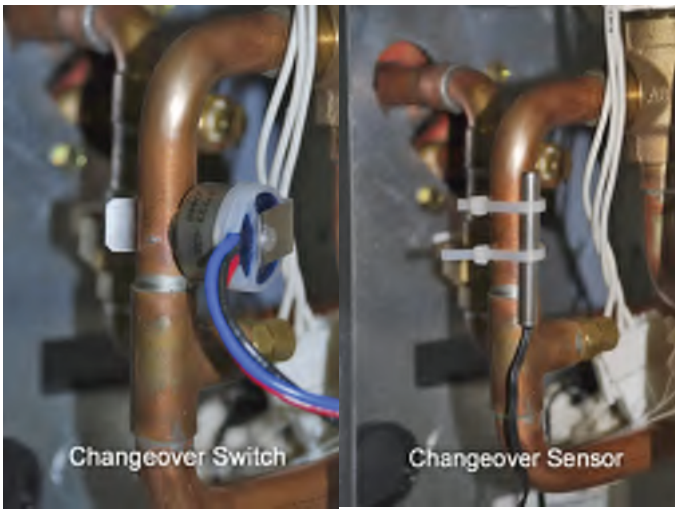
Each fan coil should be at least be equipped with shutoff valves on both the supply and return lines for easy serviceability and removal if it becomes necessary. We suggest using our combination shutoff/balancing valves between the main supply line and the fan coil unit. These are furnished as part of a field-installed valve & piping package. The balancing valve installed on the return line is used to adjust the water flow to provide the best performance.

Automatic Changeover Sensor

Two-pipe changeover units require an automatic changeover switch or pipe sensor that determines heating or cooling mode based on the supply water temperature. On units with a factory-installed valve & piping package, the factory straps the changeover switch or sensor to the piping supply water pipe. See Figure 8. For field-installed Valve Packages, the ACO must be ordered separately.

For a two-pipe system with intermediate supplemental electric heat, a second set is required including a changeover switch. See Two-Pipe Systems with Electric Heat on page 12 section for more details.

NOTE: The bypass bleed line is used on 2-pipe Fan Coils with 2-way control valves to prevent stagnation of water near the aqua-stat or pipe sensor. The bleed line allows 3 – 4 gpm of flow to bypass the coil which is necessary for the proper function of the automatic changeover system. All 2-pipe valve packages with 2-way control valves automatically include the bypass bleed line. If the bleed line is unwanted, it may be crimped by the installing contractor to prevent bypass flow.



If the unit does not have a factory-installed valve & piping package, the changeover switch or sensor can be ordered for field installation. The installer should attach the sensor or auto changeover switch parallel to and in direct contact with the supply water pipe.

NOTE: The installer is responsible to ensure the changeover sensor is installed in a location that can sense active water temperature. Otherwise, the unit may fail to sense the correct operating mode and disable temperature control.

When using field-supplied 3-way control valves, install the changeover sensor upstream of the valve and the bypass on the supply water pipe. When using field-supplied two-way control valves install the changeover sensor in a location that will detect active water temperature. The unit must always be able to sense the correct system water temperature, regardless of the control valve position.

NOTE: The maximum length of the automatic changeover wire cannot exceed 10 feet from the control panel to the sensor. If the wire extends beyond the unit chassis, use shielded conductors to eliminate radio frequency interference (RFI).

Figure 8: Automatic Changeover Switch and Sensor

Steam Piping Connections

⚠ CAUTION

Coil Damage!

In all steam coil installations, the condensate return connections must be at the low point of the coil to ensure condensate flows freely from the coil at all times. Failure to do so may cause physical coil damage from water hammer, unequal thermal stresses, freeze-up and/or corrosion

Make piping connections to the steam coil per job requirements. (Daikin does not supply steam piping connections.) Install a 1/2", 15-degree swing check vacuum breaker in the unused condensate return trapping as close as possible to the coil. The following procedures are recommended:

- Vent the vacuum breaker line to atmosphere or connect it into the return main at the discharge side of the steam trap.
- Pitch all steam supply and return mains down a minimum of one inch per ten feet in the direction of flow.
- Do not drain the steam mains or takeoff through the coils. Drain the mains ahead of the coils through a steam trap to the return line.
- Overhead returns require one psig of pressure at the steam trap discharge for each two-feet elevation to ensure continuous condensate removal.
- Proper steam trap selection and installation is necessary for satisfactory coil performance and service life. For installation, use the following steps:
  - Position the steam trap discharge at least 12 inches below the condensate return connection. This provides sufficient hydrostatic head pressure to overcome trap losses and ensure complete condensate removal.
  - Daikin recommends using float and thermostatic traps because of gravity drain and continuous discharge operation.
  - Use float and thermostatic traps with atmospheric pressure gravity condensate return, with automatic controls or where the possibility of low pressure supply steam exists.
  - Always install strainers as close as possible to the trap inlet side.

Two-Pipe Systems with Electric Heat

⚠ IMPORTANT

Daikin recommends operating the electric heater at the High motor speed setting.

The electric heating coil is designed to be the total source of heat for the unit. If used for auxiliary intermediate season heating, additional control is required. A second changeover switch is required. For units ordered with intermediate electric heat, the second changeover switch is factory installed.

To protect the electric heat elements, an automatic and manual electric heat switch disengages the electric heat to prevent overheating. For information on resetting the manual switch, see Electric Heat Over-Temp Reset Button on page 15. For a typical wiring diagram, see Figure 53.

Electrical Connections

⚠ WARNING

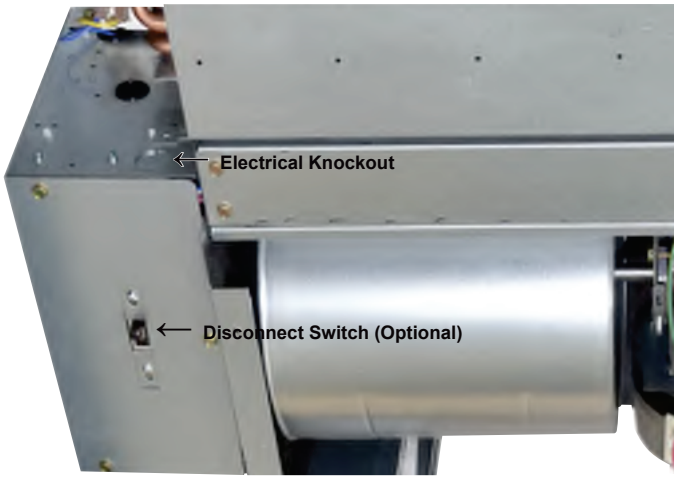
A means for disconnect from electrical supply shall be provided according to NEC or local codes. Confirm that the power has been switched OFF before installing or servicing the unit.

Installation and maintenance must be performed only by qualified personnel who are familiar with local codes and regulations, and are experienced with this type of equipment. Wiring connection must be completed according to the wiring diagram on the unit. The unit must be GROUNDED. Installation of all field wiring must comply with NEC and local codes.

Line and voltage wiring must be done in accordance with local codes or the National Electrical Code, whichever is applicable.

Apply correct line voltage to the unit. Power to the unit must be sized correctly. Branch circuit overcurrent protection must be provided per local codes. See the data plate for correct ratings.

Standard Electrical Connection



Field electrical power connections are made in the electrical control box, which is mounted to the side of the chassis opposite the primary coil piping connections. See Figure 9. An optional disconnect switch is located in this box.

Units with an electric heat option that have the same voltage as the unit have single-point power connections and bring the power conductors into this same connection box through one of the knockouts. Units with electric heat that has a different voltage should bring the electric heat into one of the knockouts on the chase. See Figure 9.

If provided by the field, low voltage wires should be brought into a knockout located next to the electrical control box. See Figure 4.

Install a strain relief and pass the wires through the strain relief into the control box. Make the connections and reinstall the control box cover.

Figure 9: Electrical Power Connections

Bottom View

Electrical Data

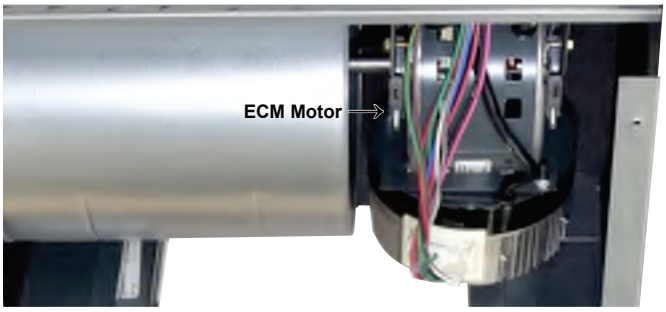
The wiring diagram for the unit is attached to the exterior of the blower housing. See Figure 10. Be sure the available power is the same voltage and phase as that shown on the unit data plate. See Figure 3, for the location of the data plate. See page 44 through page 46 for typical wiring diagrams.

Figure 10: Location of the Wiring Diagram.

Operating Voltages

Operating voltages are as follows (+/– 10%).

- 115/60/1
- 208-230/60/1
- 265-277/60/1



NOTE: Voltages listed are to show voltage range. However, units operating with overvoltage and undervoltage for extended periods of time will experience premature component failure.

ECM Blower

If the unit is equipped with an ECM blower, additional steps may be required during the air balancing process. The ECM blower is controlled by a control board. Three-speed taps are provided with an ECM blower: high, medium and low.

The unit has been factory configured to produce PSC equivalent airflow on high speed, with medium speed at 80% and low speed at 60% of full volume. If these settings are acceptable, then no further configuring is necessary. If different speeds are required select a field adjustment ECM.

Figure 11: ECM Blower

EC Motor Pin Out Locations

Figure 13 and Figure 14 show the pin locations for both connectors.

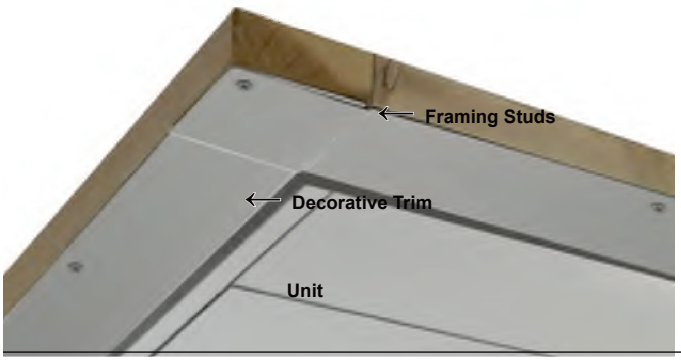
Condensate Overflow Detection Device

The condensate overflow detection device is a factory-installed option on fan coils. This device has a condensate overflow switch with dry contacts and is connected to the LV board or MicroTech board. See Figure 15.

If you suspect it is not working properly, check to be sure that the float is installed straight up with the proper elevation. See Accessing/Removing the Main Fan Deck and Motor Assembly on page 20 for instructions on removing the main drain pan to access the device.

The condensate overflow switch needs to be wired to the proper controller (MicroTech for example) to shut off the fan if excessive water is present in the drain pan.

Figure 15: Condensate Overflow Switch Installation



Decorative Trim Flange for Partially-Recessed Units

A fixed trim flange is used for partially-recessed fan coils (with height restrictions of 14.5 inches or below). Trim Flanges are also used with fan coils featuring a bottom discharge configuration.

The sheetrock location for the unit should be cut to the appropriate size, then framed with steel or wooden studs before the decorative trim flange is installed. See Figure 42 on page 38 for a sample illustration and recommended gaps.

DO NOT secure the Trim Flange without a stud frame to the drywall.

Electric Heat Over-Temp Reset Button

⚠ DANGER

PERSONAL INJURY HAZARD.

Power supply can cause electrical shock. Always disconnect power to unit before servicing.

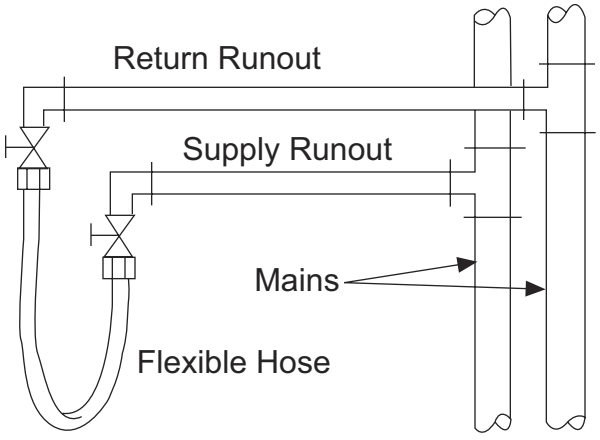
The electric heat options comes with two over-temperature switches. The first resets automatically when the over-temperature condition no longer exists. The second, backup high limit switch must be reset manually.

NOTE: The need to reset the manual switch may indicate that there are improperly functioning system components. If the switch trips again, contact Daikin Service for help in diagnosing the cause.

To reset the manual switch, carry out the following steps:

1. Disconnect all power to the unit. Verify the power has been disconnected.
2. Remove the raceway access covers (see Accessing/Removing the Main Fan Deck and Motor Assembly on page 20).
3. Access and push in the red reset button in the raceway of the heater assembly. See Figure 17.
4. Reinstall the access cover.
5. Reconnect the power.

Figure 17: Electric Heat Over-Temp Reset Button Location



Cleaning & Flushing the Water System

⚠ CAUTION

Units must be checked for water leaks upon initial water system startup. Water leaks may be a result of mishandling or damage during shipping. Failure by the installing contractor to check for leaks upon start-up of the water system could result in property damage

- Prior to first operation of any unit, clean and flush the water circulating system of all construction dirt and debris.
- If units are equipped with water shutoff valves, either electric or pressure operated, connect the supply and return runouts together at each unit location. This will prevent the introduction of dirt into the unit. See Figure 18.
- Fill the system at the water makeup connection with all air vents open. After filling, close all air vents.
- Start the main circulator with the pressure reducing valve open.
- Check vents in sequence to bleed off any trapped air, ensuring circulation through all components of the system.
- While circulating water, check for any leaks in the unit and surrounding piping and repair as neccessary.
- Drains at the lowest point(s) in the system should be opened for initial flush and blow-down, making sure city water fill valves are set to make up water at the same rate.
- Check the pressure gauge at pump suction and manually adjust the makeup to hold the same positive steady pressure both before and after opening the drain valves.

Figure 18: Connections for flushing system piping

- *Flush should continue for at least two hours or longer until the drain water is clean and clear.
- Shut off the circulator pump and open all drains and vents to completely drain down the system.
- Short-circuited supply and return run outs should now be connected to the unit supply and return connections. Do not use sealers at the swivel flare connections of hoses.
- Refill the system with clean water.Test the water using litmus paper for acidity, and treat as required to leave the water slightly alkaline (pH 7.5 to 8.5).
- Antifreeze may also be added at this time. Use commercial grade antifreeze designed for HVAC systems only. Do not use automotive grade antifreeze. Antifreeze will have an effect on the performance of the unit.
- Once the system has been filled with clean water and antifreeze (if used), precautions should be taken to protect the system from contamination.

Venting Hydronic Coils

⚠ IMPORTANT

It is not Daikin's policy to make recommendations on what brand or type of water treatment is to be installed and used. It is the responsibility of the general contractor/owner to verify that the water supply to the units is free from contaminates, corrosive agents, chemicals and/or minerals. The general contractor/owner should contact a local water treatment company regarding water quality issues and treatment. A fouled water system will lead to premature component failure.

Hydronic coils require a vent, either manual or automatic, to release air from the unit. Primary coils on all ThinLine fan coils come standard with a coil air vent. It is located on the piping side of the unit, above the coil connections.

Secondary coils on ThinLine units are not equipped with an air vent, but one is included on all factory-supplied valve and piping packages. It is located on the pipe closest to the outlet coil connection. See Figure 18.

Perform the following steps to vent both primary and secondary coils after installing the unit:

- Pressurize the building piping system with water and vent any trapped air at system vents.
- For units with manual air vents, back the set screw out to expel air from the unit and then re-tighten the set screw.
- Automatic air vents should require no adjustment for the coil to vent. However, if the coil does not vent immediately, unscrew the outer portion of the fitting to expel air from the port. If debris has become trapped in the vent, completely remove the outer portion of the fitting and clean.

Equipment Start Up Check List

⚠ IMPORTANT

Fan coils must be filled with water before operating a circulating pump. Filling the system properly will result in immediate lubrication of the bearings. The pump bearings should not be allowed to operate dry.

Receiving and Inspection

☐ Unit received undamaged
☐ Unit received complete as ordered
☐ Parts for field installation received as ordered
☐ Unit arrangement/hand correct
☐ Unit structural support complete and correct

Handling and Installation

☐ Mounting grommets/isolators used
☐ Unit mounted level and square
☐ Proper access provided for unit and accessories
☐ Proper electrical service provided
☐ Proper overcurrent protection provided
☐ Proper service switch/disconnect provided
☐ Proper chilled water line size to unit
☐ Proper hot water line size to unit
☐ All services to unit in code compliance
☐ All shipping screws and braces removed
☐ Unit protected from dirt and foreign matter
☐ Install & connect parts for field installation

Cooling/Heating Connections

☐ Protect field-provided valve package components from heat
☐ Mount field-provided valve packages
☐ Connect field piping to unit
☐ Pressure test all piping for leaks
☐ Install drain line and traps, as required
☐ Insulate all piping, as required
☐ Install secondary drain pan under piping, as required

Ductwork Connections

☐ Install ductwork, fittings and grilles, as required
☐ Flexible duct connections at unit
☐ Proper supply and return grille type and size
☐ Control outside air for freeze protection
☐ Insulate all ductwork, as required

Electrical/Controls Connection

☐ Refer to unit wiring diagram
☐ Connect incoming power service or services
☐ Install and connect parts for field installation

Unit Start-up

☐ General visual unit and system inspection
☐ Check for proper fan rotation
☐ Record electrical supply voltage
☐ Check all wiring for secure connections
☐ Close all unit isolation valves
☐ Flush water systems
☐ Fill systems with water
☐ Vent water systems, as required
☐ All ductwork and grilles in place
☐ All unit panels and filters in place
☐ Start fans, pumps, chillers, etc.
☐ Check for overload conditions of all units
☐ Check all ductwork and units for air leaks
☐ Balance water systems, as required
☐ Balance air systems, as required
☐ Record all final settings for future use
☐ Check piping and ductwork for vibration
☐ Check all dampers for proper operation
☐ Verify proper cooling operation
☐ Verify proper heating operation
☐ Reinstall all covers and access panels
☐ Verify proper condensate drainage

General Maintenance

Normal maintenance on all units is generally limited to filter changes and cleaning the condensate drain pans. Units are provided with permanently lubricated motors and require no oiling.

Record performance measurements of volts, amps, and water temperature differences (both heating and cooling). A comparison of logged data with start-up and other annual data is useful as an indicator of general equipment condition.

Filter Changes

Filter changes are required at regular intervals. The time period between changes will depend upon the project requirements. Some applications, such as motels, produce a lot of lint from carpeting and linen changes, and will require more frequent filter changes. Units equipped with a MicroTech III board may have Change Filter indicator lights set to be activated at certain time intervals (60, 90 or 120 days). For units which were not provided with MicroTech board check filters at 60-day intervals for the first year until experience is acquired. If light cannot be seen through the filter when held up to sunlight or a bright light, it should be changed. A more critical standard may be desirable.

Filters can be removed without removing any panels. See Figure 19 or Figure 20. Cabinet units are equipped with large bottom access doors allowing easy access to the filter media from any direction.

A. **To remove the filter**

Bottom return:

1. Turn the tabs on the side of the filter frame.
2. Slide your fingers along the bottom of the filter until they reach the rear paperboard edge.
3. Pull the filter out of the unit.

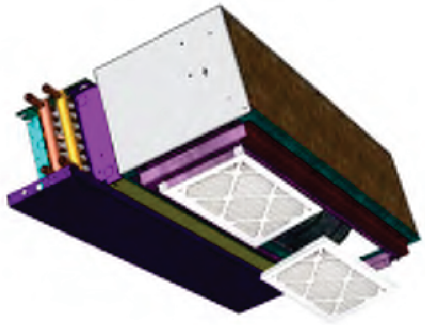
Back return:

1. Turn the tabs on the bottom of the filter frame. Open the frame.
2. Feel for the paperboard edge of the filter. Slide the filter down and remove it.

C. **To install a new filter**

1. Bottom: Slide the filter in. Turn the tabs into place.
2. Back: Push the filter up until it clears the front lip on the filter housing, then turn the tabs into place.
3. Close the tabs of the filter frame.

Figure 19: Filter Removal for Units with Bottom Returns



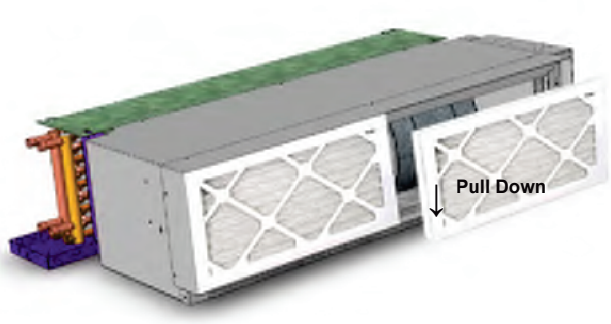


Figure 20: Filter Removal for Units with Rear Returns

Coils

Units provided with the proper type of air filters, even when replaced regularly,may require periodic coil cleaning. Coils may be cleaned in-place by removing the motor/blower assemblies and brushing the entering air face with a soft brush in a parallel motion with the fins. Do not brush perpendicular to the fin orientation, damage may occur. Brushing should be followed by blowing air through the fins with a vacuum cleaner from the leaving air side then removing all debris with the vacuum.

Electric Resistance Heater Assembly

Electric resistance heaters typically require no periodic maintenance when the unit's air filters are changed properly. Other conditions and equipment in the system may affect the operation and service life of the heaters. The most important operating conditions for an electric heater is airflow and supply voltage. As a rule, Daikin recommends operating the electric heater on the High speed, never on Low. Restricted or insufficient airflow over the elements and/or high supply voltage to the elements will result in the unit overheating. This condition may result in the heater cycling on the high limit thermal cutout and premature failure of the heater.

Open-wire type heaters provided with ThinLine fan coils (see Figure 21) have an automatic reset switch with a back up high limit thermal switch. Automatic reset switches reset after the heater has cooled. High limit thermal switches must be manually reset. The high limit thermal cutout switch and automatic reset switch are only safety devices, not intended for continuous operation. With proper unit application and normal operation, the high limit thermal devices will not trip.

The need to reset the manual switches indicates there is a problem. Any conditions that causes high limit cutout MUST be corrected immediately. High supply voltage causes excessive amperage draw and may result in tripping the circuit breaker or blowing fuses on the incoming power supply.

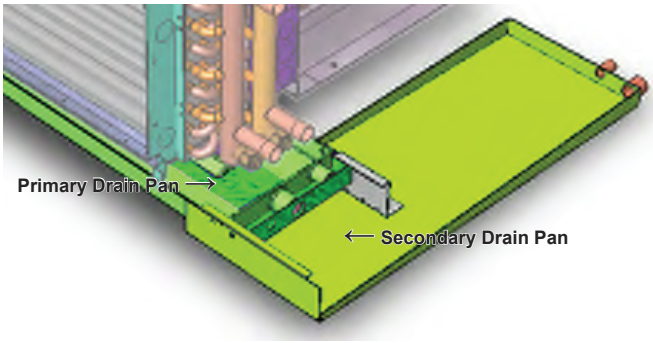

Figure 21: Exposed Electric Heater Assembly

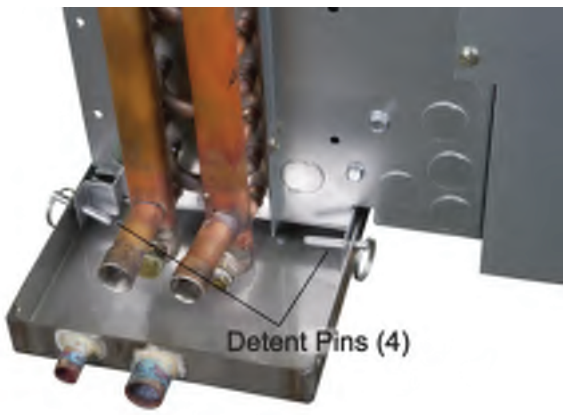
Condensate Drain Pans

The main and secondary condensate drain pans should be checked annually and cleaned and flushed as required. See Figure 22.

Figure 22: Primary and Secondary Drain Pans

Accessing the Secondary Drain Pan

DANGER



Water coils exposed to freezing temperatures should be drained or anti-freeze should be added to the water circuit to avoid freezing.

To access the secondary drain pan (cabinet units), remove the side panel from the side of the unit where the main piping connections are made (this is opposite the control panel side).

Drain Pan

1. Remove the 4 detent pins from the drain pan and move the pan to a location for inspection and cleaning.
2. After inspection and cleaning, reinstall the drain pans by reversing the procedure in Step 1.

Figure 23: Drain Pan Attachment to Coil Section

Blower

Dirt and dust should not be allowed to accumulate on the blower wheels or housing (see typical, Figure 24). Excessive debris can result in an unbalanced blower wheel condition which can damage the wheel and/or motor. The wheel and housing should be cleaned periodically using a brush and vacuum cleaner. Care must be taken to not dislodge the factory balancing weights on the blower blades.

Accessing/Removing the Main Fan Deck and Motor Assembly

Both the fan deck and the main condensate drain pan are easily removed for access and cleaning as follows.

Fan Deck:

1. Disconnect electrical power to the unit.
2. Remove the two screws that attach the fan deck to the chassis, see Figure 25 (on sizes 10 and 12 units, there are 4 screws to be removed).
3. Firmly grasp the fan deck and lift upward and off the unit. See Figure 26.
4. Disconnect the fan motor wiring harness by removing the plug where it attaches to the connector on the side of the chassis. See Figure 26.
5. To reinstall, follow these steps in reverse order.

NOTE: Push the tabs inward on the sides of the plug to free it from the connector base.

Monthly Intervals

- Inspect and clean the condensate drain pan to help avoid clogging of drainage by dirt, dust, etc. Inspect drainage piping for proper condensate flow.
- Check and clean the coil. Clean the coil with a low pressure water jet or low pressure air.
- Clean and tighten all the wiring connections.

Figure 24: Fan Housing

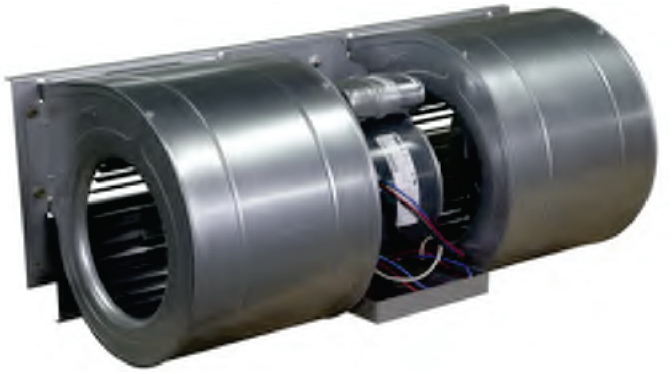


Figure 25: Removing Fan Deck Assembly

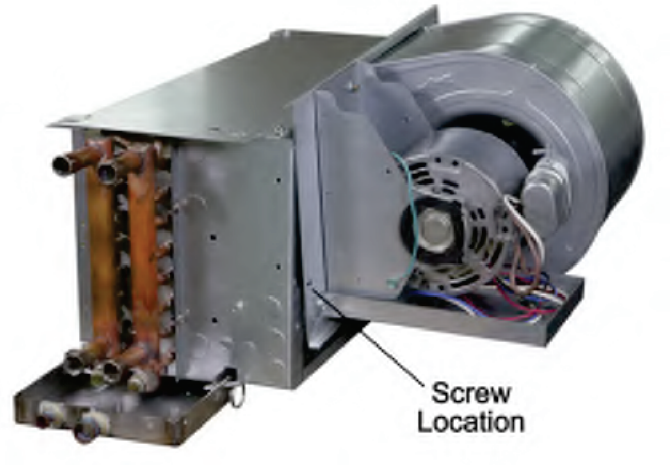

Figure 26: Unit Wiring Harness

Replacement Parts

Factory replacement parts should be used wherever possible to maintain the unit's performance, service life, operating characteristics and testing agency listings. Replacement parts may be purchased through a local Daikin sales representative.

Contact your local Daikin sales representative or Daikin Parts before attempting any unit modifications. Any modifications not authorized by Daikin could void all factory warranties and result in personal injury and/or unit damage.

When ordering replacement parts the following information must be supplied to ensure proper item identification:

1. Unit model number
2. Unit serial number
3. Unit orientation, hand connection (right or left hand when facing into the airstream)
4. Complete part description including any numbers

See replacement parts list for descriptions and part numbers. Contact Daikin for authorization of any returned parts, such as defective parts covered under warranty.

Controls

A wide variety of control options are available for Daikin ThinLine Horizontal Fan Coils, both unit-mounted and remote-mounted. This section provides a brief overview of these options and their operation. For more complete information, contact your Daikin representative.

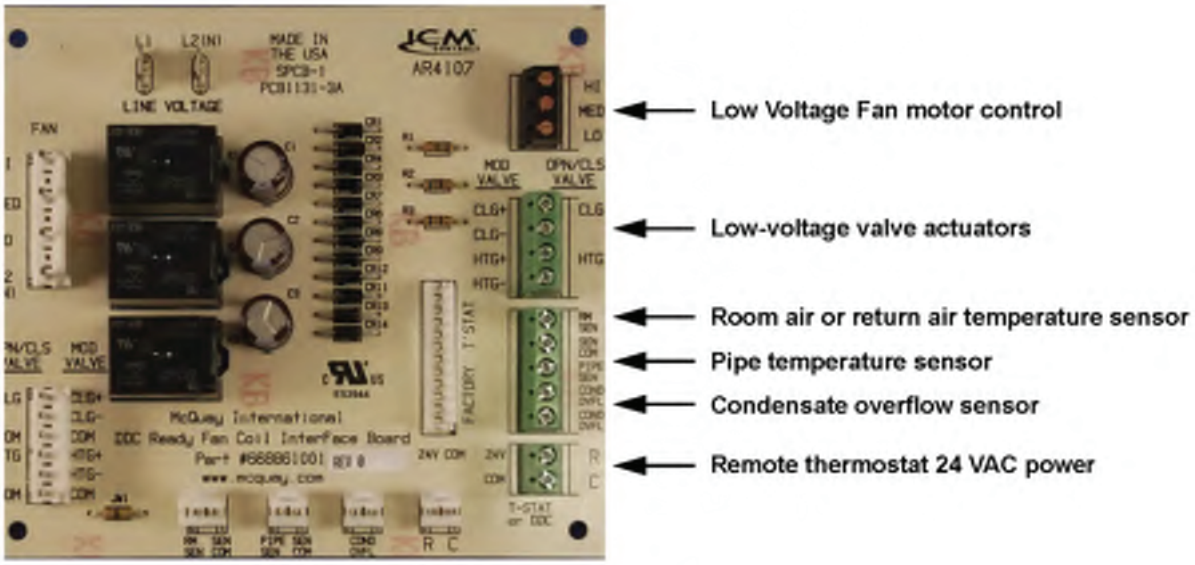
3-Position Fan Switch with Manual ON-OFF

This three-speed fan switch (High, Med, Low) with ON-OFF option, shown at the right, is available as unit- or remote-mounted. It operates on low-voltage or line-voltage power and can be provided with a factory-mounted low-voltage interface board, which contains three-24 volt relays with line voltage contactors and terminal connections. The transformer is factory-installed and wired.

Sequence of operation

- *OFF:* Fan is turned OFF. The motorized fresh-air damper, when supplied, is closed .
- *High, Medium, Low:* Fan runs continuously at the selected speed. The two-position, motorized fresh-air damper, when supplied, is opened.

Low-Voltage (LV) Interface Board



The low-voltage interface board is used with any remote (wall mounted) Daikin thermostat or control. It can also be used in conjunction with a field-supplied controller of a building automation system (BAS) control where low voltage is needed to operate the fan coil. It is located in the control box for the unit (see Figure 27).

The LV interface board includes:

- Three 24-volt relays with line-voltage contactors to operate the fan motor speeds.
- Terminal connections for interfacing to:
  - An optional remote-mounted thermostat.
  - Low-voltage actuators for heating and cooling valves.
  - A return air sensor.
  - A pipe temperature sensor for changeover from heating to cooling on two-pipe systems.
- A factory-wired and installed transformer.

See Figure 27 for a list of connecting points to the board. For additional wiring information, see the typical wiring diagram Figure 52 on page 44 or the unit's wiring diagram, which is attached to the fan coil exterior. (see Figure 10 on page 13).

Figure 27: LV Interface Board 24 VAC connections

MT155 Thermostat

For more details refer to Addendum IM 1014 — MT155 on page 55. The MT155 series thermostat provides ON-OFF control for low-voltage or line-voltage valves and fan motors. This thermostat is designed as a remote-mount with connection to the LV interface board mounted on the fan coil unit. Options include manual or automatic changeover and three-speed fan control for continuous or cycling fan operation.

Figure 28: MT155 Thermostats

Two standard control options are available:

- *Continuous fan and ON-OFF* valve cycle operation: The thermostat cycles the valves on and OFF. The fan runs continuously at the manually selected fan speed.
- *ON-OFF fan and ON-OFF valve cycle operation:* The thermostat cycles the fan from the manually selected fan speed to OFF and it cycles the valves ON and OFF.

When the system switch is in the OFF position, the fan coil system including the fan is shut OFF.

TA155: A HEAT-OFF-COOL system switch manually selects heating or cooling mode (Addendum IM 1089 — MT155 A/B on page 59). In the HEAT position, only the heat output cycles with demand. In the COOL position, only the cool output cycles with demand. In the OFF position, heating and cooling outputs are off. Units with a two position system switch or without a system switch must use a load transfer switch when both heating and cooling outputs are used. This prevents control failure and equipment damage caused by direct cycling between loads.

TB155: An ON-OFF system switch enables auto-changeover of heating and cooling modes (Addendum IM 1089 — MT155 A/B on page 59). In the ON position the thermostat activates heating or cooling outputs dependant upon the relationship between set point and ambient temperature. Heat on to cool on dead band is 4°F. In the OFF position, heating and cooling outputs are OFF. Units without a system switch cycle between heating and cooling with a 4°F dead band.

FAN: Some units have a switch for manual selection of fan speed. On these units fan operation is either internally wired for fan continuous operation or is dependant upon connection to the fan supply input . When internally wired for fan continuous operation, the fan will be OFF when the system switch is OFF. When dependant upon external connections the fan may not be OFF with the system switch in the OFF position. The fan supply input is switched to fan speed outputs (HI-MED-LO).

Digital Thermostats

Daikin offers a broad range of remote, wall-mounted digital thermostats with the capability to control ON-OFF, 3-wire and proportional modulating valves and Normally-Closed or Normally-Open actuator valves. For more information, refer to Daikin publications ED 18513 and ED 18527.

MT158 and MT168 Thermostat-Controllers with Digital Display

For more details refer to Addendum IM 1089 — MT155 A/B on page 59, Addendum IM 1016 — MT158 B on page 67 and Addendum IM 1017 — MT168 on page 71. Series MT158 and MT168 microprocessor-based thermostat-controllers combine a proportional integral control algorithm with adaptive logic. They are remote-wall mounted.

Figure 29: MT158 and MT168 Thermostats

Heating and cooling outputs for the MT158 are individually configurable for three-wire floating control valves or ON/OFF valves in the Normally Open or Normally Closed modes.

Heating and cooling outputs for the MT168 provide 0-10 Vdc or 4-20 mA for proportional modulating valve control. The integrated, three-speed fan control switch is line voltage to allow direct connection to the fan motors. Manual or automatic changeover is provided with remote setback capability from a time clock or facility management system. Features include a Fahrenheit or Celsius digital display and a built-in purge cycle which assists the controller to determine if the system is supplying hot water or cooling.

Two standard control options are available:

- *Continuous fan and modulating (or ON-OFF) valve operation:* The fan runs continuously at the manually selected fan speed (high, medium or low). The controller modulates the valves or, on the MT158, dip-switches can be set to cycle the valves ON and OFF.
- *ON-OFF fan cycle operation and modulating (or ON-OFF) valve operation:* The controller cycles the fan from the manually selected fan speed to OFF. The controller modulates the valves or, on the MT158, dip-switches can be set to cycle the valves ON and OFF.

T170 Thermostat with Digital Display

Two thermostats are offered for remote installation only: TA170 for three-speed fan control and TB170 for staged fan operation. Both thermostats are used for ON-OFF control of low- or line-voltage valves with auto changeover. Detailed installation instructions and modes of operation can be found in Addendum IM 846 — MT170 on page 75.

Figure 30: T170 Thermostat with Digital Display

T180 Programmable Thermostat

Daikin offers two different 7-Day Programmable Digital Heating/Cooling Thermostat with constant fan or Fan cycled, ON/OFF Valve Control depending on the fan speed control. The thermostat interface contains buttons for use in navigation to accompanying menus/screens and for performing specific operations. Detailed installation instructions and modes of operation can be found in Addendum IM 1019 — MT180 on page 85.

Figure 31: T180 Thermostat with Digital Display

MicroTech III Controller

⚠ IMPORTANT

Units equipped with MicroTech III controllers should be used in conjunction with wall-mounted sensors only. Thermostats should not be used with MicroTech controllers.

ThinLine fan coils can be provided with unit-mounted MicroTech controllers and multiple unit- or room-mounted sensors.

MicroTech is a unit-mounted controller able to operate in either a stand-alone non-communicating environment or a communicating environment. To operate in a communicating environment, a board named *communication module*, is installed on the unit controller. There are two types of communication modules available with MicroTech controllers: LONWORKS and BACnet MSTP.

Unit controllers and/or I-O expansion boards have inputs for room or return temperatures, temperature setpoint adjustments, fan speed switches, entering water temperatures, discharge air temperatures, changeover auto switches, low temperature detection, emergency shutdown detection, condensate overflow detection, dirty air filter detection and occupancy. All sensors are software selectable and the controller is configured based on the selection.

For units with factory installed MicroTech III controllers, please see OM 1111 for details.

Sensors

Room Temperature Sensor with Setpoint Adjustable Module and Fan Speed Control

The Digitally Adjustable sensor provides the ultimate of temperature control and display, simple user interface, alarm annunciation, and alarm reset. The easy to ready LCD clearly identifies the system operating mode including occupied/unoccupied mode, fan operation and control, unit status, timed override status, alarm annunciation, and energy savings mode through a series of recognizable icons. Tactile response buttons initiate adjustments for temperature set points, system mode, fan mode, occupancy, tenant override and fault reset functions. The large numeric LCD will display space temperature (°F or °C) with the corresponding setpoint conditions. This sensor is designed for use with BACnet or LONWORKS applications. However, it can also be installed as a standalone sensor using factory default set points.

For detailed installation instructions and modes of operation see Addendum IM 1171 — Digitally Adjustable Display Sensor on page 92.

MicroTech III Wall-Mounted Room Temperature Sensor with Timed Override

MicroTech III Wall Mounted Room Temperature Sensors provide electronic sensing of room temperatures at wall locations. The sensor features a thermistor (10kO), a green LED for unit status and tenant override button.

Sensor Specifications

- Thermistor resistance (10kΩ) (Conforms to Advance Thermal Products curve 2)
- Ambient Temperature Limits:
  - — Shipping and Storage: 40°F to 160°F (–40°C to 71°C)
  - — Operating: 40°F to 140°F (4°C to 60°C)
- Locations: NEMA Type 1, Indoor only
- Connections: Color Coded Leads

Wiring

3-lead NEC Class II low voltage wiring.

NOTE:

1. Do not install the wire cables in the same conduit with power wiring.
2. Never apply external voltage of any type to any terminal or damage will result.
3. Do not exceed ratings of the device. This is a low voltage device:
4. Always use 22-gauge wire and never locate the room temperature sensor more than 250′ from the unit:

Wiring must be installed in accordance with the National Electrical Code and all local codes and ordinances, which can require the use of plenum rated cable or conduit.

Mounting Location

Locate the sensor on a wall where exposure to unrestricted air circulation represents the average temperature of the space. A common mistake is to mount the sensor too close to the supply air diffuser in a room. This causes short cycling of the air conditioning unit and large room temperature swings.

Installation

⚠ DANGER

THIS EQUIPMENT PRESENTS HAZARDS OF ELECTRICITY.

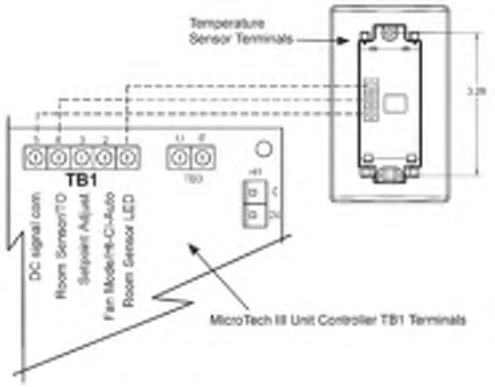
Failure to read and follow these instructions can result in property damage, severe personal injury or death.

⚠ CAUTION

Be certain that exposed portions of wires do not come in contact with each other.

1. Turn off power at the main service panel by removing the fuse or switching the appropriate circuit breaker to the OFF position.
2. To remove the cover on sensor 669529001, loosen two allen-wrench set screws located on the underside of the cover.
3. Place the wall sensor mounting base against the wall where the sensor where be located. Using the base as a template trace the mounting holes onto the wall.
4. Drill a 3/16" hole at each mounting hole mark.
5. Insert wall anchors into mounting holes and tap in to the wall surface.
6. Feed wires through the back of the sensor mounting base and align sensor mounting holes with wall anchors.
7. Use supplied screws to secure sensor base to wall.
8. Connect stripped, labeled wires to matching terminals on the temperature sensor. Refer to Figure 32 for wiring details.
9. Tighten screws on terminal connections. Gently tug wire to check for secure connections. Confirm that each wire is connected to the proper terminal.
10. Seal the hole where the wire enters through the wall behind the temperature sensor, with non-flammable insulation or putty.
11. Replace cover on wall temperature sensor by snapping it in place.
12. Turn on power to the system at the main service panel.
13. Test wall temperature sensor operation as described in “Testing”.

NOTE: Mount the sensor five feet above the floor. Do not mount the sensor on an outside wall, in direct sunlight, behind a door, or in an area affected by a vent or duct.



Utility Box Mounting of Sensor 669529001

1. Feed the cable from the utility box.
2. Strip 1/4–inch of insulation from the end of the wires.
3. Connect stripped, labeled wires to matching terminals on the temperature sensor base. See Figure 32.
4. Tighten screws on terminal connections. Gently tug wire to check for secure connections. Confirm that each wire is connected to the proper terminal.
5. Neatly store excess wire back inside the utility box.
6. Mount the sensor base to the utility box using two 6-32 × 5/8–inch flat head sheet metal screws provided with the sensor.
7. Replace cover on wall temperature sensor by attaching the catches at the top of the cover to the top tabs on the sensor base. Secure the cover to the base by tightening the two allen wrench set-screws on the bottom of the sensor cover. Do not overtighten.

NOTE: Sensor 669529001 has two allen wrench set-screws on the underside of the sensor cover to secure it in place. Do not overtighten.

Wiring

Figure 32: Temperature Sensor Wiring to MicroTech III Unit Controller

Cool Test

1. Using the building automation system (BMS), adjust room cooling setpoint to 5 degrees below room temperature.
2. Air conditioning should come on within five (5) minutes. Status indicator may come on.
3. Using the BMS, adjust the set temperature 2 degrees above the room temperature and the A/C should turn off. There may be a fan delay on your system.

Heat Test

1. Using the building automation system (BMS), adjust room heating setpoint to 5 degrees above room temperature.
2. Heating should come on within five (5) minutes. Status indicator may come on.
3. Using the BMS, adjust the set temperature 2 degrees above the room temperature and the A/C should turn off. There may be a fan delay on your system.

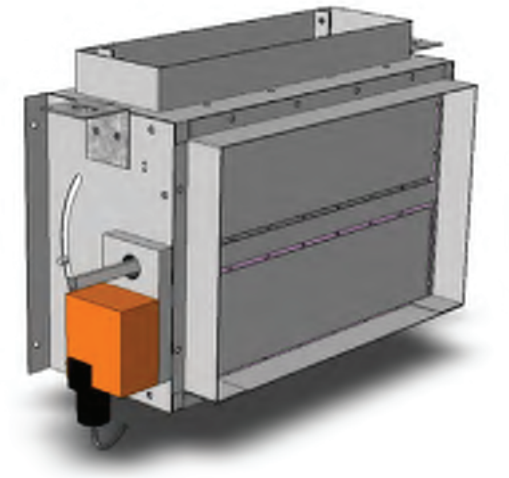
Timed Override

Press Override button for more than 3 but less than 10 seconds and Unit will return to Occupied operation until the override time expires (as programmed in BMS).

Figure 33: MicroTech III Room Temperature Wall Sensor with Timed Override

Troubleshooting

Symptom	Remedy
No LED illuminated	Check for 5 VDC at sensor, LED is dark when 5 VDC is not present
Unit turns on and off too frequently	Sensor must be located as described in " Mounting Location".



The fresh air damper module with top or rear fresh air inlets is available for concealed, recessed or exposed units. Fresh Air Damper control can be automated or manual. Automatic options include a 2-position control or a full economizer option (MicroTech controller only).

Manual Damper – The manual damper is field-adjustable to allow a zero to 25 percent fresh air position.

Auto Two-Position Damper – The auto two-position damper is factory set at 25 percent when open. The damper can be set in the field to allow a zero to 50 percent fresh air position.

Economizer Damper – The economizer damper is accompanied by a factory-installed and wired modulating actuator. The damper is factory set at 25 percent default minimum and 100 percent maximum opening. The damper is field adjustable using MicroTech III to allow a zero to 100 percent fresh air.

Factory-Installed Valve and Piping Packages

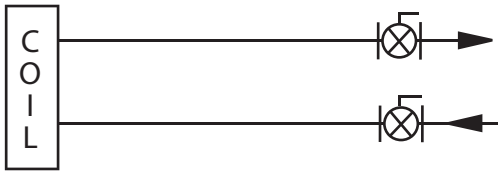
Factory valve and piping packages are available for both two-pipe and four-pipe systems with either right or left hand connections. Four-pipe systems can be configured with the heating and cooling connections on the same or opposite sides of the unit. Packages can be either factory-installed or factory-assembled and shipped loose with the unit. All factory-assembled packages are fully leak tested. Units are also available without valve and piping packages in either a right-hand or left-hand configurations.

Factory-installed packages are soldered to the coil and wired to the unit control box, MicroTech controller or LV Interface Board. For field-installed packages, chilled and hot water pipes are the only field connections required. Piping is 1/2" nominal copper (5/8" OD).

Figure 44: Four-Pipe Deluxe Valve and Piping Package

Pre-determined field connection points are located for easy access. The installing contractor can pre-pipe the building water connections before the units arrive on the jobsite. A label clearly identifies chilled and hot water connection points on every unit.

All chilled water piping and components are located to allow condensate to drain into the secondary drain pan supplied with the valve package. Insulation of the factory piping package is not required.



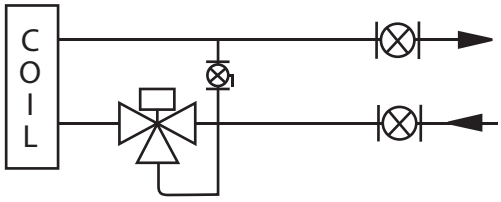
Available Packages

All factory-installed valve packages are flexible, configurable and fully software-selectable in our Daikin Tools™ selection program. Custom valve packages are available also. Numerous piping packages are available to match design configurations. Additional components can be added to meet exact requirements, including P/T ports, unions, and flexible stainless steel hoses.

Shut-Off Only Packages

Shut-Off Only piping packages provide interconnecting copper piping and shut-off ball valves for ease in connecting supply and return lines to the unit. Four-pipe packages include a venting valve for the preheat or reheat coil. Primary coils on all units have an integral venting valve.

Figure 45: Shut-Off Only Package

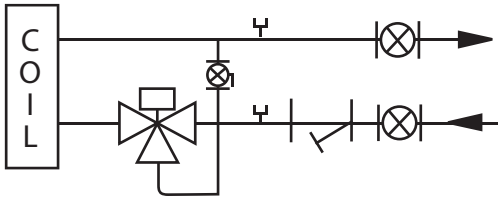


(See Figure 50 for components key)

Basic Packages

Basic valve and piping packages add control valves to the Shut-Off Only package. All Daikin control valves are factory-mounted in the supply water pipe. See Control Valve Options on page 41 for more information on the variety of control valves available.

Figure 46: Basic Package

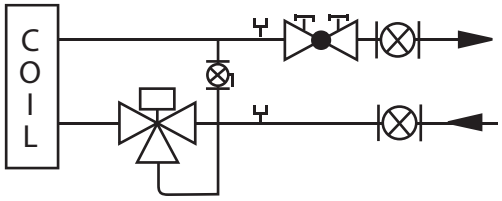


(See Figure 50 for components key)

Enhanced Packages

Enhanced valve and piping packages add a strainer to the Basic package supply water pipe. The strainer body is cast brass construction with a stainless steel mesh that is easy to remove for cleaning.

Figure 47: Enhanced Package



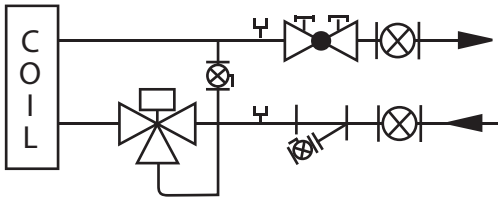
(See Figure 50 for components key)

Premium Packages

Premium valve and piping packages replace the Basic package a ball valve in the return line with a manual or automatic circuit setter. The manual circuit setter is also known as a manual flow control valve. The auto circuit setter acts as both a flow setting device and a shut-off valve. It allows water flow through the fan coil to be set quickly and accurately. The circuit setter includes a cartridge within the valve body that is sized to allow a specific flow rate through the coil without any action required by a system piping balancer.

P/T ports are included, which are used to measure the temperature or pressure drop across the valve. This pressure drop can be compared to factory supplied tables that relate the pressure drop to a specific flow rate. The manual circuit setter valve also has a memory stop so that the correct setting can be found quickly.

Figure 48: Premium Package



(See Figure 50 for components key)

Deluxe Packages

Deluxe valve and piping packages add a strainer to the Premium package. The strainer is available with or without an optional draining (blow-off) valve.

Figure 49: Deluxe Package

(See Figure 50 for components key)

Figure 50: Components Key for Schematics

		**Manual Shutoff Ball Valve:** Water shut-off. Handle rotates 90 degrees.
		**Manual Shutoff Ball Valve with Memory Stop:** Used on return line for limiting water flow.
		**2-Way, N.C., On/Off Valve, Spring Return:** Turn On or Off water flow to the coil in response to 24V or line voltage signal
		**3-Way, N.C., On/Off Valve, Spring Return:** Bypass water flow away from coil in response to 24V or line voltage signal. Includes fixed orifice for balancing.
		**2-Way Modulating Valve (3-wire or proportional):** Modulates water flow in response to 24V signal.
		**3-Way Modulating Valve (3-wire or proportional):** Modulates or bypass water flow in response to 24V signal. Includes fixed orifice for balancing.
		**PT Port:** For connecting a pressure or temperature gauge.
		**Y-Strainer:** Removable screen filters out small particles from supply line during normal system operation.
		**Manually Adjustable Circuit Setter with Shutoff:** Pressure-dependent, ball-type, manual flow control.
		**Cartridge-Type, Auto-Fixed Circuit Setter:** Pressure-compensated, automatic fixed-flow control.
		**Union:** For easy removal of piping from coil.
		**Bypass Balancing Valve:** Adjustable balancing of water flow through the bypass circuit on a 3-way control valve.

Note: Daikin 3-way valves are equipped with a fixed balance orifice in the bypass line, eliminating the need for a separate balancing valve

Control Valve Options

Except for Shut-off Only packages, all valve and piping packages include control valves for controlling water flow. All Daikin control valves are factory assembled and mounted in the supply water pipe downstream of the coil. Several options are available:

Two-Way Two-Position Valves

These valves will be either Fully-Open or Fully-Closed in response to a line voltage (115, 208-230 or 265-277 VAC) or 24 VAC signal from the Daikin thermostat or MicroTech controller. Some means of relieving pump head pressure should be applied when two-way valves are selected. Normally-Open or Normally-Closed valves are available, both spring-return type.

Three-Way Two-Position Valves

These valves either allow full water flow through the coil or divert the flow through a bypass line. The valves respond to a line voltage (115, 203-230 or 265-277 VAC) or to 24 VAC signal from the Daikin thermostat or MicroTech controller. All standard three-way valves come with a fixed-balance orifice in a bypass line to compensate for flow balancing in the bypass position, eliminating the need for an additional balancing valve. Normally-Open or Normally-Closed valves are available.

Two-Way Modulating Valves

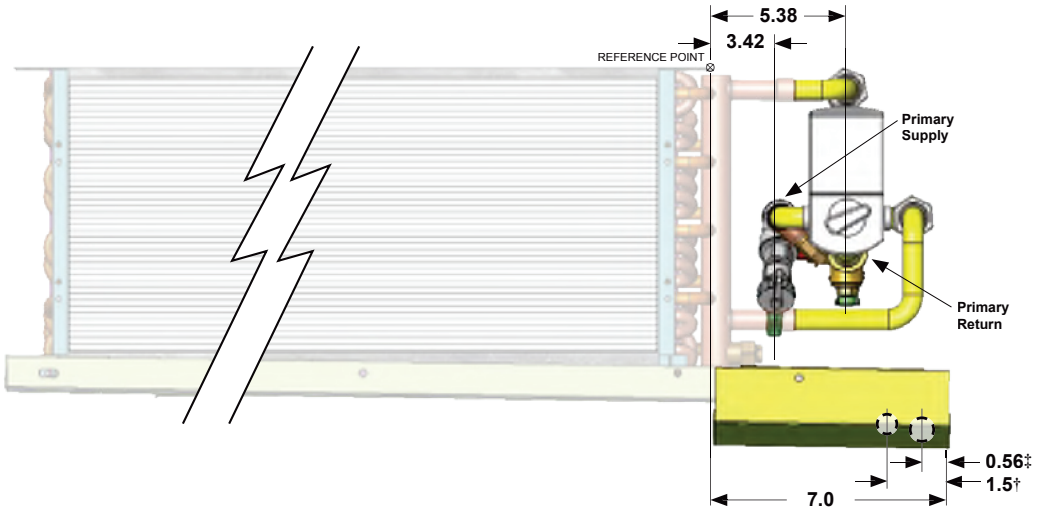
These valves modulate the water flow through the coil in response to a signal from the Daikin thermostat or controller. Standard Daikin modulating valves are three-wire floating point valves. Zero to 10 VDC equal percentage proportional valves are also available. The modulating valves are factory mounted in the supply water pipe upstream of the coil. Daikin modulating valves are failed-in-place type.

Three-Way Modulating Valves

These valves modulate water flow through a coil in response to a signal from a Daikin thermostat or controller. Three-way valves allow water that is directed through the coil to mix with water that is directed through the bypass line. This mixture exits through the leaving water pipe. Modulating valves are three-wire, floating-point valves or 0-10 VDC equal percentage proportional. The modulating valves are factory mounted in the supply water pipe upstream of the coil. Daikin modulating valves are failed-in-place type.

Selecting Correct Size Modulating Valves

Daikin Tools software automatically selects the best modulating valve size for the unit and coil being considered. By combining the ARI performance data, the coil flow rate and the DP across the water coil, the water coil Cv is calculated and the best matching modulating port size is selected. Valve and piping packages can easily be configured and automatically selected using Daikin Tools.



NOTE: MicroTech controllers do not currently support 0-10 VDC Proportional valves.

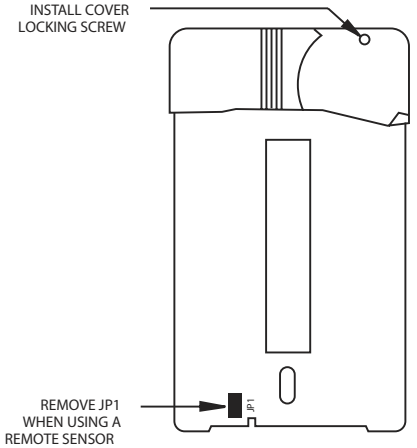
MT 155 Thermostat

Installation

⚠ DANGER



READ THESE INSTRUCTIONS CAREFULLY BEFORE ATTEMPTING TO INSTALL, OPERATE OR SERVICE THIS THERMOSTAT.

Failure to observe safety information and comply with instructions could result in PERSONAL INJURY, DEATH AND/ OR PROPERTY DAMAGE.

To avoid electrical shock or damage to equipment, disconnect power before installing or servicing. Use only wiring with insulation rated for full thermostat operating voltage. Use copper wire only. Insulate or wirenut all unused leads. Any wiring, including the remote probe,may carry the full operating voltage of the thermostat.

To avoid potential fire and/ or explosion do not use in potentially flammable or explosive atmospheres. Retain these instructions for future reference. You must review your application and national and local codes to ensure that your installation will be functional and safe.

Figure 1: Removing Jumper JP-1

1. Install the thermostat with the two furnished mounting screws to a standard 2" × 4" electrical box, 4-11/16" × 21/8" square device box with a 2" x 4" adapter ring or to a 4" × 4" box with accessory adapter plate.
2. For wall installations, mount the thermostat on an inside wall approximately 5 feet above the floor. The location should provide circulation at average room temperature. Avoid direct sunlight or sources of hot or cold air in the room or wall.
3. Remove the knob and then the cover. Mount thermostat base assembly to the outlet box using the screws provided, tighten the screws evenly but do not over tighten. Make wiring connections as noted.
4. To use a remote sensor, remove jumper JP-1 to disable local sensing. See Figure 1. Failure to remove JP-1 when using a remote sensor will cause improper operation of the thermostat. Some units do not have remote sensing capability. See Application Notes.
5. Reinstall the cover assembly. Install cover locking screw provided. Reinstall the knob.
6. Checkout: After wiring and installation are complete, energize the system and check the operation. Adjust the thermostat as necessary to complete at least one cycle. Be sure the thermostat and all other equipment are functioning correctly.

DAIKIN

Thermostat Operation

Temperature Range: 50°F - 90°F (10°C - 32°C)

TA155: A HEAT-OFF-COOL system switch manually selects heating or cooling mode. In the HEAT position, only the heat output cycles with demand. In the COOL position, only the cool output cycles with demand. In the OFF position, heating and cooling outputs are off. Units with a two position system switch or without a system switch must use a load transfer switch when both heating and cooling outputs are used. This prevents control failure and equipment damage caused by direct cycling between loads.

TB155: An ON-OFF system switch enables auto-changeover of heating and cooling modes. In the ON position the thermostat activates heating or cooling outputs dependant upon the relationship between set point and ambient temperature. Heat on to cool on dead band is 4°F. In the OFF position, heating and cooling outputs are off. Units without a system switch cycle between heating and cooling with a 4°F dead band.

FAN: Some units have a switch for manual selection of fan speed. On these units fan operation is either internally wired for fan continuous operation or is dependant upon connection to the fan supply input . When internally wired for fan continuous operation, the fan will be off when the system switch is off. When dependant upon external connections the fan may not be off with the system switch in the off position. The fan supply input is switched to fan speed outputs (HI - MED - LO).

SWITCHED POWER: L1 power is switched to this output any time the system switch is out of the OFF position.

Ratings

Table 1: Fan and system switches

Voltage Rating	Inductive		Resistive Amps	Pilot Duty	Thermostatic Switching
	FLA	LRA			
24 VAC	N.A.	N.A.	N.A.	24 VA	10 VA
120	5.8	34.8	6.0	125 VA	20 VA
240	2.9	17.4	5.0	125 VA	20 VA
277	2.4	14.4	4.2	125 VA	20 VA

Table 2: Wire Lead Colors (if applicable)

Wire Color	Purpose
White with Orange Stripe	Fan High
White with Red Stripe	Fan Med.
White with Brown Stripe	Fan Low
Red	Heat
Blue	Cool
Black	L1
Yellow	L2 or Neutral
Orange	Switched Power
Violet	Fan Supply
Brown	Remote Probe
Brown	Remote Probe

Application Notes

1. To use a remote sensor, remove jumper JP-1 to disable local sensing. See Figure 1. Failure to remove JP-1 when using a remote sensor will cause improper operation of the thermostat. Some units do not have remote sensing capability.
2. Units with remote sensing capability have a four-position terminal block at TB1. If TB1 is two position the unit is local sensing only.
3. Remote probe wiring should be located away from any electrical motors or power wiring
4. Some units are internally wired for permanent fan continuous operation.
5. On units with a Fan Supply input, the operation of the fan is determined by wiring connection. For fan continuous, jumper the Fan Supply input (TB2-5) to the Switched Power output (TB3-3).
6. For fan cycling operation with a call for heat or cool, a fan relay must be used.
7. Observe electrical ratings. Thermostatic outputs are pilot duty only.

MT 155 A/B Thermostat Field Installation

24V Valve Packages on ThinLine™ Vertical Fan Coil Units with Factory-Installed Low Voltage Interface Board

General

⚠ DANGER

READ THESE INSTRUCTIONS CAREFULLY BEFORE ATTEMPTING TO INSTALL, OPERATE OR SERVICE THIS THERMOSTAT.

Failure to observe safety information and comply with instructions could result in PERSONAL INJURY, DEATH AND/ OR PROPERTY DAMAGE.

To avoid electrical shock or damage to equipment, disconnect power before installing or servicing. Use only wiring with insulation rated for full thermostat operating voltage. Use copper wire only. Insulate or wire-nut all unused leads. Any wiring, including the remote probe, may carry the full operating voltage of the thermostat. To avoid potential fire and/ or explosion do not use in potentially flammable or explosive atmospheres. Retain these instructions for future reference. You must review your application and national and local codes to ensure that your installation will be functional and safe.

⚠ CAUTION

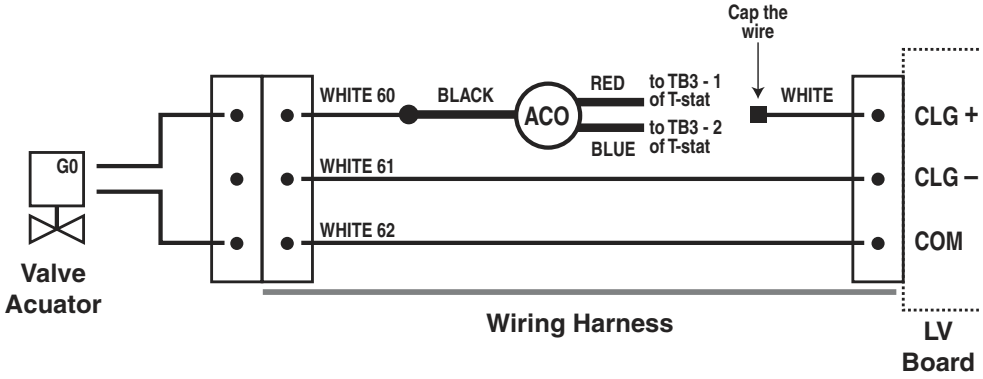
Care should be used to avoid electrostatic discharge to the microprocessor.

This unit has configuration dip switches and jumpers. You may need to reconfigure the thermostat for your application.

Installation

Two-pipe system (Cooling or Heating)

To field wire a T*155 thermostat (either as wall-mounted or unit-mounted) and field-install valve package for a 2-pipe system the following accessories are required:



- Single-Pole Double-Throw Automatic Changeover Switch (SPDT ACO Kit P/N 039398600)
- Thermostat TA155 (kit) – PN 107345302 or Thermostat TB155 (kit) – PN 107345304
- 10K Return Air Sensor - PN 107345501

Step 1: Installing NC (Normally Closed) valve packages

- Solder the appropriate inlet and outlet pipe connections from the valve package to the coil connections. Refer to Figures 1, 2, 3 and 4.
- Snap-on the SPDT ACO Switch on the supply side of the valve package (SPDT ACO Kit P/N 039398600 to be ordered as field-installed option)
- Cut white wire 60 of the wiring harness leading from the Low Voltage Interface Board terminal connection (see Fig. 1) prior to attaching the quick-connect connector of the On-Off valve actuator to the interface board (Fig. 3). The white wire lead going to the actuator will be connected to terminal No. 1 of the ACO switch (see Fig. 5):
  - Terminal No. 1: black wire - to be connected to the valve side (G terminal) with white wire of the terminal strip
  - Terminal No. 2: red wire – to be connected to the red wire (TB3-1) of the thermostat
  - Terminal No. 3: blue wire – to be connected to the blue wire (TB3-2) of the thermostat

DAIKIN

Figure 1: Automatic changeover connection between the valve actuator and the interface board

Step 2: Provide power to thermostat

- Connect a wire from thermostat terminal TB1- 4 (L2 Neutral) to the common terminal on Low Voltage Interface Board (terminal C) Refer to Figures 2 and 4.
- Connect a wire from thermostat terminal TB2- 1 (24VAC) to the 24 V terminal connection R.
- Connect fan speed wires from the thermostat to appropriate Low Voltage Interface Board terminals:
- Connect a wire from thermostat terminal TB2- 2 (High fan speed) to the HI terminal
- Connect a wire from thermostat terminal TB2- 3 (Med fan speed) to the Med terminal
- Connect a wire from thermostat terminal TB2- 24 (Low fan speed) to the Low terminal
- Remove Jumper JP1 to allow the remote mounted 10K Return Air Sensor to operate.
- Mount the 10K Return Air Sensor (PN 107345501) above the filter through the knockout provided Note: (1) If a fan coil unit is to be used for heating or cooling only, the SPDT ACO Switch (SPDT ACO Kit P/N 039398600) is not required. For such applications just follow Step 2.

Figure 2: Low Voltage Interface Board shown with all additional support options

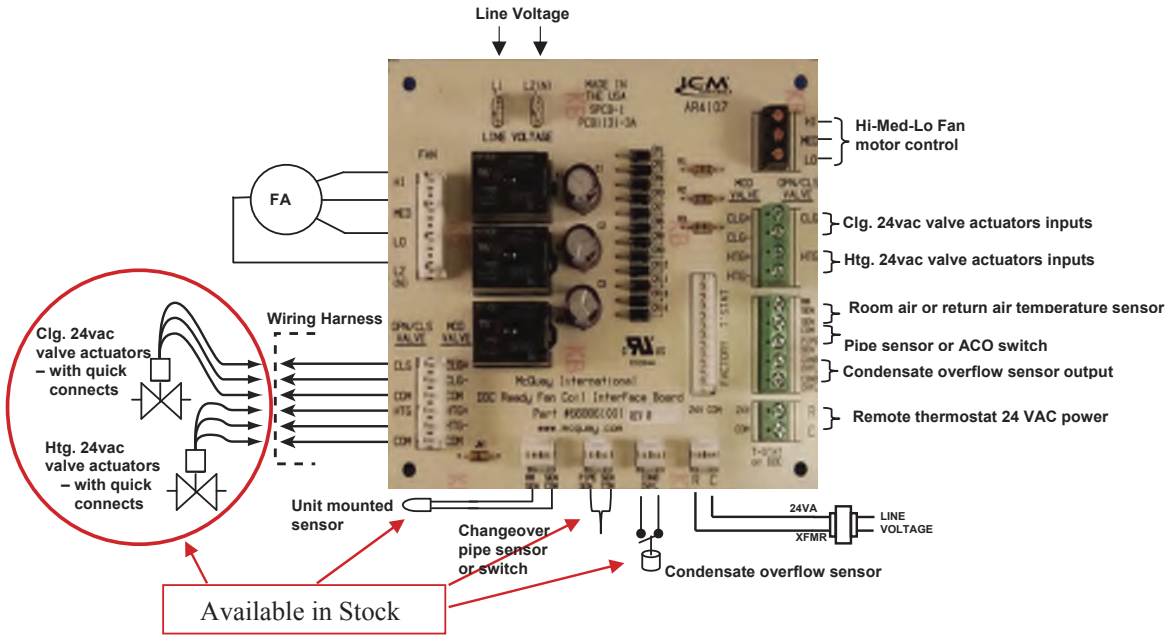


Figure 3: Factory-installed and wired Low Voltage Interface Board (Wiring Diagram)

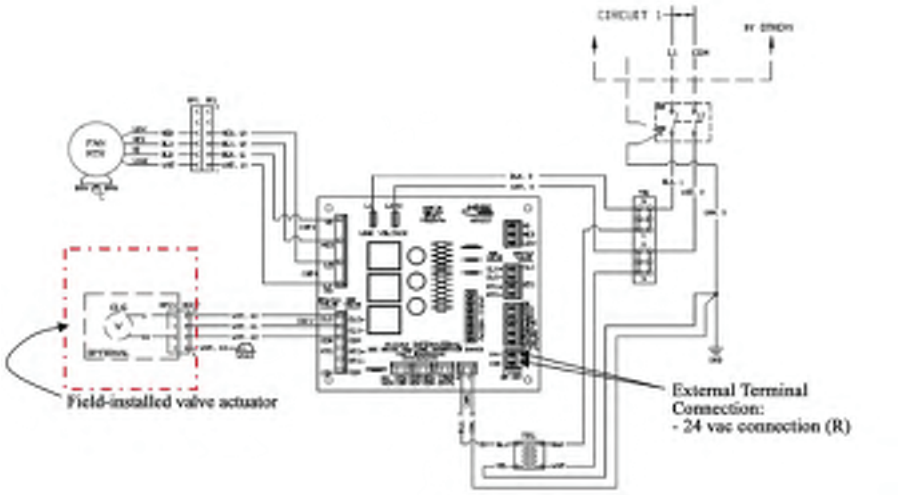

Figure 4: Thermostat TB155 autochangeover to be used with ON-OFF 24V valve packages, SPDT ACO and unit-mounted Low Voltage Interface Board

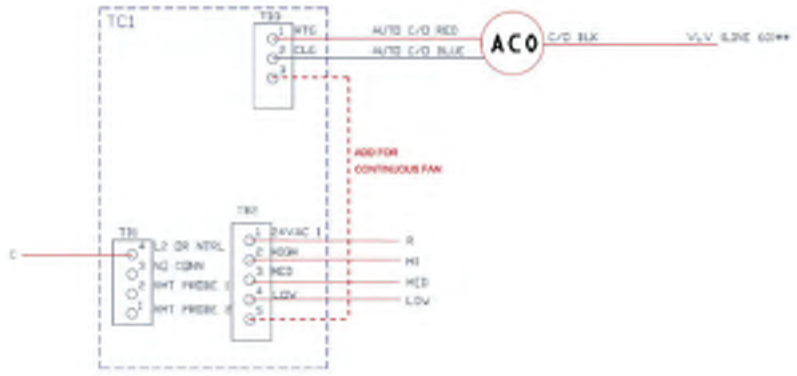

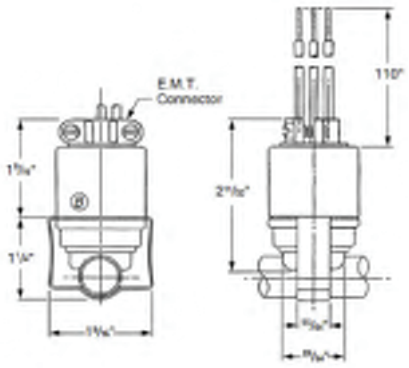

Figure 5: Automatic changeover switch (SPDT ACO Kit P/N 039398600)

Four-pipe system (Cooling and Heating)

Two piping packages will be required for CW and HW coils. The following accessories needed for field-installed thermostat model T*155 (unit-mounted or wall-mounted):

- Thermostat TA155 (kit) – PN 107345302 or Thermostat TB155 (kit) – PN 107345304
- 10K Return Air Sensor - PN 107345501 for unit-mounted applications only (for wall-mounted applications the sensor is imbedded with the thermostat)

Step 1: Installing valve packages

- Solder the appropriate inlet and outlet CW pipe connections from the valve package to the coil connections.
- Solder the appropriate inlet and outlet HW pipe connections from the valve package to the coil connections.
- Snap-on the Quick-connects of the valve actuators to the appropriate terminals of the Low Voltage Interface Board as per Fig. 2.

Step 2: Provide power to thermostat

- Connect a wire from thermostat terminal TB1- 4 (L2 Neutral)to the common terminal on the interface board (terminal C) Refer to Figure 2 and 4.
- Connect a wire from thermostat terminal TB2- 1 (24VAC) tothe 24 V terminal connection R.
- Connect fan speed wires from the thermostat to the appropriate Low Voltage Interface Board terminals:
- Connect a wire from thermostat terminal TB2- 2 (High fan speed) to the HI terminal
- Connect a wire from thermostat terminal TB2- 3 (Med fan speed) to the Med terminal
- Connect a wire from thermostat terminal TB2- 24 (Low fan speed) to the Low terminal
- Remove Jumper JP1 to allow the remote mounted the 10K Return Air Sensor to operate.
- Mount the 10K Return Air Sensor (PN 107345501) above the filter through the knockout provided

NOTE: (2) For thermostats supplied by others refer to the manufacturer's installation literature and use this manual as a guideline only.

MTA 158 Microprocessor Thermostat

ON/OFF Controller

Installation

⚠ DANGER

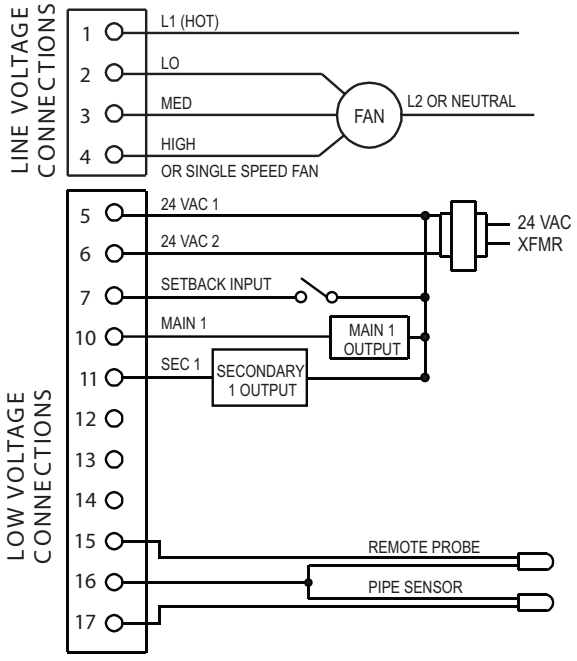
READ THESE INSTRUCTIONS CAREFULLY BEFORE ATTEMPTING TO INSTALL, OPERATE OR SERVICE THIS THERMOSTAT.

Failure to observe safety information and comply with instructions could result in PERSONAL INJURY, DEATH AND/ OR PROPERTY DAMAGE.

To avoid electrical shock or damage to equipment, disconnect power before installing or servicing. Use only wiring with insulation rated for full thermostat operating voltage. Use copper wire only. Insulate or wirenut all unused leads. Any wiring, including the remote probe,may carry the full operating voltage of the thermostat.

To avoid potential fire and/ or explosion do not use in potentially flammable or explosive atmospheres.

Retain these instructions for future reference. You must review your application and national and local codes to ensure that your installation will be functional and safe.



⚠ CAUTION

Care should be used to avoid electrostatic discharge to the microprocessor.

This unit has configuration jumpers. You may need to reconfigure this thermostat for your application.

1. Install the thermostat with the two furnished mounting screws to a standard 4-11/16" × 2-1/8" square device box with a 2" × 4" adapter ring.
2. For wall installations, mount the thermostat on an inside wall approximately 5 feet above the floor. The location should provide circulation at average room temperature. Avoid direct sunlight or sources of hot or cold air in the room or wall.
3. Remove the cover. Mount thermostat base assembly to the outlet box using the screws provided, tighten the screws evenly but do not over tighten. Connect wires as shown in the appropriate wiring diagram for your thermostat style.
4. To use a remote sensor on units with local sensing capability, remove jumper JP-1 to disable local sensing. Failure to remove JP-1 will cause improper operation of the thermostat.

Figure 1: Wiring Diagram for ON/OFF Output Configuration

DAIKIN

*Table 1: MTA 158 Operation**

Output	OFF with Demand	ON with Demand
Main 1 (Terminal 10)	ON at temperature demand	ON at temperature demand
Main 2 (Terminal 12)	NA	NA
Secondary (Terminal 11)	Summer: OFF with heat demand Winter: Disabled	Summer: ON with heat demand Summer: Disabled
Secondary 2 (Terminal 13)	NA	NA

Note: * Operation determined by configuration. See Dip Switch Configuration Table.

5. Remove the LCD plastic protective film. Reinstall the cover assembly. Install the cover locking screw provided in the hole at the left side of the control enclosure to complete the installation.
6. Checkout: After wiring and installation are complete, energize the system and check the operation. Adjust the thermostat as necessary to complete at least one cycle. Be sure the thermostat and all other equipment are functioning correctly.

Thermostat Operation

These thermostats are designed to control ON-OFF, N.O. and N.C. valves, relays and Erie® three wire floating valves. These units may include a fan switch with one or more fan speed selections.

Mode Button Operation

OFF: All thermostat outputs are off, fan is still operational if connected to manual fan speed switch.

AUTO: The thermostat automatically selects heating or cooling mode depending on the set point and room temperature. The appropriate HEAT or COOL indicator is enabled in addition to AUTO. A 3°F dead-band is provided to prevent short cycling between heating and cooling modes. After change-over the control points automatically shift so that the heating off-point or the cooling off-point equals the setpoint temperature.

COOL: The thermostat operates as a cooling-only thermostat. by pressing the UP and DOWN arrows simultaneously. The heating outputs are disabled.

HEAT: The thermostat operates as a heating-only thermostat. The cooling outputs are disabled.

If constructed without a mode button, the thermostat operates in Auto mode, subject to configuration of the 2/4 pipe jumper and pipe sensor input.

Fan Speed Switch Operation

Fan speed is determined by manual selection from fan switch OFF to HIGH, MEDIUM and/ or LOW. In units with the Cycling Fan Option (demand output), the Fan operation (CYCLING vs. CONTINUOUS) is determined by application connections. In OFF position all outputs are off and display blank.

Up/ Down Arrow Operation

A first touch of either arrow will display the set point (a single set point is employed for both heating and cooling). Continued pressure on either arrow will scroll the set point to new values. After three seconds with no pressure on either arrow, the selected set point becomes effective and the display of the room temperature resumes.

Setback Operation

Connection of the Setback Input to 24 VAC 1 will force the control into unoccupied mode (see wiring diagram). Pressing an arrow key or the mode button on the thermostat cover will disable the setback input for one hour.

Pipe Sensor Operation

If cold water is detected, the system will operate in summer mode and the Main output will be cooling. If hot water is detected, the system will operate in winter mode, the Main output will be heating and First Stage Secondary Output will be disabled. In the case of an ambiguous reading, neither hot nor cold, the thermostat will initiate a purge cycle.

Ratings

Table 2: Fan and system switches

Voltage Rating	Inductive		Resistive Amps	Pilot Duty	Thermostatic Switching
	FLA	LRA			
24 VAC	N.A.	N.A.	N.A.	24 VA	10 VA
120 VAC	5.8	34.8	6.0	125 VA	NA

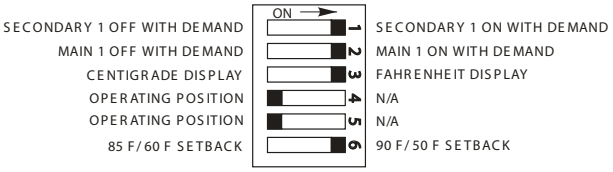
Service Menu



Access: Press UP▲ and DOWN▼ arrows for 5 seconds.

Menu Selection: Select 1 to 5 by pressing the mode button or by pressing the UP▲ and DOWN▼ arrows simultaneously.

Adjust Value: Use UP▲ or DOWN▼ arrow.

Item #	Function	Range	Default
1	Zone Temp Offset	-5.1°F to 5.1°F	0°F
2	Valve Stroke Time	30 sec. to 5 min.	120 sec.
3	Fan Delay to OFF	0 to 10 minutes	0 sec.
4	Compressor Minimum OFF Time	30 sec. to 10 min.	120 sec.
5	Purge Cycle	0 = Time Based 1 = Temperature Based	1

Figure 2: Dipswitch Configuration

Example: This dip switch is configured for on with demand, °F Display, ON-OFF Operation And 90/50°F Setback.

NOTE: Thermostat power must be cycled for changes in dip switch configuration to take effect.

Figure 3: Circuit Board Jumpers

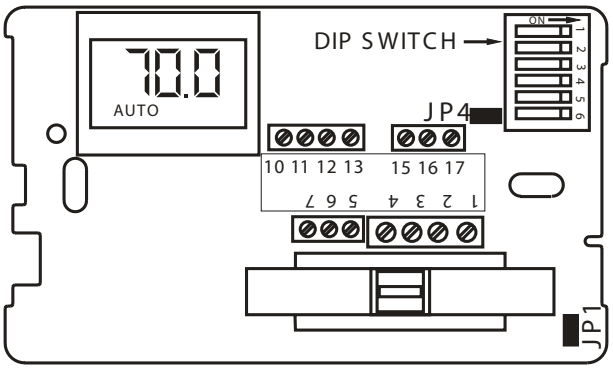


Table 3: Circuit Board Jumper Configuration

Jumper Designation	Jumper Installed ON	Jumper Removed
JP1	Local Sensing	Remote Sensing
JP4	2 Pipe System*	4 Pipe System

Application Notes

1. When no pipe sensor is used the main output controls cooling and the secondary output controls heating.
2. The pipe sensor should be mounted on the main coil input for water system operation and in the main duct system for forced air operation.
3. The set point and operating mode will be retained on a loss of power.
4. When using either a remote probe or pipe sensor, run wiring away from any electrical motors or power wiring.

Power-Up Operating Sequence

Upon application of power, an MTA158 will go directly to normal operation.

Thermostat Operation

These thermostats are designed to control ON-OFF, N.O. and N.C. valves, relays and three-wire floating valves. These units may include a fan switch with one or more fan speed selections.

*Table 2: Main and Secondary Output Operation**

Output	3-Wire Floating	OFF with Demand	ON with Demand
Main 1 (Terminal 10)	Powers main valve open	ON at temp demand	ON at temp demand
Main 2 (Terminal 12)	Powers main valve closed	Cycles ON with demand	Cycles ON with demand
Secondary (Terminal 11)	Powers secondary valve open	Summer: OFF with heat demand Winter: Disabled	Summer: ON with heat demand Winter: Disabled
Secondary 2 (Terminal 13)	Powers secondary valve closed	ON at second stage heating demand	ON at second stage heating demand

Note: * Operation determined by configuration. See Dip Switch Configuration Table.

Mode Button Operation

OFF: All thermostat outputs are off, fan is still operational if connected to manual fan speed switch.

AUTO: The thermostat automatically selects heating or cooling mode depending on the set point and room temperature. The appropriate HEAT or COOL indicator is enabled in addition to AUTO. A 3°F dead-band is provided to prevent short cycling between heating and cooling modes.

After change-over the control points automatically shift so that the heating OFF-point or the cooling OFF-point equals the set point temperature.

COOL: The thermostat operates as a cooling-only thermostat. The heating outputs are disabled.

HEAT: The thermostat operates as a heating-only thermostat. The cooling outputs are disabled.

If constructed without a mode button, the thermostat operates in Auto mode, subject to configuration of the 2/4 pipe jumper and pipe sensor input.

Fan Speed Switch Operation

Fan speed is determined by manual selection from fan switch OFF to HIGH, MEDIUM and/ or LOW. In units with the Cycling Fan Option (demand output), the Fan operation (CYCLING vs. CONTINUOUS) is determined by application connections. In OFF position all outputs are off and display blank.

Up/ Down Arrow Operation

A first touch of either arrow will display the set point (a single set point is employed for both heating and cooling). Continued pressure on either arrow will scroll the set point to new values. After three seconds with no pressure on either arrow, the selected set point becomes effective and the display of the room temperature resumes.

Setback Operation

Connection of the Setback Input to 24 VAC 1 will force the control into unoccupied mode (see wiring diagram). Pressing an arrow key or the mode button on the thermostat cover will disable the setback input for one hour.

Pipe Sensor Operation

If cold water is detected, the system will operate in summer mode and the Main output will be cooling. If hot water is detected, the system will operate in winter mode, the Main output will be heating and First Stage Secondary Output will be disabled. In the case of an ambiguous reading, neither hot nor cold, the thermostat will initiate a purge cycle.

Three Wire Floating Valve Operation

Open and Close outputs are used to position the valve. Stroke time is factory set at two minutes. Outputs are off after reaching full on or off position. Valves are periodically reset for accuracy.

Outside Air Damper Operation

This output is ON any time the control is turned ON.

Application Notes

1. When no pipe sensor is used the main output controls cooling and the secondary output controls heating.
2. The pipe sensor should be mounted on the main coil input for water system operation and in the main duct system for forced air operation.
3. The set point and operating mode will be retained on a loss of power.
4. When using either a remote probe or pipe sensor, run wiring away from any electrical motors or power wiring.

MT 168 0-10 VDC/4-20mA Thermostat

Installation

⚠ DANGER

READ THESE INSTRUCTIONS CAREFULLY BEFORE ATTEMPTING TO INSTALL, OPERATE OR SERVICE THIS THERMOSTAT.

Failure to observe safety information and comply with instructions could result in PERSONAL INJURY, DEATH AND/ OR PROPERTY DAMAGE.

To avoid electrical shock or damage to equipment, disconnect power before installing or servicing. Use only wiring with insulation rated for full thermostat operating voltage. Use copper wire only. Insulate or wire-nut all unused leads. Any wiring, including the remote probe, may carry the full operating voltage of the thermostat.

To avoid potential fire and/ or explosion do not use in potentially flammable or explosive atmospheres.

Retain these instructions for future reference. You must review your application and national and local codes to ensure that your installation will be functional and safe.

⚠ CAUTION

Care should be used to avoid electrostatic discharge to the microprocessor.

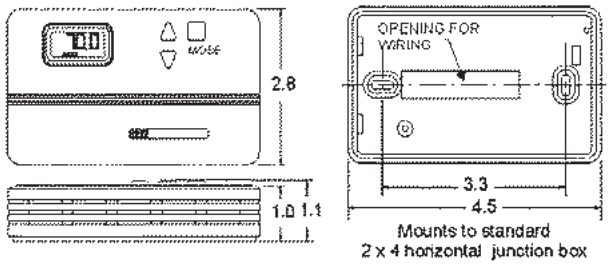
This unit has configuration dip switches and jumpers. You may need to reconfigure the thermostat for your application.

1. Install the thermostat with the two furnished mounting screws to a standard 4-1/16" × 2-1/8" square device box with a 2" × 4" adapter ring.
2. For wall installations, mount the thermostat on an inside wall approximately 5 feet above the floor. The location should provide circulation at average room temperature. Avoid direct sunlight or sources of hot or cold air in the room or wall.
3. Remove the cover. Mount thermostat base assembly to the outlet box using screws provided. Tighten the screws evenly but do not overtighten. Connect wires per wiring diagram.
4. To use a remote sensor on units with local sensing capability, remove jumper JP-1 to disable local sensing. Failure to remove JP-1 will cause improper operation of thermostat.
5. Connecting a jumper between terminals 16 and 17 will disable the secondary output and change the main output to heat mode.
6. Connection of a 24 VAC set-back signal will force the control into unoccupied mode (see diagram). Pressing an arrow key or the mode buttons on the thermostat cover will disable the setback input for one hour.
7. Remove the LCD plastic protective film to complete the installation. Reinstall the cover assembly. Install cover locking screw provided.
8. Checkout: After wiring and installation are complete, energize the system and check the operation. Adjust the thermostat as necessary to complete at least one cycle. Be sure the thermostat and all other equipment are functioning correctly.

People and ideas you can trust.™

DAIKIN

Figure 1: Mounting



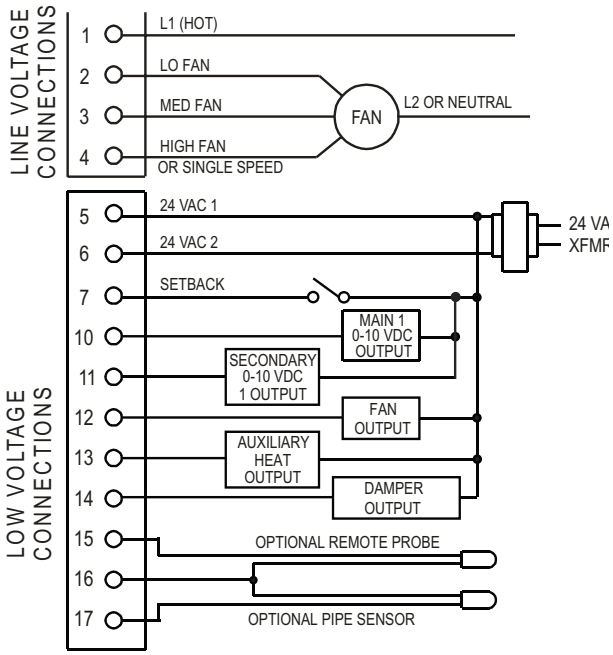


*Figure 2: Typical Wiring**

NOTE: Note: * Specific models may have fewer connections.

Electrical Ratings

Table 1: Fan switch (terminals 1-4) line voltage connections

Voltage Rating	Inductive		Resistive Amps	Pilot Duty	Thermostatic Switching
	FLA	LRA			
24 VAC	N.A.	N.A.	N.A.	24 VA	10 VA
120 VAC	5.8	34.8	6.0	125 VA	NA
240 VAC	2.9	17.4	5.0	125 VA	NA
277 VAC	2.4	14.4	4.2	125 VA	NA

Application Notes

1. When no changeover pipe sensor is used, the main output controls cooling and the secondary output controls heating.
2. The fan output, terminal 12, is energized whenever there is a demand for heating or cooling. This output can be connected to a relay that can be used to provide fan cycling to terminal 1.
3. The changeover pipe sensor should be mounted on the main coil input for water system operation and in the main duct system for forced air operation.
4. The set point and operating mode will be retained on a loss of power.
5. When using either a remote probe or pipe sensor, run wiring away from any electrical motors or power wiring.
6. The auxiliary heat output supplies a 24 VAC signal with call for heat. This output is shipped configured for staged heat.
7. The thermostat is shipped with all dip switches in the “ON” (closed) position.
8. The damper output is ON when mode is AUTO, HEAT or COOL. Damper is OFF in set back.

Thermostat Operation

These thermostats are designed to control 0-10 VDC/4-0 mA valves. These units may include a fan switch with one or more fan speed selections.

Mode Button Operation

OFF: All thermostat outputs are off, fan is still operational if connected to a manual fan switch.

AUTO: The thermostat automatically selects heating or cooling mode depending upon the relationship of the setpoint and the room temperature. The appropriate HEAT or COOL indicator is enabled in addition to AUTO. A 3°F dead band is provided to prevent short cycling between heating and cooling modes. After changeover, the control points automatically shift so that the heating OFF-point equals the set point temperature or the cooling OFF-point equals the set point temperature.

COOL: The thermostat operates as a cooling only thermostat. The heating outputs are disabled.

HEAT: The thermostat operates as a heating-only thermostat. The cooling outputs are disabled.

Fan Speed Switch Operation

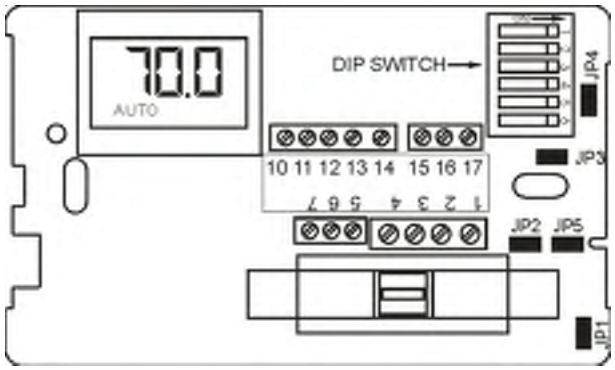
Fan speed is determined by manual selection from fan switch OFF to HIGH, MEDIUM and/or LOW. In the OFF position, all outputs are off and the display is blank.

Up/Down Arrow Operation

A first touch of either arrow will display the setpoint (a single set point is employed for both heating and cooling). Continued pressure on either arrow will scroll the setpoint to new values. After three consecutive seconds on either arrow, the selected setpoint becomes effective and the display of the room temperature resumes.

Configuration

Table 2: Circuit Board Jumper Configuration



Jumper	Closed ON*	Open OFF
JP1	Local Sensing	Remote Sensing
JP2	2 Pipe System	4 Pipe System
JP3	Factory Use Only	
JP4	0-10 VOC Main Output	4-20 mA Main Output
JP5	0-10 VOC Secondary Output	4-20 mA Secondary Output

Table 3: Dip Switch Configuration

Switch	Closed ON*	Open OFF
1	Not Use	Not Used
2	Staged Heat 3°F Diff. (Term. 13)	Aux. Heat No Diff. (Term. 13)
3	°F Display	°C Display
4	Main & Sec. Outputs 0-10 VOC (Term. 10 & 11) requires JP4 & JP5	Main & Sec. Outputs 4-20 mA (Term. 10 & 11) Remove JP4 & JP5
5	Operating Position	Not Used
6	Setback= 90°F & 50°F	Setback = 85°F & 60°F

Note: * On is with the dip switch handle to the right. See diagram.

Figure 3: Circuit Board

Service Menu:

Access: Press UP▲ and DOWN▼ arrows for 5 seconds.

Menu Selection: Select 1 to 5 by pressing the mode button or by pressing the UP▲ and DOWN▼ arrows simultaneously.

Adjust Value: Use UP▲ or DOWN▼ arrow.

Table 4: Service Functions

Item #	Function	Range	Default
1	Zone Temp Offset	-5.1 °F to 5.1 °F	°0 F
2	Valve Stroke Time	30 sec. to 5 min.	120 sec.
3	Fan Delay to OFF	2 to 10 min.	120 sec.
4	Compressor Minimum OFF Time	30 sec. to 10 min.	120 sec.
5	Purge Cycle	0 = time based 1 = temperature based	1

T170 Thermostat

24 VAC/120–277 VAC

3-Speed Fan Control (Continuous or Cycling) or Staged Fan Control

⚠ WARNING

BEFORE ATTEMPTING TO INSTALL, OPERATE, OR SERVICE THIS THERMOSTAT, CAREFULLY READ THESE INSTRUCTIONS.

Failure to observe safety information and comply with instructions could result in PERSONAL INJURY, DEATH, AND/OR PROPERTY DAMAGE.

To avoid potential fire and/or explosion, do not use in potentially flammable or explosive atmospheres.

Retain these instructions for future reference. This product, when installed, is part of an engineered system whose specifications and performance characteristics are not designed or controlled by Daikin. You must review your application and national and local codes to assure that your installation is functional and safe.

⚠ DANGER

Hazardous voltage. To avoid electrical shock or damage to equipment, disconnect power before installing or servicing.

Failure to follow these instructions will result in death or serious injury.

DAIKIN

Installation

Thermostat Model and Part Number

Daikin offers two different thermostats depending on the fan speed control used (Table 1).

Table 1: Thermostat model and part numbers

Model Number	Part Number	Fan Speed Control
TA170-001	107345335	3-Speed Fan Control
TB170-001	107345336	Staged Fan

Note – For a list of thermostat features, refer to ED 3611.

Optional Occupancy Detection Sensors/ Kits

In addition to the T170 thermostat, Daikin offers optional occupancy detection sensors that can be ordered and used in conjunction with the thermostat. When ordering, use the associated kit number(s)

Table 2: Occupancy sensor model and kit numbers

Model Number	Kit Number
SA200-001	6677877211
SB200-001	6677877311
SD200-001	6677877411
SB200-002	6677877511

Mounting and Wiring the Thermostat

⚠ CAUTION

Before applying power, the voltage selection switch must be in the appropriate position. Failure to select the correct voltage can cause thermostat malfunction or permanently damage the thermostat.

⚠ CAUTION

To use a remote sensor on units with local sensing capability, remove jumper JP1 to disable local sensing. Failure to remove JP1 can cause improper operation of the thermostat with a remote probe installed.

⚠ CAUTION

Use copper wire only. Insulate or wire nut all unused leads. Avoid electrostatic discharge to the thermostat. Failure to do so can cause thermostat malfunction or permanently damage the thermostat.

⚠ DANGER

Hazardous voltage. Combined load current is not to exceed 20 amps. Mount only to a grounded metallic box. Low voltage wiring is Class 2. To avoid electrical shock or damage to equipment, disconnect power before installing or servicing. Failure to follow these instructions will result in death or serious injury.

The thermostat base mounts to a field provided 4" × 4" outlet box with a 2" × 4" mud ring (Figure 1). The thermostat cover assembly mounts to the thermostat base.

1. Disconnect power before installing or servicing.
2. Run line voltage wiring (and low voltage wiring if applicable) into the field provided outlet box and mud ring (Figure 1).
3. Locate all connections within the mud ring/connection box and wire nut all unused wires.
4. Remove the thermostat cover assembly from its base to gain access to the circuit board (Figure 2).
5. On the circuit board, set the voltage selection switch (Figure 2) to the appropriate voltage for the application
   - 24 V = 24 VAC
   - 110–277 V = 120, 240, or 277 VAC.

NOTE: The circuit board is shipped with the voltage selection switch in the 110-227 V position. For 24 VAC use, the switch must be in the 24 V position.

6. The circuit board is also equipped with configuration jumpers (JP1, JP3, and JP4 in Figure 2). Depending on the application, it may be necessary to reconfigure the following jumpers:
   - **JP4:** 2/4 Pipe Sensor Jumper - This jumper selects between 2-pipe (jumper ON) and 4-pipe (jumper OFF) operation (Fan Operation).
   - **JP3:** Door/Window Switch Jumper - This jumper is shipped normally open. Placement of a jumper allows for occupancy detection and door/window switch only operation (Optional Occupancy Detection Equipment Operation).
   - **JP1:** Removal of this jumper allows the sensor to be located in a remote location.
7. Connect the color coded thermostat wires (Figure 3) to the line voltage wires located in the mud ring/connection box and secure the connections with wire nuts.
8. Install the thermostat base to the mud ring/outlet box using two furnished mounting screws. Tighten the screws evenly but do not over tighten.

NOTE: An output ratings chart (Table 3) is located on the inside of the base.

9. With the base now secured, verify that the circuit board is firmly snapped into the cover and is not dislodged.
10. Install the cover assembly to the base, pressing firmly to engage the cover locking snaps.

DAIKIN

Figure 1: Mounting the thermostat

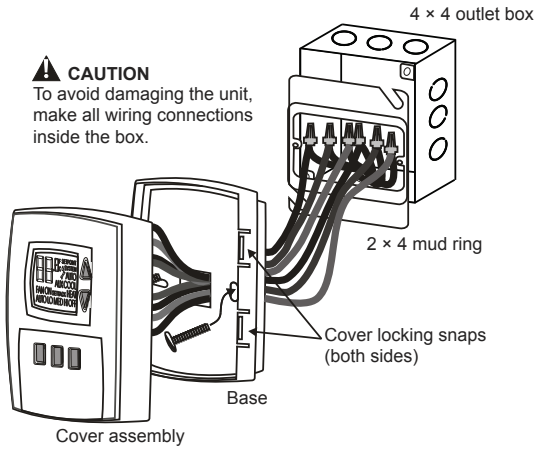

Figure 2: Circuit board

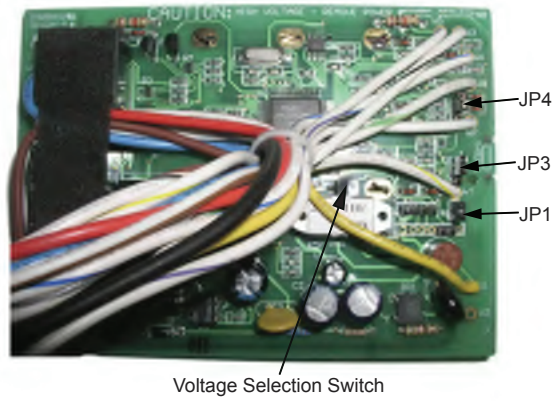

Figure 3: Wiring diagram

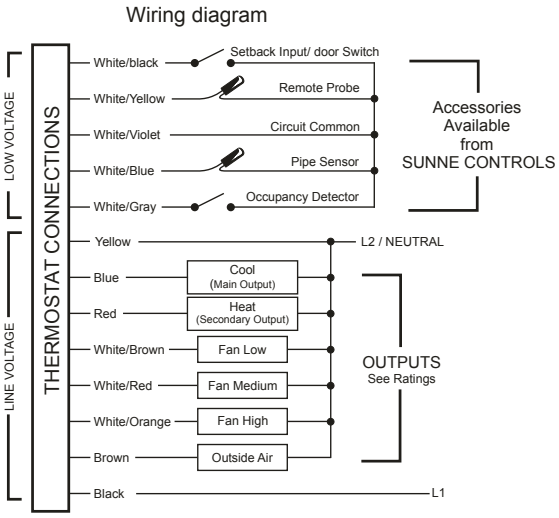

Table 3: Output ratings

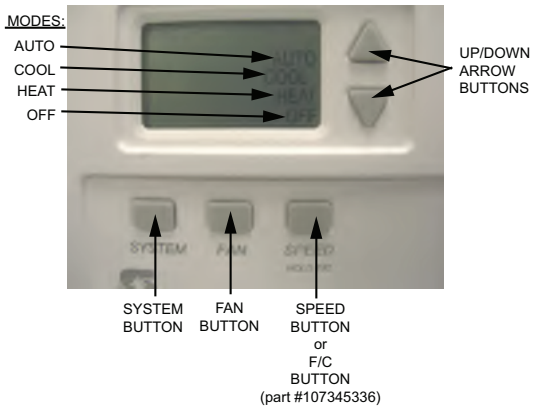


Voltage	Inductive		Resistive Amps	Pilot Duty	HP
	FLA	LRA			
24 VAC	NA	NA	NA	24 VA	NA
120 VAC	5.8	34.8	6.0	125 VA	1/4
240 VAC	2.9	17.4	5.0	125 VA	1/4
277 VAC	2.4	14.4	4.2	125 VA	1/4

Operation

Thermostat Button Operation

The thermostat interface (Figure 4) contains buttons for use in navigating to accompanying menus/screens and for performing specific operations. These buttons and operations are described below.

Figure 4: Thermostat interface (model #TA170-001 shown)

System Button Operation

The System button (Figure 4) contains and displays the following modes of operation:

OFF—All thermostat outputs are off. The fan is still operational if FAN ON is selected.

AUTO—The thermostat automatically selects heating or cooling mode depending on the set point and room temperature. If demand exists, the appropriate HEAT or COOL icon illuminates. A 3°F dead band is provided to prevent short cycling between heating and cooling modes. After changeover, the control point automatically shifts so that the control OFF point equals the set point temperature.

COOL—The thermostat operates as a cooling only thermostat.

HEAT—The thermostat operates as a heating only thermostat.

Up/Down Arrow Button Operation

4. Use the Up▲ and Down▼ arrow buttons (Figure 4) to increase or decrease the temperature.

Fan Button Operation

Use the Fan button (Figure 4) to control operation of the fan. In the ON position, the fan output operates continuously. In the AUTO position, the output cycles with demand. In the OFF position, all outputs are off.

NOTE: Model #TB170-001 (part #107345336) has staged fan control.

Speed Button Operation (TA170-001)

The fan Speed button (Figure 4) for model #TA170-001 (part #107345335) is determined by manually selecting HI, MED, or LO. Press and hold the Speed button for five seconds to toggle the displayed temperature from Fahrenheit to Celsius.

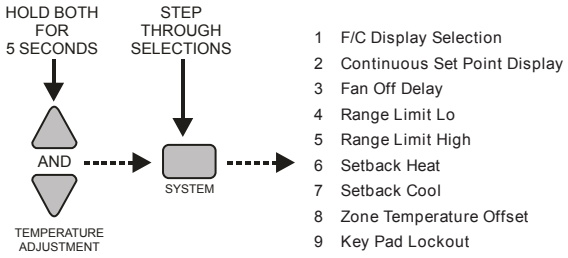
F/C Button Operation (TB170-001)

Model #TB170-001 (part #107345336) is configured for staged fan control and therefore utilizes a F/C button (Figure 4) instead of a Speed button. When pressed, the F/C button toggles between Fahrenheit and Celsius.

Verifying Thermostat Operation

To verify thermostat operation after mounting and wiring it, perform the following:

1. Energize the system.
2. Set the fan to ON.
3. Select each fan speed, if available, to verify operation.
4. Set the system button to AUTO or other available selection.
5. Using the UP▲ arrow, adjust the temperature to more than 5°F above ambient temperature to cycle on heating.
6. Using the DOWN▼ arrow, adjust the temperature to more than 5°F below ambient temperature to cycle on cooling.



Thermostat Menu Functions

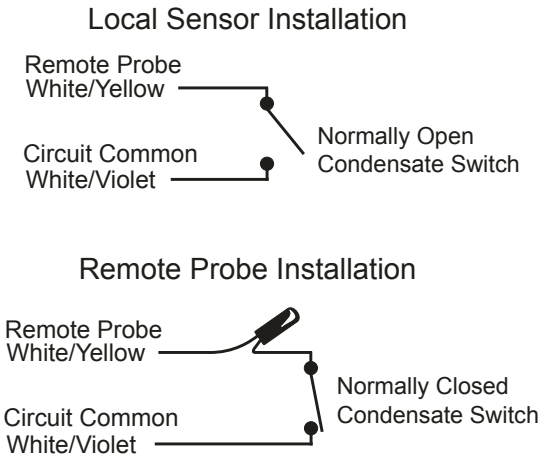
The thermostat menu contains nine functions which can be accessed using controls on the thermostat. Accessing the menu functions and details of each function are described below.

Menu Function Access

1. Press and hold the UP and DOWN arrow buttons (Figure 5) for five seconds.
2. The current display clears and the number “1” appears.
3. 3 Press the SYSTEM button to scroll to the next item number.
4. Use the UP and DOWN buttons to make changes within the selected number.

Figure 5: Thermostat menu

1. **F/C (Fahrenheit/Celsius) display selection:** When this function is selected, the F and C icons appear and the selected icon flashes. To toggle between F or C, press the up or down arrow button.
2. **Continuous set point display:** When this function is selected, the F or C icon, current digits, and the set point icon appear. If the Continuous set point display is enabled, the set point icon flashes. To toggle between continuous display of set point and display of zone temperature, press the up or down arrow button.
3. **FAN OFF delay:** When this function is selected, the FAN, OFF, and digits appear. The digits represent the number of seconds the fan stays on after the heating and cooling outputs are turned off. To increase or decrease the value from 0–255 seconds, press the up or down arrow button.
4. **Range limit low:** When this function is selected, the current minimum range setting, the SET POINT icon and the LO icon appear. To increase or decrease the value, press the up or down arrow button.
5. **Range limit high:** When this function is selected, the current maximum temperature range adjustment, SET POINT icon, and LO icon appear. To increase or decrease the value, press the up or down arrow button.



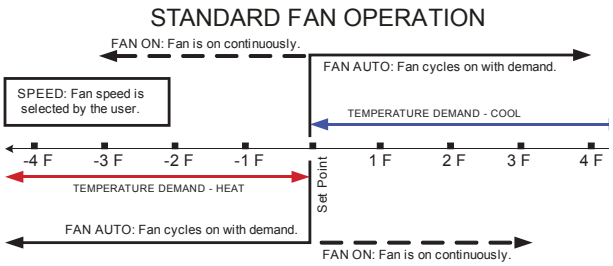
6. **Set back heat:** When this function is selected, the current temperature range adjustment, the SET BACK icon, and the HEAT icon appear. To increase or decrease the value, press the up or down arrow button.
7. **Set back cool:** When this function is selected, the current Cool setback value, the SET BACK icon, and the COOL icon appear. To increase or decrease the value, press the up or down arrow button.
8. **Zone temperature offset:** When this function is selected, the numeric ones and tenths (0.0) appear with a leading minus sign. To increase or decrease the value +/– 9°F, press the up or down arrow button. Increments are made in 1°F and 0.5°C.
9. **Keypad lockout:** When this function is selected, the ON and OFF icons appear. The enabled icon flashes. OFF is the default. ON disables the keypad except for entry into the service menu. To increase or decrease the value, press the up or down arrow button.

NOTE: In the event of a power failure, these values are stored and can be recalled.

Condensate Overflow Interrupt

The remote probe input can be used with a condensate overflow switch (CO), either in conjunction with a remote probe (normally closed CO switch, Figure 6), or with local sensing (normally open CO switch, Figure 6). When the condensate switch activates, the thermostat displays a service wrench icon and disables all outputs.

Figure 6: Local and remote probe installation



Fan Operation

The thermostat may be factory configured for standard or staged fan operation.

Standard Fan Configuration (TA170-001)

Units with standard fan operation (Figure 7) have a selectable fan Speed button.

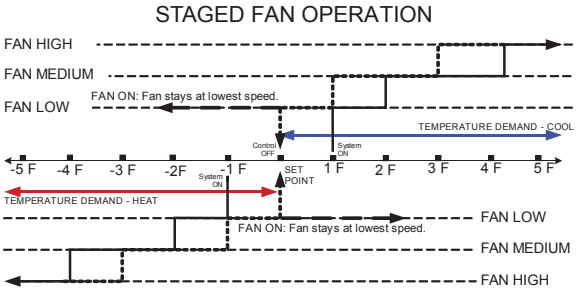


Figure 7: Standard fan operation

Staged Fan Configuration (TB170-001)

Factory configuration is available for staged fan operation (Figure 8) to provide occupant comfort while using the most effective fan speed.

Figure 8: Staged fan operation

Controlled Off Factory Configuration

A factory configuration may be provided for minimum heating and cooling requirements. Using this configuration, the HEAT and COOL outputs are automatically cycled on at the heat setback limit. Your thermostat may not have this feature.

Fan Coil Operation

Fan Coil operation is either a 2-pipe or 4-pipe configuration which is determined by jumper selection JP4 (Mounting and Wiring the Thermostat).

2-Pipe Operation

In this configuration, the thermostat permanently disables the secondary output and disables the fan from cycling in an invalid mode. The main output configuration is dependent on the pipe sensor input. With a pipe sensor connected, the thermostat automatically selects heating or cooling depending on the sensed water temperature. If the pipe sensor input is open (unconnected), the main output only cools. If the pipe sensor input is shorted, the main output only heats. Normal thermostat default is for 4-pipe operation. For 2-pipe operation, install a jumper on JP4.

4-Pipe Operation

In this configuration, both the main output (COOL) and the secondary output (HEAT) are available. These both cycle ON depending on the mode of the thermostat. With a pipe sensor connected, the thermostat automatically changes the main output to heat and disables the secondary output if the main coil water is hot. For 4-pipe operation, the JP4 jumper is removed.

Pipe Sensor Operation

A pipe sensor can be connected when the thermostat is configured for either 2-pipe or 4-pipe configuration. The pipe sensor is used to determine the water temperature in the main coil, which should be connected to the primary output.

Pipe sensor input—use a 10K Remote Probe or a standard ON-OFF Aquastat for summer/winter changeover.

Purge Cycle

With a pipe sensor connected, the thermostat initiates a purge cycle if the sensed water temperature is ambiguous (not adequately hot or cold). The sequence for purge cycle operation is as follows:

1. The thermostat has a call for heat or cooling.

NOTE: If at any time the call goes away, the thermostat stops the purge cycle.

2. The thermostat checks the pipe sensor to verify water temperature.
3. If the water temperature is beyond 15°F of the set point, normal HVAC control occurs.
4. If the water temperature is not beyond 15°F of the set point, the thermostat checks to see if the water temperature is above 80°F or below 60°F.

   If yes, normal HVAC control occurs.

   If no, the thermostat opens the main output (COOL) for three minutes.

5. After the three minute purge cycle occurs, the thermostat checks to see if the water temperature is more than 15°F from the set point, or above 80°F, or below 60°F.

   If yes, normal HVAC operation occurs.

   If no, the valve is left open and the thermostat continues to search for a valid reading.

NOTE: If at any time the demand goes away, the thermostat will stop the purge cycle.

Table 4 shows output operation, depending on the sensed water temperature.

Table 4: Output operation

2-Pipe/4-Pipe Selection	Water Temperature	Output Operation	
		Main Output	Secondary Output
2-pipe JP4 ON	Cold	Cooling only The fan does not cycle ON with a heat demand.	Disabled
	Hot	Heating only The fan does not cycle ON with a cool demand.	Disabled
4-pipe JP4 OFF	Cold	Cooling	Heating
	Hot	Heating only The fan does not cycle ON with a cool demand.	Disabled

Setback Operation

In this configuration, the low level switch input normally is open. To enable setback operation, the JP3 jumper is removed (Mounting and Wiring the Thermostat). The input will close and the thermostat heating and cooling setback limits can then be used as temperature control points. Fan operation in setback is cycled with demand. Press any thermostat key to override setback for one hour. Setback overrides any user setting except if the control is turned to OFF.

DAIKIN

Optional Occupancy Detection Equipment Operation

The T170 thermostat can be used with optional S200 series occupancy detection equipment. Purchasing and installing this equipment to compliment the thermostat adds energy savings by setting back HVAC operation during occupied and unoccupied times. Optional detection equipment configurations and operation are described below.

SB200-001 Occupancy Sensor

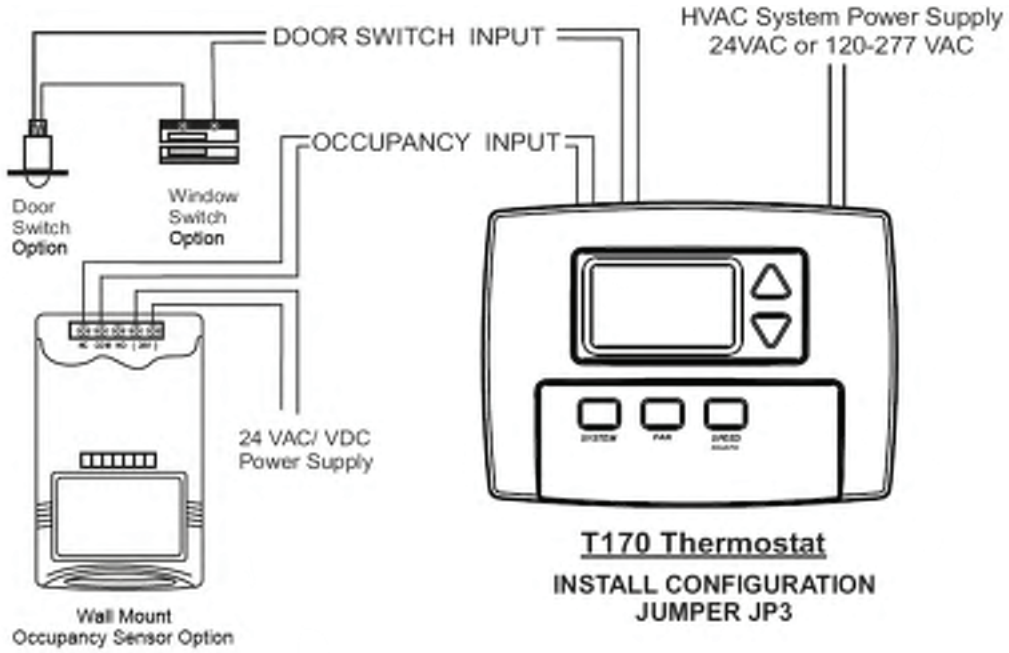
The SB200-001 occupancy sensor (Figure 9) serves as an occupancy sensor for automatic control of a guest room HVAC system. It incorporates an innovative dual delay processor which allows the sensor to verify the nature of occupancies, and is capable of eliminating unnecessary actuations of the HVAC device due to unintentional passages or short time occupancies. The sensor may also serve as a slave sensor (Figure 11).

The sensor switch is open in occupied mode and closed in unoccupied mode. An optional door and/or window switch (Figure 9) is open when the door/window is open and is closed when the door/window is closed.

NOTE: To use this configuration, a jumper must be installed to JP3 to allow occupancy input.

An optional door and/or window switch (Figure 9) can be added for use with the SB200-001 sensor.

Operation



In an occupied mode, the thermostat operates normally and looks for a door open signal. When the door opens, the thermostat waits for a door close signal. If the door is open for more than two minutes, the thermostat turns the HVAC system outputs to OFF. During this two minute period, if any button is pressed on the keypad, the time delay is extended to ten minutes. The time delay can only be extended once. Once the HVAC outputs transition to OFF, a door closure is required to re-enable the outputs. When the door closes, the thermostat starts a two minute timer and tries to detect occupancy. If the timer expires and no occupancy is detected, the thermostat transitions to an unoccupied state. If occupancy is detected while the timer is running, the thermostat will remain in the occupied mode.

In an unoccupied mode, the thermostat sets heating and cooling set points to setback values as determined by factory or user settings. The fan is automatically set to cycle with demand. The thermostat continually monitors the occupancy sensor and will enter into occupied mode if occupancy is detected.

If the installation is only using a door/window switch, the thermostat will disable the HVAC outputs if this output is open for longer than two minutes.

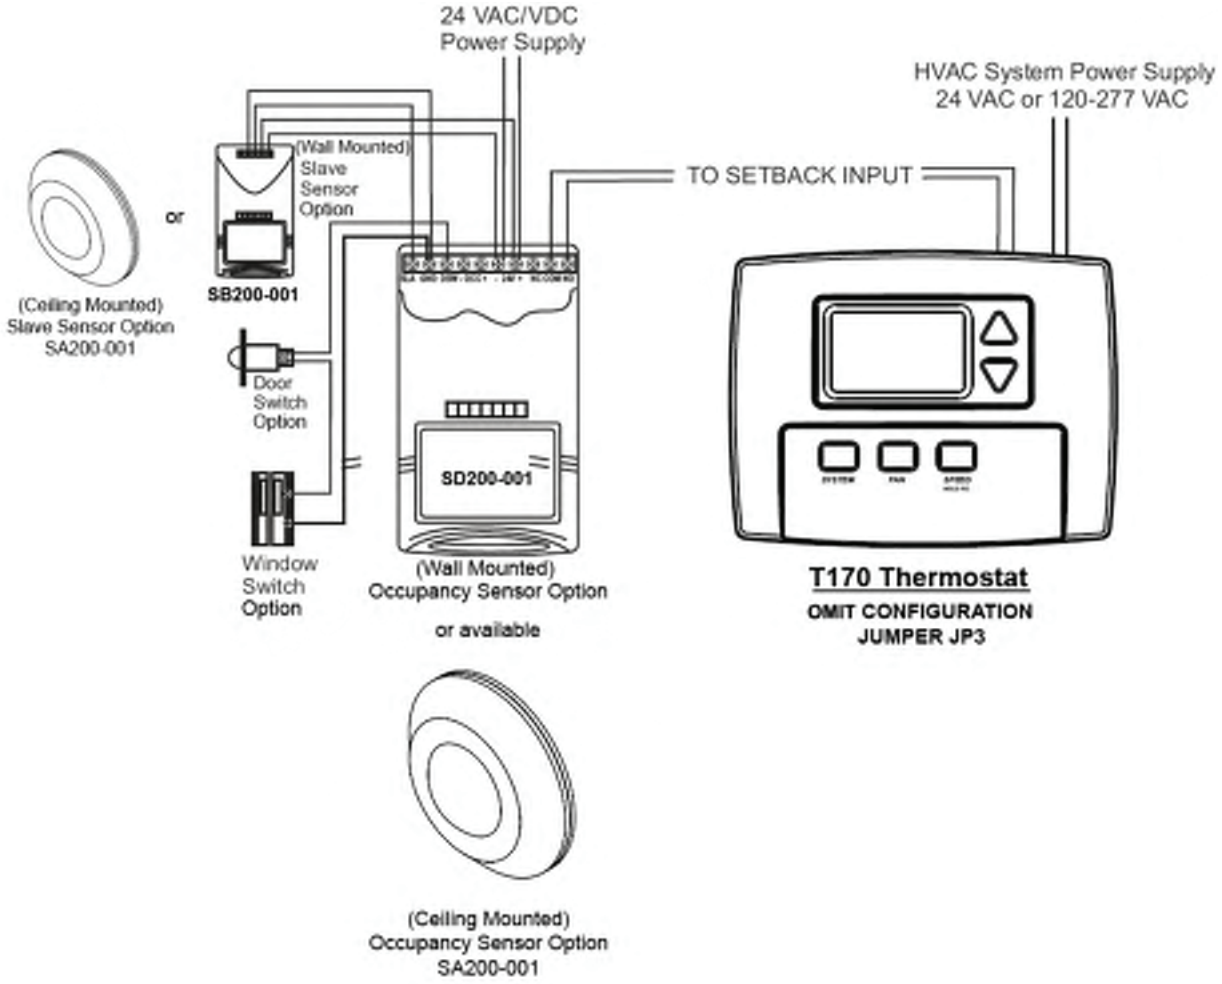
To enable door/window switch only operation, install a jumper to JP3 (Mounting and Wiring the Thermostat) and the occupancy input must be shorted to circuit common.

Figure 9: Optional equipment configuration #1

SD200-001 Occupancy Sensor

The SD200-001 occupancy sensor (Figure 10) serves as a master sensor for a guest room HVAC management system. The sensor provides HVAC operation according to occupancy status, as well as door/window switch monitoring, selectable high/low temperature setback, form-C output, slave sensor connectivity, and a five minute door open HVAC shut-off.

NOTE: To use this configuration, the jumper to JP3 is removed to allow setback input.



An optional door and/or window switch (Figure 10) and slave sensor can be added for use with the SD200-001 sensor.

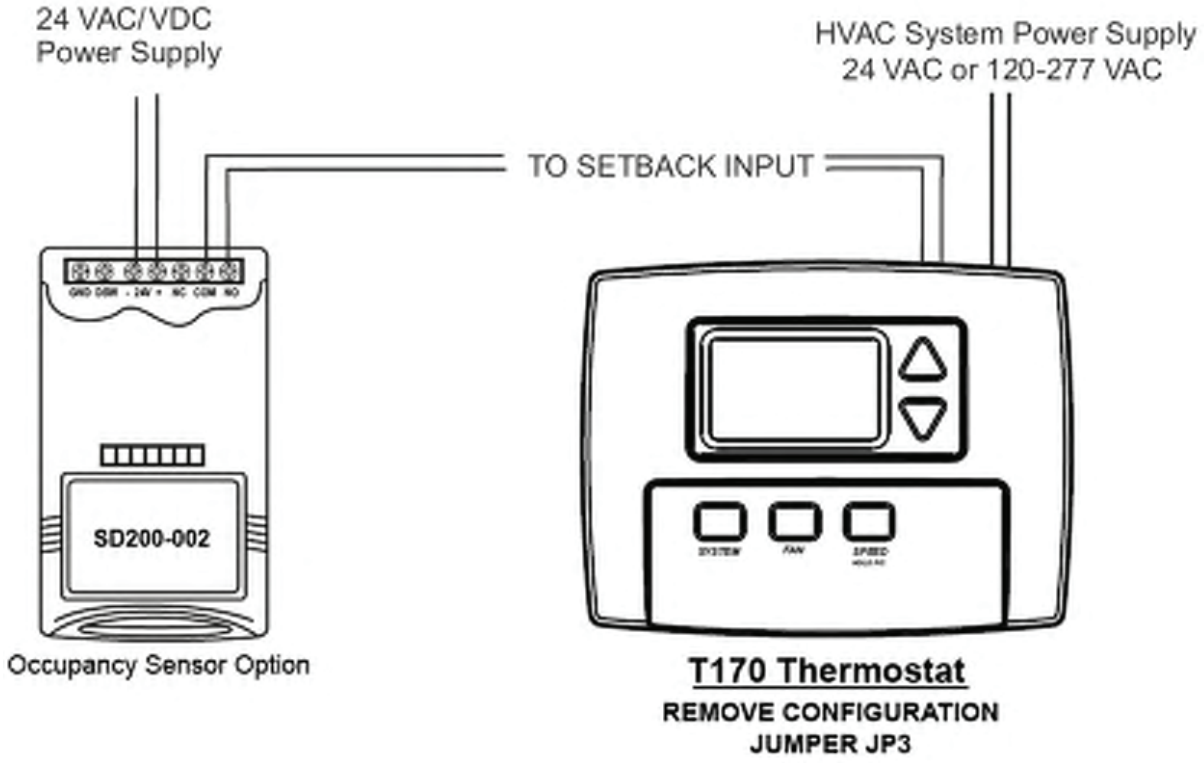
Operation

In an occupied mode, the SD200-001 occupancy sensor (Figure 10) and door switch use advanced microprocessor logic to determine occupancy. A door open signal will initiate occupancy status detection. If the sensor determines that a room is occupied, it will allow normal HVAC control. The sensor will wait for another door open signal before determining occupancy again.

In an unoccupied mode, the sensor continually monitors the room. Any occupancy detection will set the operation to occupied mode.

Figure 10: Optional equipment configuration #2

SD200-002 Occupancy Sensor



The SD200-002 occupancy sensor serves as a stand alone master sensor for a guest room HVAC management system. The sensor provides HVAC operation according to occupancy status, as well as selectable high/low temperature setback, form-C output, and a five minute door open HVAC shut-off. This system provides basic room setback and is ideal for control of HVAC in commercial spaces.

NOTE: To use this configuration, the jumper to JP3 is removed to allow setback input.

Operation

With each occupancy detection, an OFF delay is started and can be set to delay for up to 30 minutes.

Figure 11: Optional equipment configuration #3

⚠ WARNING

READ THESE INSTRUCTIONS CAREFULLY BEFORE ATTEMPTING TO INSTALL, OPERATE OR SERVICE THIS THERMOSTAT.

Failure to observe safety information and comply with instructions could result in PERSONAL INJURY, DEATH AND/OR PROPERTY DAMAGE.

To avoid electrical shock or damage to equipment, disconnect power before installing or servicing and use only wiring with insulation rated for full thermostat operating voltage.

Before installing this control, the Voltage Selection Switch must be placed in the correct position. See instructions. To avoid potential fire and/or explosion do not use in potentially flammable or explosive atmospheres.

Retain these instructions for future reference. This product, when installed, will be part of an engineered system whose specifications and performance characteristics are not designed or controlled by PECO. You must review your application and national and local codes to assure that your installation will be functional and safe.

⚠ CAUTION

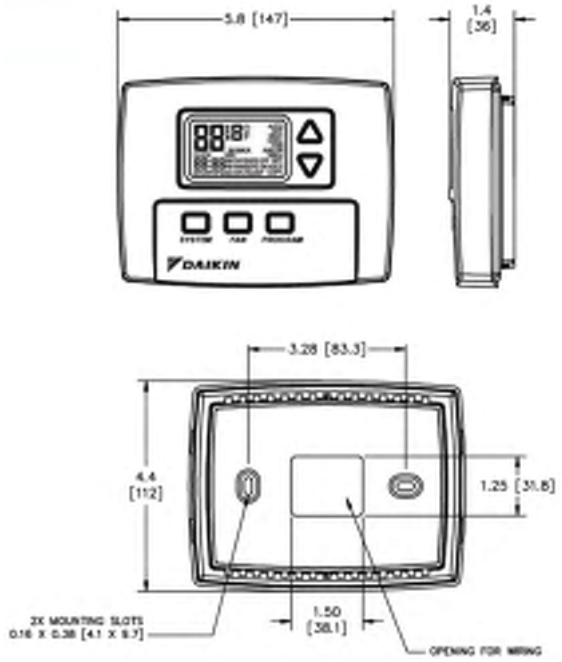
- Use copper wire only, insulate or wire nut all unused leads.
- Care should be used to avoid electrostatic discharge to the T180 thermostat.
- This unit has configuration jumpers. You may need to reconfigure this thermostat for your application

Applications and Features

For 2 or 4 Pipe Fan Coil and ON/OFF Control Applications

- 7 Day, 4 Event Programmability
- System Selection: OFF-Heat-Cool-Auto-Setback
- 6 Outputs: 1H, 1C, Up to 3 Fan, OA Damper
- Fan Control: 1-3 Speeds
  - — Cycling (Auto) or Continuous (ON)
  - — Automatic Fan Speed Staging (TB180 models only)

Connections for:



- Fan Coil Pipe Sensor
- Remote Temperature Probe
- Occupancy Control
- Door Switch or Setback
- Condensate Overflow

Thermostat Model and Part Number

Daikin offers two different 7-Day Programmable Digital Heating/Cooling Thermostat with constant fan or Fan cycled, On/Off Valve Control depending on the fan speed control used (See Table 2).

Table 2: Thermostat Model and Part Number

Model Number	Part Number	Fan Speed Control
TA180-001	910119110	3-speed fan control
TB180-001	910119111	Staged fan control

Optional Sensors/Kits

In addition to the T180 thermostat, Daikin offers optional sensors for occupancy detection (page 14 and page 15) and 10K pipe sensor page 12) that can be ordered and used in conjunction with the thermostat. Use the associated kit number(s) provided in Table 3 when ordering.

Table 3: Sensor Model and Kit Numbers

Sensor Model Number		Daikin Part Number
Occupancy Detection Sensor	SB200-001	6677877311
	SD200-001	6677877411
	SD200-002	6677877511
10K Pipe Sensor		107201601

Installing, Mounting and Wiring the Thermostat

⚠ CAUTION

Before applying power, the voltage selection switch must be in the appropriate position. Failure to select the correct voltage can cause thermostat malfunction or permanently damage the thermostat.

⚠ CAUTION

To use a remote sensor on units with local sensing capability, remove jumper JP1 to disable local sensing. Failure to remove JP1 can cause improper operation of the thermostat with a remote probe installed.

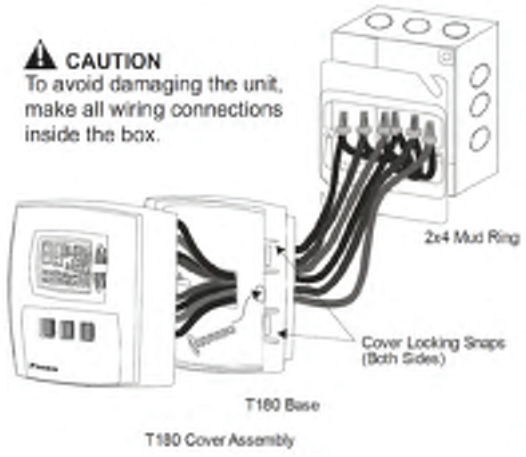
⚠ CAUTION

- Use copper wire only. Insulate or wire nut all unused leads.
- Avoid electrostatic discharge to the thermostat.
- Failure to do so can cause thermostat malfunction or permanently damage the thermostat.

⚠ DANGER

Hazardous voltage. Combined load current is not to exceed 20 amps. Mount only to a grounded metallic box. Low voltage wiring is Class 2. To avoid electrical shock or Damage to equipment, disconnect power before installing or servicing. Failure to follow these instructions will result in death or serious injury

Figure 2: Mounting the Thermostat



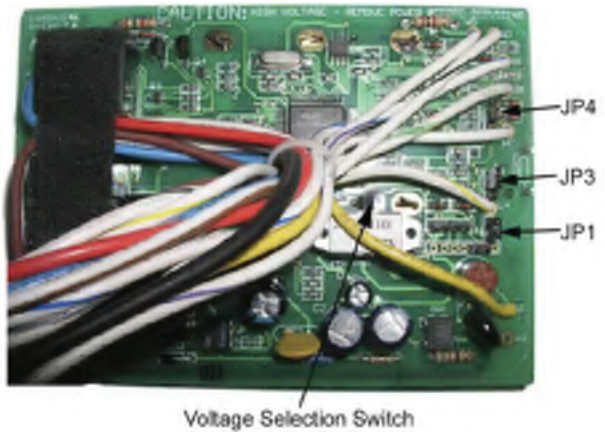


Figure 3: Circuit Board

The thermostat should be used indoors only. It should be mounted on an inner wall in a location with freely circulating air, and where it will be responsive to changes in room temperature. Avoid mounting near heat generating appliances (i.e. TV, heater, refrigerator), or in direct sunlight.

The thermostat base mounts to a field provided 4” × 4” outlet box with a 2” × 4” horizontal mud ring. The thermostat cover assembly mounts to the thermostat base.

1. Disconnect power before installing or servicing.
2. Run line voltage wiring (and low voltage wiring if applicable) into the field provided outlet box and mud ring (Figure 2).
3. Locate all connections within the mud ring/connection box and wire nut all unused wires.
4. Remove the thermostat cover assembly from its base to gain access to the circuit board (Figure 3).
5. On the circuit board, set the voltage selection switch (Figure 3) to the appropriate position prior to application of power.
   - 24V = 24 VAC
   - 110-277 V = 120, 240 or 277 VAC

NOTE: The circuit board is shipped with the voltage selection switch in the 110-227 V position. For 24 VAC use, the switch must be in the 24 V position

6. The circuit board is also equipped with configuration jumpers (JP1, JP3, and JP4 in Figure 3). Depending on the application, it may be necessary to reconfigure the following jumpers:

   JP1 Jumper Selection – Remote Temperature Sensor

   Local Sensing – Install JP1

   Remote Sensing – Remove JP1 – Accessory sensors are available in standard 60" lengths but can be extended to meet application requirements.

   JP3 Jumper Selection – HVAC Setback Systems

   The JP3 jumper allows the T180 to be configured for Setback, Occupancy Detection or Door Switch Only Occupancy Operations. For further descriptions of these conditions please see the Technical and Application Notes, page 12.

   - Setback Operation - Remove JP3
   - Occupancy Detection - Install JP3
   - Door Switch Only - Install JP3

   JP4 Jumper Selection – 2 or 4 Pipe Operation

   Connection of a pipe sensor will change the operation of the outputs as shown in Table 4. (See Technical Notes for further information on Pipe Sensor Operation, page 12)

   - 2-Pipe Operation - Install JP4 - The thermostat will permanently disable the Secondary Output and disables system and fan invalid modes.
   - 4-Pipe Operation - Remove JP4 - Both the Main Output (COOL) and Secondary Output (HEAT) will be available.

7. Connect the color coded thermostat wires (Figure 4) to the line voltage wires located in the mud ring/connection box and secure the connections with wire nuts.
8. Install the thermostat base to the mud ring/outlet box using two furnished mounting screws. Tighten the screws evenly but do not over tighten.

NOTE: Note: An output ratings chart (Table 5) is located on the inside of the base.

9. With the base now secured, verify that the circuit board is firmly snapped into the cover and is not dislodged.
10. Install the cover assembly to the base, pressing firmly to engage the cover locking snaps.

Figure 4: Wiring Diagram

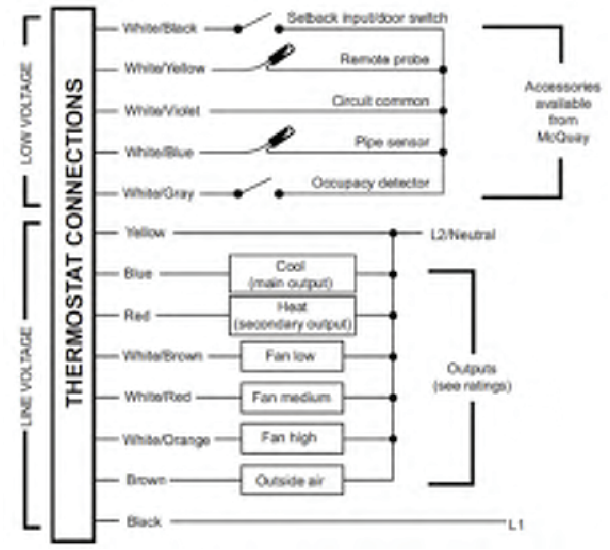

Table 4: Jumper Activation

JP4 Section	Pipe Sensor Water Temp	Aqua Stat	Main Output (Blue Wire)	Secondary Output (Red wire)
2-Pipe	Cold	Open	Cooling Only	Disabled
JP4-ON	Hot	Closed	Heating Only	Disabled
2-Pipe	Cold	Open	Cooling	Heating
JP4-OFF	Hot	Closed	Heating Only	Disabled

NOTE: *Fan will not cycle on for disabled modes.

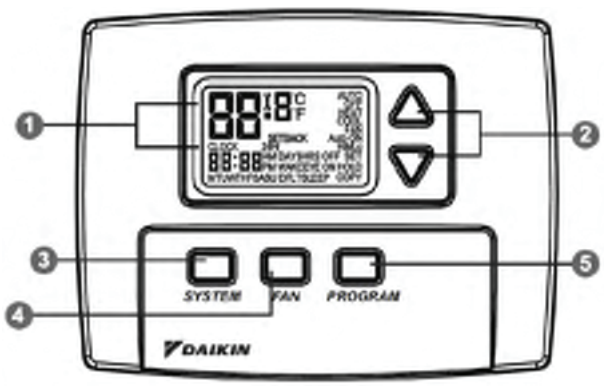

Table 5: Output Ratings

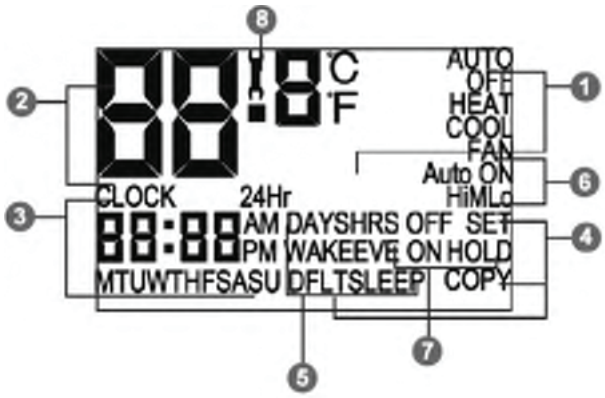
Voltage	FLA	LRA	RES Amps	Pilot Duty	HP
24 VAC	NA	NA	NA	24 VA	NA
120 VAC	5.8	34.8	6.0	125 VA	¼
240 VAC	2.9	17.4	5.0	125 VA	¼
277 VAC	2.4	14.4	4.2	125 VA	¼

Combined Load Current Not to Exceed 20 Amps

Front Panel Reference

Figure 5: MT180 Programmable Thermostat Interface



The thermostat interface (Figure 5) contains buttons for use in navigating to accompanying menus/screens and for performing specific operations. These buttons and operations are described below.

1. Liquid Crystal Display with a blue backlight
2. UP .and DOWN .Buttons
3. SYSTEM Button
4. FAN Button
5. PROGRAM Button.

Display Reference

Figure 6: MT180 Programmable Thermostat Display

1. System Mode Display (See Table 6)
2. Temperature Display (See Table 7)
3. Time and Day Display (See Table 8)
4. Programming Commands (See Table 9)
5. Time Period Indicators

   WAKE, DAY, EVE, and SLEEP are the names given to the four time periods per day. Each time period has its own unique setpoint temperatures as shown in Table 15.
6. Fan Operation Indicators (See Table 10)
7. Program Override Commands (See Table 11)
8. Service Indicator

   The wrench symbol is displayed when there is a temperature sensor error or condensate overflow error. It indicates there is an open or a short connection to the sensor switch. When this occurs, the thermostat will disable all outputs and illuminate the wrench symbol. A service technician should be called to determine the cause of the error.

Table 6: System Mode Display Overview

Menu	Description
HEAT	Indicates the system is in heating mode
COOL	Indicates the system is in cooling mode
AUTO	Indicates the system will automatically changeover between heating and cooling modes as the room temperature varies
OFF	Turns OFF the entire system
SETBACK	Indicates the heating or cooling system is operating in setback mode. Setback mode is an energy saving feature that can be either manually activated by the thermostat's user, or automatically activated by an occupancy sensor or door switch

Table 7: Temperature Display Overview

Menu	Description
Default Display	Digits display the current room temperature
During Programming	Digits are used to set the desired temperatures

Table 8: Time and Day Display Overview

Menu	Description
Default Display	Digits indicate the current time, and day abbreviations indicate the current day
During Programming	Digits and days are used to program time periods
CLOCK	Lights up during programming when the clock is being set
24Hr	Lights up during programming to indicate time will be displayed in 24-hour clock format
AM/PM	Indicates 12-hour clock format

Table 9: Programming Commands Overview

Menu	Description
SET	Enters thermostat into custom program mode which allows you to specify a unique times and temperatures for a particular day or group of days
COPY	Simplifies programming by allowing you to copy all of an individual day's settings to another day or group of day
DFLT	Restores the thermostat to the factory program

Table 10: Fan Operation Indicators Overview

Menu	Description
FAN	"FAN" will be always be lit in conjunction with "ON" or "AUTO"
ON	Indicates constant, continuous fan operation
AUTO	Indicates fan is only on with heating or cooling demand
HI	Indicates high speed fan; always lit in conjunction with "ON" or "AUTO"
M	Indicates medium speed fan; always lit in conjunction with "ON" or "AUTO"
LO	Indicates low speed fan; always lit in conjunction with "ON" or "AUTO"

Table 11: Program Override Commands Overview

Menu	Description
HOLD	Indicates thermostat is in manual operation. (Programmed settings are OFF, but not lost)
HOLD HRS	During programming, lights up in conjunction with clock digits; allows program to be put on hold for up to 24 hours
HOLD DAYS	During programming, lights up in conjunction with the clock digits; allows program to be put on hold for up to 99 days
HOLD ON	Indicates thermostat is in permanent manual operation
OFF	Turns OFF the hold and resumes programmed settings

Saving Changes

As you navigate your thermostat, be aware of the thermostat's save and exit protocol:

- The thermostat automatically saves all the changes you make, as you make them.
- When you are in the SYSTEM or FAN menus:
  - — If you push a button that is not applicable to the current menu, all changes are saved and the thermostat goes to the menu associated with the button that was pushed.
  - — If the thermostat is idle for five seconds, the thermostat times out, saves all changes, and returns to the thermostat's default display.
- When you are in the PROGRAM menu:
  - — If you push a button that is not applicable to the current menu, nothing happens (your programming is not interrupted).
  - — If the thermostat is idle for fifteen seconds, the thermostat times out, saves all changes, and returns to the thermostat's default display.

Up/Down Arrow Button Operation

The ▲ and ▼ buttons function in two ways:

- When you are in the default display, you can press ▲ to increase, or ▼ to decrease, the current temperature set-point. This will override programmed temperature settings until the next programmed time period (Wake, Day, Evening, or Sleep).
- When you are in the PROGRAM menu, you can press ▲ to scroll up, or ▼ to scroll down, through the menu, time, and temperature options.

System Button Operation

Pressing SYSTEM will light up the five system mode options described below. Press SYSTEM to scroll through the options. As you scroll, the current option will be blinking. To select the blinking option, wait for the five-second timeout, which saves your option and returns you to the thermostat's default display.

Table 12: System Button Operation Overview

Menu	Description
HEAT	The thermostat operates as a Heating Only thermostat
COOL	The thermostat operates as a Cooling Only thermostat
AUTO	The thermostat automatically selects the appropriate Heat or Cool mode depending upon the setpoint (desired temperature) and zone temperature (actual temperature)
OFF	Turns the system OFF by disabling all thermostat outputs
SET BACK	Setback mode is an energy saving feature that minimizes the heating and cooling when the room is not occupied. Setback mode overrides the programmed time and temperature settings by telling the thermostat to instead use the setback setpoint for heating and cooling. The setback setpoint temperatures are factory default or installer-selected during installation. During setback mode, when a demand for heating or cooling exists, the fan will run at the lowest speed. • Automatic setback mode: If your thermostat is connected to an occupancy sensor or door switch, setback mode is automatically turned on and off by the sensor or door switch. • Manual setback mode: Select SETBACK in the SYSTEM menu. Setback temperature settings will remain in effect until you manually turn off setback mode. Selecting HEAT, COOL, or AUTO in the SYSTEM menu will turn off setback and resume your programmed time and temperature settings. **NOTE:** SETBACK appears on your menu only if the thermostat's installer enabled this feature.

Fan Button Operation

Pressing FAN will light up the six fan mode options described below. Press FAN to scroll through the options. As you scroll, the current option will be blinking. To select the blinking option, wait for the five-second timeout, which saves your option and returns you to the thermostat's default display.

Table 13: Fan Button Operation Overview

Menu	Description
ON HI	High speed fan is on continuously, even if no demand for heating or cooling exists
ON M	Medium speed fan is on continuously, even if no demand for heating or cooling exists
ON LO	Low speed fan is on continuously, even if no demand for heating or cooling exists
AUTO HI	High speed fan cycles with active demand for heating and cooling
AUTO M	Medium speed fan cycles with active demand for heating and cooling
AUTO LO	Low speed fan cycles with active demand for heating and cooling

Program Button Operation

Function Overview

Pressing PROGRAM lights up five program mode options, described below. Press ▲ or ▼ buttons to scroll through the options. As you scroll, the current option will be blinking. To select the blinking option, press PROGRAM again and you will be taken to the menu associated with that option.

Table 14: Program Button Operation Overview

Menu	Description
CLOCK	Sets the current time and day.
°F / °C	Use this option to change the temperature display to Fahrenheit or Celsius. Your thermostat's default temperature display setting is Fahrenheit.
SET	Use to specify the time and temperature programming for a particular day or group of days. Also allows you to reset the thermostat to the factory default ENERGY STAR program.
COPY	Simplifies programming by allowing you to copy a particular day's program to another day or group of days.
HOLD	Puts the thermostat in manual operation for a permanent or temporary time period. Overrides your programmed settings, but does not lose them.

Setting the Clock & Day

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until “CLOCK” is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll through “24Hr”, “AM”, “PM” options. “24Hr” sets your thermostat to a 24-hour clock. “AM” and “PM” sets your thermostat to a 12-hour clock. To select your preference, press PROGRAM once.
4. Press▲ or▼ to scroll to the current hour. To select, press PROGRAM once.
5. Press ▲ or ▼ to scroll to the current minute. To select, press PROGRAM once.
6. Press ▲ or ▼ to scroll to the current day. To select, press PROGRAM once.

Your selections have been saved and you have exited program mode. Your thermostat is ready to function with the factory preprogrammed ENERGY STAR® program. If you want to change the program for your particular needs, follow the instructions in the “Programming Your Thermostat” section.

Setting the Temperature Display

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until “°F °C” is blinking. To select, press PROGRAM once.
3. Both “°F” and “°C” will be lit, but only one will be blinking. Press .or .to scroll so that the preferred option is blinking. To select, press PROGRAM once.

Your selection has been saved and you have exited program mode.

Copy Feature

1. Press PROGRAM once.
2. Press ▲ or ▼to scroll until “COPY” is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll to the individual day you want to copy from. “DFLT” (the default Factory Program) is also a copy option. To select your preference, press PROGRAM once.
4. Press ▲ or ▼to scroll to the day or group of days you want to copy to. To select, press PROGRAM once.

Your selection has been saved and you have exited program mode.

Thermostat Configuration/ Service Menu

To enter the Service Menu press the UP and DOWN arrows simultaneously for five (5) seconds. The current display icon will be turned off.

Service menu number 1 will appear. Push the SYSTEM button to move to the next Service Menu number. The UP and DOWN arrow keys will scroll through your range of options for each feature. All changes to the Service Menu are automatically saved when the system times out. Please refer to the service menu table (Annex II, page 17).

Programming Time & Temperature Settings

Your thermostat’s programming feature allows you to divide up a 24-hour day into four time periods (referred to as “Wake”, “Day”, “Evening”, and “Sleep”), and give each time period its own setpoint temperatures. Your “Heat Setpoint temperature” tells your heating system the room temperature to maintain during cold weather. The “Cool Setpoint Temperature” tells your cooling system the room temperature to maintain during hot weather.

Factory Program: Your thermostat comes from the factory preprogrammed with all seven days of the week set to the times and temperatures shown in Table 15.

Table 15: Factory Set-Up of Time & Temperature Settings

Time Period	Start Time	Heat Setpoint Temperature	Cool Setpoint Temperature
Wake	6:00 am	70° F (21.0° C)	78° F (25.5° C)
Day	8:00 am	62° F (16.5° C)	85° F (29.5° C)
Evening	6:00 pm	70° F (21.0° C)	78° F (25.5° C)
Sleep	10:00 pm	62° F (16.5° C)	72° F (22.0° C)

If the factory program meets your needs, simply follow the “Setting the Clock & Day” instructions and you’re done.
If you want to change the preprogrammed times and/or temperatures, follow the instructions under “Custom Program”.

Custom Program

Begin by planning your program. Use the “Custom Program Worksheet” to plan your program time periods and temperatures you want during each period. You must program four periods for each day. Fill in the complete table, as it will serve as a record of your programs, then follow this procedure:

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until “SET” is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll to the day or group of days you want to program. To select your preference, press PROGRAM once.

   Day / Group of Days options are:

   - To program each day individually, the abbreviations are: “M” is Monday, “TU” is Tuesday, “W” is Wednesday, “TH” is Thursday, “F” is Friday, “SA” is Saturday, and “SU” is Sunday.
   - “MTUWTHFSASU” allows you to give all 7 days of the week the identical heating & cooling program.
   - “MTUWTHF” allows you to give all 5 weekdays the identical heating & cooling program.
   - “SASU” allows you to give both weekend days the identical heating & cooling program.
   - “DFLT” restores all seven days of the week to the original factory preprogrammed ENERGY STAR program.
4. Press ▲ or ▼ to scroll through the four time periods. To select your preference, press PROGRAM once.
5. Press ▲ or ▼ to scroll to the desired starting hour. To select, press PROGRAM once.
6. Press ▲ or ▼ to scroll to the desired starting minute. To select, press PROGRAM once.
7. Press ▲ or ▼ to scroll to the desired HEAT setpoint temperature. To select, press PROGRAM once.
8. Press ▲ or ▼ to scroll to the desired COOL setpoint temperature. To select, press PROGRAM once.

Time & Temperature Programming Example

In this example, the thermostat user wants to program the weekend with a different schedule from the Factory Program. The user wants the Saturday and Sunday program to be identical.

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until “SET” is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll until “SASU” is blinking. To select, press PROGRAM once.
4. Press ▲ or ▼ to scroll until “WAKE” is blinking. To select, press PROGRAM once.
5. Press ▲ or ▼ .to scroll hours to “8:”. To select, press PROGRAM once.
6. Press ▲ or ▼ to scroll minutes to “:30”. To select, press PROGRAM once.
7. User wants to keep same HEAT setpoint temperature. To keep unchanged, press PROGRAM once.
8. User wants to keep same COOL setpoint temperature. To keep unchanged, press PROGRAM once.

Now you’re done setting up the Wake period, and ready to set up the other three time periods for Saturday and Sunday:

- Program the Day period for SASU by repeating steps 1 through 8, but in Step 4, select “DAY”.
- Program the Evening period for SASU by repeating steps 1 through 8, but in Step 4, select “EVE”.
- Program the Sleep period for SASU by repeating steps 1 through 8, but in Step 4, select “SLEEP”.

Now you’re done setting up all four time periods for SASU.

Overriding the Program

Your thermostat's HOLD feature allows you to put the thermostat in manual operation for either a specified or indefinite length of time. HOLD will override your programmed settings, but does not lose them.

Setting up a Temporary Hold

You may set up a temporary hold by hours and/or days.

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until "HOLD" is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll through options. "DAYS" allows you to specify 0-99 days hold; "HRS" allows you to specify 0-24 hours hold. To select your preference, press PROGRAM once.
4. Press ▲ or ▼ to scroll to the desired length of time. To select, press PROGRAM once.

The thermostat is now on hold for the time period you selected, unless you decide to turn it OFF earlier. (See Turning OFF a Hold.)

Setting up a Permanent Hold

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until "HOLD" is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll to "ON". To select, press PROGRAM once.

The thermostat is now on hold until you manually turn OFF the hold. (See Turning OFF a Hold.)

Turning OFF a Hold

1. Press PROGRAM once.
2. Press ▲ or ▼ to scroll until "HOLD" is blinking. To select, press PROGRAM once.
3. Press ▲ or ▼ to scroll to "OFF". To select, press PROGRAM once.

The thermostat will now resume your programmed time and temperature settings.

For an easy planning refer to the Custom Program Worksheet (Annex I, page 16).

System Check-out

To verify thermostat operation after mounting and wiring it, perform the following:

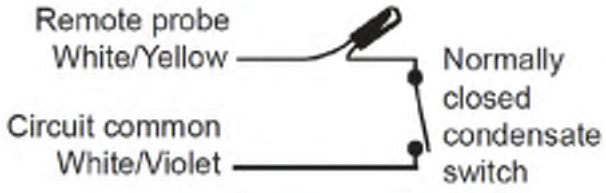
1. Energize the system.
2. Set fan to ON. Select each fan speed (TA180 Models) to verify operation.
3. Set the System button to AUTO, or available selection.
4. Using the UP arrow, adjust temperature more than 5°F above the room temperature to cycle on heating.
5. Using the DOWN arrow adjust the temperature to 5°F below room temperature to cycle on cooling.

NOTE: If the thermostat is set to utilize a time-based purge cycle (Service menu 16), the thermostat will conduct a 3-min purge on initial start-up if a pipe sensor is connected.

Condensate Overflow Interrupt

The remote probe input can be used with a condensate overflow interrupt switch (CO), either in conjunction with a remote probe (normally closed CO switch) or with local sensing (normally open CO switch). When the condensate switch activates, the T180 will display the service wrench and disable all outputs.

Figure 7: Remote Probe Installation



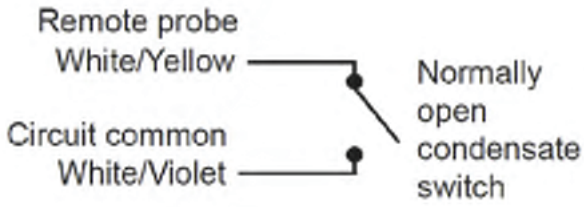


Figure 8: Local sensor installation

Fan Operation

The thermostat may be factory configured for standard or staged fan operation.

Standard Fan Operation

Single setpoint represented in Figure 9. Programming mode includes multiple setpoints.

Figure 9: Standard Fan Operation

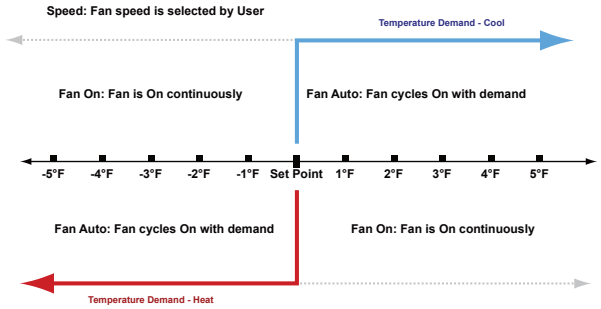

Table 16: Standard Fan Operation Overview

Menu	Description
FAN ON	Fan is on continuously and is not dependant on a heat or cool demand
FAN AUTO	Fan cycles on with a heat or cool temperature demand and cycles off with the heat or cool output
FAN SPEED	High, medium, or low is selected by the user

Staged Fan Operation with Temperature Demand

Single setpoint represented in Figure 10. Programming mode includes multiple setpoints.

Figure 10: Staged Fan Operation

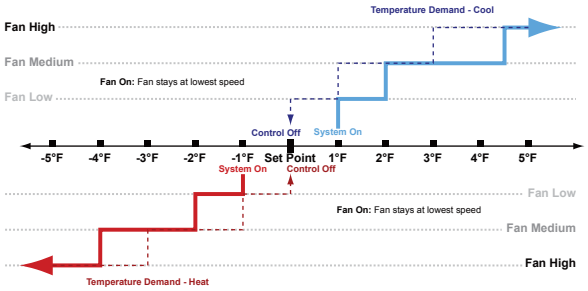

Table 17: Staged Fan Operation with Temperature Demand Overview

Menu	Description
FAN ON	Fan stages from high to medium to low and stays continuously on in the lowest available speed
FAN AUTO	Fan stages from high to medium to low and cycles off at set point
FAN SPEED	selected by the thermostat program

Fancoil Operation

Fancoil operation is either a 2-pipe or 4-pipe configuration which is determined by jumper selection JP4 (see Installing, Mounting and Wiring the Thermostat, page 4).

Pipe Sensor Operation

A pipe sensor can be connected when the thermostat is configured for either 2-pipe or 4-pipe fan coil operation (see JP4 jumper configuration). The Pipe sensor is used to determine the water temperature in the Main Coil. The Pipe Sensor should be mounted on the Main Coil supply and wrapped with insulating material.

Pipe Sensor Input: 10K Remote Probe or a standard On-Off Aqua-stat can be used for summer/winter changeover. ON (closed) is winter heating mode and OFF (open) is summer cooling mode.

Purge Cycle Operation

With a pipe sensor connected, this thermostat will initiate a purge cycle if the sensed water temperature is ambiguous (not adequately hot or cold). The purge cycle algorithm can be either temperature or time based, depending on the configuration of Service Menu 16.

Temperature-Based Purge

- When an Ambiguous mode is detected and a demand exists, a 3 minute purge timer begins and the Main Output is opened.
- After the 3 minute purge cycle, the thermostat checks again to see if the water temperature is more than 15°F from set point, or above 80°F or below 60°F.
- If Winter or Summer mode is determined, normal HVAC operation occurs. If still ambiguous, the thermostat checks to see if the COIL temperature is below 60°F or above 80°.
  - Coil < 60°F = Summer Mode.
  - Coil > 80°F = Winter mode.
- Purge Cycle is repeated until a non-ambiguous condition is sensed.

NOTE: If at any time the demand goes away, the thermostat will abort the purge cycle.

Time-Based Purge (Default)

1. The time-based purge cycle will start a 3-min purge cycle and enable the Main Output if any of the following conditions occur: transition from OFF to AUTO mode, Reset event, power cycle, and/or 1-hour timer expires.
2. After the 3 min purge cycle, a pipe sensor reading says: Pipe is 15°F+ below the zone temp = Summer mode Pipe is 15°F+ above the zone temp = Winter mode Pipe is within 15°F of zone temp = still Ambiguous
3. If a Winter or Summer mode is determined, the appropriate heating/cooling occurs. The thermostat will purge and check pipe temperatures again after 1-hour.
   - If step 2 is still ambiguous, all thermostat outputs are disabled for 1 hour.
   - After 1 hour, the purge cycle resumes at step 1.

HVAC Setback Systems

Setback Operation - Remove JP3

This is a low level input that is normally open. When switch is closed, the T180 heating and cooling setback limits are used as temperature control points. Fan operation in setback is cycled with demand. Pressing any button will override setback for 1 hour. Setback will override any user setting unless control is turned to OFF.

Intelligent Occupancy Sensors like the SD200-001 and SD200-002 can be used with this input to set the HVAC system to control at setback limits.

Door Switch Only Operation - Install JP3

A stand alone door or window switch can be connected to the T180 to disable the HVAC system (outputs) if a door or window is left open for more than 2 minutes. A one-time ten minute override can be initiated by pressing any thermostat key pad.

The T180 thermostat can be used with optional S200 series occupancy detection equipment. Purchasing and installing this equipment to compliment the thermostat adds energy savings by setting back HVAC operation during occupied and unoccupied times.

Occupancy Operation (Install JP3)

The T180 can be used with PECO S200 series occupancy detection equipment. The occupancy and switch inputs are designed to connect to the SB200 slave sensor and SE200 door switch.

The Occupancy Sensor is a low-level switch that is open when there is occupancy and closed when unoccupied.

The Door Switch is a low-level switch that is open when the door is open and closed when the door is closed. This system requires both an Occupancy Sensor and a Door Switch.

Operation from an Occupied Mode

The T180 operates normally and looks for a door close. A door close signal initiates occupancy status detection.

If occupancy is detected, the T180 will maintain normal HVAC control. It then waits for a door open signal before determining occupancy again.

If no occupancy signal is detected within 2 minutes, the T180 changes to unoccupied mode and controls at setback temperature values.

Operation from an Unoccupied Mode

In an Unoccupied State, the T180 sets heating and cooling set points to setback values, as determined in the service menu. In this mode, the fan is automatically set to cycle with demand.

The T180 will continually monitor the room for occupancy.

Any occupancy detection, including door open, will set the operation to occupied mode.

In either mode, if the door is left open for more than 2 minutes the T180 will disable the HVAC system. A one-time ten minutes override can be initiated by pressing any thermostat keypad.

Optional detection equipment configurations and operation are described below.

SB200-001 Occupancy Sensor

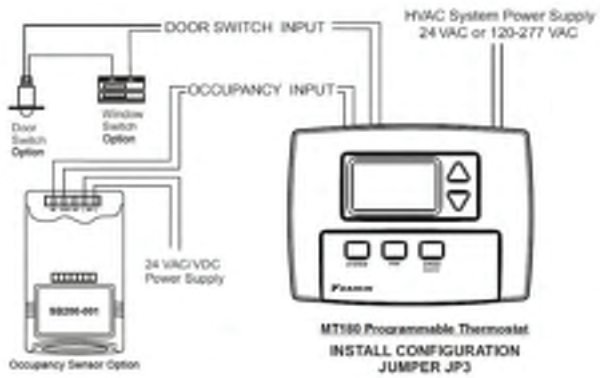
The SB200-001 occupancy sensor (Figure 11) serves as an occupancy sensor for automatic control of a guest room HVAC system. It incorporates an innovative dual delay processor which allows the sensor to verify the nature of occupancies, and is capable of eliminating unnecessary actuations of the HVAC device due to unintentional passages or short time occupancies. The sensor may also serve as a slave sensor (Figure 12, page 15).

The sensor switch is open in occupied mode and closed in unoccupied mode. An optional door and/or window switch (Figure 11) is open when the door/window is open and is closed when the door/window is closed.

NOTE: To use this configuration, a jumper must be installed to JP3 to allow occupancy input.

An optional door and/or window switch (Figure 11) can be added for use with the SB200-001 sensor.

Operation



In an occupied mode, the thermostat operates normally and looks for a door open signal. When the door opens, the thermostat waits for a door close signal. If the door is open for more than two minutes, the thermostat turns the HVAC system outputs to OFF. During this two minute period, if any button is pressed on the keypad, the time delay is extended to ten minutes. The time delay can only be extended once. Once the HVAC outputs transition to OFF, a door closure is required to re-enable the outputs. When the door closes, the thermostat starts a two minute timer and tries to detect occupancy. If the timer expires and no occupancy is detected, the thermostat transitions to an unoccupied state. If occupancy is detected while the timer is running, the thermostat will remain in the occupied mode.

In an unoccupied mode, the thermostat sets heating and cooling set points to setback values as determined by factory or user settings. The fan is automatically set to cycle with demand. The thermostat continually monitors the occupancy sensor and will enter into occupied mode if occupancy is detected.

If the installation is only using a door/window switch, the thermostat will disable the HVAC outputs if this output is open for longer than two minutes.

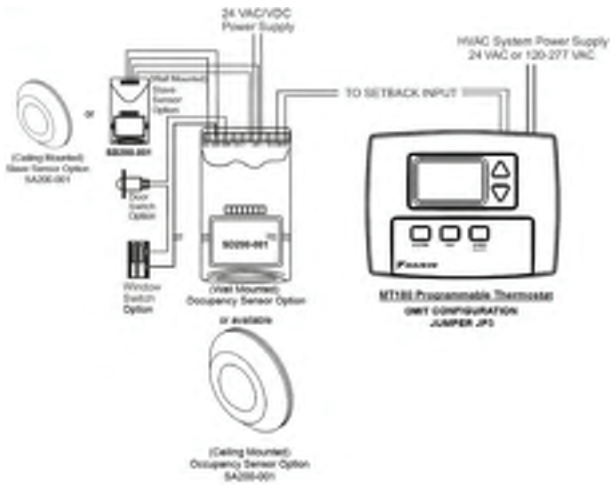
To enable door/window switch only operation, install a jumper to JP3 (see Installing, Mounting and Wiring the Thermostat, page 4) and the occupancy input must be shorted to circuit common.

Figure 11: Optional Equipment Configuration #1

SD200-001 Occupancy Sensor

The SD200-001 occupancy sensor (Figure 12) serves as a master sensor for a guest room HVAC management system. The sensor provides HVAC operation according to occupancy status, as well as door/window switch monitoring, selectable high/low temperature setback, form-C output, slave sensor connectivity, and a five minute door open HVAC shut-off.

NOTE: To use this configuration, the jumper to JP3 is removed to allow setback input.



An optional door and/or window switch (Figure 12) and slave sensor can be added for use with the SD200-001 sensor.

Operation

In an occupied mode, the SD200-001 occupancy sensor (Figure 12) and door switch use advanced microprocessor logic to determine occupancy. A door open signal will initiate occupancy status detection. If the sensor determines that a room is occupied, it will allow normal HVAC control. The sensor will wait for another door open signal before determining occupancy again.

In an unoccupied mode, the sensor continually monitors the room. Any occupancy detection will set the operation to occupied mode.

Figure 12: Optional Equipment Configuration #2

SD200-002 Occupancy Sensor

The SD200-002 occupancy sensor serves as a stand alone master sensor for a guest room HVAC management system.

The sensor provides HVAC operation according to occupancy status, as well as selectable high/low temperature setback, form-C output, and a five minute door open HVAC shut-off.

This system provides basic room setback and is ideal for control of HVAC in commercial spaces.

NOTE: To use this configuration, the jumper to JP3 is removed to allow setback input.

Operation

With each occupancy detection, an OFF delay is started and can be set to delay for up to 30 minutes (Figure 13).

Table 19: Service Menu Table

Menu	Feature	Range	Description/Comments
1	F° or C°	0-Celsius 1-Fahrenheit (Default)	Determines temperature displays in Fahrenheit or Celsius
3	Fan OFF Delay	0–99 Seconds (0-Default)	The amount of time (in seconds) the lowest available fan speed will run after the thermostat outputs are disabled.
4	Range Low	50–90°F, 10–32°C (50°F- Default)	The lowest selectable temperature setpoint value.
5	Range High	50–90°F, 10–32°C (90°F- Default)	The highest selectable temperature setpoint value.
6	Setback Low	0-OFF 50–82°F, 11–27°C (55°F- Default)	The temperature setpoint value you want the thermostat to Heat to when the T180 is in the Setback mode.
7	Setback High	0-OFF 50–90°F, 11–32°C (90°F- Default)	The temperature setpoint value you want the thermostat to Cool to when the T180 is in the Setback mode.
8	Zone Temp Offset	+/- 9°F or +/- 4.5°C (0°F-Default)	Zone Temperature offset adjusts the sensed Zone Temperature displayed, allowing calibration in the field.
9	Keypad Lockout	0-No keypad lockout (Default) 1-Disables System/Fan/Program 2-Disables all buttons	This function blocks access to certain features of the device. The Service Menu is still available if the keypad lockout is enabled.
10	Fan Mode	1-ON 2-Auto 3-ON or Auto (Default)	ON-Fan is always on, regardless of demand. Auto-Fan is only ON with heating or cooling demand. ON or Auto-User can choose either selection.
11	Fan Speeds	1-High 2-Low, High 3-Low, Med, High (Default)	Speeds which are selectable by the user.
12	System Mode	OFF, Auto OFF, Heat, Cool, Auto (Default) OFF, Heat, Cool Heat, Cool, Auto	Sets the system modes the occupant is able to select.
13	Controlled OFF or OFF Override	0-Disable (Default) 1-Enable	When enabled, the unit will control to the Setback setpoints. This function will also override the user mode setting of OFF if the room temperature is equal to or above the Cool Setback setpoint or equal to or below the Heat Setback setpoint.
14	Front Panel Setback Control	0-Disable (Default) 1-Enable	When enabled, Setback is shown as an available system mode selection. If Setback mode is selected, the thermostat will control to the current Setback Heat and Setback Cool setpoints.
15	Cycled Outside Air Damper	0-Cycles (Default) 1-Continuous	The Outside Air output will cycle with heat or cool demand if Cycles mode is chosen. The Outside Air output is active anytime the thermostat is out of the OFF mode when Continuous mode is chosen. When in Setback the Outside Air output will turn OFF.
16	Temperature Based Purge Cycle	0-Time Based (Default) 1-Temperature Based	Determines if the Purge Cycle will be Temperature or Time Based.
17	Minimum Dead Band Adjustment	3°F (Default) 3–10°F, 1.5–5°C	A changeover deadband value prevents short cycling between Heating and Cooling modes. The value is adjustable to meet various HVAC system requirements.
18	Factory Default Reset	0-Disable (Default) 1-Enable	Toggles between OFF and DFLT. When factory default is desired, select DFLT.
25	Pre-Occupancy Purge	0 Hours (Default) 0–3 Hours	Energizes Fan Low for selected number of hours (0-3) prior to events Wake (Occupied 1) and Day (Occupied 2)
30	Cycles Per Hour (CPH) Cooling	3 CPH (Default) 0–6 CPH	Defines the number of cycles per hour for cooling. A selection of 0 disables cycling.
32	Cycles Per Hour (CPH) Heating	5 CPH (Default) 0–12 CPH	Defines the number of cycles per hour for heating. A selection of 0 disables cycling.
35	Heat Recovery Rate	5°F/Hr (Default) 0–18°F/Hr 0–10°C/Hr	Defines the rate in which the device achieves the comfort setpoint. 0 disables ramp recovery.
36	Cool Recovery Rate	5°F/Hr (Default) 0–18°F/Hr 0–10°C/Hr	Defines the rate in which the device achieves the comfort setpoint. 0 disables ramp recovery.
40	Minimum OFF Time	4 Minutes (Default) 1–10 Minutes	Sets the minimum OFF time for both heat and cool output
45	Intermittent Fan	0-Disable (Default) 1-Enable	If enable is selected, the intermittent fan will operate during setback operation. (Default values will be used unless menu 46 and 47 are adjusted.)
46	Intermittent Fan-ON Time	5 Minutes (Default) 1–60 Minutes	Defines the duration in which fan low will be ON. Fan ON will be activated after Fan OFF time has passed.
47	Intermittent Fan-OFF Time	25 Minutes (Default) 0–60 Minutes	Defines the duration in which fan low will be OFF. Fan OFF will be activated after Fan ON time has passed. A selection of 0 will result in continuous Fan.
71	Revision	—	Upon menu selection, the firmware and configuration revision will be displayed.
80	System Test Main Output (Cool)	0-Disable (Default) 1-Enable	If enable is selected, it will activate the main output (cool output) for 10 minutes. Fan High will automatically turn ON. If a different menu is selected the output will be disabled.
81	System Test Main Output (Heat)	0-Disable (Default) 1-Enable	If enable is selected, it will activate the secondary output (heat output) for 10 minutes. Fan High will automatically turn ON. If a different menu is selected the output will be disabled.
82	System Test Fan Output	0-Disable (Default) 1-Enable Fan Low Output 2-Enable Fan Medium Output 3-Enable Fan High Output	If enable is selected, it will activate the fan output for 10 minutes. If a different menu or a different fan speed is selected the output will be disabled.

DAIKIN

People and ideas you can trust.™

Daikin Applied Training and Development

Now that you have made an investment in modern, efficient Daikin equipment, its care should be a high priority. For training information on all Daikin HVAC products, please visit us at www.DaikinApplied.com and click on Training, or call 540-248-9646 and ask for the Training Department.

Warranty

All Daikin equipment is sold pursuant to its standard terms and conditions of sale, including Limited Product Warranty. Consult your local Daikin Applied representative for warranty details. To find your local Daikin Applied representative, go to www.DaikinApplied.com.

Aftermarket Services

To find your local parts office, visit www.DaikinApplied.com or call 800-37PARTS (800-377-2787). To find your local service office, visit www.DaikinApplied.com or call 800-432-1342.

This document contains the most current product information as of this printing. For the most up-to-date product information, please go to www.DaikinApplied.com.

Products manufactured in an ISO Certified Facility.

The display sensor is used in conjunction with the MicroTech III equipped units as described in the Application Section below. The same sensor is used for Water Source Heat Pump (WSHP) and for Fan Coil Units (FCU) with just a hardware jumper and menu change during configuration. The sensor has a digital display for Temperature, Humidity, Occupancy, Fan Speed, System Mode, Alarm, Setpoint and Status indication. Controls include six buttons for Setpoint, System Mode, Fan Speed, Occupied/Unoccupied Request, and Override Reset. (Figure 1).

Sensor buttons & dimensions

Figure 1: Digital display sensor - Water Source Heat Pump P/N 910121754, Fan Coil P/N 910113679, 910113575, 910152148

The display sensor can be used on the products shown in Table 1.

Table 1: Product usage guide

Units	Product		Models	Controls	Used with Digitally Adjustable Sensor with Temperature and Humidity Display
Water Source Heat Pumps	Horizontal	Enfinity™	W.CCH, CCW	MicroTech III Unit Controller	Yes
	Vertical		W.VFC, VFW		
	Vertical Stacked		W.VHC		
	Console		W.MHC, MHW

Note: *[1]With optional Boilerless controls*

Sensor functions

910152148, 910113575, 910113679, Fan-coil unit model:

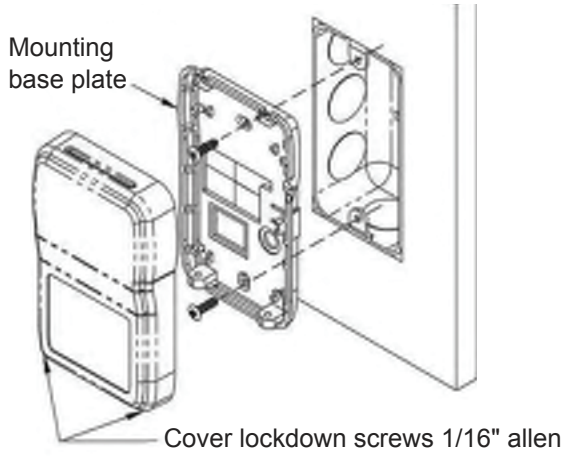
- Display sensor to show room Temperature, fan speed (AUTO/HIGH/MEDIUM/LOW), system mode (HEAT/COOL/AUTO/OFF), ALARM, Override and occupancy.

Note: *910113575 will not display a temperature value as this is measured using a unit-mounted return air sensor.*

910121754, Water source heat pump model:

- Display sensor to show room Temperature, room humidity, fan speed (AUTO/ON), system mode (HEAT/COOL/AUTO/OFF/DHUM), ALARM, Override and occupancy.
- De-humidification output contact has an adjustable setpoint and configurable deadband. This output operates automatically using the RH setpoint and deadband in the system “AUTO” mode or in the “DHUM” mode.

Mounting



Location

Avoid mounting on outside walls or in direct sunlight.

Junction Box, (J-Box)

1. Pull the wire through the wall and out of the junction box, leaving about six inches free.
2. Pull the wire through the hole in the base plate.
3. Secure the back plate to the box using the #6-32 × 1/2 inch mounting screws provided.
4. Screw the plate firmly to the wall so the foam plate backing is compressed about 50%.
5. Terminate the unit according to the guidelines in the Termination section.
6. Attach Cover by latching it to the top of the base, rotating it down and snapping into place.
7. Secure the cover by backing out the lock-down screws using a 1/16" Allen wrench until it is flush with the bottom of the cover.

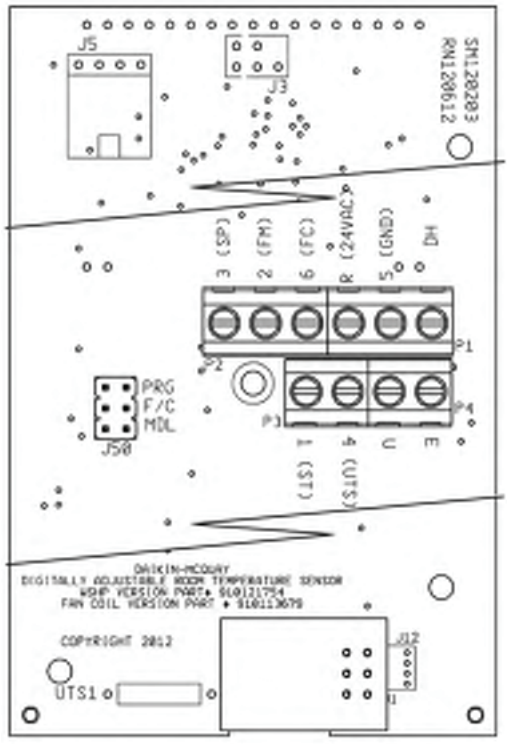
Figure 2: Junction box mounting (hardware is provided for both junction box and drywall installation.)

Drywall mounting

1. Place the base plate against the wall where you want to mount the sensor.
2. Mark out the two mounting holes where the unit will be attached to the wall. Drill a 3/16" hole in the center of each mounting hole and insert a drywall anchor into the holes.
3. Drill one 1/2" hole in the middle of the marked wiring through hole area.
4. Pull the wire through the wall and out the 1/2" hole, leaving about six inches free.
5. Pull the wire through the hole in the base plate.
6. Secure the base to the drywall anchors using the #6 × 1" mounting screws provided.
7. Screw the plate firmly to the wall so the foam plate backing is compressed about 50%.
8. Terminate the unit according to the guidelines in the Termination section.
9. Attach cover by latching it to the top of the base, rotating it down and snapping it into place.
10. Secure the cover by backing out the lock-down screws using a 1/16" Allen wrench until it is flush with the sides of the cover

Note: *in any wall-mount application, the wall temperature and the temperature of the air within the wall cavity can cause erroneous readings.*

The mixing of room air and air from within the wall cavity can lead to condensation, erroneous readings and sensor failure. To prevent these conditions, Daikin recommends sealing the conduit leading to the junction box with fiberglass.



Maintenance

Wipe the display as needed with a damp water only cotton cloth. Do not use any type of cleaner as it may damage the buttons or scratch the display. Do not paint.

Terminations

Daikin recommends using a twisted shielded pair of at least 22AWG for the power wire connections. The shield should be earth grounded only at the power source. Larger gauge wire may be required for long runs.

Figure 3: Sensor Circuit Board

⚠ CAUTION

Combination of power wiring (R, 5, DH) and analog (1, 2, 3, 4, and 6 to ground) wiring in a common cable may cause signal interference and must be avoided.

All wiring must comply with the National Electric Code (NEC) and local codes. Do NOT run any of this device's wiring in the same conduit as other AC power wiring. Tests show that fluctuating and inaccurate signal levels are possible when AC power wiring is present in the same conduit as the signal lines. If you are experiencing any of these difficulties, please contact your Daikin representative.

Sensor	Digitally Adjustable Room Temperature Sensor (Part No. 910113679) / 910152148, 910113575							

Terminal descriptions

Note: *Refer to "Figure 3: Sensor Circuit Board" on page 4 for terminal locations*

R.....15 to 28VAC* (AC requires separate shielded wire) (Shield terminated at power source only)

DH .....Dehumidification Contact (Triac from R to DH @170mA, WSHP Only).

U.....Unoccupied Contact. (Terminal grounded when in Unoccupied, VDC only).

E.....System "Off" Indication. (Terminal grounded when in System "Off" mode, VDC only).

1.....Status Indicator Input from the MicoTech III Unit Controller. (5VDC).

2.....Output Signal, and Fan Mode System (0 to 5VDC). Output Signal, System Mode Select for FCU only, (0 to 5VDC).

3.....Output Signal, Setpoint Adjust from 55º to 95˚F (default) or ±5º Configurable. (0 to 5VDC) See Setpoint Analog Range Tolerances. See Table 3.

4.....Output Signal, Room Temp Thermistor Sensor. (10K ATP Z curve, 10K-2). 910113575 tenant override only

5.....Ground or Neutral* (AC requires separate shielded wire). Common Reference for All Signal Terminals.

6.....Output Signal, Fan Speed Select for FCU only. (0 to 5VDC). Terminal 6 not used for WSHP units.

Note: ** The AC power wiring at terminals [R] & [5] should be run in a separate twisted shielded pair to avoid possible fluctuating and inaccurate signal levels induced into the other sensor signal wires.*

This sensor AC power can be run in the same conduit with the sensor signal wire as long as it's run in twisted, shielded pair and terminated properly.

Setpoint analog range tolerance

Table 3: Setpoint analog range tolerance

Setpoint Analog Tolerance			
55˚ to 95˚F Scale	**-3˚ to +3˚F Scale**	**-5˚ to +5˚F Scale**	**Terminal 3 Analog Output**
@ 55˚F (min.)	@-3˚F (min.)	@ -5˚F (min.)	0.0 to 0.10 vdc
@65˚F	@-1.5˚F	@-2.5˚F	1.3 to 1.42 vdc
@75˚F	@0˚F	@0˚F	2.12 to 2.2 vdc
@85˚F	@+1.5˚F	@+2.5˚F	2.58 to 2.63 vdc
@95˚F (max.)	@+3˚F (max.)	@+5˚F (max.)	3.0 to 4.0 vdc

Initial start-up occupied sequence

On initial installation power-up, the sensor is in "Occupied" mode with a solid occupied icon and DC voltage at terminal "U". If the "STATUS/Dot" input on Terminal 1 from the controller indicates occupied ("ON" continuous), then the unit continues to stay "Occupied". If the "STATUS/Dot" input on Terminal 1 from the controller indicates unoccupied (5 seconds "ON" then 5.5 seconds "OFF"), then the occupied icon will flash the desired occupancy state every 8 seconds, indicating to the user a mismatch of the desired occupied status and system occupied status at the controller

Power fail start-up occupied sequence

On a power failure, the sensor retains its last known desired occupancy status in non-volatile memory. On restoration of power, the sensor restores its last known desired occupancy state from memory. The occupied icon will reflect this with a solid (occupied) or hollow (unoccupied) indication and terminal "U" will have voltage applied (occupied) or grounded (unoccupied). If the "STATUS/Dot" input on Terminal 1 from the controller matches this occupancy state then the occupied status icon will continue to be solid or hollow depending on the last known state. If the "STATUS/Dot" input on Terminal 1 from the controller is different from the sensor occupied state, then the occupied icon will flash the desired occupancy state every 8 seconds indicating to the user a mismatch of the desired occupied status and system occupied status at the controller.

Display descriptions

Numerical display

The factory setting default numerical display (Figure 6) shows current temperature (°F or °C) and toggles to humidity and setpoint display every 5 seconds.

Figure 6: Sensor numerical display

Adjusting the setpoint

(Temperature or humidity)

Whichever is displayed at the time, temperature or humidity:

- Push the ▲ or ▼ button, the displayed setpoint can be adjusted up or down.
- After an adjustment, the setpoint is displayed for 5 seconds.

During the setpoint display push (System Mode Button) to switch between the temperature display or the humidity display.

- Push the ▲ or ▼ button, the displayed setpoint can be adjusted up or down. (See "Front Panel Button Operation" on page 7 for details.)

The unit can also be programmed in the field to "Setpoint Only" display or Setpoint Lockout. See the "Optional Technician Adjustments" on page 9.

Occupied icon indicator

The Occupied Icon on the left side of the display indicates whether the room sensor is in the Occupied or Unoccupied Mode, (Figure 7).

Figure 7: Occupied & unoccupied icons

 = "Occupied"  = "Unoccupied"

Solid is Occupied and Hollow is Unoccupied.

- A blinking icon every 8 seconds indicates an override request that has not been fulfilled.

"OVERRIDE" on the display

The **"OVERRIDE"** word indicator in the top left corner illuminates when the sensor is signalled by the "Status" input (Terminal 1).

This is initiated from the Override/Reset Button at first and then confirmed from the "Status" input code which keeps the "OVERRIDE" indicator on.

Fan status & speed indicators

 **"Fan & No Wavy Lines"** indicate the fan is Off.

 **"Fan & 2 Wavy Lines"** indicate Low.

 **"Fan & 3 Wavy Lines"** indicate Medium.

"Fan & 4 Wavy Lines" indicate High, **and the word "AUTO"** indicate fan Auto mode.

System mode "HEAT/COOL/AUTO/OFF/DHUM" indicators

The **"HEAT/COOL/AUTO/OFF/DHUM"** Mode Indicators on the bottom of the display describe each of the sensor's modes. The mode is changed by pushing the System Mode button on the sensor. (Dhum is only used on WSHP units.)

"ALARM" on the display

The **"ALARM"** word indicator on top illuminates when the sensor interprets the "Status" input code from the controller as an alarm. See Table 4 on page 7.

"E-SAVE" word on the display

The **"E-SAVE"** word indicator on top illuminates when the sensor interprets the "Status" input code from the controller as Standby Mode (See Table 4 on page 7).

"SETPOINT" word on the display

The **"Setpoint"** word on top illuminates when the sensor is displaying the setpoint on the numerical display (Temperature or Humidity). When this "Setpoint" indicator is off, the numerical display shows the actual room temperature or humidity.

"STATUS" word & dot on the display

The Status "Dot" on the display indicates the unit status or alarm condition. It is turned "On" and "Off" by interpreting the status input from the controller on terminal 1.

Table 4 shows the alternating conditions and sensor status.

Table 4: WSHP unit status input timing definition

Status Dot "ON" (+ 5 vdc) time	Status Dot "OFF" (0 vdc) Time	WSHP Availability	Display Indication
0.5 seconds	0.5 seconds	Controller Off (or Network "Wink" operation active)	"ALARM" On
0.0 seconds	Continuous	Unit running in Night Setback Override Mode or no power to the unit	"OVERRIDE" On
0.5 seconds	5.5 seconds	Unoccupied Mode	Hollow Occupied Icon
5.5 seconds	0.5 seconds	Standby Mode	"E-SAVE" On
Continuous	0.0 seconds	Occupied Mode	Solid Occupied Icon

Table 5: Fan Coil (FCU) unit status input timing definition

Status Dot "ON" (+ 5 vdc) time	Status Dot "OFF" (0 vdc) Time	Fan Coil Availability	Display Indication
0.3 seconds	0.3 seconds	Alarm Active	"ALARM" On
0.0 seconds	Continuous	Unit running in Night Setback Override Mode or no power to the unit	"OVERRIDE" On
0.5 seconds	5.5 seconds	Unoccupied Mode	Hollow Occupied Icon
5.5 seconds	0.5 seconds	Standby Mode	"E-SAVE" On
Continuous	0.0 seconds	Occupied Mode	Solid Occupied Icon
3.0 seconds	3.0 seconds	Calibration Mode/ Network Wink	No Change

Front panel button operation

System mode indication (FCU only)

"HEAT/COOL/AUTO/OFF"

The "HEAT/COOL/AUTO/OFF" Mode Indicators on the bottom of the display show the mode status of the sensor and are changed by pushing the System Mode button.

- **"HEAT"** on the display means the unit will only provide heating.
- **"COOL"** on the display means the unit will only provide cooling.
- **"AUTO"** on the display means the unit switches automatically to provide cooling or heating.
- **"Off"** on the display means the unit will not provide cooling, heating or fan operation.

There should always be one indicator “ON” unless the sensor has no power or has a problem. The System Mode Analog Output voltage on Term. 2 will change based on the system mode.

Fan speed indication (FCU only)

“AUTO/HIGH/MEDIUM/LOW”

The Fan Speed Indicators on the display show the fan speed status (AUTO/HIGH/MEDIUM/LOW) and are changed by pushing the Fan Mode button.

“Fan & 4 Wavy Lines & AUTO” - the fan stages up or down automatically depending on the demand for HEAT/COOL.

“Fan & 4 Wavy Lines” - the fan runs continuously at high speed regardless of the system mode setting of HEAT/COOL/AUTO.

“Fan & 3 Wavy Lines” - the fan runs continuously at medium speed regardless of the system mode setting of HEAT/COOL/AUTO.

“Fan & 2 Wavy Lines” - the fan runs continuously at low speed regardless of the system mode setting of HEAT/COOL/AUTO.

“Fan & No Wavy Lines” - Indicates the fan is Off.

There should always be one indicator “On” unless the sensor has no power or has a problem. The Fan Speed Analog Output voltage on Terminal 6 will change based on the fan speed selection.

System mode indication (WSHP only)

“HEAT/COOL/AUTO/OFF/DHUM”

The “HEAT/COOL/AUTO/OFF/DHUM” Mode Indicators on the display show the mode status of the sensor and are changed by pushing the System Mode button.

- **“HEAT”** on the display means the unit will only provide heating.
- **“COOL”** on the display means unit will only provide cooling.
- **“AUTO”** on the display means the unit can switch automatically to provide cooling or heating or dehumidification.
- **“OFF”** on the display means the unit will not provide cooling, heating, dehumidification or fan operation (“E” terminal goes Low).
- **“DHUM”** on the display means that only dehumidification will operate.

There should always be one indicator “On” unless the sensor has no power or has a problem. The System Mode Analog Output voltage on Terminal 2 will change based on the system mode selection.

Fan indication (WSHP only)

“AUTO/ON”

The Fan Indicators on the left side of the display show the fan status (AUTO/ON) of the sensor and are changed by pushing the Fan Mode button.

“Fan & 4 Wavy Lines & AUTO” - the fan runs on a call for HEAT/COOL/DHUM. Otherwise the fan is off.

“Fan & 4 Wavy Lines” - the fan runs continuously regardless of the system mode setting of HEAT/COOL/AUTO/DHUM.

“Fan & No Wavy Lines” - the fan is Off when the system mode is “Off”.

Override/Reset button (timed override & alarm reset)

When the “Override/Reset” Button is pressed, the thermistor sensor is shorted. If held for more than 3 seconds but less than 11 seconds, it puts the controller into a timed Occupied Override (the time is set by the controller). If the unit is in alarm, then holding the “Override/Reset” Button for more than 11 seconds will clear all alarms in the controller but only if the cause of the alarm has already returned to its non-alarm condition. Some alarms will not reset from the digital room sensor.

In this case, power to the unit must be cycled off for 5 seconds to clear the alarm. Continuously resetting alarms from the room sensor could damage the controller. Please call a service technician when repeated alarm resets are required to keep the unit operational.

Occupied button (occupied/ unoccupied request)

Note: *Terminal “U” opens HI to source power on power-up “Occcupied”*

When the “Occupancy” Button is pushed, the current “Occupied” or “Unoccupied” status of the sensor will be toggled to the opposite condition for 20 seconds. Both the display and “U” terminal output reflect the new status during the 20 seconds. If a confirmation signal is received from the controller into the Status Input terminal “1” within 20 seconds, then the new occupancy condition remains; otherwise the “U” terminal will return to the original state and the “Occupied” Icon will flash the desired occupancy state every 8 seconds.

Up & down setpoint buttons temp or humidity)

Press the Setpoint “Up/Down” Buttons once to enter the Setpoint Adjustment Mode. View the display to see whether the unit is in Temperature or Humidity Setpoint mode. If needed, press the “System Mode” Button once to toggle to the desired Setpoint. The current setpoint value will display for 5 seconds. When the “Up/Down” Buttons are pressed in this mode, the temperature or humidity setpoint will change in one degree or percent (%) increments. It will only change within the temperature setpoint range that was ordered (or the setpoint range that was set via the Program Mode).

The humidity setpoint is always between 40% to 90%. After 5 seconds of no buttons being pushed, the sensor will go into the standard display mode.

System mode button (FCU has HEAT/COOL/AUTO/OFF) or (WSHP has HEAT/COOL/AUTO/OFF/DHUM)

When the “System” Button is pushed, the unit switches between system modes.

Fan mode button (FCU has AUTO/ HIGH/MEDIUM/LOW/OFF) (WSHP has AUTO/ON)

When the “Fan” Button is pushed, the fan speed changes in order from one speed to another.

Optional technician adjustments

Note: *The sensor setup is factory set per your order. Setup adjustments are not required*

The unit is shipped ready to install per the order and does not require any special setup or programming. The following Program Menu Changes are available if the installer decides to change the factory settings. The Setpoint Up/Down Buttons and Occupancy Button are used in the Programming Mode to make Menu changes and selection.

Set-up jumper (J50) configuration

(Factory set per order)

⚠ CAUTION

Turn off power to the unit before reconfiguring the F/C or MDL jumper settings.Damage to the sensor board can occur if jumpers are moved while there is power to the unit and sensor.

Figure 8: J50 Jumper

Label description setting

PRG	Program Mode or Run Mode Menu below).	Program Mode = Jumper installed for Program Mode (See Program Run Mode = Jumper removed for Run Mode (Place jumper on one pin only).
F/C	ºC Indication or ºF Indication	ºC = Jumper installed for ºC . ºF = Jumper removed for ºF Indication (Place jumper on one pin only). 910152148, 910113575
MDL	Sets the Model FCU or WSHP	910113679 = Jumper removed for FCU (Default for units ordered as FCU). 910121754 = Jumper installed for WSHP (Default for units ordered as WSHP).

Program mode menu pages:

(Display required)

Note: *Both J50 “F/C” and J50 “MDL” jumpers must be configured first before entering the program “PRG” mode.*

Entering program mode and making changes

1. Install the J50 “PRG” jumper onto both pins with power turned on to enter Program Mode.
2. Press the Up/Down Buttons to advance to the desired program parameter from P1 through P14 (Parameters described below).
3. Press the Occupancy Button to select the specific program parameter to change.
4. Change the parameter value as described in the Mode Menus section below. (Usually with the Up/Down Button)
5. Press the Occupancy Button again to set the selected parameter.
6. Press the Up/Down Buttons to proceed to the next parameter (as in Step 2 above).
7. When done making changes, remove the J50 “PRG” jumper (and place over one pin). This action will end the Programming Mode and store all the values. The sensor is now in the Run Mode.

Program mode menu pages

P1 **Setpoint Mode** (Factory set to temperature value “S1”. J50 ºF/ºC must be set before entering the program “PRG” mode).

- **S1** – “UP/DOWN” to select setpoint to absolute temperature setpoint value. Actual setpoint value set in P4 and P5. **Example:** 55ºF (13º C) to 95ºF (35º C).
- **S2** – “UP/DOWN” to select setpoint to relative temperature setpoint value of ±5.0ºF (±2.8ºC).
- **S3** – “UP/DOWN” to select setpoint to relative temperature setpoint value of ±3.0ºF (±1.67ºC) for Enfinity systems.

P2 **Temperature Offset** (Factory set to zero).

- “UP” to increase offset up to +2.
- “DOWN” to decrease offset down to -2.

P3 **Humidity Offset** (Factory set to zero).

- “UP” to increase offset up to +5
- “DOWN” to decrease offset down to -5.

P4 **Setpoint Low Range** (Factory set to 55°F or 13°C depending on J50 °F/°C setting).

P1 in S1 Mode: Adjustment range 55 to 65°F or 13 to 18°C.

- “UP” to increase the low setpoint range up to 65°F or 18°C.
- “DOWN” to decrease the low setpoint range down to 55°F or 13°C.

P1 in S2 Mode: No adjustment. Factory set to -5°F (-2.8°C).

P1 in S3 Mode: No adjustment. Factory set to -3°F (-1.6°C) for Enfinity systems.

P5 **Setpoint High Range** (Factory set to 95°F or 35°C depending on J50-°F/°C setting).

P1 in S1 Mode: Adjustment range 85 to 95°F or 29 to 35°C.

- "UP" to increase the high setpoint range up to 95°F or 35°C.
- "DOWN" to decrease the high setpoint range down to 85°F or 29°C.

P1 in S2 Mode: No adjustment. Factory set to 5°F (2.8°C).

P1 in S3 Mode: No adjustment. Factory set to 3°F (1.6°C) for Enfinity systems.

P6 **Fan Lock Mode** (Factory set to Unlocked "Unl")

- "UP/DOWN" to set Fan Lock mode. Choose from list below:

All Models	**Unl**	Enables fan to be controlled by the Sensor Fan button
All Models	**FA**	Locks fan to the Fan Auto position (No Sensor Fan button control)
WSHP Models	**FO**	Locks fan to the Fan On position (No Sensor Fan button control)
FCU Models	**FH**	Locks fan to the Fan High speed position (No Sensor Fan button control)
FCU Models	**Fd**	Locks fan to the Fan Medium speed position (No Sensor Fan button control)
FCU Models	**FL**	Locks fan to the Fan Low speed position (No Sensor Fan button control)
FCU Models	**Fo**	Locks fan to the Fan Off position (No Sensor Fan button control)

P7 **System Lock Mode** (Factory set to Unlocked "Unl")

- "UP/DOWN" to set System Lock mode. Choose from list below:

Unl	Enables System to be controlled by the Sensor System Mode button.
UH	Locks System to the Heat mode (No Sensor System button control).
UC	Locks System to the Cool mode (No Sensor System button control).
UA	Locks System to the Auto mode (No Sensor System button control).
UO	Locks System to the Off mode (No Sensor System button control).
Ud	Locks System to the Dhum mode (No Sensor System button control).

P8 **Display Resolution** (Factory set to ±0.5 resolution, "0.5").

- **0.1** "UP/DOWN" to set resolution to ±0.1, (Rounds up at .05).
- **0.5** "UP/DOWN" to set resolution to ±0.5, (Rounds up at .08).
- **1** "UP/DOWN" to set resolution to ±1.0, (Rounds up at .5).

P9 **Dehumidification Dead band (DB)** (Factory set to 2%), (WSHP Only).

- **2** "UP/DOWN" to set Dead band at 2% (On at setpoint SP, Off at SP-DB).
- **3** "UP/DOWN" to set Dead band at 3% (On at setpoint SP, Off at SP-DB).
- **4** "UP/DOWN" to set Dead band at 4% (On at setpoint SP, Off at SP-DB).
- **5** "UP/DOWN" to set Dead band at 5% (On at setpoint SP, Off at SP-DB).

P10 **Display Mode** (Factory set to #16 for WSHP units, factory set to #4 or #3 for FCU Units).

- "UP/DOWN" to set display mode.
- Choose from numbered list below. Choices 5-16 will not be shown if P12 = nOH.

1 = No value on the main display (Blank).
2 = Temperature Value (TV).
3 = Temperature Setpoint (TSP) (FCU Default 910113575).
4 = Temperature Value & Temperature Setpoint (FCU Default 910152148, 910113679).
5 = Humidity Value (HV).
6 = Temperature Value & Humidity Value.
7 = Humidity Value & Temperature Setpoint.
8 = Temperature Value, Temp Setpoint & Humidity Value.
9 = Humidity Setpoint (HSP).
10 = Temperature Value & Humidity Setpoint.
11 = Temperature Setpoint & Humidity Setpoint.
12 = Temperature Value & Temp Setpoint & Humidity Setpoint.
13 = Humidity Value & Humidity Setpoint.
14 = Temperature Value, & Humidity Value & Humidity Setpoint.
15 = Humidity Value & Temperature Setpoint & Humidity Setpoint.
16 = Temperature Value & Temperature Setpoint & Humidity Value & Humidity Setpoint (WSHP Default).

P11 **Setpoint Button Lockout** (Factory set to "0": Temp. & Humidity Setpoint Enabled.

Note: *1. Selections in P11 will impact Menu P10).*

2. After changing P11 option, remove PRG jumper on J50 to exit programming mode and refresh options. In order to make additional programming changes, PRG Jumper must be reinstalled to enter programming mode.

0 Both Temperature & Humidity Setpoints are enabled (No Setpoint lockout, WSHP Units Only).

1 Humidity Setpoint Only is Enabled (Temperature setpoint is locked out, WSHP Units Only).

2 Temperature Setpoint Only is Enabled (Humidity setpoint is locked out).

3 Both Temperature & Humidity Setpoints are Disabled (Full Setpoint lockout).

P12 Dehumidification Enable/Disable

nOH Dehumidification is Disabled (Factory default for FCU Units).

HuA Dehumidification is Enabled (Factory default for WSHP Units).

P13 Occupancy Button Enable/Disable (Factory set to enabled "ObE").

ObE Occupancy Button Enabled (Factory default)

Obd Occupancy Button Disabled

P14 Firmware Version - XXX.X

P15 For Units with a BACnet or LONWORKS Communications Module

Setpoint Calibration Offset (Factory set to "0".)

- "UP" to increase offset up to +100 will raise the MicroTech III perceived set point from the sensor.
- "DOWN" to decrease offset down to -100. This will lower the MicroTech III perceived set point from the sensor.

Calibrate the displayed set point to the set point value sent to the MicroTech III as follows:

1. Set the digital room sensor displayed set point to 90° F.
2. Observe the local set point via the BAS/EMS connected by the BACnet or LonWorks Communications Module.
3. Adjust the Configuration Menu P15 on the sensor until the local set point and the displayed set point are equal.

P15 For Units without a BACnet or LONWORKS Communications Module

Setpoint Calibration Offset (Factory set to "0".)

- "UP" to increase offset up to +100 will raise the MicroTech III perceived set point from the sensor.
- "DOWN" to decrease offset down to -100. This will lower the MicroTech III perceived set point from the sensor.

The Setpoint Calibration Offset can be calculated using the following formula:

ROUND [(Controller Vdd / Sensor Vdd)*1000]-1000

Example:

Given: Controller Vdd = 5.15VDC

Sensor Vdd = 4.95 VDC

The programmed Calibration Offset would be

[(5.15/4.95)*1000] -1000 = 40

Diagnostics

Problem & possible solution

No display

- Check the power connections and power voltage level
- Replace unit if power is okay.

No temperature signal

- Be sure the termination and wiring is correct and the controller is set up properly. Make sure the "Override/ Reset" button is not stuck down.
- Replace unit if all checks are okay.

Override/Reset not working

- Measure the resistance to ground at the sensor output terminal (Term. 4). When pushing the Override Button, it should show a short. If not, replace the sensor.

No fan voltage signal

- Be sure the termination and wiring is correct and the controller is set up properly.
- Replace unit if all checks are okay.

No system voltage signal

- Be sure the termination and wiring is correct and the controller is set up properly.
- Replace unit if all checks are okay.

De-humidification not working

- Adjust the System Mode to DHUM and check terminal DH for voltage.
- Change the RH setpoint above and below the ambient RH to prove the output contact.
- Replace unit if it still doesn't work.

Occupied not working

- Verify that this terminal is in a powered circuit. Measure the voltage to ground at the occupied terminal (U). When pushing the Occupied Button (<2 secs), it should read close to 0 volts. When you lift the button it should read high volts.
- Replace unit if it still doesn't work.

"Err" shown on the screen

- This indicates that the temperature and humidity sensing element has failed.

FAN key does not change fan mode

- Check to verify FAN is not locked out in Programming Mode Menu Page P6.

MODE key does not change system mode

- Check to verify Mode is not locked out in Programming Mode Menu Page P7.

Up or Down key does not change setpoints

- Check to verify Set points are not locked out in Programming Mode Menu Page P11.

Solid Man goes away after 20 seconds

- Occupancy Request was not acknowledged by Main controller, check wiring of Status Signal from controller.

Supply voltage

Fan Coil Thermostat Conversion Kit

to Eliminate 3-speed Switch Capability

Safety Information

The installation of this equipment shall be in accordance the regulations of authorities having jurisdiction and all applicable codes. It is the responsibility of the installer to determine and follow the applicable codes. This equipment is to be installed only by an experienced installation company which employs trained personnel.

⚠ WARNING

Rigorously adhere to field wiring procedures regarding proper lockout and tagout of components.

⚠ WARNING

To avoid electrical shock, personal injury or death:

1. Installer must be qualified, experienced technician.
2. Disconnect power supply before installation to prevent electrical shock and damage to equipment.

Introduction

This thermostat conversion **kit number 107345245** converts a fan coil unit thermostat to a thermostat without a 3-speed switch. The thermostat kit includes a cover that does NOT have an opening for the 3-speed control switch. The following is the proper procedure to convert the thermostat.

Procedure

⚠ CAUTION

If the FAN Switch remains in the left-most (Off) position the thermostat will NOT function properly.

1. Carry out this procedure before mounting the thermostat or applying power to it. If the thermostat is already mounted, turn off all power to it before proceeding.
2. Slide the FAN switch on the front of the thermostat to the setting at which you want the motor to run all the time.
3. Remove the cover from the thermostat by gently prying with behind the left hand edge of the cover with a small screwdriver, then pulling it off as shown in Figures 1 and 2.

NOTE: Once you exchange thermostat covers, the user can no longer change this setting.

4. Adjust the dip switch and jumpers to your desired configuration (see thermostat installation manual).
5. Pull off the fan slide switch cap (Figure 3). Note: Be careful not to change the position of the switch you set in Step 2.
6. Place the new thermostat cover that does not have the 3-speed switch opening on the thermostat (Figure 4).

DAIKIN

Automatic Changeover Switch

for Automatic Seasonal Changeover on Two-pipe Systems

⚠ WARNING

Installation and maintenance are to be performed only by qualified personnel who are familiar with and in compliance with state, local and national codes and regulations, and experienced with this type of equipment.

⚠ CAUTION

Sharp edges and coil surfaces are a potential injury hazards. Avoid contact with them

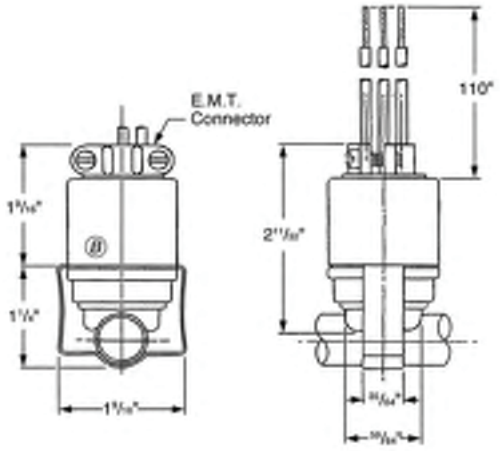
These line voltage changeover switches are designed to switch a thermostat from heating to cooling based on a change in supply water temperature. The switches can be mounted on 5/8" or 7/8" O.D. copper tube or iron pipe.

Both models are easily mounted to the supply piping with a simple spring clip included with the thermostat.

Models

The 039398600 model (Fig. 1) has 110 in. leads and is the standard changeover switch. The 06361801 model (Fig. 2) has the same operating characteristics and includes 18 in. conduit and connector.

Both models are snap acting, SPDT switches.



Terminal No. 1 has a black wire and is the common (C) connected to valve (valve cycle) or to the yellow wire of the speed switch (fan cycle).

Terminal No. 2 has a red wire and is normally open (N.O.). Connected to the heating (red) wire of the thermostat.

Terminal No. 3 has a blue wire and is normally closed (N.C.). Connected to the cooling (blue) wire of the thermostat.

At approximately 65°F, plus or minus 6°F, terminals 1 and 3 are closed and terminals 1 and 2 are open. At 95°F, plus or minus 6°F, terminals 1 and 2 are closed and terminals 1 and 3 are open.

- IM 1171 — Digitally Adjustable Display Sensor Installation and Maintenance Manual
- OM 1095 — MicroTech III The Downloading And Configuration Procedure
- ED 15135 — MicroTech III Fan Coil Unit Controller Protocol Information

For information on ThinLine Fan Coils and Cabinet Unit Heaters see

- Catalog 724 — ThinLine Horizontal Fan Coils (Type FCHC, FCHH, and FCHR)
- Catalog 725 — ThinLine Horizontal Cabinet Unit Heaters (Type FHHC, FHHH, and FHHR)
- IM 1152 — Installation Manual Daikin ThinLine Horizontal Fan Coils and Cabinet Unit Heaters (Type FC and FH Horizontal Design).

General Use and Information

The MicroTech unit controller is a fan coil/cabinet unit heater control platform used to control the fan coil/unit heater in all modes of operation, including economizers, control valves, and all components used to control conditioned space temperature. By adding a communication module, (LONWORKS or BACnet) network integration is possible. The controller can be used with wall sensor control only.

No outside power sources may be used to operate MicroTech controller. All units must be properly grounded per local code requirements. See the Installation Manual IM 1152 for specific power requirements.

Control Inputs

The baseboard accepts the following analog and binary control inputs:

1. Room Temp and Tenant Override . . . . . Analog
2. Local Setpoint Adjust . . . . . Analog
3. Fan Mode/Speed Switch . . . . . Analog
4. Entering Water Temperature (EWT) . . . . . Analog
5. Discharge Air Temperature (DAT) . . . . . Analog
6. Heat/Cool/Auto Mode Switch . . . . . Analog
7. Freeze Fault Detection. . . . . Binary
8. Occupancy Sensor . . . . . Binary
9. Condensate Overflow . . . . . Binary

Input Description

Room or Return Air Temp & Tenant Override

Analog input may be used to measure Room or Return Air temperature using a 10k NTC thermistor. The same analog input is used to sense the position of the timed override switch when a room sensor is applied. This sensor is mandatory in the Fan Coil/Cabinet Unit Heater units unless the input value is provided through network communications.

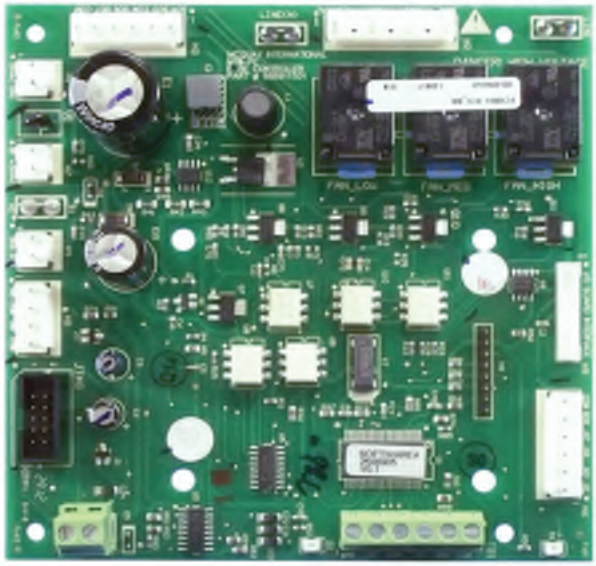
Condensate Overflow

Analog input may be used to detect the presence of water in condensate pan. While the input is analog (microOhms), the result of the algorithm is binary (dry or wet). If the value is below 2.5 microOhms, the pan is dry. If the value is above 2.5 microOhms, the pan is wet. Ultimately the pan is considered dry for analog inputs above 1.8 VDC.

Local Setpoint Adjust

Analog input may be used to determine hardwired setpoint position based on a 1.5K Ω potentiometer that is mounted on the room temperature sensor. Setpoint is at its minimum value at 0 Ohms (0.0 VDC), maximum value at 1.5K Ohms (3.0 VDC). Range of input is determined by the setting of an equipment configuration bit. Long range input is limited by Max and Min clamp settings. Either “Short” or “Long” range is selected during the unit order and preset at the Daikin factory. See “nciSoftJumpers” in Table 18 for specification details.

- If “Short Range” is selected, the nvoSetptShift variables are used.
- If “Long Range” is selected, the nvoSetpoint variable is used.



Fan Mode/Speed Switch

Analog input may be used to determine the position of the fan mode and speed switch. Input DC voltages are defined as follows: 0.0v = Auto, 1.0v = High, 2.0v = Medium, 3.0v = Low, 4.0v = Off, 5.0v = Switch is not present.

Entering Water Temperature (EWT)

Analog input may be used to measure temperature of water entering the hydronic coil using a 10k NTC thermistor. The sensor is only required in 2-Pipe Cooling/Heating systems or Heating-only with Supplemental Electric Heat, and is optional elsewhere.

Figure 1: MicroTech Baseboard

Discharge Air Temperature (DAT)

Analog input may be used to measure discharge air temperature sensor using a 10k NTC thermistor.

Heat/Cool/Auto Mode Switch

Analog input may be used to determine the position of the heat/cool/auto mode switch. Input DC voltages are defined as follows: 0.0v = Cool, 1.0v = Auto, 2.5v = Heat, 5.0v = Switch is not present.

Freeze Fault Detection

Binary input may be used to detect the position of a low discharge air temperature freeze fault detection switch. The sensor part of the switch is installed in the air stream. If the contact on the switch is open, the temperature in the air stream is below freezing (alarm active). If the contact on the

switch is closed, the temperature in the air stream is above freezing (alarm inactive). Must use “nciSoftJumpers” to enable or disable this input. See Table 18. Input span is 0.0 to 3.6 VDC, with a threshold of 1.5 VDC.

NOTE: Freezestat sensor should be provided from the factory or field-supplied

Occupancy Sensor

Binary input may be used to detect the position of an occupancy sensor. This could be a motion detector or a time clock. Open sensor contact represents occupied, closed sensor contact represents unoccupied. Network-effective occupancy has priority over position of this input. Input span is 0.7 (unoccupied) to 5.0 VDC (occupied), with a threshold of 2.85 VDC.

NOTE: Note: Occupancy sensor is field-supplied

Control Outputs

The MicroTech baseboard provides the following Binary Outputs:

1. Fan Low Speed
2. Fan Medium Speed
3. Fan High Speed
4. Valve Output #1
5. Valve Output #2
6. Valve Output #3/Electric Heat S1
7. Valve Output #4
8. Fresh (Outside) Air Damper – 2-Position only.
9. Room Sensor Status Output

Output Description

Each binary output is either a relay with normally-open contacts or a triac. A triac is treated like a relay with normally-open contacts. In other words, energizing the triac is like closing a normally-open contact.

Fan Speed Outputs

There are three fan speed outputs on baseboard, and three fan speed outputs on I/O expansion board. The two separate fans operate in unison. In other words – if the low speed output on baseboard is energized, the low speed output on I/O expansion board is also energized, etc. If all three outputs are de-energized, the fan motor is off. Only a single type (low, medium, high) of speed output shall be turned on when fan operation is required.

- **Low Speed:**

  This binary output is used to operate the fan at low speed. If this output is energized, the fan operates at low speed.

- **Medium Speed:**

  This binary output is used to operate the fan at medium speed. If this output is energized, the fan operates at medium speed.

- **High Speed:**

  This binary output is used to operate the fan at high speed. If this output is energized, the fan operates at high speed.

Two-Position Damper Output

Binary output may be used to open a fresh air ventilation damper. If the output is de-energized, the damper is closed. If the output is energized, the damper is open.

Room Sensor Status Output

Binary output may be used to energize and de-energize an indicator located on the room sensor. See Room Sensor Status Output Annunciation Table below.

Status Annunciation Tables

Table 1: Room Sensor Status Output Annunciation Table

Condition *	Indicator On Time (Sec)	Indicator Off Time (Sec)
Alarm Active: Specific Alarm Determines Number of Flashes (See Alarms section)	0.3	0.3 (1.3 Between Cycles)
Calibration or Network Wink Active	3.0	3.0
Service Test Mode	0.0	Continually
Unoccupied Mode	0.5	5.5
Standby Mode	5.5	0.5
Occupied, Bypass Mode	Continually	0.0

* Annunciation conditions are listed in order of priority.

Table 2: Baseboard Diagnostic LED Annunciation Table

Diagnostic LED State	Condition
LED #1: On Steady	Normal I/O Expansion Board SPI Communications
LED #1: Flashing	Failed I/O Expansion Board SPI Communications
LED #2: On Steady	Normal Comm Module SPI Communications
LED #2: Flashing	Failed Comm Module SPI Communications

The I/O Expansion Module is an extension of the main board and provides extra functionality to the MicroTech control system. The MicroTech unit controller in combination with the I/O Expansion Module will be the standard control system for ThinLine Fan Coils and Cabinet Unit Heaters. See Figure 2.

Adding an I/O Expansion Module (with an interconnect cable) to the main controller allows:

- Economizer Control
- Second Fan Motor Control
- Additional control inputs

I/O Expansion Board Inputs & Outputs

I/O expansion Board accepts the following inputs:

1. Outdoor Air Temperature (OAT) – analog
2. Dirty Air Filter – binary[1]
3. Emergency Shutdown Detection – binary [Future option]
4. Humidistat – binary [Future option]

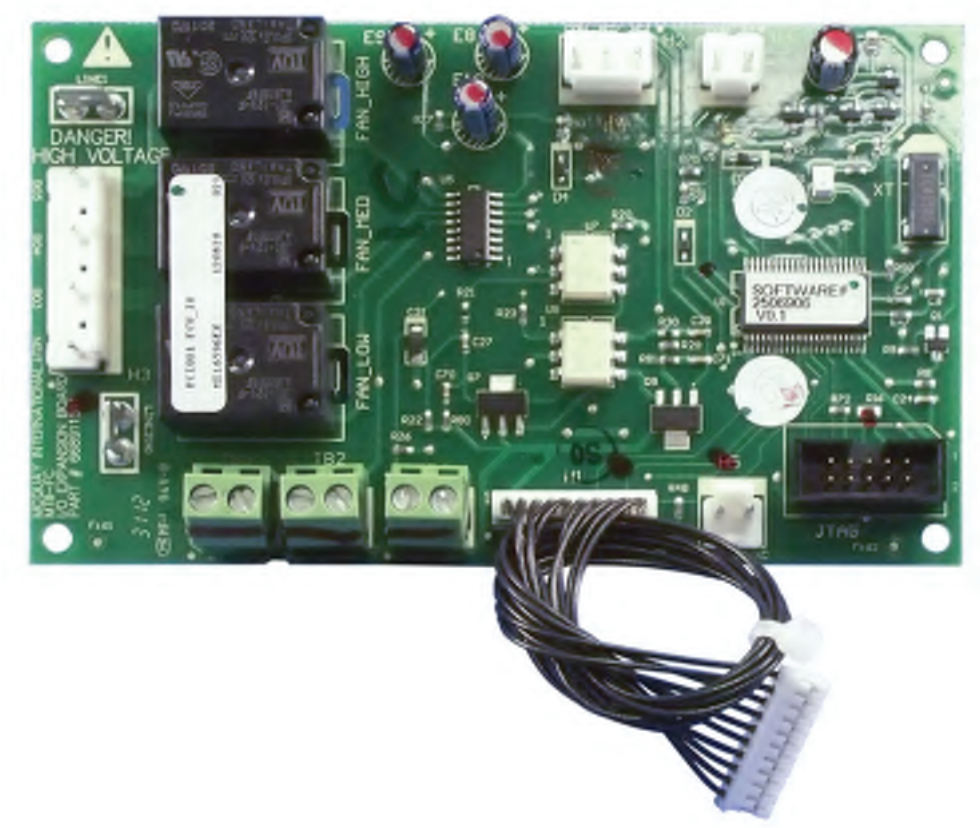
[1] Currently Dirty Filter indication uses timer only

Input Description

Outdoor(Fresh) Air Temperature (OAT)

Analog input may be used to measure outdoor air temperature using a 10k NTC thermistor.

Dirty Air Filter



Binary input may be used to detect Dirty Filter[2] condition. Dirty air filter alarm is active when the input contact opens. Must use “nciSoftJumpers” to enable or disable this input. See Table 18 for details. Input span is 0.0 to 3.6 VDC, with a threshold of 1.5 VDC.

[2] Currently Dirty Filter input uses timer signal only.

Humidistat [future option]

Binary input may be used to detect humidistat position. Contact closes when dehumidification is required. This feature is only allowed for 4-Pipe Heating & Cooling systems with modulating valves and 2-Pipe Cooling-only systems. Input span is 0.0 to 3.6 VDC, with a threshold of 1.5 VDC.

Figure 2: MicroTech I/O Expansion Module

Output Description

I/O Expansion Board provides the following binary Outputs:

1. Economizer Open
2. Economizer Closed
3. Fan Low Speed
4. Fan Medium Speed
5. Fan High Speed

Economizer Control Outputs

I/O expansion board binary outputs 1 and 2 are may be used for economizer control. Output #1 drives the economizer toward the open position. Output #2 drives the economizer toward the closed position.

Emergency Shutdown [future option]

Binary input may be used to detect an emergency shutdown condition. Shutdown occurs when the input contact opens. Must use “nciSoftJumpers” to enable or disable this input. See Table 18 for details. Input span is 0.0 to 3.6 VDC, with a threshold of 1.5 VDC.

Second Fan Motor Speed Outputs

There are three fan speed outputs on baseboard, and three fan speed outputs on I/O expansion board. The two separate fans operate in unison. In other words – if the low speed output on baseboard is energized, the low speed output on I/O expansion board is also energized, etc. If all three outputs are de-energized, the fan motor is off. Only a single type (low, medium, high) of speed output shall be turned on when fan operation is required.

- **Low Speed:**

  This binary output is used to operate the fan at low speed. If this output is energized, the fan operates at low speed.

- **Medium Speed:**

  This binary output is used to operate the fan at medium speed. If this output is energized, the fan operates at medium speed.

- **High Speed:**

  This binary output is used to operate the fan at high speed. If this output is energized, the fan operates at high speed.

Table 3: I/O Expansion Board Diagnostic LED Annunciation Table

Condition *	LED On Time (Sec)	LED Off Time (Sec)
SPI Communications Receive (RX) Fail	0.5	0.5
SPI Communications Transmit (TX) Fail (From Baseboard)	2.5	2.5
Normal SPI Communications	Continually	0.0

* Annunciation conditions are listed in order of priority.
